8. The combination of a receiving-cylinder, a supply-pipe connecting said cylinder with a barrel or cask, a delivery-cylinder, a flexible pipe between the receiving and delivery cylinders, said flexible pipe being of larger cross-sectional area than the supply-pipe, siphon-tubes fitted to the delivery-cylinder, and cocks in said supply and flexible tubes having bores or openings flaring in the direction of the flow of liquid, substantially as set forth.

9. The combination, of a receiving-cylinder, a supply-pipe connecting the same with a barrel or cask, a delivery-cylinder, a flexible pipe between the receiving and delivery cylinders, said pipe being of larger diameter than the supply-pipe, and a longitudinally-slotted delivery-pipe in said delivery-cylinder of larger size than the flexible pipe, substantially as set forth.

10. The combination, in a bottle-filling machine, of an upper receiving-cylinder, a lower delivery-cylinder provided with siphons, a valved connecting-pipe between the upper and lower cylinders, a gas-distributing cylinder connected with a source of carbonic-acid gas under pressure, a pipe connecting said gas-distributing cylinder with the keg or barrel the contents of which are to be bottled, valved pipes connecting the gas-distributing cylinder respectively with the receiving and delivery cylinders, and a vent device for each of said connecting-pipes, substantially as set forth.

705,280. PURLING DEVICE FOR OVEREDGE SEWING-MACHINES. JAMES G. GREENE, Elizabeth, N. J., assignor to The Singer Manufacturing Company, a Corporation of New Jersey. Filed Dec. 3 1901. Serial No. 84,553. (No model.)

Claim.—1. In a sewing-machine, the combination with an overseaming stitch-forming mechanism, of a purling device for producing a purl edge on the upper side of the work and consisting of a forked thread-carrying looper, and means for imparting longitudinal reciprocating and oscillating movements to said looper.

2. In a sewing-machine, the combination with an overseaming stitch-forming mechanism, of a purling device for producing a purl edge on the upper side of the work and consisting of a forked thread-carrying looper, means for imparting longitudinal reciprocating and oscillating movements to said looper, and a take-up device for the purling-thread.

3. In a sewing-machine, the combination with an overseaming stitch-forming mechanism, of a purling device for producing a purl edge on the upper side of the work and consisting of a forked thread-carrying looper, means for imparting longitudinal reciprocating and oscillating movements to said looper, and a detachable connection whereby the operating mechanism for said looper may be disconnected to render said looper inoperative, without requiring its removal from the sewing-machine.

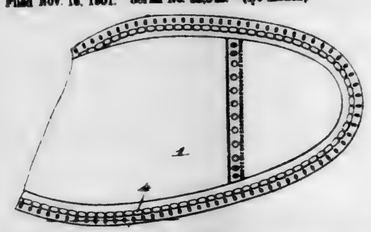
4. In a sewing-machine, the combination with an overseaming stitch-forming mechanism, of a thread-carrying purling-looper above the work-plate of the machine, means for imparting longitudinal reciprocating and oscillating movements to said looper and means for disconnecting the operating mechanism so that the said looper may be rendered inoperative without requiring its removal from the sewing-machine.

5. In a sewing-machine, the combination with an overseaming stitch-forming mechanism, of a purling device consisting of a forked thread-carrying looper arranged above the work-plate of the machine, an inclined bar by which said looper is carried and means for imparting oscillating and longitudinally-reciprocating movements to said bar and to the looper mounted thereon.

6. In a sewing-machine, the combination with an overseaming stitch-forming mechanism, of a purling device consisting of a forked thread-carrying looper arranged above the work-plate of the machine, an inclined bar by which said looper is carried, means for imparting oscillating and longitudinally-reciprocating movements to said bar and to the looper mounted thereon, and a take-up device coöperating with said looper and serving to tighten the purling-loops.

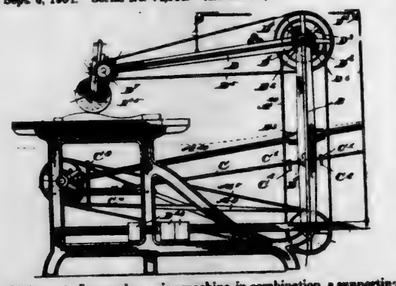
7. In a sewing-machine, the combination with an overseaming stitch-forming mechanism, of an inclined bar located above the work-plate of the machine and provided at its lower end with a forked thread-carrying looper for laying loops of purling-thread around the overedge-bights of needle-thread, a pinion having a splined connection with said bar, a sector-gear engaging said pinion, means for vibrating said sector-gear and means for reciprocating said bar lengthwise through said pinion.

705,281. BOOT OR SHOE. JOHN B. HADAWAY, Brockton, Mass. Filed Nov. 16, 1901. Serial No. 82,543. (No model.)



Claim.—An article of manufacture comprising a boot or shoe upper, a sole and a line of unseparated stitches appearing upon the upper surface of the projecting edge of the sole, the projecting edge of the sole being provided with a series of depressions located at varying distances apart corresponding to the varying lengths of the stitches for determining the location of the indentations during the stitch-separating operation, substantially as described.

705,282. SANDPAPERING-MACHINE. JOHN A. HALLDEN, Rockford, Ill., assignor of one-third to Enoch Carlson, Chicago, Ill. Filed Sept. 6, 1901. Serial No. 74,508. (No model.)



Claim.—1. In a sandpapering machine, in combination, a supporting-frame; a tilting frame pivotally mounted with relation to said supporting-frame; a sandpapering device supported by said tilting frame; means for actuating said sandpapering device; a screw-threaded shaft having a connection with said tilting frame; and means for rotating said shaft to oscillate said frame and reciprocate the sanding device with relation to the supporting-frame.

2. In a sandpapering-machine, in combination, a supporting-frame; a tilting frame pivotally mounted with relation to said supporting-frame; an arm having a pivotal connection with said tilting frame; a sandpapering device supported by said arm; means for actuating said sandpapering device; a screw-threaded shaft having a connection with said tilting frame; and means for rotating said shaft to oscillate said tilting frame and reciprocate the sanding device relatively to the supporting-frame.

3. In a sandpapering-machine, in combination, a supporting-frame; a tilting frame pivotally mounted with relation to said supporting-frame; a sandpapering device supported by said tilting frame; means for actuating said sandpapering device; a screw-threaded shaft having connection with said tilting frame; means for rotating said shaft in opposite directions; and means adapted to be operated by the movement of said tilting frame for changing the rotative direction of said screw-threaded shaft.

4. In a sandpapering-machine, in combination, a supporting-frame; a tilting frame pivotally mounted with relation to said supporting-frame; a sandpapering device supported by said tilting frame; means for actuating said sandpapering device; a shaft having a screw-thread engagement with a portion of said tilting frame; means for rotating said shaft in opposite directions; and means adapted to be operated by the movement of said tilting frame for changing the rotative direction of said shaft.

5. In a sandpapering-machine, in combination, a supporting-frame; a sandpapering device; means for supporting the sandpapering device; means for reciprocating the sandpapering device with relation to its supporting means; and means for reciprocating said supporting means with relation to the frame.

6. In a sandpapering-machine, in combination, a supporting-frame; a sandpapering device; an arm for supporting said sandpapering device; means for reciprocating said sandpapering device with relation to said arm; and means for reciprocating said arm with relation to said supporting-frame.

7. In a sandpapering-machine, in combination, a supporting-frame; a sandpapering device; an arm for supporting said sandpapering device; means for reciprocating the sandpapering device with relation to said arm; a tilting frame for reciprocating said arm with relation to the supporting-frame; and means for oscillating said tilting frame.

8. In a sandpapering-machine, in combination, a supporting-frame; a sandpapering device; an arm for supporting said sandpapering device; means for reciprocating said sandpapering device with relation to said arm; a tilting frame for reciprocating said arm with relation to the supporting-frame; a shaft having a screw-thread engagement with said tilting frame; and means for rotating said shaft in opposite directions.

9. In a sandpapering-machine, in combination, a supporting-frame; a sandpapering device; an arm for supporting said sandpapering device; means for reciprocating the sandpapering device with relation to the arm; a tilting frame for reciprocating said arm with relation to the supporting-frame; a shaft having a screw-thread engagement with said tilting frame; means for rotating said shaft; and means adapted to be operated by the movement of said tilting frame for changing the rotative direction of said shaft.

10. In a sandpapering-machine, in combination, a supporting-frame; a sandpapering device having a plurality of independent abrading-surfaces; means for supporting the sandpapering device; means for reciprocating said independent abrading-surfaces in contrary directions with relation to each other; and means for reciprocating said supporting means with relation to the frame.

11. In a sandpapering-machine, in combination, a supporting-frame; a sandpapering device having a plurality of independent abrading-surfaces; an arm for supporting said sandpapering device; means for reciprocating said independent abrading-surfaces in contrary directions with relation to each other; a tilting frame for reciprocating said arm with relation to the supporting-frame; and means for oscillating said tilting frame.

12. In a sandpapering-machine, in combination, a supporting-frame; a sandpapering device having a plurality of independent abrading-surfaces; an arm for supporting said sandpapering device; means for reciprocating said independent abrading-surfaces in contrary directions with relation to each other; a tilting frame for reciprocating said arm with relation to the supporting-frame; a shaft having a screw-thread engagement with said tilting frame; and means for rotating said shaft in opposite directions.

13. In a sandpapering-machine, in combination, a supporting-frame; a sandpapering device having a plurality of independent abrading-surfaces; an arm for supporting said sandpapering device; means for reciprocating the independent abrading-surfaces in contrary directions with relation to each other; a tilting frame for reciprocating said arm with relation to the supporting-frame; a shaft having a screw-thread engagement with said tilting frame; means for rotating said shaft; and means adapted to be operated by the movement of said tilting frame for changing the rotative direction of said shaft.

14. In a sandpapering-machine, in combination, a supporting-frame; a sandpapering device having a plurality of rubbing-blocks; an arm for supporting said sandpapering device; guides for said rubbing-blocks; means for moving said rubbing-blocks upon said guides in contrary directions with relation to each other; a tilting frame for reciprocating said arm with relation to the supporting-frame; a shaft having a screw-thread engagement with said tilting frame; means for rotating said shaft; and means adapted to be operated by the movement of said tilting frame for changing the rotative direction of said shaft.

15. In a sandpapering-machine, in combination, a supporting-frame; a sandpapering device having a plurality of rubbing-blocks; an arm for supporting said sandpapering device; a guide-rod for each of said rubbing-blocks; two oppositely-extending eccentrics; eccentric-rods connecting said eccentrics with said rubbing-blocks; means for rotating said eccentrics to move said rubbing-blocks upon said guide-rods; a tilting frame for reciprocating said arm with relation to the supporting-frame; a shaft having a screw-thread engagement with said tilting frame; means for rotating said shaft; and means adapted to be operated by the movement of said tilting frame for changing the rotative direction of said shaft.

16. In a sandpapering-machine, in combination, a supporting-frame; a sandpapering device comprising two rubbing-blocks; means for reciprocating said blocks in contrary directions with relation to each other; and means for bodily moving the sandpapering device forward and backward with relation to the supporting-frame.

17. In a sandpapering-machine, in combination, a supporting-frame; a sandpapering device comprising two rubbing-blocks, the adjacent edges of which rubbing-blocks are formed at an angle with the line of movement of said blocks; and means for reciprocating said blocks in contrary directions with relation to each other.

18. In a sandpapering-machine, in combination, a supporting-frame; a sandpapering device comprising two rubbing-blocks, the adjacent edges of which rubbing-blocks are formed at an angle with the line of movement of said blocks; guides for said rubbing-blocks; and means for moving said rubbing-blocks in opposite directions upon said guides.

19. In a sandpapering-machine, in combination, a supporting-frame; a sandpapering device comprising two rubbing-blocks, the adjacent edges of which rubbing-blocks are formed at an angle with the line of movement of said blocks; guides for said rubbing-blocks; means for moving said rubbing-blocks in opposite directions upon said guides; and means for reciprocating the sandpapering device bodily forward and backward.

20. In a sandpapering-machine, in combination, a supporting-frame; a sandpapering device comprising two rubbing-blocks, the adjacent edges of which are formed at angle with the line of movement of said blocks; an eccentric for reciprocating one of said rubbing-blocks; a tilting frame for moving said sandpapering device bodily forward and backward; means for rotating said eccentrics; and means for oscillating said tilting frame.

21. In a sandpapering-machine, in combination, a supporting-frame; a tilting frame pivotally mounted with relation to said supporting-frame; a sandpapering device supported by said tilting frame; means for actuating said sandpapering device; a counterbalance-lever for said sandpapering device; a shaft having a screw-thread engagement with a portion of said tilting frame; means for rotating said shaft in opposite directions; and means adapted to be operated by the movement of said tilting frame for changing the rotative direction of said shaft.

22. In a sandpapering-machine, in combination, a supporting-frame; a tilting frame pivotally mounted with relation to said supporting-frame; a pivoted arm connected with said tilting frame; a sandpapering device mounted on said pivoted arm; an eccentric for actuating said sandpapering device; a shaft having a screw-thread engagement with a portion of said tilting frame; means for rotating said shaft in opposite directions; and means adapted to be operated by the movement of said tilting frame, for changing the rotative direction of said shaft.

23. In a sandpapering-machine, in combination, a supporting-frame; a tilting frame pivotally mounted with relation to said supporting-frame; an arm pivotally connected with said tilting frame; a sandpapering device mounted on said arm; two eccentrics for actuating said sandpapering device; a counterbalance-lever for said sandpapering device; a connection between the pivoted arm and said counterbalance-lever; a shaft having a screw-thread engagement with a portion of said tilting frame; means for rotating said shaft in opposite directions; and means adapted to be operated by the movement of said tilting frame for changing the rotative direction of said shaft.

24. In a sandpapering-machine, in combination, a supporting-frame; a tilting frame pivotally mounted with relation to said supporting-frame; a sandpapering device supported by said tilting frame, which sandpapering device comprises two rubbing-blocks; means for reciprocating said rubbing-blocks in contrary directions with relation to each other; and means for oscillating said tilting frame to move the sandpapering device bodily forward and backward.

25. In a sandpapering-machine, in combination, a supporting-frame; a tilting frame pivotally mounted with relation to said supporting-frame; an arm pivotally connected with said tilting frame; a sandpapering device supported by said arm, said sandpapering device comprising two rubbing-blocks; means for reciprocating said rubbing-blocks in contrary directions with relation to each other; a shaft having a screw-thread connection with said tilting frame; and means for rotating said shaft in opposite directions to oscillate said tilting frame and move said sandpapering device bodily forward and backward.

26. In a sandpapering-machine, in combination, a supporting-frame; a work-table thereon; a tilting frame pivotally mounted with relation to said supporting-frame; an arm pivotally connected with said tilting frame; a sandpapering device supported by said arm, which sandpapering device comprises two rubbing-blocks; means for reciprocating said rubbing-blocks in contrary directions with relation to each other; and a shaft having a screw-thread engagement with said tilting frame, which shaft is adapted to be rotated in opposite directions to oscillate said tilting frame and move said sandpapering device forward and backward over said work-table.

27. In a sandpapering-machine, in combination, a supporting-frame; a tilting frame pivotally mounted with relation to said supporting-frame; an arm pivotally connected with said tilting frame; a sandpapering device supported by said arm, which sandpapering device comprises two rubbing-blocks; a shaft at the pivotal connection between the tilting frame and the arm pivotally mounted thereon; two eccentrics fixed on said shaft; eccentric-rods for connecting said eccentrics with said rubbing-blocks; a shaft having a screw-thread engagement with said tilting frame, which shaft is adapted to be rotated in opposite directions to oscillate said tilting frame and move said sandpapering device forward and backward over said supporting-frame.

28. In a sandpapering-machine, in combination, a supporting-frame; a tilting frame pivotally mounted with relation to said supporting-frame; an arm pivotally connected with said tilting frame; a sandpapering device comprising two rubbing-blocks and a guide for each of said rubbing-blocks; a two-part shaft for pivotally connecting said sandpapering device to the free end of said pivoted arm; a weighted lever for counterbalancing the sandpapering device; a shaft mounted in the supporting-frame, having a screw-thread connection with said tilting frame; and means for rotating said shaft in opposite directions to oscillate said tilting frame and move the sandpapering device bodily forward and backward.

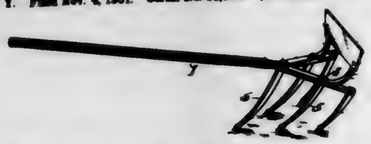
29. In a sandpapering-machine, in combination, a supporting-frame; a tilting frame pivotally mounted with relation to said supporting-frame; an arm pivotally connected with said tilting frame; a sandpapering device supported by said arm, said sandpapering device comprising two rubbing-blocks and a guide-rod for each of said rubbing-blocks; a two-part shaft for pivotally connecting said sandpapering device to the free end of said pivoted arm; a shaft at the pivotal connection between the tilting frame and the arm pivotally mounted thereon; two oppositely-extending eccentrics fixed on said shaft; eccentric-rods connecting said eccentrics with said rubbing-blocks; a shaft mounted in the supporting-frame and having a screw-thread connection with said tilting frame; and a crossed belt and a straight belt adapted to rotate said shaft in opposite directions to oscillate said tilting frame and move the sandpapering device bodily forward and backward.

30. In a sandpapering-machine, in combination, a supporting-frame; a sandpapering device comprising a yoke, two guide-rods fixed in said yoke, and rubbing-blocks slidably mounted upon each of said guide-rods, the adjacent edges of said rubbing-blocks being formed at an angle with their line of movement, straps at the sides of each of said blocks for securing sandpaper upon the blocks, and rods for connecting said straps together at the ends of the latter; two eccentrics; an eccentric-rod extending between each of said eccentrics and one of said rubbing-blocks; a tilting frame for supporting the sandpapering device; means for rotating said eccentrics; and means for oscillating said tilting frame.

31. In a sandpapering-machine, in combination, a supporting-frame; a tilting frame pivotally mounted with relation to said supporting-frame; an arm having a pivotal connection with said tilting frame; a sandpapering device supported by said arm; a weighted lever for counterbalancing the sandpapering device; a flexible connection extending between said pivoted arm and said weighted lever; a shaft mounted in said supporting-frame, having a screw-thread connection with said tilting frame; a straight and a crossed belt for rotating said shaft alternately in opposite directions; a shifting device for said belts; means on the tilting frame for operating said shifting device to change the rotative direction of said shaft; and means for actuating said sandpapering device.

32. In a sandpapering-machine, in combination, a supporting-frame; a tilting frame pivotally mounted with relation to said supporting-frame; an arm having a pivotal connection with said tilting frame; a sandpapering device supported by said arm, which sandpapering device comprises two rubbing-blocks adapted to be reciprocated in opposite directions and a guide for each of said rubbing-blocks; two oppositely-extending eccentrics for reciprocating said rubbing-blocks; an eccentric-rod connecting each of said eccentrics with one of said rubbing-blocks; a shaft rotatably mounted in said supporting-frame and having a screw-thread connection with said tilting frame; a straight and a crossed belt for rotating said shaft in contrary directions; a shifting device for said belts, the rod for operating said shifting device extending through a stud upon said tilting frame; and adjustable stops mounted on said rod and adapted to be engaged by said stud.

705,283. GARDEN IMPLEMENT. BYTA M. HARTELL, Brooklyn, N. Y. Filed Nov. 4, 1901. Serial No. 81,072. (No model.)



Claim.—1. An improved garden-tool, comprising a handle, a V-shaped frame secured at one end of such handle, teeth depending from said frame and provided with sharpened ends, arms rising from said frame near the open end oppositely to said teeth and a hoe-shaped blade carried by said arms.

2. An improved garden-tool, comprising a handle, a V-shaped frame secured at one end of such handle and provided with apertures, square in cross-section, in its apex and in each of its branches, teeth having their upper ends reduced in size forming shoulders abutting against the frame, portions adapted to fit the apertures and screw-threaded ends adapted to receive nuts adapted to be screwed on said ends, arms integral with said frame and rising from said frame near its open end, and a hoe-shaped blade secured to the ends of said arms.

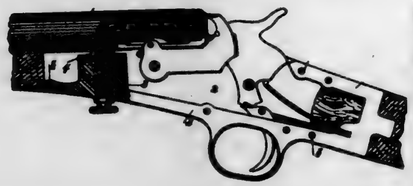
3. An improved garden-tool, comprising a handle, a V-shaped frame secured at one end of said handle and provided with depending teeth and upwardly-projecting arms and a hoe-shaped blade carried by said arms.

4. An improved garden-tool, comprising a handle, a V-shaped frame secured to one end of said handle, forwardly-inclined teeth secured in said frame and provided with sharpened ends, said teeth decreasing in length from the one at the apex of said frame to those at the ends of its branches, arms secured to said frame near its open end and extending oppositely to said teeth, and a hoe-shaped blade secured to the ends of said arms.

5. An improved garden-tool, comprising a handle, a V-shaped frame secured at one end of said handle, forwardly-inclined teeth detachably secured in said frame and provided with sharpened points, said teeth decreasing in length from the one at the apex of said frame to those at the ends of the branches of said frame, arms detachably secured near the open end of said frame and extending oppositely to said teeth and a hoe-shaped blade secured to the ends of said arms.

6. An improved garden-tool, comprising a handle, a V-shaped frame secured at its closed end to one end of the handle and provided with perforations in its apex and in each of its branches, forwardly-inclined teeth provided with sharpened points and with reduced screw-threaded upper ends adapted to fit in said apertures and be secured therein by nuts, a U-shaped member provided with perforations at the ends of its base whereby it may be secured on the upper ends of a pair of the outer teeth, the arms of said member being turned up oppositely to the teeth, and a hoe-shaped blade secured to the ends of said arms.

705,284. FIREARM. WILFRID HARTLEY, Utica, and EUGENE D. RIVERS and EDWARD BEACH, Ilion, N. Y., assignors to Remington Arms Company, Ilion, N. Y. Filed Sept. 20, 1901. Serial No. 75,856. (No model.)



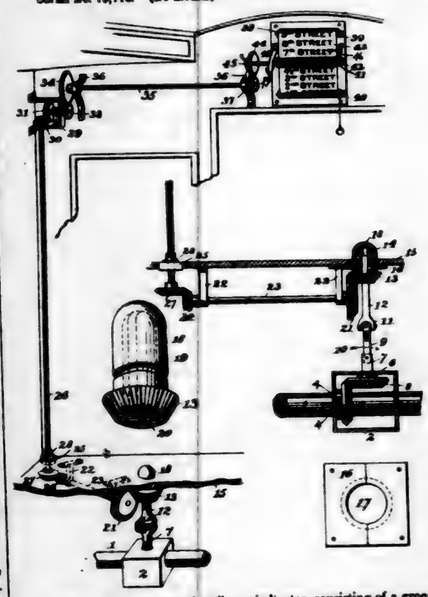
Claim.—1. The combination in a firearm of the barrel portion having grooves in its under side, a frame having side plates engaging in said grooves and means for securing the barrel portion and frame together, substantially as set forth.

2. The combination in a take-down firearm of the barrel having grooves in its under side and a depending lug or projection of a frame having side plates, the upper edges of which are received in said grooves, and having a recess to receive said lug or projection and means for securing the barrel and frame together, substantially as set forth.

3. A frame construction for a firearm consisting of the sheet-metal side plates and an intermediate skeleton-frame part including the trigger-guard and rivets passing transversely through the said side plates and skeleton frame securing them together, substantially as set forth.

4. A frame construction for a firearm consisting of the sheet-metal side plates, an intermediate skeleton-frame part and rivets passing through the said side plates and skeleton plates securing them together, substantially as set forth.

705,285. STREET-CAR AND RAILWAY INDICATOR. WILLIAM W. HARER and WILLIAM D. CREW, Eldorado, Ark. Filed Oct. 24, 1901. Serial No. 79,770. (No model.)



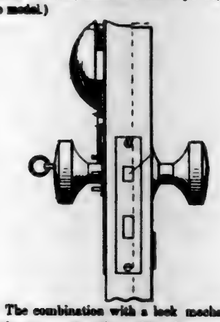
Claim.—1. An automatic railway-indicator, consisting of a grooved pulley, rigidly secured on one of the truck-axles; a horizontal shaft journaled in bearings beneath the car-floor, and having rigidly secured to one end a spool pulley-wheel; a spiral-spring belting passing around said pulleys; a beveled pinion cog-wheel rigidly secured to the other end of said shaft; a vertical shaft running up through the floor of the coach and borne in suitable bearing; a beveled wheel rigidly secured on its lower end, meshing with last-mentioned pinion-wheel; a pinion-wheel rigidly secured on the upper end of said vertical shaft; a shaft journaled in a bracket and having on one end a beveled cog-wheel meshing with last-mentioned beveled pinion-wheel, and on its other end a face pinion-wheel; a horizontal shaft journaled in brackets; a cog-wheel rigidly secured on one end of said shaft and meshing with the last-mentioned pinion-wheel; a pinion-wheel secured on the other end of said shaft; a board secured to the wall of the coach having a spring-actuated roller journaled in suitable brackets near its upper end; a spring-actuated roller journaled in brackets near the lower end of said board; said rollers adapted to be held at proper tension by ratchet-wheels, pawls and springs; rear and front center rollers journaled in suitable brackets; the front roller adapted to be pressed against the rear roller by springs; a cog-wheel loosely journaled on the shaft of the rear roller; a lock adapted to lock said wheel; an indicator-apron bearing on its face the names of stations, streets and depots, and having one end secured to the upper roller and the other to the lower roller; said apron adapted to be wound first on one roller and then on the other or partly on both, and being held in place by the two center rollers; and a pointer secured to the board, pointing out the names of the stations where the car stops, substantially as shown and described and for the purposes set forth.

2. A railway-indicator consisting of a board, brackets secured to said board near its center and its upper and lower ends; spring-actuated rollers journaled in the upper and lower brackets; ratchet-wheels, pawls, and springs secured to the ends of the upper and lower rollers and adapted to lock them; a rear and front roller journaled in the central brackets; an indicator-apron having one end secured to the upper roller, said apron passing down between the center rollers and its lower end secured to the lower roller; said rollers pulling against each other so as to keep the apron taut, said apron adapted to be wound on the upper or lower roller or partly on both; the front center roller held against the apron by springs; levers secured to said board and adapted to raise said springs; said indicator adapted to be operated by gear-wheels and shafts running back to an axle of the trucks; substantially as shown and described.

3. A railway-indicator consisting of a board, brackets secured to said board near its center and its upper and lower ends; spring-actuated rollers journaled in the upper and lower brackets; ratchet-wheels, pawls, and springs secured to the ends of the upper and lower rollers and adapted to lock them; a rear and front roller journaled in the central brackets; an indicator-apron having one end secured to the upper roller, said apron passing down between the center rollers and its lower end secured to the lower roller; said rollers pulling against each other so as to keep the apron taut; said apron adapted to be wound on the upper and lower roller or partly on both; springs for holding the front center roller against the apron; means for withdrawing said springs; manually-operated means for operating the lower one of the spring-actuated rollers, and gearing connections between said rear roller and an axle of the car, substantially as shown and described and for the purposes set forth.

4. In combination with a street-car indicator, a system of reversing-wheels consisting of bearing-plates 50, a series of cog-wheels journaled between said bearing-plates and adapted to run back or forward; a lever operating against a projection on one of the bearing-plates and adapted to throw one of the initial wheels in mesh with the driving-wheel; a spring-actuated locking-bar adapted to catch in recesses in the bearing-plates and thereby hold either initial wheel in mesh with the driving-wheel or both out of mesh therewith; said reversing device adapted to be secured on the axle of the rear center roller; substantially as shown and described.

705,286. DOOR-LOCK ATTACHMENT. ANDREW T. HATFILL and GEORGE B. LEE, Decorah, Idaho. Filed Sept. 20, 1901. Serial No. 75,864. (No model.)



Claim.—1. The combination with a lock mechanism and a knob-spindle for operative connection therewith, of means for throwing the spindle into and out of operative relation to the lock mechanism, a striker carried by the spindle, a gong, a spring-plate projecting at one end into the path of the striker and fixed at its opposite end, and a clapper carried by the spring-plate, the gong being disposed for engagement by the clapper when the spring-plate is released by the striker.

2. The combination with a lock mechanism including a rocker, of a knob-spindle passed through the rocker, a feather carried by the spindle for engagement with the rocker to lock the latter thereto, means for holding the feather yieldably engaged with the rocker, means for holding the feather in disengaged position, a striker carried by the spindle, and a bell having a clapper disposed for operation by the striker.

3. The combination with a lock mechanism and a knob-spindle for operating it, of a striker carried by the spindle, a gong, a spring-plate fixed at one end and extending with its other end beneath the gong and into the path of the striker for operation thereby, stops at opposite sides of the spring-plate between the point of attachment of the end of the plate and the striker, and a clapper attached to the plate at a point between the stops and the attached end of the plate.

4. The combination with a lock mechanism including a spindle of means for throwing the spindle into and out of operative relation to the mechanism, a gong, a spring-plate attached at one end beneath the gong and projecting with its opposite free end therefrom, strikers carried by the spindle for engagement with the free end of the plate, stops at opposite sides of the plate at a point between its ends, and clappers carried by the plate at a point between the stops and the attached end of the plate for engagement with the gong.

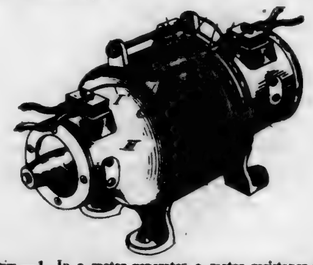
705,287. TABLE-SERVER. ALBERT T. HAVEN, South Elgin, Ill. Filed Apr. 11, 1902. Serial No. 102,410. (No model.)

Claim.—1. In a table-server, the combination of a spider having a hub or body and arms radially extending, a top mounted on the spider, a circular groove or channel in the lower face of the hub or body, a supporting disk or plate having in its upper face a circular groove or channel coinciding with the groove or channel in the hub or body and forming therewith a runway, balls within the runway, a circular groove or channel in the lower face of the supporting disk or plate, a bearing disk or cup below the supporting disk or plate, a groove or channel in the upper face of the bearing disk or cup coinciding with the groove or channel in the lower face of the supporting disk or plate and a fixed connection between the hub of the spider and the bearing disk or cup, substantially as described.

2. In a table-server the combination of a spider having a hub of body and arms radially extending, a top mounted on the spider, a circular groove or channel in the lower face of the hub or body, a supporting disk or plate having in its upper face a circular groove or channel coinciding with the groove or channel in the hub or body and forming therewith a runway, balls within the runway, a circumferential rim or wall encircling the hub or body, a circular groove or channel in the lower face of the supporting disk or plate of greater diameter than the groove or channel in the upper face of the supporting disk or plate, a bearing disk or cup below the supporting disk or plate, a groove or channel in the upper face of the bearing disk or cup coinciding with the groove or channel in the lower face of the supporting disk or plate and a fixed connection between the hub of the spider and the bearing disk or cup, substantially as described.

3. In a table-server the combination of a spider having a hub or body and arms radially extending, a top mounted on the spider, a circular groove or channel in the lower face of the hub or body, a supporting disk or plate having in its upper face a circular groove or channel coinciding with the groove or channel in the hub or body and forming therewith a runway, balls within the runway, a circumferential rim or wall on the supporting disk or plate encircling the hub or body, a circular groove or channel in the lower face of the supporting disk or plate of greater diameter than the groove or channel in the upper face of the supporting disk or plate, a bearing disk or cup below the supporting disk or plate having an internally-screw-threaded hole extending therethrough, a groove or channel in the upper face of the bearing disk or cup coinciding with the groove or channel in the lower face of the supporting disk or plate, a circumferential rim or wall on the supporting disk or plate encircling the bearing disk or cup, a stud-screw threaded on its end fixedly attached to and extending down from the body or hub of the spider through a hole in the supporting disk or plate and through the hole in the bearing disk or cup to have its screw-threads engage with the screw-threads of the hole, a jam-nut screw-threaded onto the stud to contact with the outer face of the bearing disk or cup, and legs fixedly attached to the supporting disk or plate, substantially as described.

705,288. ELECTRICAL MACHINE. TRACY R. HATCH, Menomonie, Wis., assignor to Submerged Electric Motor Company, Menomonie, Wis., a Corporation of Wisconsin. Filed Nov. 15, 1901. Serial No. 82,877. (No model.)

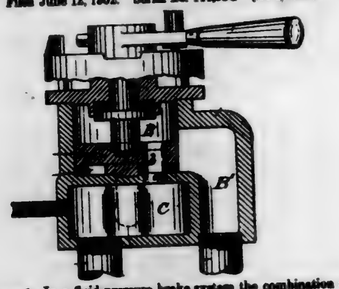


Claim.—1. In a motor-generator, a motor resistance-winding for high pressure wound about and exposed upon the frame of the machine, and a regulating-resistance low-pressure winding for the generator exposed upon the machine, and switch devices on the frame of the machine connected respectively with the motor and generator circuits and movable along the said resistance-windings, substantially as and for the purpose set forth.

2. In a motor-generator, constructed as shown and described, a re-

resistance-wire for the motor and a regulating resistance-wire for the generator, both wound about the field structure, and switch devices mounted upon the frame of the machine and movable along said resistance-windings, substantially as and for the purpose set forth.

705,289. FLUID-PRESSURE BRAKE SYSTEM. EDGAR J. HENDEE, Whitehaven, N. Y., assignor to Abraham R. Levy, New York, N. Y. Filed June 12, 1902. Serial No. 111,314. (No model.)



Claim.—1. In a fluid-pressure brake system the combination of an engineer's valve having ports for an application and release of the brakes, a spring-actuated recharging-valve, a port in the engineer's controlling-valve for regulating the admission of air to the port of the recharging-valve, all arranged so that when the engineer's valve is on "lap" the recharging-valve is receiving air-pressure and the brake application and release-ports in the engineer's valve will be blanked; a train-pipe in communication with the recharging-valve and with one or more triple valves, brake-cylinders and auxiliary reservoirs and a check-valve governing the flow of air to an auxiliary reservoir when the triple valve is in position to apply the brakes, the said check-valve being mechanically disconnected from the triple valve and in constant communication with the train-pipe.

2. In a fluid-pressure brake system, the combination of an engineer's valve having ports for an application and release of the brakes, a spring-actuated recharging-valve, a port in the engineer's valve for regulating the admission of air to the port of the recharging-valve, the recharging-valve receiving air only when the lever of the engineer's valve is in the lap position and the other ports are blanked, whereby equalization cannot be effected and consequently the brakes can be released by throwing the lever to the release position; a train-pipe in communication with the recharging-valve and with suitable brake apparatus embodying in its structure a check-valve mechanically disconnected from the triple valve and in constant communication with the train-pipe, said check-valve governing the influx of air to the auxiliary reservoir.

705,240. ROTARY TAKE-UP FOR SEWING-MACHINES. MARTIN HEBLER, Elizabeth, N. J., assignor to The Singer Manufacturing Company, a Corporation of New Jersey. Filed May 7, 1901. Serial No. 59,111. (No model.)

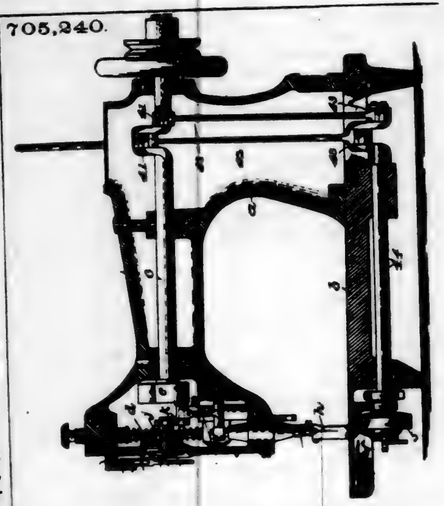
Claim.—1. In a sewing-machine, the combination with a rotary take-up and its operating mechanism, of means for automatically clearing the needle-thread from the said take-up while the machine is running should the said thread be broken between the tension device and the work and thus become entangled with or wound up on the said take-up.

2. In a sewing-machine, the combination with a rotary take-up, of a stationary knife or thread-cutter arranged to automatically sever the needle-thread between two separated parts of the take-up and thus clear the thread from said take-up while the machine is running should the thread become entangled with or wound up on the said take-up.

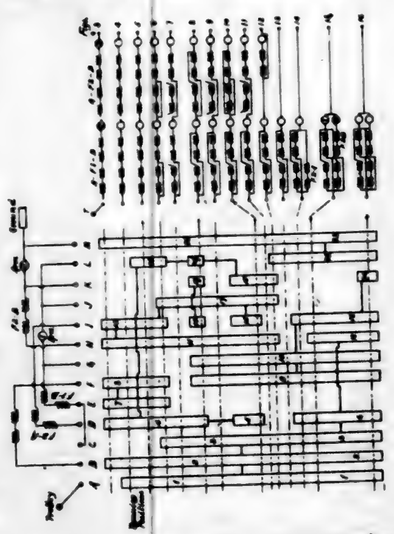
3. In a sewing-machine, the combination with a rotary take-up and its operating mechanism, of a knife or thread-cutter arranged to automatically sever the needle-thread adjacent to said take-up should said thread be caught on or entangled with said take-up, and a guard or housing inclosing said knife or thread-cutter.

4. In a sewing-machine, the combination with a rotary take-up having a slit or recess in its peripheral portion, of means for operating said take-up, a stationary knife or thread-cutter arranged to extend into said slit or recess during some part of the rotation of said take-up to sever the needle-thread should the latter become caught on the take-up and thus be extended across the said slit or recess.

5. In a sewing-machine, the combination with a rotary take-up and its operating mechanism, of a stationary tool for automatically clearing the needle-thread from said take-up while the machine is running should said thread accidentally be broken between the tension device and the work and thus become entangled with or wound up on the said take-up.



705,241. ELECTRIC CONTROLLER. JOHN C. HENRY, Denver, Colo.; Susie A. Henry, executrix of said John C. Henry, deceased, assignor to Stanley Electric Manufacturing Company, a Corporation of New Jersey. Filed Apr. 1, 1901. Serial No. 53,999. (No model.)



Claim.—1. The combination with an electric motor having a plurality of pairs of poles with magnetizing-coils connected in series, of a switch arranged to cut out a pair of said coils, thereby increasing the current through the other coils and changing the motor from an ordinary multipolar machine to a consequent-pole machine.

2. The combination with an electric motor having a plurality of pairs of poles with magnetizing-coils connected in series, of a switch having contacts and connections adapted and arranged to cut out a pair of said coils, thereby increasing the current through the other coils and then changing the field-coils from series to parallel relation.

3. The combination with a pair of electric motors having a plurality of pairs of poles with magnetizing-coils, of a switch having contacts and connections adapted and arranged to cut out a pair of the magnet-coils, reconnecting the coils in reverse manner to demagnetize the field, then short-circuiting the said motor and removing it from the circuit.

4. The combination with a motor having a plurality of pairs of poles with magnetizing-coils thereon, of a controller having contacts and connections adapted, in one position of the controller, to interrupt the circuit on one pair of said coils, allowing the corresponding pole series to act as consequent poles.

5. The combination with a motor having a plurality of pairs of field-magnet poles with magnetizing-coils thereon, of a controller having contacts and connections adapted and arranged in different positions of the controller to place the said field-magnet coils in series and in parallel relation, and in an intermediate position to interrupt the circuit on one pair of coils, allowing the corresponding pole-pieces to act as consequent poles.

6. The combination with an electric motor, of a controller having contacts and connections adapted and arranged to reverse a field-magnet coil of said motor and in a subsequent position, to place the said motor on short circuit.

7. The combination with an electric motor having a plurality of field-magnetizing coils, of a controller having contacts and connections adapted and arranged to reverse a part of the field-coils and to subsequently short-circuit the armature through another part of the field-coils.

8. In a series-parallel controller, a switch arranged to disconnect one of the motors from the circuit and to speed up the other motor by connecting a section of the fields of the idle motor in parallel with those of the other motor.

9. The combination with a plurality of motors, one at least of which has a plurality of field-coils, of a switch having contacts and connections adapted and arranged to disconnect one of the motors from the circuit and to speed up the other motor by connecting a part of the field-coils of the idle motor in parallel with those of the other motor.

10. In a series-parallel controller, a switch arranged to disconnect one of the motors from the circuit, and to excite a section of the field-coils of said idle motor, and then to connect the armature and balance of the field-coils of said motor to the line in parallel with the other motor.

11. In a series-parallel controller, a switch having contacts and connections adapted and arranged to disconnect one of the motors from the circuit and to then connect the idle motor to the circuit in parallel instepe substantially as follows, first connecting one section of the field-coils of said motor in parallel with the field-coils of the active motor, next connecting the balance of the field-coils and the armature of the idle motor, in parallel with the other motor, and finally establishing a cross connection between all of the field-coils and armatures.

12. The combination with a pair of electric motors, of a controller having contacts and connections adapted and arranged to disconnect one of the motors from the circuit, and to excite a section of the field-coils of said idle motor, and then to connect the armature and balance of the field-coils of said motor in parallel with the other motor.

705,242. SUPPORT FOR INCANDESCENT MANTLES. MAX HERSKOVITS, Chicago, Ill. Filed Nov. 4, 1901. Serial No. 81,082. (No model.)

Claim.—1. In a mantle-support, a cup having horizontal sockets on opposite sides, and a standard having horizontal, parallel feet extending through said sockets at right angles to the plane of the standa-

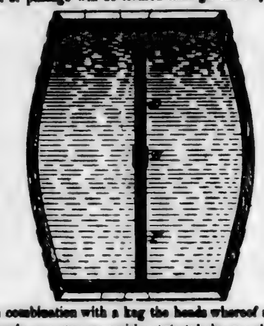
2. In a mantle-support, a standard having two legs terminating in parallel feet bent at right angles to the plane of the standard, and said bent portions doubled upon themselves, substantially in the manner described.

3. In a mantle-support, a standard having two legs with the end portions thereof bent to extend in opposite directions and at right angles to the plane of the legs, then bent inwardly toward each other, and terminating in portions lying parallel to each other and at right angles to the plane of the legs, as set forth.

705,248. BEER-COOLING APPARATUS. JOHN P. RICKEY, Washington, D. C. Filed Sept. 20, 1901. Serial No. 75,836. (No model.)

Claim.—1. In combination with a keg the heads whereof are each provided with an opening; a stay comprising two tubular members open at their ends, said members being secured in the openings in the heads of the keg and joined together at their adjacent ends within the keg, substantially as described.

2. In combination with a keg the heads whereof are each provided with an opening; a stay comprising two tubular members each provided with a shouldered head, the reduced portion of the head being threaded and said threaded sections being secured within the openings in the keg; and means for connecting the inner ends of said members, whereby the heads of the keg will be braced or held against separation and a continuous channel or passage will be formed through the stay.



3. In combination with a keg the heads whereof are each provided with an opening; a stay comprising two tubular members each member being formed with a shouldered head the reduced portion whereof is threaded and secured within the openings in the heads of the keg; a threaded connection between the inner ends of the sections; and a thread extending throughout the inner face of the stay, substantially as described.

705,244. PROCESS OF MANUFACTURING IMPROVED CELLULOSE FABRICS. ALBERT J. HILL, Twickenham, England. Filed Apr. 21, 1902. Serial No. 104,049. (No specimens.)

Claim.—1. The process of producing a crimpable cellulose fabric consisting in coating the fibers of a hydrated cellulose fabric with a proteid in solution drying the fabric and applying to it a varnishing solution containing an insoluble formaldehyde compound.

2. A process of producing a crimpable cellulose fabric consisting in applying a solution of cellulose to the fibers of a hydrated cellulose fabric, precipitating the cellulose and washing out the solvent, and coating the fibers with a proteid in solution.

3. A process of producing a crimpable cellulose fabric consisting in first coating the fibers of a hydrated cellulose fabric with albumen in solution, drying the fabric and then applying to it a varnishing solution containing an insoluble formaldehyde compound.

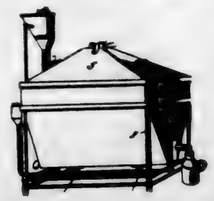
4. A process of producing a crimpable cellulose fabric consisting in coating the fibers of a hydrated cellulose fabric with a proteid in solution.

5. A process of producing a crimpable cellulose fabric consisting in coating the fibers of a hydrated cellulose fabric with albumen in solution.

6. A hydrated cellulose fabric having a proteid coating thereon.

7. A hydrated cellulose fabric having a coating of albumen thereon.

705,245. MILK PASTEURIZER AND STERILIZER. CHARLES E. HINMAN, Council Bluffs, Iowa, assignor of one-half to William C. McPherson, Council Bluffs, Iowa. Filed Mar. 11, 1901. Serial No. 50,698. (No model.)



Claim.—1. In a pasteurizing and sterilizing apparatus, the combination of a feed-tank, a valve controlling the outlet therefrom, corrugated plates inclined downwardly from their upper ends toward each other to receive the liquid, and means disposed within the upper ends of said plates for dividing the flow of the liquid to distribute it to the inner faces of said plates, substantially as described.

2. In a pasteurizing and sterilizing apparatus, the combination of a feed-tank, a valve controlling the outlet therefrom, corrugated plates inclined downwardly from their upper ends toward each other to receive the liquid, and means disposed within the upper ends of said plates for dividing the flow of the liquid to distribute it to the inner faces of said plates, and a water-jacket within which said plates are disposed and heaters disposed beneath said jacket, substantially as described.

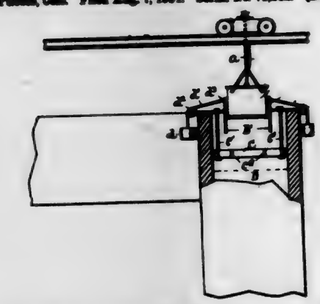
3. In a pasteurizing and sterilizing apparatus, the combination of a tank, a valve controlling the discharge therefrom, corrugated inclined planes, a water-jacket, means for heating the same, a cover and a suction-fan carried thereby, substantially as described.

4. In a pasteurizing and sterilizing apparatus, the combination of a tank, a regulating-valve having oppositely-disposed discharge-ways, oppositely-disposed corrugated inclined planes, inclined downward from their upper ends toward each other with an inclined delivery at the lower end, means interposed between said planes and the valve for dividing the liquid and directing it to opposite sides of said planes, and means for adjusting said valve and holding it in its adjusted position, substantially as described.

5. In a pasteurizing and sterilizing apparatus, the combination of a tank, a regulating-valve having oppositely-disposed discharge-ways, oppositely-disposed corrugated inclined planes, means interposed between said planes and the valve for dividing the liquid and directing it to both of said planes, a cover and a suction-fan carried thereby for removing the impurities arising from the liquid on said inclined planes, substantially as described.

6. In a pasteurizing and sterilizing apparatus, the combination of a receptacle, a water-jacket around the same, inclined corrugated planes, a cover for said receptacle, a suction-fan mounted thereon, a feed-tank and controlling-valve therefor, and an air-vent and discharge-pipe connected with the lowermost portion of said inclined planes, substantially as described.

705,246. FURNACE-FEEDING APPARATUS. WILLIAM H. HOWARD, Pueblo, Colo. Filed Aug. 7, 1901. Serial No. 71,212. (No model.)



Claim.—1. The combination with a furnace having doors yieldingly held in closed position, of a feed-box, and means for lowering said box against said doors to open the same and enter said furnace when feeding the same, substantially as described.

2. The combination with a furnace having at each side of its top a downwardly-opening door, of a feed-box adapted to fit easily into the opening normally closed by said doors, and means for lowering said feed-box upon said doors.

3. The combination with a furnace having at each side of its top a downwardly-opening door, of a feed-box adapted to fit easily into the opening normally closed by said doors, means for lowering said feed-box upon said doors, and counterweights for holding said doors normally closed.

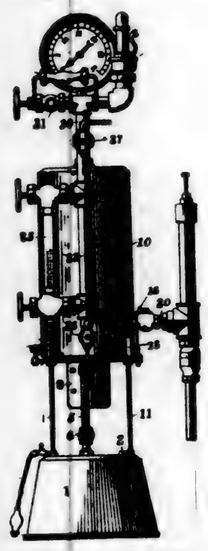
4. The combination with a furnace, of a feed-box therefor, means for moving said box to and away from said furnace, a cover for said box supported independently thereof, means for bringing said box against said cover after filling, and means for moving both box and cover into the feeding position.

5. The combination with a furnace, of a traveling crane, a feed-box supported and adapted to be raised into feeding position thereby, and a cover for said feed-box also supported by said crane and in the path of vertical movement of said box, the supports for said box being longer than those for the cover so that when the box is lowered to the filling position the cover will be arrested and held suspended before the box reaches its lowest point, substantially as described.

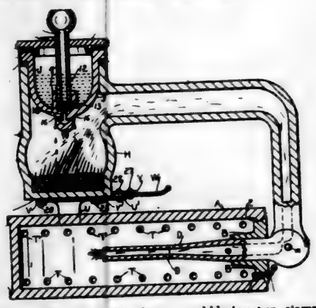
705,247. BEER-PIPE CLEANER. CLARENCE B. JOHNSON, Norfolk, Va., assignor of one-half to David B. Creecy, Jr., Norfolk, Va. Filed May 1, 1902. Serial No. 105,625. (No model.)

Claim.—1. In a cleaner for beer-coils, the combination with an upright steam-boiler, of a feed-tank having a burner connected thereto and located beneath the boiler, uprights connected to the feed-tank and having brackets on which the boiler rests, a ring on the uprights having projecting arms, and projections on the boiler removably coupled to said arms on the ring.

2. In a beer-pipe cleaner, the combination of the upright steam-boiler, the heater removably connected thereto, a cock forming a hot-water connection for a flexible hose and communicating with the boiler below the water-line, a similar cock forming steam connection above the water-line, and a second cock of larger size forming a second steam connection.



705,248. SMOOTHING-IRON. JOE JONES, Summit, Miss. Filed Sept. 20, 1901. Serial No. 75,793. (No model.)



Claim.—1. In a smoothing-iron, a carbid-chamber, clamps on the base of the chamber, a bushing secured in the rear end of the iron, a gas-burner pipe in said iron and extending through said bushing, a handle communicating with the carbid-chamber and with the outer end of said pipe, and pivotally connected thereto, said iron capable of revolving on said pipe and means for contracting said clamps to the iron, substantially as described and set forth.

2. The combination of a carbid-chamber, clamps pivotally connected to the under side of said chamber, a reversible smoothing-iron, a bushing secured in the rear end of the iron, a gas-pipe in the iron and protruding through the rear end thereof, a handle with rear elbow extending from the carbid-chamber and pivotally connected to the protruding end of the gas-pipe, said iron capable of revolving on said gas-pipe and means for opening and closing said clamps, substantially as described and set forth.

705,249. PLAYING-BALL. ELEAZER KEMPSHALL, Boston, Mass. Filed June 14, 1902. Serial No. 111,775. (No model.)

Claim.—1. A playing-ball comprising a sphere of plastic material in which is embedded a perforated shell of metal; said shell being close to the periphery of said sphere, and also inclosing a portion of said sphere.

2. A playing-ball comprising a celluloid shell in which is embedded a perforated shell of metal; said shell being between the outer and inner sides of said celluloid shell, and the latter being provided with a filling.

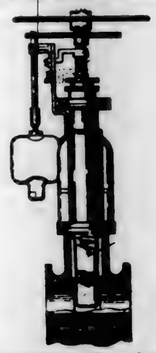
3. A playing-ball comprising a celluloid shell in which is embedded a perforated shell of metal; said metal shell being between the outer and inner sides of said celluloid shell, and the latter being provided with a filling, and holding said filling under compression.

4. A playing-ball comprising a celluloid shell between whose outer and inner surfaces is embedded a shell of metal; said metal shell being close to the periphery of said celluloid shell, and the latter being also provided with fabric.

5. A playing-ball comprising a celluloid sphere in which is embedded a sphere of perforated metal; said metal sphere being close to the periphery of said celluloid sphere, and the latter being filled with a sphere of soft rubber which is held under compression by said celluloid shell.

6. A playing-ball comprising a shell of celluloid in which is embedded a shell of perforated metal; said metal shell being between an inner and an outer surface of said celluloid shell, and the latter being provided with a filling, and being also reinforced by a layer of fabric.

705,250. MEANS FOR OPERATING VALVES. CHARLES G. Y. KING, Chicago, Ill. Filed Nov. 14, 1901. Serial No. 82,196. (No model.)



Claim.—1. The combination with a valve, a motor for actuating said valve, means for automatically arresting said motor before the valve reaches its final position in closing, and auxiliary means for completing the final movement of the valve, as and for the purpose set forth.

2. The combination with a valve, power mechanism for operating said valve, means for automatically arresting the power mechanism before the valve reaches its closed position, and manually-actuated devices for completing the closing movement of the valve, as and for the purpose set forth.

3. The combination with a valve and power mechanism for operating the same, of manually-actuated devices for imparting the initial movement to the valve in opening, as and for the purpose set forth.

4. The combination with a valve and power mechanism for operating the same, of manually-actuated devices for initially starting the valve toward open position, and means for automatically arresting the power mechanism when the valve reaches its completely open position, as and for the purpose set forth.

5. The combination with a valve, an electric motor for operating said valve, circuits for said motor, means for opening the circuit of said motor before the valve completes its movement toward closed position, and manual actuated devices for completing the closing movement of the valve, as and for the purpose set forth.

6. The combination with a valve and an electric motor for operating the same, circuits for said motor, of manually-actuated devices for initially starting the valve toward open position, and means for opening the circuit of said motor when the valve reaches the limit of its opening movement, as and for the purpose set forth.

7. The combination with a valve, a stem therefor, an operating hand-wheel connected to said stem, power mechanism, and gearing connected to said power mechanism and valve-stem, the initial movement of the valve in opening being imparted by the hand-wheel and the movement completed by the power mechanism, as and for the purpose set forth.

8. The combination with a valve, of manual actuating devices connected to said valve for imparting the initial movement to the valve in opening, and power mechanism also connected to said valve for completing the opening movement, as and for the purpose set forth.

9. The combination with a valve having a threaded stem, a motor geared to said valve-stem for actuating the same, a nut mounted upon said threaded stem and held against rotation, means actuated by the travel of said nut for automatically arresting said motor before the valve reaches the limit of its movement in closing, and auxiliary means for completing the closing movement of the valve, as and for the purpose set forth.

10. The combination with a valve having a threaded stem, an electric motor geared to said stem, circuits for said motor, a traveling nut mounted on said stem, means actuated by said traveling nut for automatically opening the circuits of said motor before said valve reaches the limits of its movement in closing, and auxiliary means for completing the closing movement of the valve, as and for the purpose set forth.

11. The combination with a valve having a threaded stem, a motor geared to said valve, circuits for said motor, a traveling nut mounted on said stem, a bar carried by said nut, and switch-levers arranged in the path of travel of said bar and arranged to be engaged thereby to be opened or closed, said switch-levers being arranged in the circuits of said motor, as and for the purpose set forth.

12. The combination with a valve having a threaded stem, a motor geared to said stem, a traveling nut mounted on said stem, a bar carried by said nut, switch-blocks arranged to be engaged by said bar at the limits of travel thereof, and switch-arms carried by said switch-blocks and operating to automatically open the motor-circuits to arrest the motor at the limits of travel of said bar, as and for the purpose set forth.

13. The combination with a valve having a threaded stem, of a motor geared to said valve-stem, a traveling nut mounted on said stem, a bar carried by said nut, oppositely-presented switch-blocks arranged respectively at the limits of travel of said nut to be engaged by said bar as it approaches the limits of its travel, whereby in the initial movement of said bar the adjacent switch-block is left in position to close a circuit of the motor, and in the final movement of said bar a switch-block is actuated to open the circuit of the motor, as and for the purpose set forth.

14. The combination with a valve, a threaded stem therefor, a nut mounted on said threaded stem, a hand-wheel connected to said stem, a motor geared to said stem, contacts arranged in the circuits of said motor and arranged to be engaged and actuated by said traveling nut to open and close the motor-circuits, said contacts being arranged to open the motor-circuits before the valve, in closing, reaches its final closing movement, as and for the purpose set forth.

705,251. APPARATUS FOR ADMINISTERING MEDICINES. WILLIAM P. KIRK and ELMER H. KIRK, Syracuse, N. Y. Filed July 31, 1901. Serial No. 70,417. (No model.)

Claim.—1. An apparatus for administering veterinary medicine, comprising a shell having end heads and transverse partitions dividing the shell into end and intermediate compartments having fixed relation to each other, said partitions having valved openings for the purpose specified, a piston movable in one of the end compartments to compress air in the intermediate compartment, and a conduit leading from a point in proximity to one of the partitions through the end head of the other compartment whereby medicine may be forced from said latter compartment through the conduit by air-pressure.

2. An apparatus for administering veterinary medicine, comprising a shell having a liquid-containing chamber provided with inlet and discharge openings in its opposite ends, a conduit leading from the inlet to a point in proximity to the opposite end of the liquid-chamber, a second conduit leading from a point in proximity to the end having the inlet through the outlet, and a powder-containing reservoir connected to the outer end of the second conduit.

3. An apparatus for administering veterinary medicines comprising

a cylinder having air and liquid containing chambers and a partition dividing said chambers, said partition having a passage connecting the chambers and formed with a valve-chamber connecting the passages, a valve movable in the valve-chamber and having an operating member projecting through the adjacent wall of the cylinder, a conduit leading from the passage to a point in proximity to the end head of the liquid-chamber, and an additional conduit leading from a point in proximity to the partition outwardly through said head.

4. An apparatus for administering veterinary medicines comprising a cylinder having air and liquid containing chambers and a partition dividing said chambers, said partition having a passage connecting the chambers and formed with a valve-chamber connecting the passages, a valve movable in the valve-chamber and having an operating member projecting through the adjacent wall of the cylinder, a conduit leading from the passage to a point in proximity to the end head of the liquid-chamber, and an additional conduit leading from a point in proximity to the partition outwardly through said head, and means for compressing air in the air-chamber.

5. An apparatus for administering veterinary medicines comprising a cylinder having air and liquid containing chambers and a partition dividing said chambers, said partition having a passage connecting the chambers and formed with a valve-chamber connecting the passages, a valve movable in the valve-chamber and having an operating member projecting through the adjacent wall of the cylinder, a conduit leading from the passage to a point in proximity to the end head of the liquid-chamber, and an additional conduit leading from a point in proximity to the partition outwardly through said head, a piston-chamber within the cylinder in fixed relation to the air-chamber, a partition dividing said piston and air chambers and provided with a connecting-passage and a valve, and a piston movable in the piston-chamber for the purpose set forth.

6. An apparatus for administering veterinary medicines comprising a cylinder having air and liquid containing chambers and a partition dividing said chambers, said partition having a passage connecting the chambers and formed with a valve-chamber connecting the passages, a valve movable in the valve-chamber and having an operating member projecting through the adjacent wall of the cylinder, a conduit leading from the passage to a point in proximity to the end head of the liquid-chamber, and an additional conduit leading from a point in proximity to the partition outwardly through said head and a powder-containing receptacle secured to the outer end of the additional conduit and receiving the liquid discharged therethrough.

705,252. TOP-SPINNING DEVICE. FREDERICK W. KRAHE, Minneapolis, Minn. Filed Aug. 5, 1901. Serial No. 70,875. (No model.)

Claim.—1. The combination with a top having a stem, of a spinning device comprising a strand of wire or the like lying substantially in the same plane throughout, having its one end bent into a semicircular portion adapted to engage said stem and lie upon the upper face of the top, the wire being looped intermediate of its ends and having its opposite end bent upwardly and contacting with the wire at the inner termination of the looped portion, the cord being received between said contacting portions of wire and retained by the tension of the last-named end, and wrapped around the stem above the first-named end of the wire, substantially as described.

2. The combination with a top having a stem, of a spinning device comprising a strand of wire lying substantially in the same plane throughout having an intermediate looped portion and an upwardly-bent portion on the termination of said looped portion contacting therewith, the opposite end of the wire being bent to engage the stem of the top and lie on the upper face of said top, the string being received between said contacting portions of the wire and retained by the tension of said first-named end of the wire, the cord being wrapped around said stem above the said last-named end of the wire, substantially as described.

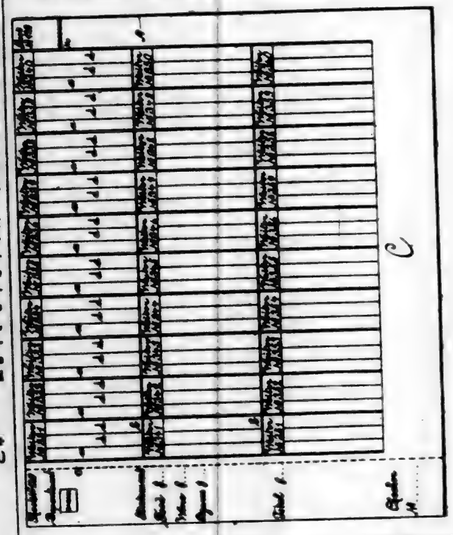
705,253. METHOD OF REMOVING OIL FROM WATER. ARTHUR B. KRAMER, Jersey City, N. J. Filed May 23, 1901. Serial No. 61,518. (No specimens.)

Claim.—1. The herein-described process of extracting oil from water, which consists in mixing with the mixture of oil and water a magnesium body of the character described, that is, one that is insoluble or only sparingly soluble in water, thereby causing said substance to gather the oil particles by physical action, and finally separating said body and gathered oil from the water, substantially as set forth.

2. The herein-described process of extracting oil from water, which consists in mixing with the mixture of oil and water a finely-divided magnesium body of the character described, that is, one that is insoluble or only sparingly soluble in water, thereby causing said substance to gather the oil particles by physical action, and finally separating said body and gathered oil from the water, substantially as set forth.

3. The herein-described process of extracting oil from water, which consists in mixing serpentine with the mixture of oil and water, thereby causing the serpentine to gather the oil particles by physical action, and finally separating the serpentine and gathered oil from the water, substantially as set forth.

705,254. CONTROL-SHEET. MAX KUHR, New York, N. Y. Filed Nov. 22, 1901. Serial No. 83,287. (No model.)



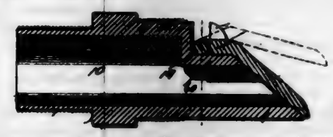
Claim.—1. A tally-sheet for hotels, restaurants, and the like establishments, comprising a sheet divided into two parts each part bearing the same number, and the designation of the checker using the tally-sheet; one part being divided by longitudinal and transverse lines into columns designated by numbers of the waiters employed in the department, where the tally-sheet is used, and subdivided into spaces for the entry of items of sales of different groups or classes of articles; and the other part being provided with a statement of names of the different groups and classes of articles corresponding to the subdivisions of the columns of the other part, and with a space thereunder for entering the total of all items of sales entered in the tally sheet.

2. A tally-sheet for hotels, restaurants, and the like establishments, comprising a body A and a stub B each having printed thereon the same number, and the designation of the checker using the tally-sheet; the body of the tally-sheet being divided by longitudinal and transverse lines into columns designated by the numbers of the waiters employed in the department where the tally-sheet is used, and subdivided into spaces for the entry of items of sales of different groups or classes of articles; and the stub being provided with a statement of names of the different groups and classes of articles corresponding to the subdivisions of the columns of the body of the tally-sheet, and with a space thereunder for entering the total of all items of sales entered in the tally-sheet.

705,255. CHECK OR CLACK VALVE. FRANK W. LEHRKNER, Marietta, Ohio. Filed Jan. 4, 1902. Serial No. 88,461. (No model.)

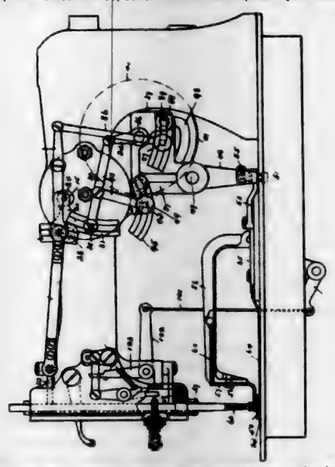
Claim.—1. The combination with a pipe-section having an obliquely-cut-off discharge end and a closed-in portion or bridge above said discharge, of lugs rising from said bridge and a valve or closure for the oblique discharge end having a stem engaging between said lugs and having bearings therein, substantially as set forth.

2. A pipe-section having its discharge end cut obliquely to its axis and having a closed-in portion or bridge above such oblique discharge, in combination with a valve seated upon the latter and having a stem seated between lugs upon the bridge-piece and having a transverse head or cross-piece engaging bearings in said lugs, the latter being beveled upon the front sides, substantially as set forth.



3. A pipe-section having an oblique discharge end and a closed-in portion forming a bridge above the same, lugs rising from said bridge and having beveled front sides and rounded edges corresponding with the contour of the pipe, one of said lugs being transversely perforated, and a transverse slot in the opposing lug, and a valve seated upon the oblique discharge end of the pipe and having a stem, engaging between the lugs rising from the bridge and provided with a cross-piece engaging the perforation and slot in said lugs, substantially as set forth.

705,256. BAR-STITCHING MACHINE. FRANCIS T. LEILICH, San Francisco, Cal., assignor of one-half to James G. Simonton, San Francisco, Cal. Filed Oct. 17, 1896. Serial No. 608,810. (No model.)



Claim.—1. In a sewing-machine, the combination of a laterally-vibrating needle-bar, a clamp for the work, a cam-wheel having a cam operatively connected with said clamp to shift the same, said cam having a series of undulations for shifting the clamp quickly through the full extent of its reciprocations, followed by an incline for shifting the clamp slowly, means for feeding said cam step by step and means for varying the extent of said feed, substantially as described.

2. In a sewing-machine, the combination of a laterally-vibrating needle-bar, a clamp for the work, a cam-wheel having a cam operatively connected with said clamp to shift the same, said cam having a series of undulations for shifting the clamp quickly through the full extent of its reciprocation, followed by an incline for shifting the clamp slowly, means for feeding said cam step by step and means for varying the extent of said feed, said means being operated by said cam in its revolution, substantially as described.

3. In a sewing-machine, the combination of a laterally-vibrating needle-bar, a clamp for the work, a cam-wheel having a cam operatively connected with said clamp to shift the same, said cam having a series of undulations for shifting the clamp quickly through the full extent of its reciprocation followed by an incline for shifting the clamp slowly, a pawl, and means connected with the driving-shaft for variably vibrating the same, said cam having two series of ratchet-teeth of different sizes, with which said pawl engages, to correspond with the variations in the vibrations of the pawl, substantially as described.

4. In a sewing-machine, the combination of a laterally-vibrated needle-bar, a clamp for the work, a cam-wheel having a cam operatively connected with said clamp to shift the same, a rock-shaft, a pawl vibrated thereby and feeding the cam-wheel, an arm carried by said rock-shaft, a link operatively connecting said arm with said pawl to impart its said vibrations thereto, the end of said link being movable along said arm, and means operated by said cam-wheel, for so moving said link to vary the feed, substantially as described.

5. In a sewing-machine the combination of a rock-shaft carrying a vibrating arm, a link having its end movable along a vibrating arm of the rock-shaft and operatively connected with the needle-bar to vary the same, a clamp for the work, a cam-wheel for shifting the same, a vibrating pawl-carrying arm for feeding said cam-wheel, a link having its end movable along a vibrating arm of the rock-shaft and operatively connected with the pawl-carrying arm to vibrate the latter, and means, operated by said cam-wheel, for independently shifting the end of each link along a vibrating arm on the rock-shaft, substantially as described.

6. In a sewing-machine the combination of a vibrating needle-bar, a clamp for the work, a cam-wheel for shifting the same, said cam-wheel having two series of teeth of different sizes, a vibrating pawl-carrying arm, said pawl engaging said teeth, means for vibrating said arm, and means, operated by said cam-wheel, for varying the extent of vibration of said pawl to correspond with the size of the teeth, substantially as described.

7. In a sewing-machine the combination of a needle-bar, means for vibrating the same, a clamp for the work, a cam-wheel for shifting the clamp, means for feeding the cam-wheel, means, operated by the cam-wheel, for varying the extent of vibration of the needle-bar, and means, operated by the cam-wheel, for varying the rapidity of feed of the cam-wheel, substantially as described.

8. In a sewing-machine, the combination of a transversely-vibrating needle-bar, a clamp for the work, means for longitudinally reciprocating said clamp quickly during a small number of vibrations of the needle-bar, and then slowly during a large number of said vibrations, a device carrying an independent cord, and means, coöperating with the clamp, for laying down said cord on the cloth in a line parallel with the reciprocation of the clamp, and centrally of the vibrations of the needle-bar, substantially as described.

9. In a sewing-machine, the combination of a needle-bar, a clamp for the work, means for reciprocating one of said elements transversely relatively to the other, means for longitudinally reciprocating said clamp quickly during a small number of said transverse reciprocations and then slowly during a large number thereof, a device carrying an independent cord, and means coöperating with the clamp, for laying down said cord on the cloth longitudinally of the clamp, substantially as described.

10. In a sewing-machine, the combination of a needle-bar, a clamp for the work, means for reciprocating one of said elements transversely relatively to the other, a device carrying an independent cord, and means for simultaneously reciprocating said clamp and device in opposite directions, substantially as described.

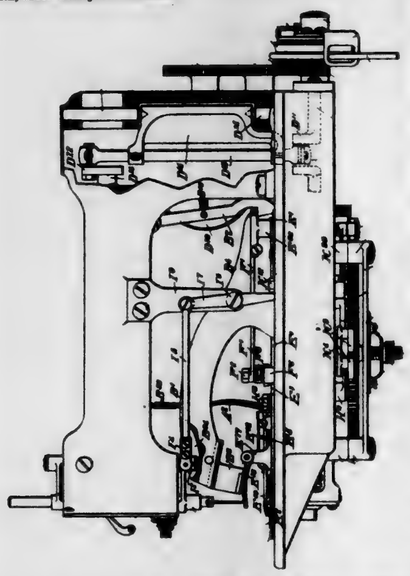
11. In a sewing-machine, the combination of a needle-bar, a clamp for the work, a rock-shaft, means, driven by said rock-shaft, for reciprocating one of said elements relatively to the other, a cam-wheel driven step by step by said rock-shaft, a device carrying an independent cord, said clamp and device being reciprocated simultaneously in opposite directions by said cam-wheel, and independent means actuated by said cam-wheel for shifting said device, substantially as described.

12. In a sewing-machine for forming a bar, in combination with a stitch-forming mechanism comprising a laterally-vibrated needle; of a driving mechanism; a clamp to hold the material in the vibratory path of the said needle; a feeding mechanism for the said clamp adapted to move the same over the entire length of the bar for a predetermined number of movements and then return the clamp across the path of the said needle slowly for the entire length of the bar to overstitch the bar-threads as laid in; a cord-guide pivotally mounted on the frame of the machine and adapted to vibrate across the vibratory path of the needle parallel to the movement of the said clamp; and a connecting mechanism to vibrate the said cord-guide, substantially as described.

705,257. BUTTONHOLE-SEWING MACHINE. FRANCIS T. LEILICH, San Francisco, Cal., assignor of one-half to James G. Simonton, San Francisco, Cal. Filed Sept. 14, 1896. Serial No. 605,826. (No model.)

Claim.—1. In a buttonhole-sewing machine, the combination of a cutter, a cam for operating the cutter, a stitch-forming mechanism, a power device transmitting motion alternately to said cam and mechanism, a device for clamping the work, a starting device, operated independently of the clamping device, and which, when moved in one direction, brings the cam into operative relation with the cutter, means whereby the reverse movement of said starting device interrupts said operative relation, a stop limiting the further movement, in the first direction, of said starting device, and means, operated by said cam at a predetermined point in its ef-

festive movement, for removing said stop, said starting device then, in its further movement, shifting said power device to operate the stitching mechanism, substantially as described.



2. In a buttonhole-sewing machine, the combination of a cutter, a cam for operating the cutter, a stitch-forming mechanism, a power device transmitting motion alternately to said cam and mechanism, a starting device, which, when moved in one direction, brings the cam into operative relation with the cutter, means whereby the reverse movement of said starting device interrupts said operative relation, a stop limiting the further movement, in the first direction, of said starting device, and means, operated by said cam at a predetermined point in its effective movement, for removing said stop, said starting device then, in its further movement, shifting said power device to operate the stitching mechanism, substantially as described.

3. In a buttonhole-sewing machine, the combination of a cutter, a cutter-operating mechanism, a stitch-forming mechanism, a power device transmitting motion to said mechanisms alternately, a device for clamping the work, a starting device, operated independently of the clamping device, and which, when moved in one direction, brings the cutter-operating mechanism into operative relation with the cutter, means whereby the reverse movement of said starting device interrupts said operative relation, a stop limiting the further movement, in the first direction, of said starting device, and means, operated by said cutter-operating mechanism at a predetermined point in its effective movement, for removing said stop, said starting device then, in its further movement, shifting said power device to operate the stitching mechanism, substantially as described.

4. In a buttonhole-sewing machine, the combination of a cutter, a cutter-operating mechanism, a stitch-forming mechanism, a power device transmitting motion to said mechanism alternately, a starting device, which, when moved in one direction, brings the cutter-operating mechanism into operative relation with the cutter, means whereby the reverse movement of said starting device interrupts said operative relation, a stop limiting the further movement, in the first direction, of said starting device, and means, operated by said cutter-operating mechanism at a predetermined point in its effective movement, for removing said stop, said starting device then, in its further movement, shifting said power device to operate the stitching mechanism, substantially as described.

5. In a buttonhole-sewing machine, the combination of a cutter, a cutter-operating mechanism, a stitch-forming mechanism, a device for clamping the work, a starting device, operated independently of the clamping device, and which is reciprocated to render the cutter-operating mechanism effective or ineffective on the cutter, said starting device, in its further movement in the first direction of its reciprocation, bringing into operation the stitch-forming mechanism, the first part of its movement in said direction being controlled by the position of the stitch-forming mechanism, and the said further movement being controlled by the position of the cutter-operating mechanism, substantially as described.

6. In a buttonhole-sewing machine, the combination of a cutter, a cutter-operating mechanism, a stitch-forming mechanism, a starting device which is reciprocated to render the cutter-operating mechanism effective or ineffective on the cutter, said starting device, in its further movement in the first direction of its reciprocation, bringing into operation the stitch-forming mechanism, the first part of its movement in said direction being controlled by the position of the stitch-forming mechanism, and the said further movement being controlled by the position of the cutter-operating mechanism, substantially as described.

7. In a buttonhole-sewing machine the combination of a cutter, a cam for operating the cutter, a stitch-forming mechanism, a power device, a reciprocating starting device, which, when moved in one direction, brings the cam into operative relation with the cutter, means whereby the reverse movement of said starting device interrupts said operative relation, an obstruction limiting the further movement in the first direction of said starting device, a lever for removing said obstruction, means, adjustably carried by said cam for operating said lever, and a belt-shifter moved by said starting device in its further movement, to shift the belt to operate the stitching mechanism, substantially as described.

8. In a buttonhole-sewing machine the combination of a cutter, a cam for operating the cutter, a stitch-forming mechanism, a power device, a reciprocating starting device, which, when moved in one direction, brings the cam into operative relation with the cutter, means whereby the reverse movement of said starting device interrupts said operative relation, an obstruction limiting the further movement in the first direction of said starting device, a lever for removing said obstruction, means, carried by said cam for operating said lever, and a belt-shifter moved by said starting device in its further movement, to shift the belt to operate the stitching mechanism, substantially as described.

9. In a buttonhole-sewing machine, the combination of a cutter, a cam for operating the cutter, a stitch-forming mechanism, a power device transmitting motion alternately to said cam and mechanism, a reciprocating rod, a tilting lever swung by said rod, a hook, operated by said cam, and shifted by said lever into engagement with said rod, and means, operated with the movement of said cam, for tilting said lever and thereby freeing said rod from further movement said rod being connected with said power device to thereupon by said further movement shift the latter from the cam to the mechanism, substantially as described.

10. In a sewing-machine, the combination of a work-holding clamp, a vertically-reciprocating needle, means for imparting a transverse vibration to the needle, means for imparting a longitudinal reciprocation to the clamp, a bed-plate, four vertical rock-shafts pivotally mounted in said bed-plate, each carrying an arm above and an arm below said bed-plate, rollers on said lower arms, a horizontal rotating cam-wheel mounted below said bed-plate having in its upper surface four cam-grooves in which said rollers ride, and links extending from the upper arms, of which two are operatively connected with the clamp to reciprocate the same longitudinally and transversely respectively, and the other two are connected respectively with the aforesaid means, to control their operation, substantially as described.

11. In a sewing-machine, the combination of a work-holding clamp, a vertically-reciprocating needle, means for imparting a transverse reciprocation to one of said elements relatively to the other, means for imparting a longitudinal reciprocation to one of said elements relatively to the other, a bed-plate, four vertical rock-shafts pivotally mounted in said bed-plate, each carrying an arm above and an arm below said bed-plate, rollers on said lower arms, a horizontal rotating cam-wheel mounted below said bed-plate having in its upper surface four cam-grooves in which said rollers ride, and links extending from the upper arms, of which two are operatively connected with the clamp to reciprocate the same longitudinally and transversely respectively, and the other two are connected respectively with the aforesaid means, to control their operation, substantially as described.

12. In a sewing-machine, the combination of a work-holding clamp, a vertically-reciprocating needle, means for imparting a transverse vibration to the needle, means for imparting a longitudinal reciprocation to the clamp, a bed-plate, four vertical rock-shafts pivotally mounted in said bed-plate, each carrying an arm above and an arm below said bed-plate, rollers on said lower arms, a horizontal rotating cam-wheel mounted below said bed-plate having in its upper surface four cam-grooves in which said rollers ride, and links extending from the upper arms, and independently adjustable thereon, of which two are operatively connected with the clamp to reciprocate the same longitudinally and transversely respectively, and the other two are connected respectively with the aforesaid means, to control their operation, substantially as described.

13. In a sewing-machine, the combination of a work-holding clamp, a vertically-reciprocating needle, means for imparting a transverse reciprocation to one of said elements relatively to the other, means for imparting a longitudinal reciprocation to one of said elements relative to the other, a bed-plate, four vertical rock-shafts pivotally mounted in said bed-plate, each carrying an arm above and an arm below said bed-plate, rollers on said lower arms, a horizontal rotating cam-wheel mounted below said bed-plate having in its upper surface four cam-grooves in which said rollers ride, and links extending from the upper arms, and independently adjustable thereon, of which two are operatively connected with the clamp to reciprocate the same longitudinally and transversely respectively, and the other two are connected respectively with the aforesaid means, to control their operation, substantially as described.

14. In a sewing-machine, the combination of a work-holding clamp, a vertically-reciprocating needle-bar, a bracket having arms removably secured to the under side of the bed-plate of the machine, a suitably-driven horizontal cam-wheel revolubly supported on said bracket and having cam-grooves in its upper surface, mechanism operated thereby, extending through said bed-plate, for controlling the relative movements of the needle-bar and clamp, and means, carried by said arms, for accurately centering the cam-wheel in its revolution, substantially as described.

15. In a sewing-machine, the combination of a work-holding clamp, a vertically-reciprocating needle, means for imparting a transverse reciprocation to one of said elements relatively to the other, means for imparting a longitudinal reciprocation to one of said elements relatively to the other, a bracket having arms removably secured to the under side of the bed-plate of the machine, a suitably-driven horizontal cam-wheel revolubly supported on said bracket and having cam-grooves in its upper surface, mechanism operated thereby, extending through said bed-plate, for controlling the relative movements of the needle-bar and clamp, and means carried by said arms, for accurately centering the cam-wheel in its revolution, substantially as described.

16. In a sewing-machine, the combination, with the stitching mechanism, of a work-holding clamp, a clamp feed-plate, a lever operatively connected to said plate, whereby the rocking of the lever reciprocates the plate, said lever having two movable fulcra, a train of mechanism from the main driving-shaft to rock one of said fulcra synchronously with a predetermined number of stitches of the stitching mechanism to impart a short rapid reciprocation to said clamp, and a rotary cam-wheel having two cams, whereof one controls the action of said train of mechanism to increase or diminish the rocking of said fulcrum rocked thereby, and the other rocks the other fulcrum, to impart a longer slow reciprocation to said clamp, substantially as described.

17. In a sewing-machine, the combination, with the stitching mechanism, of a work-holding clamp, a clamp feed-plate extending from front to rear of the machine, a link pivotally connected at its rear end with the clamp feed-plate, a lever to which the front end of said link is adjustably connected, said lever having two movable fulcra, a train of mechanism from the main driving-shaft to rock one of said fulcra synchronously with a predetermined plurality of stitches of the stitching mechanism to impart a short rapid reciprocation to said clamp, and a rotary cam-wheel having two cams, whereof one controls the action of said train of mechanism to increase or diminish the rocking of said fulcrum rocked thereby, and the other rocks the other fulcrum, to impart a longer slow reciprocation to said clamp, substantially as described.

18. In a sewing-machine, the combination with the stitching mechanism, of a work-holding clamp, a clamp feed-plate extending from front to rear of the machine, a reciprocating guide-block to which the rear end of said plate is pivotally connected, a link pivotally connected and longitudinally adjustably connected at its rear end with the rear end of the clamp feed-plate, a lever to which the forward end of the link is adjustably connected, means for rocking said lever whereby a longitudinal reciprocation is imparted to the clamp, and independent means for transversely reciprocating said clamp, substantially as described.

19. In a buttonhole-sewing machine, the combination of a work-holding clamp, a vertically-reciprocating needle-bar, a link connected to one of said elements to rock the same transversely relatively to the other, a link connected to one of said elements to rock the same longitudinally relatively to the other, a lever for reciprocating said links arranged to make a complete reciprocation during three complete vertical reciprocations of the needle-bar, being at one end of its reciprocation during two of the complete reciprocations of the needle-bar, and at the other end during one, whereby two stitches are formed in the cut of the buttonhole and one stitch in the work during each complete reciprocation of said lever, and a cam driven step by step by said lever in its reciprocations, and having grooves controlling the action of said links, substantially as described.

20. In a buttonhole-sewing machine, the combination of a work-holding clamp, a vertically-reciprocating needle-bar, a link connected to one of said elements to rock the same transversely relatively to the other, a link connected to one of said elements to rock the same longitudinally relatively to the other, a cam for reciprocating said links arranged to make a complete revolution during three complete vertical reciprocations of the needle-bar, holding said links in one position of their reciprocation during two of the complete reciprocations of the needle-bar, and in the other position during one, whereby two stitches are formed in the cut of the buttonhole and one stitch in the work during each complete reciprocation of said lever, and a second cam driven step by step by said first cam in its revolutions and having grooves controlling the action of said links, substantially as described.

21. In a sewing-machine, the combination of a work-holding clamp, a vertically-reciprocating needle, means for imparting a transverse vibration to the needle, means for imparting a longitudinal reciprocation to the clamp, a rotary cam-plate having four cam-grooves in its face, rock-shafts having arms rocked by said cam-grooves, links reciprocated by the respective other arms of said shafts, and independent means for varying the extent of the reciprocations so produced, two of said links being connected with the work-holding clamp to feed the same longitudinally and transversely respectively, and the other two being connected, respectively, with the means for vibrating the needle and for reciprocating the clamp, to control the operation of said means, substantially as described.

22. In a sewing-machine, the combination of a reciprocating needle-bar and needle, a work-holding clamp, a cam making a complete revolution during a plurality of reciprocations of the needle-bar, a train of mechanism from said cam to the needle-bar to impart a transverse vibration thereto, a train of mechanism from the cam to the clamp to impart a longitudinal reciprocation thereto, a second cam, and controlling devices therefrom to the trains to render the latter operative or inoperative as desired at predetermined points in the revolution of the latter cam, said controlling devices comprising elements adjustably secured to each other, whereby the bite of the stitches formed by the vibration of the needle and the reciprocation of the clamp may be varied at pleasure, and suitable feed mechanism for advancing the work, substantially as described.

23. In a sewing-machine, the combination of a work-holding clamp, a vertically-reciprocating needle-bar, a rotary cam-plate, a vibrating lever, trains of mechanism from said lever to the needle-bar, the clamp, and the cam-plate to vibrate the needle-bar, reciprocate the clamp, and intermittently feed the cam-plate, all synchronously, rock-shaft arms rocked by cam-grooves in the face of the cam-plate, and links reciprocated by the respective other arms of said shafts, and connected to the trains of mechanisms to the needle-bar and clamp to control their movement, substantially as described.

24. In a sewing-machine, the combination of a work-holding clamp, a vertically-reciprocating needle-bar, a rotary cam-plate, a cam, trains of mechanisms from said cam to the needle-bar, the clamp, and the cam-plate to vibrate the needle-bar, reciprocate the clamp, and intermittently feed the cam-plate, all synchronously, rock-shafts having arms rocked by cam-grooves in the face of the cam-plate, and links reciprocated by the respective other arms of said shafts, and connected to the trains of mechanisms to the needle-bar and clamp to control their movement, substantially as described.

25. In a buttonhole-sewing machine, in combination with a stitch-forming mechanism comprising a laterally-vibrated needle; a clamp to hold the material in which the buttonhole is formed; a feeding mechanism to move the said clamp transversely across the vibratory path of the needle; a guiding mechanism for the movement of the said clamp adapted to shift the same at the ends of the buttonhole to present the material on the opposite sides of the buttonhole to the operation of the needle, and to vibrate the said clamp parallel with the vibration of the needle at the end of the buttonhole to produce a bar across the buttonhole; said feeding and guiding mechanism being operated by cams, a controlling mechanism for said feeding mechanism, also operated by a cam, all of said cams being on a pattern-plate revolubly below the bed of the table, substantially as described.

26. In a buttonhole-sewing machine, in combination with a stitch-forming mechanism comprising a laterally-vibrated needle; a driving mechanism; a clamp adapted to hold the material in which the buttonhole is formed; a feeding mechanism for the said clamp mechanism adapted to move the said clamp parallel with the cut of the buttonhole; a controlling mechanism adapted to supplement and modify the extent of the movement of the clamp by the feeding mechanism and to vibrate the clamp parallel to the cut of the buttonhole under the path of the needle; and a guiding mechanism adapted to control the path of the said clamp while being operated on by the said feeding and controlling mechanisms and to vibrate the clamp transversely across the path of the operation of the said feeding mechanism and controlling mechanism; and a connecting mechanism for the said feeding mechanism and said driving mechanisms, said feeding, controlling, guiding and connecting mechanisms being all operated by cams on a common revolvable plate, substantially as described.

27. In a buttonhole-sewing machine, in combination with a stitch-forming mechanism; a driving mechanism; a needle-vibrating mechanism adapted to laterally vibrate the needle; a connecting mechanism between the said needle-vibrating mechanism and the driving mechanism comprising means for producing two movements of the vibrating mechanism to three reciprocations of the needle, and an interposed rocking

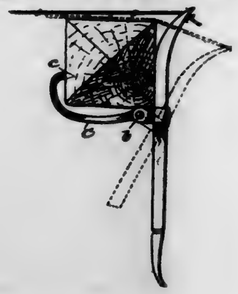
member connected to the vibrating mechanism by means of a movable connection; and a controlling mechanism comprising a pattern-cam, and adapted to move the said movable connection on the said rocking member over, and to both sides of the rocking center, substantially as described, whereby there is produced a buttonhole-stitch consisting in a single stitch at one end of the lateral vibration of the needle and a double superimposed stitch at the other end of the lateral vibration and means for reversing the positions of the single and double superimposed stitches.

28. In a buttonhole-sewing machine, in combination with a stitch-forming mechanism; a driving mechanism; a clamp adapted to hold the material in which the buttonhole is to be formed; a feeding mechanism adapted to vibrate the clamp across the path of the needle parallel with the buttonhole cut; a connecting mechanism between the said feeding mechanism and driving mechanism adapted to produce two movements of the feeding mechanism to every three reciprocations of the needle, and comprising a rocking member; a connection between the said feeding mechanism movably secured to the said rocking member; and a controlling mechanism comprising a pattern-cam and adapted to move the said connection over the rocking center of the rocking member and to both sides thereof, substantially as described, whereby the said clamp may be brought to rest during two reciprocations of the needle at either end of the throw of the said feeding mechanism.

705,258. HYDROCARBON-VAPOR BURNER. EDOUARD LE PHILETIER, Vienna, Austria-Hungary. Filed Sept. 13, 1898. Serial No. 690,857. (No model.)

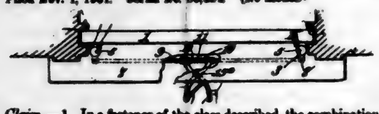
Claim.—In a vaporizing-burner for petroleum, the combination with a main tube having a double bend with the ends on each side thereof in axial alinement, of a supplemental vaporizing-tube communicating with the upper end of said main tube and extending downward therefrom, a vapor-jet nozzle or tip carried at the lower end of said supplemental tube and made in two parts screwed into one another, the lower one carrying a spindle for regulating the vapor-feed, a fusible metal in the vapor-tip closing the joint between the two parts of the tip, said burner-tip being in line with the alining ends of the main tube, and an outer burner-tube encircling the main tube and having a burner-gauze at its upper end, substantially as described.

705,259. WIRE-STRETCHER. CHARLES LIEBHARDT, Allport, Pa. Filed June 18, 1901. Serial No. 64,710. (No model.)



Claim.—A wire-stretcher comprising a bar or lever having one end curved outwardly and notched, a detachable sleeve slidably positioned upon the bar and having perforated ears formed integral therewith and a hook member pivotally held by the sleeve at one end and having its opposite end terminating in an inwardly-bent hook, substantially as shown and described.

705,260. SASH-FASTENER. JAMES G. LODOR, Wilmington, N. C. Filed Nov. 1, 1901. Serial No. 80,894. (No model.)



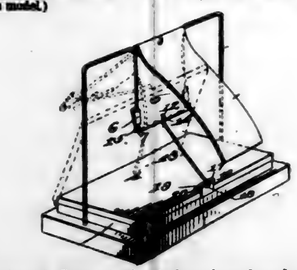
Claim.—1. In a fastener of the class described, the combination with a fixed and a sliding frame, of two rotatable cylindrical rods circumferentially corrugated and eccentrically mounted at their ends in bearings fixed to the opposite sides of one of said frames, said rods constituting cams or eccentrics, and each provided with a lateral projecting lug, two links each pivotally connected at its outer end to one of said lugs, a spring arranged between the adjacent ends of the links and operating to force the latter apart and rotate the rods to cause the latter to wedge against the other of said frames, and means for simultaneously drawing together said links to rotate the rods out of engagement, substantially as described.

2. In a fastener of the class described, the combination with a fixed and a sliding frame, of two rotatable rods eccentrically mounted at their ends in bearings fixed to the opposite sides of one of said frames and each provided with a laterally-projecting lug, two links each pivotally connected at its outer end to one of said lugs, a spring arranged between the adjacent ends of the links and operating to force apart the latter and rotate the rods to cause the latter to wedge against the other of said frames, and two crossed and pivoted levers loosely connected at their inner ends to the respective links and terminating at their outer ends in handles adapted to be grasped by the hand for simultaneously drawing together said links to turn the rods out of engagement, substantially as described.

3. In a fastener of the class described, the combination with a fixed and a sliding frame, of two rotatable rods eccentrically mounted at their ends in bearings fixed to the opposite sides of one of said frames and each provided with a laterally-projecting lug, two links each pivotally connected at its outer end to one of said lugs, a spring arranged between the adjacent ends of the links and operating to force apart the latter and rotate the rods to cause the latter to wedge against the other of said frames, means for simultaneously drawing said links together to rock the rods out of engagement, and locking device for positively locking said links apart, substantially as described.

4. In a fastener of the class described, the combination with a fixed and a sliding frame, of two rotatable rods eccentrically mounted at their ends in bearings fixed to the opposite sides of one of said frames and each provided with a laterally-projecting lug, two links each pivotally connected at its outer end to one of said lugs, a spring arranged between the adjacent ends of the links and operating to force apart the latter and throw the rods into engagement with the other of said frames, two crossed levers pivoted together at their intersection and each pivotally connected at one end to the inner end of one of said links, and a latch pivoted at one end to the free end of one of said levers and adapted to engage a notch in the free end of the other of said levers, substantially as described.

705,261. ACTUATING DEVICE FOR LIDS OR COVERS. JAMES C. LODOR, Wilmington, N. C. Filed Aug. 12, 1901. Serial No. 71,770. (No model.)

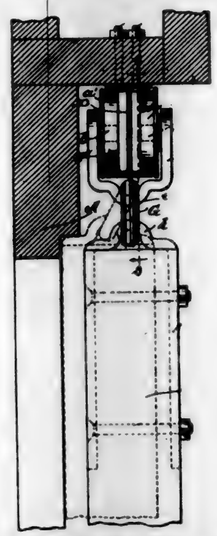


Claim.—1. In an actuating device, a frame formed of a single piece of material and having its top provided with a depressed portion, an operating-lever mounted thereon and formed of two sections, a pin extending through the top of the lever for securing it upon a frame, a cover, and means pivotally connected at one end to one end of one section of said lever and extending therefrom toward the free end of the other section of said lever and attached to the cover.

2. In an actuating device for lids or covers, a frame formed of a single piece of material and provided with a depressed portion, a lever mounted in said depressed portion, a pin extending through the lever for connecting the same to the frame, a bar, means for hinging the bar to the lever, and means for hinging the bar to the cover.

3. In an actuating device for lids or covers, a frame formed of a single piece of material and provided with a depressed portion, a lever mounted therein and comprising in its construction a weighted rear section, a bar arranged between the cover and lever, means for hinging one end of the bar to the weighted rear section of the lever, said means for hinging the other end of the bar to the cover.

705,262. DOOR-HANGER. JOHN F. LYDEN, Davenport, Iowa, assignor to the International Manufacturing Company, Davenport, Iowa, a Corporation of Iowa. Filed Jan. 28, 1901. Serial No. 44,800. (No model.)



Claim.—1. The combination with a suitable overhead tram or track and a door carrier or track adapted to move thereon, of means suspending the door from said carrier adapted to allow lateral movement of the door, in planes parallel to its plane of rest substantially as described.

2. The combination with a suitable overhead tram or track, and a carrier or track adapted to move thereon, of a suspended door, and a laterally-movable link connecting said carrier and door, and articulated both at its point of connection with said door and said carrier substantially as described.

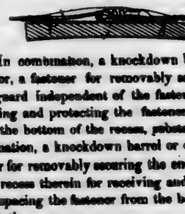
3. The combination with a suitable tram or track, a door carrier or track adapted to move thereon, and a door, of a link articulated in parallel planes to said door and said carrier, substantially as described.

4. The combination with a suitable overhead tram or track, of a carrier comprising a U-shaped yoke the bend of which is below and the legs of which pass on each side of the lower flanges of said tram or track and wheels journaled thereon, of a suspended door, knuckles secured to the upper edge thereof and a rectangular chain-link having the horizontal portions thereof seated in and articulating with the bend of said yoke and the said knuckles substantially as described.

705,263. DUST RING OR DISK FOR AXLE-BOXES. GOTTFRIED MAAS, Duisburg, Germany. Filed Mar. 12, 1902. Serial No. 97,574. (No model.)

Claim.—1. In a journal dust-guard, the combination, with a guard-plate formed of sections, of an inner lining-ring of flexible material which bears against the shaft and forms a hinge for the said sections, and a spring for contracting the said sections and lining-ring upon the shaft, substantially as set forth.

2. In a journal dust-guard, the combination, with a guard-plate formed of sections, said sections being provided with cover-plates *g* and *h* at one joint, of an inner lining-ring of flexible material which bears against the shaft and forms a hinge for the said sections, and a spring for contracting the said sections and lining-ring upon the shaft, substantially as set forth.



3. In a journal dust-guard, the combination, with a guard-plate formed of sections, one of the said sections being provided with a projecting joint-plate *n* which engages with a groove in the next adjacent section, of an inner lining-ring of flexible material which bears against the shaft and forms a hinge for the said sections, and a spring for contracting the said sections and lining-ring upon the shaft, substantially as set forth.

705,264. ELECTROLYTIC APPARATUS FOR THE PRODUCTION OF CHLORIN AND ALKALI. JAMES MACTEAR, Westminster, England. Filed Sept. 3, 1901. Serial No. 74,214. (No model.)

Claim.—1. In an electrolytic apparatus, a cathode-cell having a plate arranged therein to form a space between the same and the walls of said cell, said plate provided with a recess, a well, and a series of ducts for establishing communication between the said space and well, an anode-cell mounted upon said plate and engaging in said recess, a supply and overflow pipe for the anode-cell, a propeller mounted in said well and having a spindle extending through the anode-cell, a seal for the said spindle, a cathode for said cathode-cell, and an anode for said anode-cell.

2. In an electrolytic apparatus, a cathode-cell having a plate arranged therein to form a space between the same and the walls of said cell, said plate provided with a recess on its upper face, a centrally-arranged well and a series of ducts on its lower face for establishing communication between the said space and said well, an anode-cell mounted upon said plate and engaging in the said recess, a supply and overflow pipe for the anode-cell, a propeller mounted in said well and having a spindle extending through the anode-cell, a seal for the said spindle, a cathode for said cathode-cell, and an anode for said anode-cell.

3. In an apparatus of the character described, a cathode-cell provided with a plate having a space between the same and the walls of the cell, a well and a series of ducts for establishing communication between the space and the well, a layer of mercury in the said cathode-cell forming a cathode and adapted to fill the space, ducts and well, an anode-cell mounted in said cathode-cell, an anode in said anode-cell, and a propeller mounted in the said well, substantially as shown and for the purpose described.

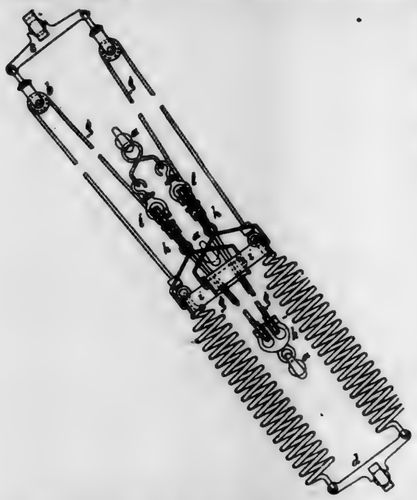
705,265. KNOCKDOWN BARREL, CASK, &c. AMOS MALTBY, New York, N. Y. Filed May 18, 1901. Serial No. 60,806. (No model.)

Claim.—1. In combination, a knockdown barrel or other receptacle, a hoop therefor, a fastener for removably securing the ends of the hoop together, a guard independent of the fastener and having a recess therein for receiving and protecting the fastener and means for spacing the fastener from the bottom of the recess, substantially as set forth.

2. In combination, a knockdown barrel or other receptacle, a hoop therefor, a fastener for removably securing the ends of the hoop together, a guard having a recess therein for receiving and protecting the fastener and cross-ribs for spacing the fastener from the bottom of the recess, substantially as set forth.

3. In combination, a knockdown barrel or other receptacle, a hoop therefor, a locking-lever pivoted to one end and having a removable engagement with the other end of the hoop, a sliding clip arranged to engage and disengage the lever, a guard having a recess therein for receiving and protecting the fastener and means for spacing the end of the hoop which carries the clip away from the bottom of the recess for permitting the free sliding movement of the clip, substantially as set forth.

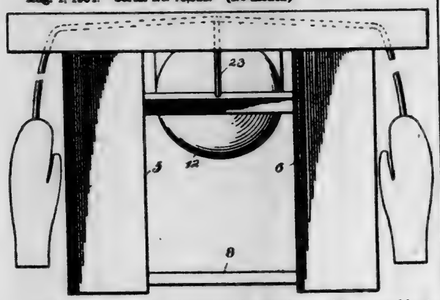
705,266. GYMNASTIC APPARATUS. DAVID G. MATTHIOS, Altona, Germany. Filed Feb. 26, 1902. Serial No. 95,619. (No model.)



Claim.—1. A gymnastic apparatus composed of a pair of upper pulleys, two pair of lower pulleys arranged above one another, and a pair of cords that pass from the upper pulleys around the lowermost pulleys and thence around the intermediate pulleys, substantially as specified.

2. A gymnastic apparatus composed of a bail having pulleys, a pair of springs, a pair of upper pulley, a pair of lower pulleys, and a pair of cords that pass from the springs first over the bail-pulleys, then over the lower pulleys and then over the upper pulleys, substantially as specified.

705,267. WARMER. FRANZ J. MEIER, Weigand, Nebr. Filed Aug. 1, 1901. Serial No. 70,523. (No model.)



Claim.—1. A device of the class described comprising spaced heating-plates, means for heating the plates, and a flexible lap-covering comprising spaced fabrics and connections between the covering and the plates for conveying heated air from the plates to the covering.

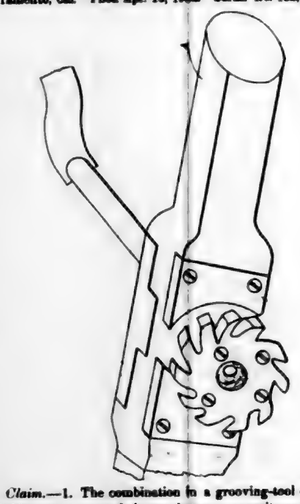
2. A device of the class described comprising hollow heating boxes or plates having means for heating them and provided with tubular projections communicating therewith, of a lap-covering comprising spaced fabrics having a strip secured therebetween at one end of the fabrics, said strip having openings in which the tubular projections are received and perforations registering with the bores of the projections whereby heat may pass from the plates between the layers of fabric.

3. A device of the class described comprising spaced inclined boxes having their lower ends open, a flue connecting the boxes near to their upper ends, a lamp having a hood connected to the flue, flexible tubes connected with the flue and having hand-receiving mitts attached thereto to receive heat therefrom, and a covering device removably connected with the plates of which the boxes are formed.

4. A device of the class described comprising inclined boxes spaced laterally and having a flue connecting them, a lamp having a hood connected with the flue to supply heat therethrough to the boxes, projections at the upper ends of the boxes, and a flexible covering having a recessed plate at its edge for engagement with the projections to hold the covering in position to be stretched over the boxes.

5. A device of the class described comprising spaced heating-plates and having a flue connecting them adjacent to their upper ends, a lamp having a hood communicating with the flue, a pipe leading forwardly from the flue beyond the plates, flexible tubes connected with the pipe, and hand-receiving devices connected to the tubes, a flexible covering being connected to the upper and side edges of the plates.

705,268. ROTARY GROOVING-TOOL. ALBERT R. MEREDITH, Sacramento, Cal. Filed Apr. 10, 1902. Serial No. 102,181. (No model.)



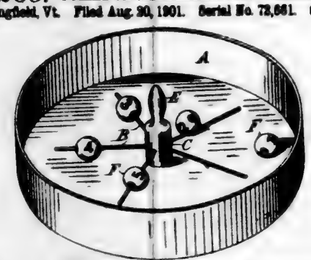
Claim.—1. The combination in a grooving-tool of a handle and a revoluble cutter mounted thereon between opposite ends and turnable in a plane parallel with the handle.

2. The combination in a grooving-tool of a handle adapted to be engaged at either end, a revoluble cutter turnable in a plane parallel with the handle, and transversely-extending means intermediate of its ends for supporting said cutter.

3. The combination in a grooving-tool of a handle, a transverse revoluble shaft supported intermediate of the ends of said handle, a cutter mounted on said shaft and turnable in a plane parallel with said handle, and means by which the space intermediate of the saw and handle may be varied.

4. The combination in a grooving-tool of a handle adapted to be grasped at either end, a cutter, a revoluble shaft disposed transversely of the handle, and having a flange to which said cutter is secured, antifrictional supporting means for said shaft and flexible connections between said shaft and a source of power.

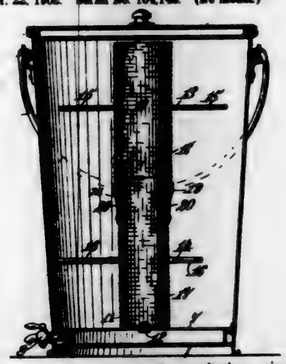
705,269. PUZZLE OR GAME APPARATUS. ELIZABETH MEYER, Springfield, Vt. Filed Aug. 20, 1901. Serial No. 72,681. (No model.)



Claim.—1. In a puzzle or game apparatus, the combination of a receptacle, a series of pins extending radially from a hub pivoted on the floor of said receptacle, and a series of balls apertured to permit of their being strung on the ends of said pins by a movement of a ball along the floor, whereby a pin may be turned toward a ball and the inclining of the receptacle will cause such ball to roll down and engage the end of the pin and whereby a further inclination will cause such ball to engage the pin more securely, said pins being curved at their outer ends to facilitate their entering the aperture in a ball.

2. In a puzzle or game apparatus, the combination of a receptacle, a pivot D consisting of a short nail having its head below the floor and its body projecting upward from the floor of said receptacle, a hub C fitting loosely over said body and free to be lifted therefrom and replaced thereon, a series of pins extending radially from said hub, and a series of balls apertured to permit of their being strung on the ends of said pins by a movement of a ball along the floor, whereby a pin may be turned toward a ball and the inclining of the receptacle will cause such ball to roll down and engage the end of the pin, and whereby a further inclination will cause such ball to engage the pin more securely.

705,270. WINE-COOLER. JOHN H. MEYER, New York, N. Y. Filed Apr. 22, 1902. Serial No. 104,168. (No model.)



Claim.—1. In a wine-cooler, a body constituting an ice-receptacle, a perforated false bottom therein, a cylindrical foraminous bottle-chamber mounted for rotation within said receptacle on said false bottom, and means for drawing off the water from the space beneath said false bottom.

2. In a wine-cooler, a body constituting an ice-receptacle, a perforated false bottom therein, a cylindrical foraminous bottle-chamber having a swivel connection with said false bottom, and means for drawing off the water from the space beneath said false bottom.

3. In a wine-cooler, a body constituting an ice-receptacle, a perforated false bottom therein, a cylindrical perforated bottle-chamber mounted for rotation within said receptacle on said false bottom, rings surrounding said chamber at its upper and lower ends, and bracing-arms connecting said rings with said body.

4. In a wine-cooler, a body constituting an ice-receptacle, a perforated false bottom therein, a cylindrical, foraminous bottle-chamber within said receptacle having a swivel connection with said false bottom, guide-rings embracing said bottle-chamber at different points, and a drain-cock leading from the space beneath said false bottom.

5. In a wine-cooler, an ice-receptacle, and a cylindrical bottle-inclosing chamber therein made up of a plurality of telescoping sections.

6. In a wine-cooler, an ice-receptacle and a rotary foraminous bottle-chamber therein made up of a plurality of telescoping sections.

7. In a wine-cooler, an ice-receptacle, a cylindrical bottle-inclosing chamber therein made up of a plurality of telescoping sections, and spring-catches for preventing the collapse of said sections, when extended.

8. In a wine-cooler, an ice-receptacle, a cylindrical bottle-inclosing chamber therein made up of a plurality of telescoping sections, and outwardly-spring-pressed catches connected to one of said sections and adapted to engage the other for positively locking said sections against inward movement, and thereby preventing the collapse of said sections, when extended.

705,271. COMBINATION STOPPER AND BRUSH FOR BOTTLES. BENJAMIN F. MIXER, Montague, Mass. Filed Apr. 30, 1901. Serial No. 58,110. (No model.)

Claim.—1. A holder for liquid shoe-dressing and the like, comprising a bottle, and a closure device composed of an incasing cap having positive means of attachment to the said bottle, a vertically-elongated wooden block narrower than the bottle-mouth and rigidly secured centrally of and depending from the said cap, and a swab-rod having its upper end rigidly inserted in the lower end of the elongated block, and carrying the liquid swab or sponge.

2. A holder for liquid shoe-dressing and the like, comprising a bottle, an incasing cap provided with positive means for locking it to the bottle, an elongated block 10 of rigid material, and narrower than the mouth of the bottle, depending centrally from the said cap, a packing-disk intervening the same and the said cap and adapted to be brought down into compressible relation with the bottle-mouth by the locking of the cap, an adjustable fastening inserted through the top of said cap, through the packing-disk and into the elongated block 10, which connects the same rigidly to the cap and seals its connection thereto by the said disk, and a swab-rod having its upper end rigidly inserted into the lower end of the elongated block, and carrying the liquid swab or sponge.

3. A holder for liquid shoe-dressing and the like, comprising a bottle, and a closure device consisting of a cap having means for positively locking it to the bottle, an elongated wooden block 10 narrower than the mouth of the bottle and depending from the center of the cap, a packing-disk intervening the same and the cap, a swab-rod having its upper end driven into the lower end of the said block and carrying the liquid swab or sponge, and a screw inserted through the said cap and the packing-disk and into the elongated block to secure the same rigidly to the cap.

4. A holder for liquid shoe-dressing and the like, comprising a bottle, and a closure device consisting of a cap having means for positively locking it to the bottle, an elongated wooden block 10 narrower than the mouth of the bottle and depending from the center of the cap, a swab-rod having its upper end driven into the lower end of the said block and carrying the liquid swab or sponge, a handle or knob mounted upon the top of said cap, and a reversely-threaded screw inserted into the elongated block and into said handle or knob whereby the said block and knob may simultaneously be tightened upon the cap.

5. A holder for liquid shoe-dressing and the like, comprising a bottle formed with one or more angular or bayonet-shaped projections upon the outside thereof, and a closure device therefor consisting of an incasing cap formed with inwardly-directed lugs or projections adapted to operate in connection with the bayonet-shaped projections upon the bottle to effect a locking and tightening connection of the said cap therewith, an elongated conical wooden block centrally depending from the said cap and narrower than the bottle-neck whereby it is freely removable therefrom, a swab-rod having its upper end driven into the lower end of the said elongated wooden block whereby to have a rigid and immovable bearing therein, and carrying upon its lower end the liquid swab or sponge, a packing-disk inserted between the upper face of the block and the under or inner face of the cap, and adapted to bear upon the bottle-mouth and be compressed upon the same by the tightening of the cap thereon in its locking movement, and a screw inserted through the outside of the cap and through the packing-disk and into the top of the wooden block to adjustably join the said block rigidly to the said cap and in compressible relation with the said disk.

705,272. ACETYLENE-GAS GENERATOR. LEO MONTEL, New York, N. Y., assignor to Acetylene Manufacturing Company, New York, N. Y., and Jersey City, N. J., a Corporation of New Jersey. Filed Oct. 5, 1900. Serial No. 32,063. (No model.)

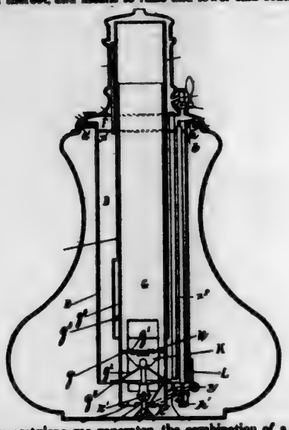
Claim.—1. In an acetylene-gas generator, the combination with the generating-chamber and the carbid-container, of a lifter fork or frame pivoted on the wall of the generating-chamber, a swinging bar secured to the arms of said fork or frame, and a lifting-rod engaging said bar.

2. In an acetylene-gas generator, the combination with a reservoir of a generating-chamber adapted to be placed in said reservoir and having a vent to permit the escape of entrapped air, and a valve to control said vent disposed between cooperating parts of the reservoir and chamber whereby it is pressed against the vent to close the same as the generating-chamber is placed within the reservoir.

3. In an acetylene-gas generator, the combination of a carbid-container, a scratcher for the carbid movably mounted in the container, and means secured to the body of the generator to engage said scratcher and hold the same from movement, whereby the carbid may be moved with the container and with respect to the scratcher.

4. In an acetylene-gas generator, the combination of a body, a shell rotatably supported by said body, a carbid-container held by said shell, a scratcher mounted rotatably in the end of said carbid-container and means secured to the body to engage said scratcher and hold the same from rotation as the shell and carbid-container are rotated.

5. In an acetylene-gas generator, the combination of a reservoir, a tube adapted to be supported within said reservoir, a carbid-container adapted to be placed within said tube and having a cap or head to close the lower end thereof, and means to raise and lower said container.



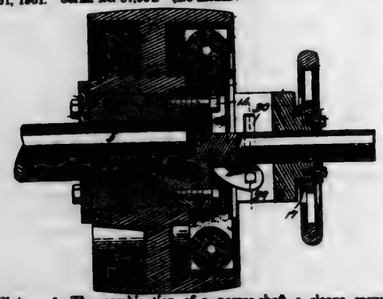
6. In an acetylene-gas generator, the combination of a reservoir, a shell adapted to be supported within said reservoir, a carbid-container within said shell and having at its lower end a ring slotted on its lower edge, and a pivoted lifter for said container having fingers to engage said slotted ring and prevent accidental separation of said container from the shell.

7. In an acetylene-gas generator, the combination with a carbid-container, of a lifter to engage the same, a rod to engage said lifter and having a pin, a tube slotted for the movement of said pin, and having a shoulder to engage the same as the rod is turned at the end of its movement, and means to raise and turn said rod.

8. In an acetylene-gas generator, the combination with a carbid-container, a lifter to engage the same, a rod engaging said lifter and having a pin, a guide for said rod, and a lever having a cam-slot with a locking projection to engage said pin and operate the rod, said projection engaging with the pin to prevent accidental movement of the rod.

9. In an acetylene-gas generator, the combination with a reservoir, a generating-chamber open at its bottom, a gas-receiving chamber connected with the generating-chamber through a stop-cock, and a blow-off pipe connected to the gas-receiving chamber and terminating within the generating-chamber with its end slightly above the lower edge of the generating-chamber, whereby gas generated after the stop-cock is closed is discharged through the blow-off pipe into the gas-receiving chamber and is prevented from escaping through the open bottom of the generating-chamber.

705,278. CLUTCH. HERMAN MOOR, Grove City, Pa. Filed Dec 31, 1901. Serial No. 87,004. (No model.)



Claim.—1. The combination of a power-shaft, a sleeve secured thereon, a pulley loose on the said sleeve, and having an annular friction-flange, a spindle projecting outwardly from said sleeve, radially-movable friction-jaws adapted to engage the said pulley to clutch the same to said shaft, supports for the said jaws with which the said sleeve is provided, cams to move said jaws laterally, said cams having operating-arms, a head revolubly with and longitudinally movable on said spindle, connections between the said head and said operating-arms, and an operating element loose on the said head and revolubly independently thereof, substantially as described.

2. The combination of a power-shaft, a sleeve secured thereon, a pulley loose on the said sleeve and having an annular friction-flange, a spindle projecting from said sleeve, guides with which the latter is provided, radially-movable friction-jaws adapted to engage said flange of said pulley, said jaws having supporting elements engaging said guides, bars connected to the said friction-jaws, axles connecting the said friction-jaws together and disposed at the ends of said bars, oscillating cams on said axle, coacting cams with which the said bars are provided, a sliding head on said spindle and revolubly therewith, connections between the said sliding head and said oscillating cams, and means to operate the said sliding head, substantially as described.

3. The combination of a power-shaft, a sleeve secured thereon, a pulley loose on said sleeve and having an annular friction-flange, a spindle projecting from said sleeve, radially-movable friction-jaws, adapted to engage said flange of said pulley, and provided with cam elements, guides and supports for said jaws, carried by said sleeve, oscillating cams mounted between said jaws and having operating-arms, said oscillating cams and said cam elements of said jaws coacting, a head revolubly with and adapted to slide on said spindle, said head being connected to said oscillating cam-arms, and an operating element, loose on said head, to move the same longitudinally on said spindle, substantially as described.

4. The combination of a power-shaft, a loose pulley carried thereby and having a friction-flange, jaws having supports revolubly with the shaft, cams to move the jaws into contact with the friction-flange, a longitudinally-movable head, revolubly with the shaft, connections between the head and the cams whereby the latter may be operated, and means carried by and revolubly independently of the head to move the latter longitudinally of the shaft, and thereby operate said cams and jaws, substantially as described.

5. The combination of a shaft, a head mounted for movement longitudinally of the shaft and for revolution therewith, a loose pulley having a friction-flange, jaws and cams to move them into contact with said friction-flange, said jaws and cams revolving with the head and said cams being connected to the latter for operation thereby, and means, connected to and revolubly independently of the head, to move the latter longitudinally of the shaft and thereby operate said cams and jaws, substantially as described.

705,274. ROTARY ENGINE. CHARLES O. MORLEY, Brooklyn, N. Y., assignor of one-half to John J. May, Brooklyn, N. Y. Filed July 10, 1901. Serial No. 67,761. (No model.)

Claim.—1. In a rotary engine, a cylindrical casing, a cylindrical and rotatable piston mounted eccentrically therein and in contact with the bottom wall thereof, a slide member mounted radially in said piston longitudinally thereof, and provided at the opposite sides of said piston with pivoted vanes, a collar connected with one end of said piston, and communicating passages formed in the casing and in the collar, a steam-inlet in communication with the passages in the collar, a four-way cock controlling the communication between the passages in the casing, and the passages in the collar, and an exhaust and means for controlling the same.

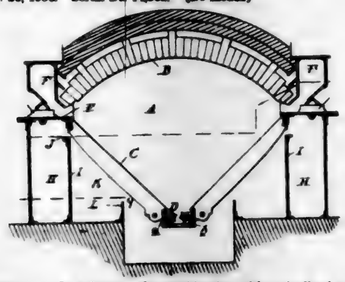
2. In a rotary engine, a cylindrical casing, a cylindrical piston mounted eccentrically therein and in contact with the bottom wall thereof, ports or passages formed in said casing and communicating with the interior thereof at the opposite sides of the bottom portion thereof, exhaust ports or passages also communicating with said ports or passages at the opposite sides of the casing, a collar connected with one end of said piston and provided with a circular port or passage in communication with the first-named ports or passages and means for controlling the communication between the passage in the collar and said first-named ports or passages.

3. A rotary engine comprising a cylinder and a rotatable piston mounted therein and provided with vanes movably mounted relatively thereto and adapted to rotate the piston under steam-pressure within the cylinder, a collar provided with a circular passage and rotating with the said piston, a passage in the cylinder leading to the inside thereof, a steam-inlet connected to the circular passage of the collar, a four-way cock connecting the said circular passage to the passage of the cylinder, a similar cylinder-passage upon the opposite side thereof and an exhaust to which it is connected by the four-way cock.

705,275. CHANGEABLE DIRECTORY-BOARD. FRANK B. MOSHER, MICHAEL J. SOBEL, and EDWARD H. H. MARTINS, Cleveland, Ohio. Filed July 12, 1901. Serial No. 68,120. (No model.)

Claim.—The frame A having integral flange *a* and removable right-angled strips 2 about its inside, in combination with board B having a series of holes 5 scattered over its surface and fixed about its edge to said strips, and the glass G having metallic frame 4 about its edge and removably supported between flange *a* and strips 2, substantially as described.

705,276. FURNACE. THOMAS MURPHY, Detroit, Mich. Filed Apr. 26, 1900. Serial No. 14,392. (No model.)



Claim.—1. In a furnace, the combination with an inclined grate, of inclosing walls forming an angular chamber beneath said grate, the wall adjacent to the upper edge of the grate being hollow and having connecting-apertures with the upper angle of the chamber beneath said grate whereby cool air may be introduced in the upper portion of said chamber through said hollow wall.

2. In a furnace, the combination with inclosing walls, a central grate-bearer and grates supported thereon inclining upward to the opposite side walls and forming angular air-chambers therebeneath, of means for introducing a cooling-current from one end of the furnace and distributing it along the opposite upper angles of said chambers beneath the grate.

3. In a furnace, the combination with an inclined grate and the inclosing walls forming an angular chamber beneath said grate of means for introducing a cooling-current into said chamber and distributing it along the upper edge of said grate, deflector for directing the downward current from said upper edge of the grate in an inclined course against said grate at a lower point in said chamber.

4. In a furnace, the combination with an inclined grate a fuel-shelf at the upper edge of said grate, and inclosing walls forming a chamber beneath said shelf and grate, of a division-wall or diaphragm dividing said chamber into two compartments; with a connecting-passage at the upper end of said diaphragm, and means for feeding air into the compartment beneath said shelf, and distributing it through said connecting passage beneath the upper end of the grate.

5. In a furnace, the combination with an inclined grate a fuel-feeding device at the upper end of said grate and walls inclosing a chamber beneath said feeding devices and grate, of diaphragms subdividing said chamber into three compartments formed respectively beneath said fuel-feed and an upper, and a lower portion of said grate said compartments constituting respectively a dust-pit, a screening-pit and ash-pit, and means for feeding air into said dust-pit and therefrom over said diaphragm into said screening and ash pits.

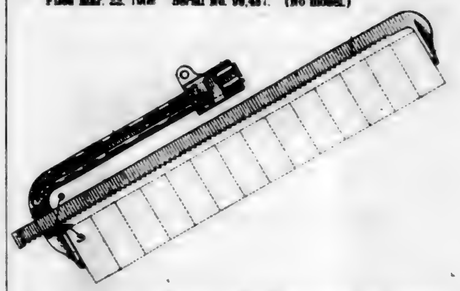
6. A furnace comprising a grate, fuel-feeding devices at one side thereof a wall or diaphragm between said feed devices and grates separating the space thereunder into a dust-pit and a screening and ash pit, a furnace-front having a single door-opening therein communicating with both pits, a door therefor and a second door or damper for shutting off said screening-pit.

7. A furnace comprising a grate, fuel-feeding devices at one side thereof, a furnace-front having a door-opening therein, and a door therefor, a wall or diaphragm between said feed device and grate dividing the space thereunder into a dust-pit and a screening and ash pit, said diaphragm being in line with and cut away or apertured opposite said door-openings, and a door or damper hinged to said diaphragm at the edge of said aperture adapted in one position to cut off said screening and ash pit.

8. A furnace comprising a grate, fuel-feeding devices at one side thereof, a wall or diaphragm between said feed devices and grate dividing the space thereunder into a dust-pit and a screening and ash pit, with an air-passage between said pits at the upper end of said diaphragm, a furnace-front having a single door-opening therein communicating with both of said pits, a dampered door for said opening and a second door or damper adapted in one position to cut off said screening and ash pit, for the purpose described.

9. In a furnace, the combination with an inclined grate and walls inclosing a chamber beneath said grate, of a wall or diaphragm dividing said chamber in two compartments with an air connecting-passage at the upper end of said wall and means for feeding air into the compartment beneath the highest point of the grates and distributing it through said passages into the other compartment and directing it against the under side of the grate.

705,277. BRICK-CARRIER. JOHN G. MCDOWELL, Pittsburg, Pa. Filed Mar. 22, 1902. Serial No. 99,487. (No model.)



Claim.—1. A brick-carrier having two jaws, one of said jaws having a handle arranged to extend over the row of bricks, and a sliding support mounted on the handle; substantially as described.

2. A brick-carrier having a stationary jaw, a movable jaw connected therewith, a handle extending from the stationary jaw toward the movable jaw, and a supporting-slide movable along the handle; substantially as described.

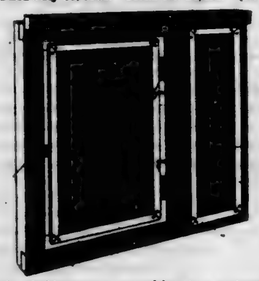
3. A brick-carrier having a slotted stationary jaw with a tooth in the slot, a movable jaw having a toothed stem extending through the slot and engaging the teeth therein; substantially as described.

4. A brick-carrier having a slotted stationary jaw with a tooth in the slot, a movable jaw having a toothed stem extending through the slot and engaging the tooth therein, a handle extending from the stationary jaw toward the toothed jaw, and a slide movable along the handle; substantially as described.

5. A brick-carrier having jaws, one of the jaws being provided with an overhanging handle of about one-half the length of the carrier, and a slide adjustable along the handle; substantially as described.

6. A carrier having two jaws, one of said jaws having a connecting-bar extending over the bricks or material carried, the other jaw having a handle extending longitudinally over the connecting-bar, and a supporting device adjustable to different points along the said handle; substantially as described.

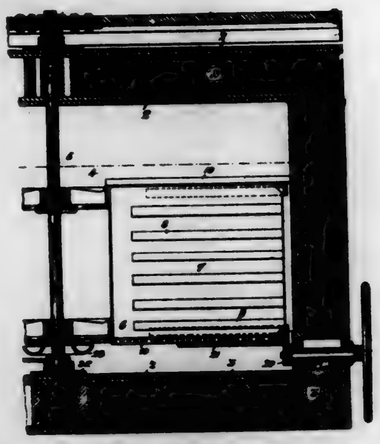
705,278. WINDOW-SCREEN. JOHN P. MCKEEVER, Wardensville, W. Va. Filed July 21, 1900. Serial No. 24,452. (No model.)



Claim.—A window-screen comprising two rectangular frames of unequal size hinged together along their vertical edges, the two frames,

when assembled, being of a width to extend from side to side of the window-casing and to project within the spaces between the parting-beads and the sash-strips and be held in position thereby, thus obviating the necessity of employment of supplemental fastening devices for the purpose, a permanent screen associated with the smaller frame, a supplemental frame hinged to the larger frame and carrying a screen, the smaller frame being adapted to move outward to permit placing the structure in position between the sides of the window-casing, and the supplemental frame being adapted to move inward to afford access to the exterior of the window, locking means carried by the larger frame to hold the supplemental frame normally closed, and marginal strips secured to the upper edges of the inner portions of the two frames to overlap the bottom rail of the window-sash and thus preclude entrance of insects, all substantially as and for the purpose specified.

705,279. APPARATUS FOR USE IN REFRIGERATING, HEATING, DRYING, IMPREGNATING, OR OTHERWISE TREATING GOODS. JAMES MCRAE, London, England, assignor of one-half to John Cooper Broadbent, Huddersfield, Yorkshire, England. Filed Mar. 5, 1901. Serial No. 49,889. (No model.)



Claim.—1. The combination of a rotary holder comprising a plurality of radial compartments each open above and below, with a casing closed above and below and having a doorway in the side wall thereof, said casing closely surrounding said holder at the sides thereof but inclosing free spaces, above and below said holder, whereby free circulation of atmosphere is permitted within said casing vertically through said compartments, a door for closing said doorway and shutters above and below the rotary holder adjacent to the door of the casing, adapted to close above and below that compartment which is alined with the doorway when the door is opened for the purpose set forth.

2. The combination of a rotary holder comprising a plurality of radial compartments open above and below, with a casing closed above and below and having a doorway in the side wall thereof of a width and height equivalent to the width and height of each radial compartment, said casing closely surrounding said holder at the sides thereof but inclosing free spaces above and below said holder, a door for closing said doorway, shutters above and below the rotary holder adjacent to the door of the casing and means for operating said shutters to close above, and below that compartment which is alined with the doorway when the door is opened for the purpose set forth.

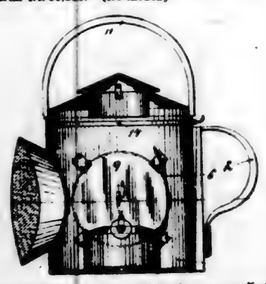
3. The combination of a rotary holder comprising a plurality of radial compartments each open above and below with a casing closed above and below and having a doorway in the side wall thereof of a width and height equivalent to the width and height of each radial compartment, said casing closely surrounding said holder at the sides thereof but inclosing free spaces above and below said holder, whereby free circulation of atmosphere is permitted within said casing vertically through said compartments, a door for closing said doorway, shutters above and below the rotary holder adjacent to the door of the casing, adapted to close above and below that compartment which is alined with the doorway when the door is opened, and means for cooling the atmosphere in said casing.

4. The combination of a rotary holder comprising a plurality of radial compartments open above and below and surrounding a central shaft, with a casing closed above and below and having a doorway in the side wall thereof of a width and height equivalent to the width and height of each radial compartment, said casing closely surrounding said holder at the sides thereof but inclosing free spaces above and below said holder, a door for closing said doorway, shutters above and below the rotary holder adjacent to the door of the casing, adapted to close above and below that compartment which is alined with the doorway when the door is opened for the purpose set forth, means for cooling the atmosphere in said casing in the space above the rotary holder and a fan for causing a circulation of said atmosphere in a direction upwardly centrally of said radial compartments into contact with said cooling means and downwardly through the compartments.

5. The combination of a rotary holder comprising a plurality of radial compartments open above and below and surrounding a central shaft with a casing closed above and below and having a doorway in the side wall thereof of a width and height equivalent to the width and height of each radial compartment, said casing closely surrounding said holder at the sides thereof but inclosing free spaces above and below said holder, a door for closing said doorway, shutters above and below the rotary holder adjacent to the door of the casing, means for operating said shutters to close above and below that compartment which is alined with the doorway when the door is opened for the purpose set forth, means for cooling the atmosphere in said casing comprising a series of refrigerating-pipes in the space above the rotary holder and a fan for causing a circulation of said atmosphere in a direction upwardly centrally of said radial compartments into contact with said cooling means and downwardly through the compartments.

6. The combination of a rotary holder comprising a plurality of radial compartments open above and below and surrounding a central shaft, with a casing closed above and below and having a doorway in the side wall thereof of a width and height equivalent to the width and height of each radial compartment, said casing closely surrounding said holder at the sides thereof but inclosing free spaces above and below said holder, a door for closing said doorway, shutters above and below the rotary holder adjacent to the door of the casing, adapted to close above and below that compartment which is alined with the doorway when the door is opened for the purpose set forth, refrigerators for cooling the atmosphere in said casing in the space above the rotary holder, means for draining the condensation products on said refrigerator through the central shaft and an outflow-pipe for said condensation products adapted to be sealed thereby.

705,280. SIGNAL-LAMP. THOMAS MCWATTERS, Swissvale, Pa., assignor of two-thirds to Joseph M. Flannery, Braddock, Pa., and Andrew H. McKim and Alexander McKim, Sr., Swissvale, Pa. Filed July 24, 1901. Serial No. 69,539. (No model.)

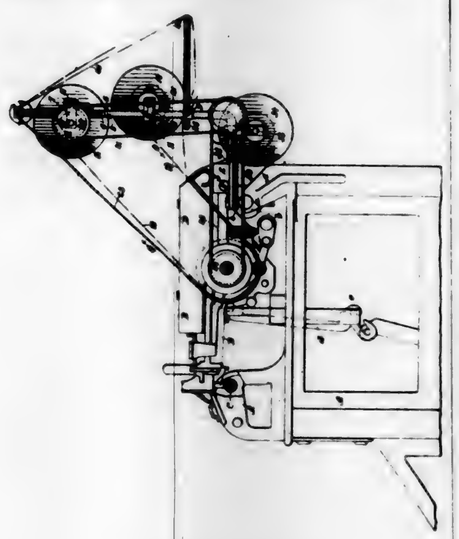


Claim.—In a signal-lamp, the combination of a cylinder closed at the bottom and provided with a lamp and having a circular aperture in the front thereof, an inner cylinder, adapted to be seated in said first-mentioned cylinder, having an annular recess near the top thereof, a spring-controlled trigger adapted to be seated and guided in said recess and to lock the said inner cylinder in any given position, and means to rotate said cylinder, substantially as described.

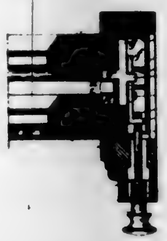
705,281. TYPE-WRITING MACHINE. JACOB E. HEARN, Buffalo, N. Y., assignor to The Wagner Typewriter Company, New York, N. Y., a Corporation of New York. Filed Mar. 27, 1901. Serial No. 53,053. (No model.)

Claim.—1. In a type-writing machine, the combination of a frame, a carriage, an auxiliary frame secured to the carriage to travel therewith, and paper-roll supports for the supply and take-off each of said supports being adjustable independently on the said auxiliary frame toward and from the other support.

2. In a type-writing machine, the combination of a stationary frame, a traveling carriage, an auxiliary frame connected with the carriage, a platen, a guide in the rear of the platen, another guide in front of the said guide, but at a higher level and in the rear of the platen, an endless copying-ribbon extending over said guides and platen, and means for guiding paper over said platen.



705,282. SASH-FASTENER. WILLIAM H. NELSON, Hazleton Iowa. Filed Jan. 11, 1902. Serial No. 89,281. (No model.)



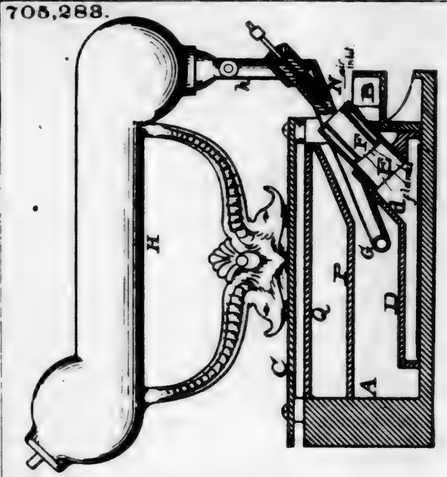
Claim.—1. A sash-fastener, consisting of the combination of window-sashes having a plurality of recesses on the inner corners of their vertical edges nearest the lock, with a lock having bolts arranged to engage the sides of said recesses, a recessed slide-piece adapted to actuate said bolts, springs to hold said bolts in engagement with said recesses in the sashes, a key having a slotted barrel and adjustable spindle, and a key-plate, substantially as shown and described.

2. A sash-fastener, consisting of the combination of a lock-casing, bolts movable in and through said casing, tension-springs for keeping said bolts in one position, a movable slide-piece for actuating said bolts, with a key having a slotted barrel and adjustable spindle having studs near its end on its opposite sides, and a key-plate, substantially as shown and described.

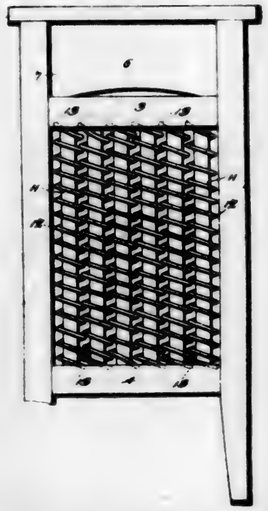
705,288. FLAT-IRON. WEBSTER NEGUS, Cleveland, Ohio. Filed Sept. 3, 1901. Serial No. 74,164. (No model.)

Claim.—A flat-iron heater comprising a combustion-chamber, a return generating-tube over said combustion-chamber, an entrance-tube into the combustion-chamber, a small tube supported in said entrance-tube providing an air-inlet space between said tubes, and a nozzle terminating said generating-tube having a vapor-jet orifice controlled by a needle-valve and arranged to discharge vapor into said small tube, in combination, substantially as described.

705,283.



705,284. WASHBOARD. GEORGE W NEWSOM, Sachse, Tex. Filed Feb. 15, 1902. Serial No. 94,369. (No model.)



Claim.—1. A washboard comprising a frame, longitudinal supporting-bars angular in cross-section arranged within the frame, and coiled springs arranged on and supported by the said bars and provided with projecting portions, substantially as and for the purpose described.

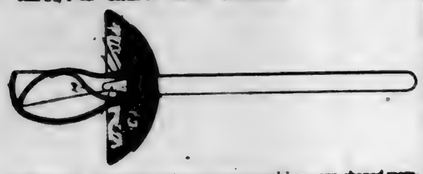
2. A washboard comprising a frame, longitudinal supporting-bars angular in cross-section slidably mounted within the frame and capable of a limited movement transversely of the washboard, and coiled springs arranged on the supporting-bars and having projecting portions forming rubbing-surfaces, and spacing the supporting-bars, substantially as described.

3. A washboard comprising a frame provided with upper and lower bars having grooves, polygonal supporting-bars having their ends fitted in the grooves, and coiled springs disposed on the supporting-bars and having their terminals extended into the said grooves and abutting against the walls thereof, whereby the springs are held against rotary movement to prevent their ends from being exposed, substantially as described.

4. A washboard comprising a frame provided with upper and lower bars having grooves, polygonal supporting-bars having their ends fitted in the grooves and capable of a limited movement transversely of the washboard, and coiled springs disposed on the supporting-bars and having pro-

jecting portions forming rubbing-surfaces at both faces of the washboard and yieldably spacing the supporting-bars, substantially as described.

705,285. PESSARY. BENJAMIN F. OVERTON, Cuero, Tex. Filed Jan. 24, 1902. Serial No. 91,169. (No model.)



Claim.—1. An intra-uterine pessary comprising a cup-shaped member, a stem carrying said cup-shaped member and adapted to engage the inner walls of the uterus, said stem comprising a plurality of separate members, and an auxiliary spring having an inherent tendency to spread said members.

2. A pessary-support comprising two members arranged one partially within the other and a spring tending to separate said members.

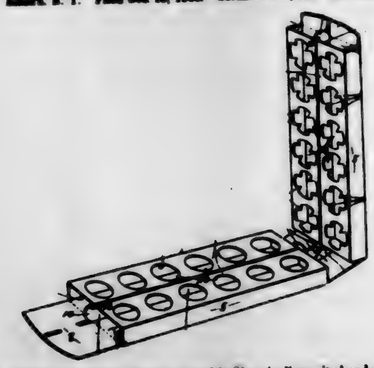
3. A pessary comprising a cup-shaped member, a sectional stem one member of which is secured to the cup and the second member being arranged partly within the first, and a spring tending to separate said members.

4. An intra-uterine pessary comprising a metallic cup adapted to receive the os uteri, an expansible stem carrying said cup, a lower concaved disk and a yielding ring carried between the cup and disk and extending beyond the periphery thereof to protect the vaginal walls from contact with said cup.

5. A pessary comprising a cup-shaped member, an intra-uterine member secured thereto, a second movable intra-uterine member, a spring tending to separate said intra-uterine members and press the same into contact with the inner walls of the uterus, half-nuts carried by each of said members and an introducing-rod having a threaded portion to engage said half-nuts and thereby draw said members toward each other.

6. A pessary comprising a cup-shaped portion, a sectional stem one member of which is secured to the cup and the second member being arranged partly within the first, a spring tending to separate said members, and an introducing-rod adapted to engage with and contract said members against the spreading action of the spring.

705,286. EGG-CRATE. GEORGE B. PALMER and JOSEPH H. LAKE, Elmira, N. Y. Filed Oct. 15, 1900. Serial No. 32,967. (No model.)



Claim.—1. An egg-crate comprising box-bodies united end to end, each having opposite lengthwise flaps provided with lengthwise rows of openings and adapted to be folded inwardly to form separate lengthwise compartments open from end to end, the box-bodies folding one over the other lengthwise of the compartments.

2. An egg-crate comprising box-bodies united end to end, each having opposite lengthwise flaps provided with lengthwise rows of openings and adapted to be folded inwardly to form separate lengthwise compartments open from end to end, the box-bodies folding one over the other lengthwise of the compartments and the free ends of each body having interlocking members integral therewith to hold the lengthwise flaps in their inwardly-folded position.

3. An egg-crate comprising box-bodies united end to end, each having opposite lengthwise flaps provided with lengthwise rows of openings and adapted to be folded inwardly to form separate lengthwise compartments open from end to end, the box-bodies folding one over the other lengthwise of the compartments and the opposite ends of each body having interlocking members formed integral therewith to hold the lengthwise flaps in their inwardly-folded position.

4. An egg-crate comprising box-bodies united end to end, each having opposite lengthwise flaps provided with lengthwise rows of openings and adapted to be folded inwardly to form separate lengthwise compartments open from end to end, the box-bodies folding one over the other lengthwise of the compartments and the opposite ends of each body having interlocking members formed integral therewith to hold the lengthwise flaps in their inwardly-folded position.

5. An egg-crate comprising box-bodies united end to end, each having opposite lengthwise flaps provided with lengthwise rows of openings and adapted to be folded inwardly to form separate lengthwise compartments open from end to end, the box-bodies folding one over the other lengthwise of the compartments and the free ends of the bodies having interlocking members.

6. An egg-crate comprising box-bodies united end to end, each having opposite lengthwise flaps provided with lengthwise rows of openings and adapted to be folded inwardly to form separate lengthwise compartments open from end to end, the box-bodies folding one over the other lengthwise of the compartments and the free ends of the bodies having interlocking members said members being arranged to hold the inner walls of the folded bodies separated one from the other.

7. A blank for forming the herein-described egg-crate consisting of a single piece of suitable material of sufficient length to form two similar hollow box-sections folding lengthwise one over the other, said blank having parallel scores forming the corners of the outer and side walls of each section, the central portions of the blank at opposite sides of said scores being cut away to form opposite similar flaps for each section, and the flaps are each provided with parallel scores and a row of openings lengthwise between the latter scores, said latter scores forming the corners of the inner and side walls and also the corners of the inner and central lengthwise wall or partitions.

8. A blank for forming the herein-described egg-crate consisting of a single piece of suitable material of sufficient length to form two similar hollow box-sections folding lengthwise one over the other, said blank having parallel scores forming the corners of the outer and side walls of each section, the central portions of the blank at opposite sides of said scores being cut away to form opposite similar flaps for each section, and the flaps are each provided with parallel scores and a row of openings lengthwise between the latter scores, said latter scores forming the corners of the inner and side walls and also the corners of the inner and central lengthwise wall or partitions, the adjacent ends of the lengthwise flaps being separated a distance greater than the distance between the scores forming the edges of the side walls.

9. A blank for forming the herein-described egg-crate consisting of a single piece of suitable material of sufficient length to form two similar hollow box-sections folding lengthwise one over the other, said blank having parallel scores forming the corners of the outer and side walls of each section, the central portions of the blank at opposite sides of said scores being cut away to form opposite similar flaps for each section, and the flaps are each provided with parallel scores and a row of openings lengthwise between the latter scores, said latter scores forming the corners of the inner and side walls and also the corners of the inner and central lengthwise wall or partitions, the adjacent ends of the lengthwise flaps being separated a distance greater than the distance between the scores forming the edges of the side walls and the blank having transverse scores alined with the adjacent ends of the flaps to form the corners of one end wall and the outer walls.

10. A blank for forming the herein-described egg-crate consisting of a single piece of suitable material of sufficient length to form two similar hollow box-sections folding lengthwise one over the other, said blank having parallel scores forming the corners of the outer and side walls of each section, the central portions of the blank at opposite sides of said scores being cut away to form opposite similar flaps for each section, and the flaps are each provided with parallel scores and a row of openings lengthwise between the latter scores, said latter scores forming the corners of the inner and side walls and also the corners of the inner and central lengthwise wall or partitions, the adjacent ends of the lengthwise flaps being separated a distance greater than the distance between the scores forming the edges of the side walls and the blank having transverse scores alined with the adjacent ends of the flaps to form the corners of one end wall and the outer walls, the portions forming said end wall and the adjacent ends of the flaps having interlocking members.

11. A blank for forming the herein-described egg-crate consisting of a single piece of suitable material of sufficient length to form two similar hollow box-sections folding lengthwise one over the other, said blank having parallel scores forming the corners of the outer and side walls of each section, the central portions of the blank at opposite sides of said scores being cut away to form opposite similar flaps for each section, and the flaps are each provided with parallel scores and a row of openings lengthwise between the latter scores, said latter scores forming the corners of the inner and side walls and also the corners of the inner and central lengthwise wall or partitions, the adjacent ends of the lengthwise flaps being separated a distance greater than the distance between the scores forming the edges of the side walls and the blank having transverse scores alined with the adjacent ends of the flaps to form the corners of one end wall and the outer walls, the portions forming said end wall and the adjacent ends of the flaps and also the extreme ends of the blank having interlocking members.

705,287. HEAT-DISTRIBUTING SYSTEM. WILLIAM H. PEARCE, Chicago, Ill. Filed July 27, 1901. Serial No. 70,001. (No model.)

Claim.—1. In a heat-distributing system, a service-main, a return-main, and drain-pipes connecting said service and return mains, said mains being in sections, and a connection for the adjacent ends of each of said sections comprising a sleeve, the ends of the main-sections operating loosely in the ends of said sleeves, means for anchoring said sleeves, and supports for said main-sections, said supports forming part of the anchoring means and embracing said sections to hold the same against lateral movement, as and for the purpose set forth.

2. In a heat-distributing system, a service-main made in sections, a coupling for the proximate ends of adjacent sections comprising a sleeve having an enlarged chamber centrally the length thereof, the ends of said main-sections operating loosely in the ends of said sleeve, supporting-seats arranged to receive and embrace the ends of said main-sections, said seats operating to hold the main-sections against lateral movement, and serving as a guide in the longitudinal expansion and contraction thereof, a return-pipe, and means for affording communication between the lowermost point of the enlarged chamber of said sleeve and said return-pipe, as and for the purpose set forth.

3. In a heat-distributing system, a service-main made in sections, a connection for the proximate ends of adjacent sections comprising a sleeve having an enlarged central chamber, both ends of said main-sections projecting loosely into the ends of said sleeve, a bracket or frame having seats arranged to embrace and support said main-sections and said sleeve, and serving to hold the same against lateral movement, while permitting longitudinal expansion and contraction thereof, means for anchoring said frame or bracket, a return-pipe, a drain-pipe communicating with the lowermost point of the enlarged chamber of said sleeve and delivering into said return-pipe, and a trap arranged in said drain-pipe, as and for the purpose set forth.

4. In a heat-distributing system, a service-main made in sections, means for connecting the proximate ends of adjacent sections including a sleeve having an enlarged central chamber, said sleeve provided with flanges or riffles on the interior surface thereof, the ends of said service-main sections operating freely through the ends of said sleeve, a return-pipe, and means for opening communication between said return-pipe and the lowermost point of said enlarged chamber, as and for the purpose set forth.

5. In a heat-distributing system, a service-main made in sections, means for connecting the proximate ends of adjacent sections including a sleeve having an enlarged chamber, the ends of said main-sections telescoping loosely into the ends of said sleeve, a return-pipe, means for connecting said return-pipe with the lowermost point of said enlarged chamber, and an anchor-plate having guiding-seats adapted to receive said sleeve, as and for the purpose set forth.

6. In a heat-distributing system, a service supply-main made in sections, means for coupling the proximate ends of adjacent sections including a sleeve, a return-pipe, also made in sections and arranged alongside of said supply-pipe, and a connecting-sleeve for the proximate ends of adjacent sections of said return-pipe, independent means for connecting branch pipes to said sleeves, said means being offset from each other or out of transverse alinement, and an anchor-plate having guiding-seats adapted to receive said sleeve, as and for the purpose set forth.

7. In a heat-distributing system, a service-main made in sections having means for coupling the proximate ends of adjacent sections including a sleeve rigidly mounted and anchored, a branch pipe connecting with said sleeve, the proximate ends of the sections of the main service-pipe operating loosely in the open ends of said sleeve, and means for supporting and guiding the ends of said service-main in true longitudinal relation with respect to said sleeve during expansion or contraction thereof, said means operating to prevent lateral movement of said section ends whereby the branch-pipe connection with said sleeve is relieved of any movement due to the endwise expansion of service-main sections, as and for the purpose set forth.

8. In a heat-distributing system, the combination of a service-main and a branch connection, an anchored sleeve to which said branch connection is connected, said service-main telescoping loosely into the ends of said sleeve, and means for supporting and guiding said service-main in true longitudinal relation with respect to said sleeve, said means operating to prevent lateral movement of the service-main, as and for the purpose set forth.

9. In a heat-distributing system, a service-main and a return-pipe, said main and pipe being made in sections, in combination with a sleeve interposed between the proximate ends of the adjacent sections of said main and provided with an enlarged chamber, said chamber having riffles upon the inner surface thereof, a drain-pipe communicating with said enlarged chamber, and delivering into said return-pipe, as and for the purpose set forth.

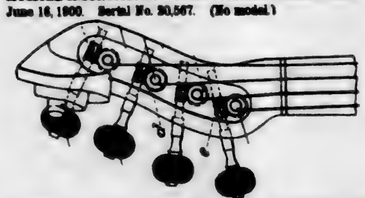
10. In a heat-distributing system, a service-main made in sections, a sleeve interposed between the proximate ends of the adjacent sections, an anchor-plate having seats arranged to receive said sleeve and also the said service-main sections, said seats constructed to embrace said sleeve and sections, respectively, whereby said sleeve and sections are held against lateral movement, but longitudinal movement, due to expansion and contraction, is permitted, and means for anchoring said anchor-plate, as and for the purpose set forth.

11. In a heat-distributing system, a service-main and a return-pipe, drain-pipes opening communication between said main and return-pipe, an anchor-plate having seats arranged to receive and embrace said main, said anchor-plate also provided with seats arranged to embrace and receive said return-pipe, and means for anchoring said plate, whereby said main and pipe are held against lateral movement but are permitted to expand or contract longitudinally, as and for the purpose set forth.

12. In a heat-distributing system, a service-main made in sections, a sleeve interposed between proximate ends of the adjacent sections, said sleeve provided with an enlarged chamber, a return-pipe, means for opening communication between said chamber and return-pipe, an anchor-plate having brackets or castings formed with seats adapted to receive and embrace said main sections, said anchor-plate also having brackets formed with seats adapted to receive and embrace said return-pipe, and means for anchoring said plate, as and for the purpose set forth.

13. In a heat-distributing system, a service-main made in sections, a sleeve arranged to receive freely in the ends thereof the proximate ends of adjacent main-sections, a packing interposed between said sleeve and main-sections, an anchor-plate having brackets or castings formed with seats arranged to receive and embrace said main-sections, said plate also provided with seats arranged to receive said sleeve, straps for binding said sleeve to said plate, and means for anchoring said plate, whereby said sleeve is rigidly held and said main-sections are supported and held against lateral movement but are permitted longitudinal movement for expansion or contraction, as and for the purpose set forth.

705,288. TENSION APPARATUS FOR STRINGS OF STRINGED MUSICAL INSTRUMENTS. PAUL PÉCHEMART, Bizaz, France. Filed June 16, 1900. Serial No. 20,567. (No model.)

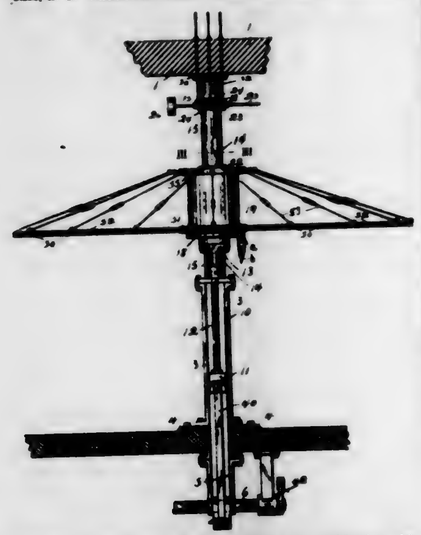


Claim.—1. A violin or like stringed instrument having a head and a neck provided with a finger-board, and tension-pegs all arranged longitudinally of said head and on one side only thereof, substantially as described.

2. A violin or like stringed instrument having a head and a neck provided with a finger-board, and tension-pegs with worm-gearing all arranged longitudinally of said head and on one side only thereof, substantially as described.

3. A violin or like stringed instrument having a head and a neck provided with a finger-board, spindles to which the strings are attached said spindles being arranged obliquely to the finger-board, and pegs for actuating the spindles by means of worm-gearing, the pegs being all arranged longitudinally of said head, and on one side only thereof, substantially as described.

705,289. CANDLE-MAKING MACHINE. ARTHUR B. PECK, Syracuse, N. Y. Filed Nov. 17, 1900. Serial No. 36,708. (No model.)



Claim.—1. In a candle-dipping machine, the combination with a suitable standard, of a wheel fitted thereto and rotating thereon to carry the wicks, means to secure the wicks on the wheel, rotating mechanism on the standard continuously rotated by power, connections between the wheel and the rotating mechanism, arms fitted to the standard to support the wheel in engagement with the rotating mechanism, and a hand-operated lever connected to said arms to elevate the wheel into engaging position, and to depress it periodically into dipping position.

2. In a candle-dipping machine, the combination with a hollow standard, of a rotating wheel fitted thereto, jointed connections fitted to the standard and connected to the wheel, rotating mechanism operated by power, teeth on the main wheel to engage with said rotating mechanism when the wheel is in elevated position, and a hand-operated lever connected to the jointed connections periodically to depress and elevate the wheel, substantially as described and shown.

3. In combination in a candle-dipping machine, upper and lower supports, a pedestal secured to the lower support, a piston fitting the pedestal and vertically reciprocating therein, a wheel carried on the piston, a ratchet on the wheel, a ratchet on the upper support, means for rotating the upper ratchet, and means for elevating the piston and wheel to bring the ratchets into engagement intermittingly.

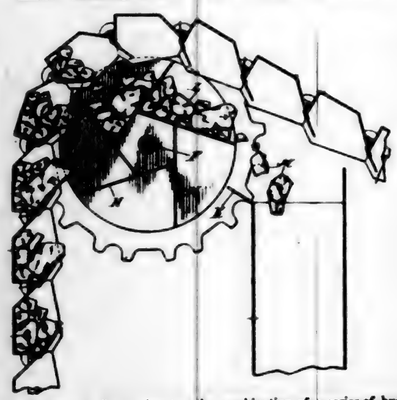
4. In combination in a candle-dipping machine, upper and lower supports, a pedestal secured to the lower support, a piston fitting the pedestal and vertically reciprocating therein, a wheel carried on the piston, a ratchet on the wheel, a ratchet on the upper support, means for rotating the upper ratchet, means for elevating the piston and wheel to bring the ratchets into engagement intermittingly, and frames provided with means for the attachment of the wicks and with hooks for securing the respective frames on the wheel.

5. In combination in a candle-dipping machine, upper and lower supports, a pedestal secured on the lower support having depending arms, a piston fitted to the pedestal and vertically reciprocating therein, a shaft journaled in the lower arms, a compound lever connecting the shaft to the pedestal, a base-plate supported on the piston, an enlarged hub and wheel supported on the plate, antifriction-balls arranged between the hub and plate, a ratchet on the wheel-hub, an upper ratchet on the upper support, means for rotating the upper ratchet, and means for rotating the lower shaft periodically to elevate the piston and wheel to bring the two ratchets into engagement.

6. In combination in a candle-dipping machine, suitable upper and lower supports, a hollow pedestal on the lower support, lower arms depending from the pedestal, a shaft journaled in said arms, a block and piston fitted to the pedestal and reciprocating therein, a compound lever connecting the shaft to the block, a guide-tube supported on the pedestal formed with opposite guide-slots, a cross-arm on the upper end of the piston outwardly extending through the slots, a wheel base-plate supported on the cross-arm, an enlarged hub and wheel supported on said base-plate, antifriction-balls arranged between the wheel and the base-plate, a ratchet on the upper end of the hub, an upper ratchet supported by hangers below the upper support, a worm and gear, and means for rotating the worm to rotate the upper ratchet, means for rotating the shaft periodically to elevate the wheel, and detachable frames provided with means for attachment of the wicks, and with hooks for securing the frames to the wheel.

7. In combination in a candle-dipping machine, suitable upper and lower supports, a hollow pedestal on the lower support, lower arms depending from the pedestal, a shaft journaled in said arms, a block and piston fitted to the pedestal and reciprocating therein, a compound lever connecting the shaft to the block, a guide-tube supported on the pedestal formed with opposite guide-slots, a cross-arm on the upper end of the piston outwardly extending through the slots, a wheel base-plate supported on the cross-arm, an enlarged hub and wheel supported on said base-plate, antifriction-balls arranged between the wheel and the base-plate, a ratchet on the upper end of the hub, an upper ratchet supported by hangers below the upper support, a worm and gear, and means for rotating the worm to rotate the upper ratchet, means for rotating the shaft periodically to elevate the wheel-ratchet into engagement with the upper ratchet and turn the wheel, detachable frames provided with means for the attachment of the wicks and with hooks for securing the frames to the wheel, a latch on the base-plate having a beveled tip, and a spring for forcing it up into engagement with the hub.

705,290. ELEVATOR. STANTON B. PECK, Chicago, Ill., assignor to the Link Belt Machinery Company, Chicago, Ill., a Corporation of Illinois. Filed May 13, 1901. Serial No. 59,981. (No model.)



Claim.—1. In an elevator, the combination of a series of buckets, each opening inwardly and traveling about a certain axis of rotation, with a series of receiving-pockets rotating about said axis of rotation and formed by side flanges and two substantially flat plates set each at a tangent to an inner circle about the axis of rotation.

2. In an elevator, the combination of a series of buckets, each opening inwardly and traveling about a certain axis of rotation, with a series of deep and wide-mouthed receiving-pockets rotating about said axis of rotation, each provided with a bottom inclined so that when its outer edge has reached on its ascending motion the horizontal line through the axis of rotation, the bottom of each pocket is inclined inwardly to hold the load which falls into it from the bucket above.

3. In an elevator, the combination of the elevating chain and buckets with a series of rotating pockets, each composed of side walls and two substantially flat plates, which form respectively the top and bottom of each pocket and which are joined together near the axis of rotation of such pockets.

4. In an elevator, the combination of the elevating chain and buckets, adapted each to discharge its load inwardly as it ascends, with a series of rotating pockets, each composed of side walls and two substantially flat plates, which form respectively the top and bottom of each pocket and which are joined together near the axis of rotation of such pockets.

5. In an elevator, the combination of a suitable driving-chain with a series of contiguous buckets, opening at the side and which travel around a certain axis, with a series of pockets, rotating about the same axis and opening outwardly, with wide unobstructed mouths to receive the material which projects from the side openings of the buckets, said pockets formed by thin partitions and presenting to the buckets in the line of rotation only the sharp edges of such partitions.

6. In an elevator, the combination of a suitable driving-chain with a series of contiguous buckets, opening at the side and which travel around a certain axis, with a series of pockets, rotating about the same axis and opening outwardly, with wide unobstructed mouths to receive the material which projects from the side openings of the buckets, said pockets formed by thin partitions and presenting to the buckets in the line of rotation only the sharp edges of such partitions, said partitions placed tangentially so as to present an inwardly-inclined bottom when the outer edge is in the horizontal line on the ascending side.

7. In an elevator, the combination of an elevating-chain with a series of contiguous buckets thereto attached and opening inwardly toward the axis about which the chain and buckets travel, a series of pockets rotating about such axis and opening outwardly to receive the contents of the buckets, said chain and buckets departing from the pockets on the descending side and said pockets discharging beneath such chain and buckets on the descending side and at one side of the vertical line through the axis of rotation.

8. In an elevator, the combination of the elevating chain and buckets with a series of rotating pockets, each composed of side walls and two substantially flat plates, which form respectively the top and bottom of such pocket and which are joined together near the axis of rotation of such pockets, the receiving-bottom of each of such pockets placed tangentially so that when such pocket is on its ascending side, its bottom will have a downward and inward dip when its outer edge is in a horizontal line with the axis of rotation.

9. In an elevator, the combination of the elevating chain and buckets with a series of rotating pockets, each composed of side walls and two substantially flat plates, which form successively the receiving and discharging bottoms of such pocket and which are joined together near the axis of rotation of such pockets, the discharging-bottom of each of such pockets placed tangentially so that when such pocket is on its descending side, its bottom has an outward and downward dip when its outer edge is in a horizontal line with the axis of rotation.

10. In an elevator, the combination of the elevating chain and buckets, adapted each to discharge its load inwardly as it ascends, with a series of rotating pockets each composed of side walls and two substantially flat plates, which form respectively the top and bottom of such pocket and which are joined together near the axis of rotation of such pockets, the receiving-bottom of each of such pockets placed tangentially to a circle concentric with the axis of rotation.

11. In an elevator, the combination of the elevating chain and buckets, adapted each to discharge its load inwardly as it ascends, with a series of rotating pockets, each composed of side walls and two substantially flat plates, which form respectively the top and bottom of such pocket and which are joined together near the axis of rotation of such pockets, the discharging-bottom of each of such pockets placed tangentially to a circle concentric with the axis of rotation.

12. In an elevator, the combination of a series of contiguous ascending buckets adapted to travel around an axis of rotation at a certain point, with a series of carrying-pockets adapted to rotate about the same axis of rotation and receive the material from the ascending buckets.

13. In an elevator, the combination of a series of contiguous ascending buckets opening inwardly and adapted to travel around an axis of rotation at a certain point, with a series of carrying-pockets opening outwardly and adapted to rotate about the same axis of rotation and receive material from the ascending buckets.

14. In an elevator, the combination of a series of contiguous, continuously-traveling, carrying-buckets, with a series of continuously-rotating, carrying-pockets, the same associated so that the load of the buckets is discharged into the pockets while the buckets are ascending.

15. In an elevator, the combination of a series of contiguous, continuously-traveling carrying-buckets with a series of continuously-rotating carrying-pockets, the same associated so that the load of the carrying-buckets is discharged into the carrying-pockets, said carrying-pockets shaped so as to hold the load, carry it partially around the axis of rotation and discharge it.

16. In an elevator, the combination of a series of buckets, each opening inwardly and traveling about a certain axis of rotation, with a series of carrying-pockets rotating about said axis of rotation, opening outwardly, the inner edges of the buckets and the outer edges of the pockets traveling in substantially the same circle.

17. In an elevator, the combination of a series of buckets, each opening inwardly and traveling about a certain axis of rotation, with a series of carrying-pockets rotating about the same axis of rotation opening outwardly, the inner edges of the buckets and the outer edges of the pockets traveling in substantially the same circle, the inner edges of the buckets being somewhat in advance of the outer edges of the pockets in such circle.

18. In an elevator, the combination of a series of buckets, each opening inwardly and traveling about a certain axis of rotation, with a series of carrying-pockets rotating about said axis of rotation and opening outwardly, the inner edges of said buckets being somewhat in advance of the outer edges of the pockets in such circle.

19. In an elevator, the combination of a series of buckets, each opening inwardly and traveling about a certain axis of rotation, with a series of carrying-pockets rotating about said axis of rotation and opening outwardly, said buckets adapted to discharge their loads while ascending and said pockets adapted to discharge their loads while descending.

20. In an elevator, the combination of a series of contiguous, laterally-discharging elevator-buckets traveling about a certain axis of rotation, with a series of receiving-pockets rotating about such axis of rotation, the speed of such travel and rotation being such as to keep the buckets and the pockets in the same relative position while they are traveling about the same axis of rotation.

21. In an elevator, the combination of means for elevating the material vertically and discharging it laterally, with carrying-pockets adapted to receive the material from the means for elevating the same, said means for elevating the material and said rotating carrying-pockets adapted to retain their relative positions during the period of their travel about the same axis of rotation.

22. In an elevator, the combination of a series of laterally-discharging elevating-buckets, with a series of carrying-pockets, both traveling in the same direction for at least a portion of their travel and adapted to retain their relative positions during the period of such travel.

23. In an elevator device, the combination of a series of ascending carrying-buckets with a series of rotating carrying-pockets around which the buckets pass, each pocket triangular in cross-section and located so as to receive and hold its load while traveling upwardly and means for driving and rotating the buckets and pockets together.

24. In an elevator device, the combination of a series of ascending carrying-buckets with a series of rotating carrying-pockets, each pocket triangular in cross-section and located so as to receive and hold its load while traveling upwardly the pockets and buckets so spaced and timed that the bottom of the pocket follows at a greater or less interval the bottom of the bucket, and means for driving and rotating the buckets and pockets together, said carrying-pockets also shaped and located so as to carry the load over the axis of rotation and discharge it while such pockets are descending.

25. In an elevator, the combination of means for elevating material with rotating carrying-pockets around which the elevating device passes and adapted to receive and hold the material at one side of the axis of rotation, retain it until it has been carried across the axis of rotation and discharge it at the other side of the axis of rotation beyond the vertical tangent to the circle described by the outer edges of such pockets.

26. In an elevator, the combination with the elevating chain and buckets of a series of rotating carrying-pockets, around which the buckets pass and adapted to receive the contents of the buckets and carry it over a vertical line through the axis of rotation and to freely discharge the same to one side of the path of rotation of the pockets.

27. In an elevator, the combination with the elevating chain and buckets of a series of rotating carrying-pockets, around which the buckets pass and adapted to receive the contents of the buckets at one side of the path of rotation of the pockets and carry it over a vertical line through the axis of rotation and to freely discharge the same to the other side of the path of rotation of the pockets.

28. In an elevator, the combination with the elevating chain and buckets, adapted each to discharge its load inwardly as it ascends, of a series of rotating carrying-pockets, adapted to receive the contents of the buckets and carry it over a vertical line through the axis of rotation and to freely discharge the same to one side of the path of rotation of the pockets.

29. In an elevator, the combination with the elevating chain and buckets, adapted each to discharge its load inwardly as it ascends, of a series of rotating carrying-pockets, adapted to receive the contents of the buckets at one side of the path of rotation of the pockets and carry it over a vertical line through the axis of rotation and to freely discharge the same to the other side of the path of rotation of the pockets.

30. In an elevator, the combination of a suitable driving-chain with a series of contiguous buckets, opening at the side and which travel around a certain axis, with a series of carrying-pockets, rotating about the same axis and opening outwardly, with wide unobstructed mouths to receive the material which projects from the side openings of the buckets.

31. In an elevator, the combination of means for elevating the ma-

terial vertically and discharging it laterally, with carrying-pockets adapted to receive the material from the means for elevating the same, said means for elevating the material and said rotating carrying-pockets adapted to retain their relative positions during the period of their travel about the same axis of rotation, said carrying-pockets forming parts of the pulley over which the ascending carrying-buckets pass.

32. In an elevator, the combination of a series of laterally-discharging elevating-buckets, with a series of carrying-pockets, both traveling in the same direction for at least a portion of their travel and adapted to retain their relative positions during the period of such travel, said carrying-pockets forming parts of the pulley over which the ascending carrying-buckets pass.

33. In an elevator device, the combination of a series of ascending carrying buckets with a series of rotating carrying-pockets, each pocket triangular in cross-section and located so as to receive and hold its load while traveling upwardly, and means for driving and rotating the buckets and pockets together, said carrying-pockets forming parts of the pulley over which the ascending carrying-buckets pass.

34. In an elevator device, the combination of a series of ascending carrying-buckets with a series of rotating carrying-pockets, each pocket triangular in cross-section and located so as to receive and hold its load while traveling upwardly, and means for driving and rotating the buckets and pockets together, said carrying-pockets also shaped and located so as to carry the load over the axis of rotation and discharge it while such pockets are descending, said carrying-pockets forming parts of the pulley over which the ascending carrying-buckets pass.

35. In an elevator, the combination of means for elevating material with rotating carrying-pockets adapted to receive and hold the material at one side of the axis of rotation, retain it until it has been carried across the axis of rotation and discharge it at the other side of the axis of rotation beyond the vertical tangent to the circle described by the outer edges of such pockets, said carrying-pockets forming parts of the pulley over which the ascending carrying-buckets pass.

36. In an elevator, the combination with the elevating chain and buckets of a series of rotating carrying-pockets, adapted to receive the contents of the buckets and carry it over a vertical line through the axis of rotation and to freely discharge the same to one side of the path of rotation of the pockets, said carrying-pockets forming parts of the pulley over which the ascending carrying-buckets pass.

37. In an elevator, the combination with the elevating chain and buckets of a series of rotating carrying-pockets, adapted to receive the contents of the buckets at one side of the path of rotation of the pockets and carry it over a vertical line through the axis of rotation and to freely discharge the same to the other side of the path of rotation of the pockets, said carrying-pockets forming parts of the pulley over which the ascending carrying-buckets pass.

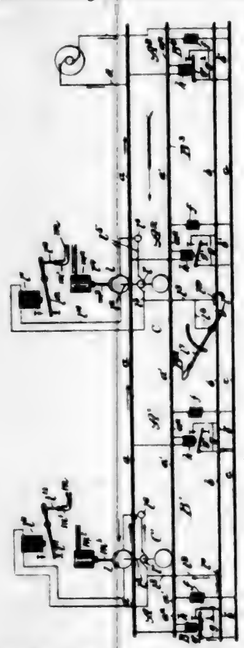
38. In an elevator, the combination of a series of elevating-buckets with a series of carrying-pockets, both traveling in the same direction for at least a portion of their travel, said carrying-pockets associated with a pulley over which the ascending carrying-buckets pass.

705,291. TRAIN-CONTROLLING APPARATUS. JONATHAN D. PRICE and ALEXANDER C. MILLER, Aurora, Ill. Filed Dec. 9, 1901. Serial No. 85,168. (No model.)

Claim.—1. In apparatus of the character described, the combination of a track having one electrically-continuous rail serving as a main and one rail electrically divided into sections corresponding to blocks, a third rail or conductor electrically divided into sections corresponding to blocks, a fourth rail or conductor which is electrically continuous and serves as a main, an electric generator connected with said first-named track-rail and said fourth rail, connections between said fourth rail and the sections of said third rail through which said sections are energized, instruments connected with both said track-rails and controlling said last-named connections, and connections for supplying current to said last-named instruments.

2. In apparatus of the character described, the combination of a track having one electrically-continuous rail and one rail having sections insulated from each other, a third rail or conductor having sections corresponding with said last-named sections, a fourth rail or conductor which is electrically continuous, a generator connected with said first-named rail and said last-named rail, conductors connecting said fourth rail with the several sections of said electrically-divided track-rail, conductors connecting said fourth rail with the several sections of said third rail and supplied with switches, and electromagnets controlling said switches and connected with both track-rails.

3. In apparatus of the character described, the combination of a track having one electrically-continuous rail and one rail having sections insulated from each other, a third rail or conductor having sections corresponding with said last-named sections, a fourth rail or conductor which is electrically continuous, a generator connected with said first-named rail and said last-named rail, conductors connecting said fourth rail with the several sections of said electrically-divided track-rail, and having in their courses suitable resistance-coils, conductors connecting said fourth rail with the several sections of said third rail and supplied with switches, and electromagnets controlling said switches and connected with both track-rails.



4. In apparatus of the character described, the combination of a track having one rail electrically divided into sections, a third rail electrically divided in corresponding sections, a fourth rail which is electrically continuous, resistance-coils connected with said fourth rail and with the sections of said electrically-divided track-rail, conductors connected with said fourth rail and with the advance ends of the sections of said third rail and supplied with switches, electromagnets controlling said switches and connected with said electrically-continuous track-rail and with the rear ends of the sections of said electrically-divided track-rail, and an electric generator connected with said electrically-continuous track-rail and with said fourth rail.

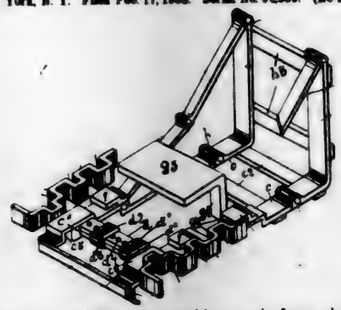
5. In apparatus of the character described, the combination of a track having an electrically-continuous rail, and a rail electrically divided into sections, a third rail electrically divided into corresponding sections, a fourth rail or conductor connected with the several sections of said electrically-divided track-rail, switch-supplied connections between said fourth rail and the several sections of said third rail, electromagnets controlling said switches and connected with both track-rails, train-carried mechanism having a conductor engaging said electrically-continuous track-rail and a conductor engaging said third rail, and a generator serving to energize said electrically-continuous track-rail and said fourth rail.

6. In apparatus of the character described, the combination of a track having an electrically-continuous rail, and a rail electrically divided into sections, a third rail electrically divided into corresponding sections, a fourth rail or conductor connected with the several sections of said electrically-divided track-rail, switch-supplied connections between said fourth rail and the several sections of said third rail, electromagnets controlling said switches and connected with both track-rails, a generator connected with said electrically-continuous track-rail and said fourth rail, and a train-carried electric motor having a conductor engaging said electrically-continuous track-rail and a conductor engaging said third rail.

7. In apparatus of the character described, the combination of a track having an electrically-continuous rail, and a rail electrically divided into sections, a third rail electrically divided into corresponding sections, a fourth rail or conductor connected with the several sections of said electrically-divided track-rail, switch-supplied connections between said fourth rail and the several sections of said third rail, last-named electromagnets controlling said switches and connected with both track-rails, a generator connected with said electrically-continuous rails, a train-carried electric motor, a train-carried brake mechanism, a magnet controlling said brake mechanism, conductors connecting said electric motor and said electromagnet with said electrically-continuous track-rail, and a conductor connecting said electromagnet and said electric motor with said third rail whereby said motor is deprived of current and the brakes applied simultaneously therewith when a deënergized third-rail section is encountered.

8. In apparatus of the character described, the combination of a track having an electrically-continuous rail, and a rail electrically divided into sections, a third rail electrically divided into corresponding sections, a fourth rail or conductor connected with the several sections of said electrically-divided track-rail, switch-supplied connections between said fourth rail and the several connections of said third rail, electromagnets controlling said switches and connected with both track-rails, a generator connected with said electrically-continuous rails, a train-carried electric motor having a conductor engaging said electric continuous track-rail and a conductor engaging said third rail, and a manually-controlled conductor connected with said electric motor and movable into contact with said fourth rail.

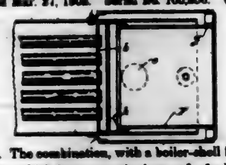
705,292. WINDOW-CLEANING CHAIR. SUSDEL RAMBOWITH, New York, N. Y. Filed Feb. 17, 1902. Serial No. 94,359. (No model.)



Claim.—1. A window-chair comprising a main frame adapted to engage the transverse members of the bottom of the window-frame, transversely-adjustable bars mounted in said main frame and provided with locking devices adapted to engage the beads or strips of the sides of the window-frame, a hinged member connected with the outer end of the main frame and adapted to be held in an upright position, side rods hinged to the top portion of the said hinged member and to the sides of the main frame and composed of separate parts hinged together, and a seat detachably connected with the main frame, substantially as shown and described.

2. A window-chair comprising a main frame adapted to engage the transverse members of the bottom of the window-frame transversely-adjustable bars mounted in said main frame and provided with locking devices adapted to engage the beads or strips of the sides of the window-frame, a hinged member connected with the outer end of the main frame and adapted to be held in an upright position, side rods hinged to the top portion of said hinged member and to the sides of the main frame and composed of separate parts hinged together, and a seat detachably connected with the main frame, said seat being so placed as to cover the transversely-adjustable bars, substantially as shown and described.

705,293. FEED-WATER HEATER. FRED W. RENCH, Tipton, Kans. Filed Mar. 27, 1902. Serial No. 100,856. (No model.)



Claim.—1. The combination, with a boiler-shell having an end plate and a prolongation which forms a smoke-box; of a feed-water heater having an inner shell secured to the inside of the said prolongation at one end, and an outer shell secured to the outside of the boiler at the same end, thereby forming a water-space on each side of the said prolongation, and a ring connecting the said inner and outer shells together beyond the end of the said prolongation, substantially as set forth.

2. The combination, with a boiler-shell having an end plate and a prolongation which forms a smoke-box; of a feed-water heater having an inner shell and an outer shell, two flanged rings secured respectively between the said boiler and the outer shell and between the said prolongation and the inner shell, thereby forming a water-space on each side of the said prolongation, and a ring connecting the inner and outer shells together beyond the end of the said prolongation, substantially as set forth.

3. The combination, with a boiler-shell having an end plate and a prolongation which forms a smoke-box; of a feed-water heater having an inner shell secured to the inside of the said prolongation, and an outer shell secured to the outside of the boiler-shell at the same end, thereby forming a water-space on each side of the said prolongation, and a ring connecting the said inner and outer shells beyond the end of the said prolongation; and a smoke-pipe which passes through the said inner and outer shells and prolongation, substantially as set forth.

705,294. BLANKET FOR USE IN THE ART OF PRINTING. JOSEPH E. RHODES, Boston, Mass. Filed July 27, 1897. Serial No. 646,092. (No model.)

Claim.—1. A blanket adapted to be applied to a cylinder or platen of a printing press or machine, and consisting of a sheet of rubber or analogous material having a surface formed with numerous small integral points or projections larger at their bases than at their upper ends whereby the area of resistance in each projection is increased in proportion to the compression of said projection, each projection being independent of and close to the adjacent projections, substantially as set forth.

2. A blanket adapted to be applied to a cylinder or platen of a printing press or machine, and consisting of a sheet of rubber or analogous material having a surface formed with numerous small integral points or projections approximately conical or conoidal in shape, each independent of but near to the adjacent points or projections, substantially as described.

3. A blanket for the impression member of a printing-press composed of a flexible backing, and numerous closely-disposed elastic projections increasing in size toward their bases.

4. In a printing-press, the combination of impression-producing devices, and a blanket interposed between said devices and composed of a flexible backing and numerous closely-disposed elastic projections constituting an impression-surface having independently-yielding areas, said projections increasing in size toward their bases.

5. The herein-described printers' blanket composed of a soft rubber backing having a facing of closely-disposed projections increasing in size toward their bases, said backing and projections being integral one with the other, and the extremities of said projections constituting an impression-surface having independently-yielding areas.

6. A blanket for the impression member of a printing-press, composed of a flexible backing and numerous small and closely-disposed short and comparatively thick projections, made elastic and of such proportions as to expand transversely when pressure is applied longitudinally thereto, each projection being independent of and close to the adjacent projections.

7. A blanket for the impression member of a printing-press, composed of a soft rubber flexible backing and numerous small and closely-disposed short and comparatively thick integral soft-rubber projections, made elastic and of such proportions as to expand transversely when pressure is applied thereto longitudinally, each projection being independent of and close to the adjacent projection.

8. A blanket for the impression member of a printing-press, composed of a flexible backing and numerous small and closely-disposed projections, increasing in size toward their bases, and made elastic to expand transversely when pressure is applied longitudinally thereto, each projection being independent of and close to the adjacent projection.

9. A blanket for the impression member of a printing-press having a suitable support combined with numerous closely-disposed elastic rubber projections, each projection independent of the adjacent projections, and all so closely and uniformly disposed as that their ends constitute an impression-surface having a multiplicity of small independently-yielding areas.

10. A blanket for the impression member of a printing-press composed of a rubber support or base formed with numerous closely-disposed elastic rubber projections, each projection independent of the adjacent projections, and all so closely and uniformly disposed as that their ends constitute an impression-surface having a multiplicity of small independently-yielding areas.

11. A blanket for the impression member of a printing-press consisting of numerous closely-disposed elastic projections increasing in size toward their bases, combined with a suitable basic support.

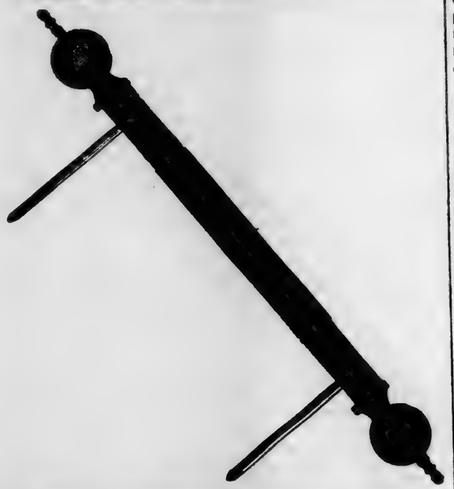
12. A blanket for the impression member of a printing-press, composed of a flexible support and numerous small and closely-disposed short and comparatively thick projections made elastic and of such proportions to expand transversely when pressure is applied longitudinally thereto.

705,295. CLOTHES-DRYING ATTACHMENT FOR RANGE-BOILERS. SAMUEL L. RICHARDSON, New York, N. Y. Filed Apr. 13, 1901. Serial No. 55,670. (No model.)

Claim.—1. An improved clothes-drying attachment for range-boilers, comprising a body portion which is formed to fit the outer surface of the boiler, means for securing the same in operative position, and a bracket-arm adjustably carried by said body portion, said body portion being provided with a slidably-mounted keeper consisting of a metallic blank the end portions of which are folded inwardly about the body portion and the central portion of which is formed into a socket in which the inner end of the bracket-arm is fitted.

2. An improved clothes-drying attachment for range-boilers, comprising a body portion which is formed to fit the outer surface of the boiler and consists of a plurality of strips or bands provided with overlapping ends and with means for securing said overlapping ends in predetermined relation, means for securing said strips in position to clamp the body portion to the boiler, and a bracket-arm adjustably carried by the body portion, said body portion being provided with a slidably-mounted keeper consisting of a metallic blank the end portions of which are folded inwardly about the body portion and the central portion of which are formed into a socket in which the inner end of the bracket-arm is fitted.

705,296. CURTAIN-POLE. THOMAS C. RICHARDS, Winsted, Conn. Filed May 17, 1901. Serial No. 60,741. (No model.)

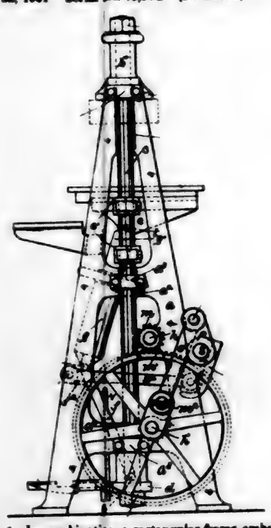


Claim.—1. The combination of a curtain-pole comprising three members, the central member made tubular and telescoping over the end members, and all of said members having alined flattened faces, the end sections having holes through the same parallel with said flat faces, and hooks having upright members at their free ends passing through said holes.

2. The combination of a series of pole-sections, each having longitudinal corrugations, the central section made of sheet metal and telescoping over the end sections, the end sections having alining flattened peripheral faces, and the central sheet-metal section having a portion of its corrugated periphery bent and made to extend across the flat faces of the end sections.

3. The combination of a series of pole-sections, the central section made of sheet metal and telescoping over the end sections, hook-brackets, each passing at one end through a hole in an end section, and spring-clips attached to said hook-brackets for retaining the pole in position relatively thereto.

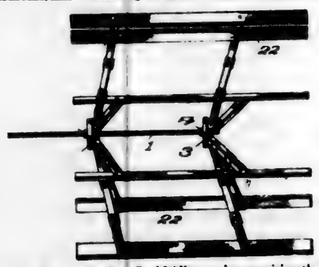
705,297. EMBOSSING-MACHINE. HAMILTON RICE, Mystic, Conn. Filed Oct. 22, 1901. Serial No. 79,574. (No model.)



Claim.—1. In combination, a rectangular frame embodying a cross-head with fixed platen b^4, a bed-plate slidably mounted on said frame, a toggle as herein set forth for moving the said bed-plate, and means disposed substantially in vertical line with said platen, bed-plate and toggle for operating said toggle consisting of rock-shaft s and links s^2, and means for rocking shaft s consisting of a crank w^2 and a rod o connecting said crank with the said rock-shaft.

2. The combination of the driving-shaft, the fixed platen and the movable bed-plate, of toggle members connecting said bed-plate and a fixed portion of the frame for operating the bed-plate, a gear on said shaft, a shaft parallel with the driving-shaft, a gear thereon meshing with the gear on the driving-shaft disposed in vertical alinement with said platen, bed-plate and toggle members, a crank-pin on the last-mentioned gear, a link connected thereto, a crank and crank-pin connected to the other end of said link, a rock-shaft connected to said crank-pin and a connection between said rock-shaft and one of the toggle members, as set forth.

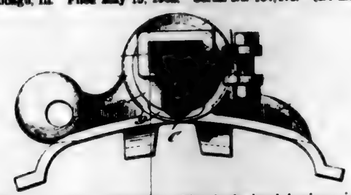
705,298. HARVESTING-MACHINE. BENJAMIN F. RIEKER, Moorsville, Ind. Filed Aug. 30, 1901. Serial No. 73,863. (No model.)



Claim.—The herein-described folding reel, comprising the main shaft 1 threaded at its inner and outer ends, combined with a pair of disks, one

for each threaded end of said threaded shaft and means to hold said disks in an adjusted position; suitable sockets formed upon each of said disks; folding arms comprising the members 6, 8 and 10; suitable hinges connecting said members and means, substantially as described, for reinforcing said hinges and enabling said members to be folded parallel with each other or extended, all combined substantially as specified and for the purpose set forth.

705,299. ADJUSTABLE BRAKE-HEAD. GILBERT P. RITTER, Chicago, Ill. Filed May 15, 1902. Serial No. 107,473. (No model.)



Claim.—1. The combination with a brake-head having a journal-opening for the reception of a journal on the end of a brake-beam, of a split-ring or strap clamp adapted to grip said journal and means for confining said clamp to the brake-head, substantially as and for the purposes specified.

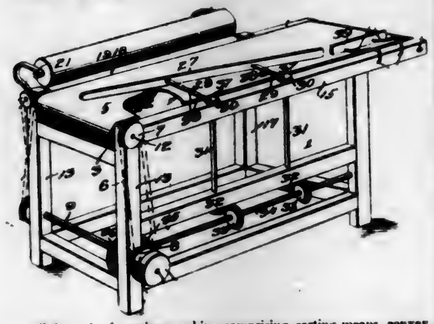
2. The combination with a brake-head having a journal-opening, of a split-ring clamp which coincides with the journal-opening of the brake-head, substantially as and for the purposes specified.

3. The combination with a brake-head having a journal-opening and a lug or projection adjacent thereto, of a split-ring clamp having ears which engage the lug or projection on the brake-head, and means for confining the split ring thereto, substantially as and for the purposes specified.

4. The combination with a brake-head having a journal-opening, of a split-ring clamp, and means for confining the split-ring clamp to the brake-head and reducing the diameter of the split-ring clamp, substantially as and for the purposes specified.

5. The combination with a brake-head having a journal-opening and provided with a T-lug adjacent to said opening, of a split ring having perforate ears and a bolt and nut which engage the ears of the split ring, substantially as and for the purposes specified.

705,300. MACHINE FOR SORTING TOBACCO-LEAVES. ELMER A. ROLLMAN, West Manchester, Ohio. Filed Mar. 27, 1902. Serial No. 100,290. (No model.)



Claim.—1. A sorting-machine comprising sorting means, conveying mechanism, and feeding means having a reciprocatory movement with relation to the conveying mechanism.

2. A sorting-machine comprising sorting means, conveying mechanism, and feeding means obliquely disposed to the conveying mechanism and having a transverse movement with relation thereto.

3. A sorting-machine comprising sorting means, conveying mechanism, and feeding means obliquely disposed to the conveying mechanism and having an orbital movement with relation thereto.

4. A sorting-machine comprising sorting-rollers, conveying mechanism, and feeding means obliquely disposed to the conveying mechanism and having an orbital movement with relation thereto.

5. A sorting-machine comprising sorting-rollers, conveying mechanism, and adjustable feeding means obliquely disposed to the conveying mechanism and having an orbital movement with relation thereto.

6. A sorting-machine comprising sorting means, conveying mechanism, and feeding means having a movement transverse to that of the conveying mechanism.

7. In a sorting-machine, the combination with an endless conveyer and sorting means, of feeding means having a transverse movement with relation to the conveyer.

8. In a sorting-machine, the combination with an endless conveyer and sorting means, of feeding means obliquely disposed to the conveyer and having orbital movement with relation thereto.

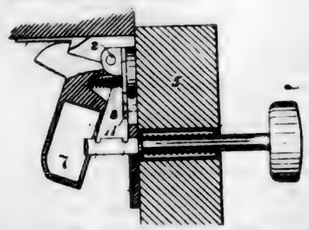
9. A sorting-machine comprising sorting-rollers, conveying mechanism, feeding means having a reciprocatory movement with relation to the conveying mechanism, and a guide coacting with the feeding means.

10. A sorting-machine comprising sorting-rollers, conveying mechanism, adjustable feeding means having a reciprocatory movement with relation to the conveying mechanism, and an adjustable guide coacting with the said means.

11. A sorting-machine comprising sorting-rollers, conveying mechanism, and feeding means having a reciprocatory movement with relation to the conveying mechanism.

12. A sorting-machine comprising sorting-rollers, conveying mechanism, and reciprocatory feeding means disposed at an angle to the rollers.

705,301. LATCH. ELLIS J. ROOT, San Francisco, Cal. Filed Dec. 4, 1900. Serial No. 38,666. (No model.)



Claim.—1. In combination, a bell-crank latch, one of its arms adapted to engage with a suitable stop, the other provided with a contracted mouth-recess and a longitudinally-movable rod or bar having an enlarged end to engage with the contracted mouth of the recess suitably arranged whereby the latch is operated by motion in one direction only of the rod or bar, the latch being so connected that it may be operated from one side of the door independent of the movable rod or bar.

2. In combination, a bell-crank latch, one of its arms adapted to engage with a suitable stop, the other provided with a contracted mouth-recess and a longitudinally-movable rod or bar having an enlarged end to engage with the contracted mouth of the recess suitably arranged whereby the latch is operated by motion in one direction only of the rod or bar and a pivoted latch or pawl adapted to engage with the rod or bar whereby through such engagement longitudinal motion of the rod or bar is prevented.

3. In combination, a latch adapted to engage with a suitable stop, a longitudinally-movable device suitably arranged to operate said latch by its motion in one direction only and a pivoted latch or pawl adapted to engage with the operating device in two positions whereby through such engagement longitudinal motion of the operating device is prevented and the said device is secured at either end of its motion by the pivoted latch or pawl.

4. In combination, a latch adapted to engage with a suitable stop, a longitudinally-movable device suitably arranged to operate said latch by its motion in one direction only and a pivoted latch or pawl adapted to engage with the operating device whereby through such engagement longitudinal motion of the operating device is prevented, said rod or bar being provided with more than one catching device to provide for locking said rod or bar in different positions by engagement with the latch or pawl.

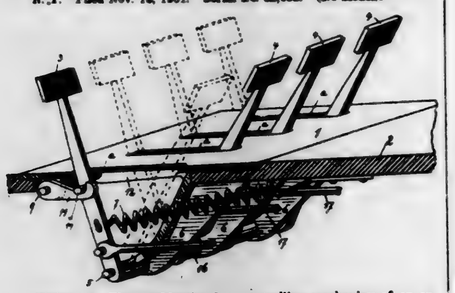
5. In combination, a latch adapted to engage with a suitable stop, a longitudinally-movable rod or bar suitably arranged to operate said latch by its motion in one direction only and a pivoted latch or pawl adapted to engage with the rod or bar whereby through such engagement longitudinal motion of the rod or bar is prevented said rod or bar being provided with more than one catching device to provide for locking said rod or bar in different positions by engagement with the latch or pawl.

6. In combination, a latch adapted to engage with a suitable stop, a longitudinally-movable rod or bar having a lost-motion connection with the latch whereby it operates said latch by its motion in one direction only and a pivoted latch or pawl adapted to engage with the rod or bar whereby through such engagement longitudinal motion of the rod or bar is prevented, said rod or bar being provided with more than one catch-

ing device to provide for locking said rod or bar in different positions by engagement with the latch or pawl.

7. In combination, a bell-crank latch, one of its arms adapted to engage with a suitable stop, the other provided with a contracted mouth or recess and a longitudinally-movable rod or bar having an enlarged end to engage with the contracted mouth of the recess suitably arranged whereby the latch is operated by the motion in one direction only of the rod or bar and a pivoted latch or pawl adapted to engage with the rod or bar whereby through such engagement longitudinal motion of the rod or bar is prevented, said rod or bar being provided with more than one catching device to provide for locking said bar in different positions by engagement with the latch or pawl.

705,802. CONTROLLING MECHANISM. HARRY ROSS, Utica, N. Y., assignor to Remington Automobile & Motor Company, Utica, N. Y. Filed Nov. 18, 1901. Serial No. 82,632. (No model.)



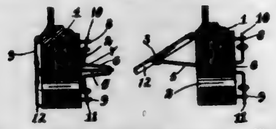
Claim.—1. The combination in a controlling mechanism of an operative controlling-lever, a spring for returning said lever to its inoperative position, a catch for securing said lever in operative position, a second adjacent controlling-lever, a spring for returning said second lever to its inoperative position and means cooperating with said second lever for releasing said catch, substantially as set forth.

2. The combination in a controlling mechanism of a set of controlling-levers operating in parallel planes and arranged adjacent to each other, a catch for securing one of said levers in operative position, means for cooperating with each of the other levers of the set for releasing said catch upon operating any of said other levers and springs for returning said several levers to their inoperative positions, substantially as set forth.

3. The combination in a controlling mechanism of a swinging lever, means for returning it to its inoperative position, a catch for securing it in its operative position, a second adjacent controlling-lever and means cooperating with said second adjacent controlling-lever for throwing out or disengaging said catch, substantially as set forth.

4. In a controlling mechanism, the combination of the base or plate, a series of controlling-levers pivotally supported beneath said base or plate and operating through slotted openings therein, means for returning each of said levers to their inoperative positions, a catch 11 for securing one of said levers in operative position, a rock-shaft on which said catch is mounted, angular levers 12 secured to said rock-shaft and means on the several other levers of said set for engaging with, or operating on said levers 12 whereby the catch is released, substantially as set forth.

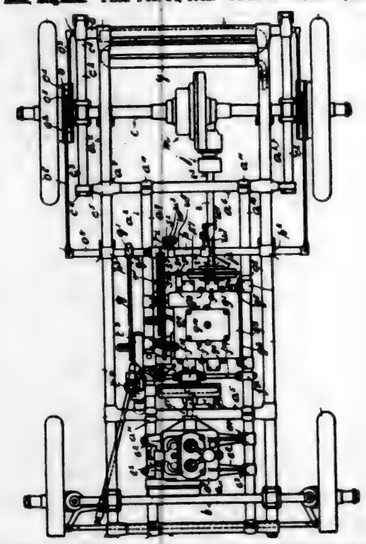
705,808. WINDOW-VENTILATOR. JOHN A. RUSSELL, Rangeley, Me. Filed Mar. 11, 1901. Serial No. 50,550. (No model.)



Claim.—1. In an apparatus of the character specified, having a perforated sash-bar and a shutter hinged to said sash-bar and adapted to cover the perforations in the same, means comprising a bell-crank lever having an arm 6 connected with the shutter by a link and constructed substantially as described to allow the said link to pass the fulcrum of the lever, a fulcrum advanced beyond the surface of the sash-bar, and a U-shaped arm 7 substantially at right angles to the said arm 6 and adapted to bear against the surface of the sash-bar, for operating the shutter and locking the same when closed and when opened to its fullest extent.

2. The combination with a perforated sash-bar, of a shutter hinged to the outer side of the bar and formed to cover the perforated portion thereof, and shutter-operating means comprising a bell-crank lever hinged to the inner side of the sash-bar, and a link connecting one arm of said lever with the shutter.

705,804. MOTOR-VEHICLE. CHARLES T. R. SABISTER, Birmingham, England. Filed Feb. 24, 1902. Serial No. 95,280. (No model.)



Claim.—1. In a motor-car, the combination with the main driving-clutch and the speed-change gear as set forth, of a shaft directed transversely across the framing of the car, a lever for controlling the main driving-clutch, pedal-levers for operating the back-axle and counter-shaft brakes, and a double-armed rocker for transmitting motion to the speed-change gear, said levers and the rocker being all mounted on said shaft, as set forth.

2. In a motor-car, a motor, a crank-shaft therefor, a speed-change-gear mechanism provided with a driving-shaft, a driving-clutch carried by the driving-shaft, and a detachable fork for connecting said clutch to the crank-shaft of the motor, said connection between said clutch and crank-shaft being such as to permit of the removal of the former independently of the latter.

3. In a motor-car, a speed-change-gear mechanism, a driving-shaft therefor, an outer drum mounted on said shaft, a motor provided with a crank-shaft, a fork connection for coupling said outer drum to said crank-shaft, an inner drum adapted to frictionally clutch said outer drum, a longitudinally-extending slidable sleeve connected to said inner drum and mounted upon said driven shaft, a sleeve connected with said inner drum and surrounding said slidable sleeve, a spring interposed between said sleeves, means for causing frictional engagement between said drums, and movement-transmitting devices connected with said speed-change-gear mechanism.

4. In a motor-car, a motor provided with a crank-shaft, a speed-gear driving-shaft, pinions carried thereby, a driven shaft, a slidable sleeve mounted upon said driven shaft, gear-wheels carried by said sleeve and adapted to suitably engage with and be operated by said pinions causing thereby the operation of said driven shaft, means connected with and adapted to shift said sleeve to cause the engagement of the pinions and gear-wheels, a driving-clutch carried by the speed-gear driving-shaft, and a fork connection for connecting said clutch to the crank-shaft of the motor.

5. In a motor-car, the combination with a motor and speed-change-gear mechanism suitably connected therewith and operated thereby, of a balance-gear, a driving counter-shaft, a pinion thereon operated by said mechanism, a driven toothed wheel adapted to mesh with said pinion to drive said balance-gear, and means to permit of adjusting laterally said driven wheel independent of the balance-gear.

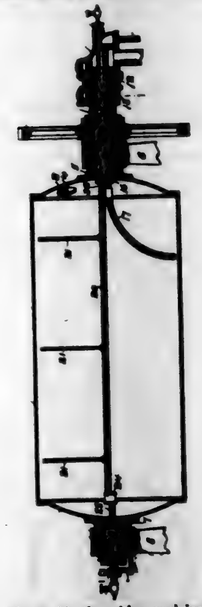
6. In a motor-car, the combination with a motor and a speed-change-gear mechanism connected therewith and operated thereby, of an adjustable pinion connected with said speed-change-gear mechanism and operated thereby, a balance-gear connected with and operated by said pinion, a sectional rear axle operated by said balance-gear, adjustable bearings for said pinion, balance-gear and said rear axle, and means for releasing and relocking the said pinion, balance-gear and axle prior to and after adjustment, substantially as herein described.

7. In a motor-car, the combination of its frame, a motor supported by the frame, a speed-change-gear-reversing mechanism, a clutch connected with said mechanism and said motor for causing the operation of the former, a shaft extending transversely of the said frame, a lever mounted on said shaft for controlling the said clutch, a back axle connected with and operated by said speed-change-gear-reversing mechanism, counter-shaft brakes for said axle, and a pair of pedal-levers mounted on said shaft and adapted to operate the said brakes, substantially as described.

8. In a motor-car, a motor, a speed-change-gear mechanism, a driving-shaft for said mechanism, means for connecting said driving-shaft to said motor for operating said mechanism, an outer drum mounted on said shaft, an inner drum adapted to frictionally clutch said outer drum, a longitudinally-extending slidable sleeve connected to said inner drum and mounted upon said driving-shaft, a sleeve connected with said inner drum and surrounding said slidable sleeve, a spring interposed between the said sleeves, means for causing frictional engagement between the said drum, and movement-transmitting devices connected with said speed-change-gear mechanism.

9. In a motor-car, a motor, a speed-change-gear mechanism, a driving-shaft for said mechanism, means for connecting said driving-shaft to said motor for operating said mechanism, an outer drum mounted on said shaft, an inner drum adapted to frictionally clutch said outer drum, a longitudinally-extending slidable sleeve connected to said inner drum and mounted upon said driving-shaft, a sleeve connected with said inner drum and surrounding said slidable sleeve, a spring interposed between said sleeves, means for causing frictional engagement between the said drum, a counter-shaft suitably connected with said speed-change-gear mechanism, a bevel-pinion carried thereby, a sectional axle, a balance-gear for operating said axle, a bevel-wheel connected with said balance-gear and engaging said pinion to be operated thereby, and adjustable bearings for said pinion, balance-gear and axle.

705,805. AIR-EXHAUST FOR REVOLVING STEAM DRYING OR HEATING CYLINDERS. THOMAS H. SAVERY, Wilmington, Del. Filed Mar. 3, 1900. Serial No. 7,180. (No model.)



Claim.—1. The combination with a revolving steam drying or heating cylinder or drum, of means for admitting steam thereto, an air-outlet pipe extending substantially across the cylinder or drum, and a plurality of pipes connected therewith and extending toward the surface of the cylinder, substantially as described.

2. The combination with a revolving steam drying or heating cylinder or drum, of means for admitting steam thereto, an air-outlet pipe extending substantially across the cylinder or drum, means for supporting

said pipe near the axial center of the cylinder or drum, and a plurality of pipes connected to said outlet-pipe and extending toward the surface of the cylinder or drum, substantially as described.

3. The combination with a revolving steam drying or heating cylinder or drum, of means for admitting steam thereto, means for removing the water of condensation, an air-outlet pipe extending substantially across the cylinder or drum, and a plurality of pipes connected therewith and extending toward the surface of the cylinder or drum, substantially as described.

4. The combination with a revolving steam drying or heating cylinder or drum having a hollow journal, of means for admitting steam to the cylinder or drum, an air-outlet pipe, a pipe passing through the hollow journal to which one end of the outlet-pipe is connected by a sliding joint, and means for supporting the other end of the outlet-pipe, substantially as described.

5. The combination with a revolving steam drying or heating cylinder or drum having a hollow journal, of means for admitting steam to the cylinder or drum, an air-outlet pipe, a plurality of pipes extending from the air-outlet pipe toward the surface of the cylinder, a pipe passing through the hollow journal to which one end of the outlet-pipe is connected by a sliding joint, and means for supporting the other end of the outlet-pipe, substantially as described.

6. The combination with a revolving steam drying or heating cylinder or drum having a hollow journal, of a steam-inlet pipe passing through said journal, an air-outlet pipe extending substantially across the cylinder or drum, a pipe with which one end of the air-outlet pipe is connected by a sliding joint, said pipe passing through the steam-inlet pipe, and means for supporting the other end of the air-outlet pipe, substantially as described.

7. The combination with a revolving steam drying or heating cylinder or drum having a hollow journal, of a steam-inlet pipe passing through said journal, an air-outlet pipe extending substantially across the cylinder or drum, a pipe with which one end of the air-outlet pipe is connected by a sliding joint, said pipe passing through the steam-inlet pipe, means for supporting the other end of the air-outlet pipe, and a plurality of pipes connected to the air-outlet pipe and extending toward the surface of the cylinder, substantially as described.

8. The combination with a revolving steam drying or heating cylinder or drum having a hollow journal, of a steam-inlet pipe passing through said journal, a pipe for removing the water of condensation extending through the steam-pipe, an air-outlet pipe extending substantially across the cylinder, a pipe with which one end of said air-outlet pipe is connected by a sliding joint, said pipe passing through the steam-pipe, means for supporting the other end of the air-outlet pipe, and a plurality of pipes connected to the air-outlet pipe and extending toward the surface of the cylinder, substantially as described.

9. The combination with a revolving steam drying or heating cylinder or drum having a hollow journal, of a steam-inlet pipe passing through said journal, a pipe for removing the water of condensation extending through the steam-pipe, an air-outlet pipe extending substantially across the cylinder, a pipe with which one end of said air-outlet pipe is connected by a sliding joint, said pipe passing through the steam-pipe, means for supporting the other end of the air-outlet pipe, and a plurality of pipes connected to the air-outlet pipe and extending toward the surface of the cylinder, substantially as described.

10. The combination with a revolving steam drying or heating cylinder or drum, of a steam-inlet pipe, an air-outlet pipe extending substantially across the cylinder or drum, and means whereby the air is permitted to escape from the air-outlet pipe at each end of the cylinder, substantially as described.

11. The combination with a revolving steam drying or heating cylinder or drum, of a steam-inlet pipe, an air-outlet pipe extending substantially across the cylinder or drum, and a pipe connected to each end of said air-outlet pipe and extending outside the cylinder or drum, the joint between one of said pipes and the air-outlet pipe being a sliding joint, substantially as described.

12. The combination with a revolving steam drying or heating cylinder or drum, of a steam-inlet pipe, an air-outlet pipe extending substantially across the cylinder or drum, a pipe connected to each end of said air-outlet pipe and extending outside the cylinder or drum, the joint between one of said pipes and the air-outlet pipe being a sliding joint, and a plurality of pipes connected to the air-outlet pipe and extending toward the surface of the cylinder, substantially as described.

13. The combination with a revolving steam drying or heating cylinder or drum, of a steam-inlet pipe, an air-outlet pipe, a pipe to which one end of said air-outlet pipe is connected by a sliding joint, and means for supporting the other end of said outlet-pipe, substantially as described.

14. The combination with a revolving steam drying or heating cylinder or drum provided with journals, of a steam-inlet pipe, an air-outlet pipe, a pipe to which said air-outlet pipe is connected, said pipe passing through one of the journals, suitable packing whereby a tight joint is formed between the pipe and the journal, means for preventing said pipe

from turning with the journal, and a plurality of pipes connected to the air-outlet pipe and extending toward the surface of the cylinder, substantially as described.

15. The combination with a revolving steam drying or heating cylinder or drum provided with journals, of a steam-inlet pipe, an air-outlet pipe, a pipe to which said air-outlet pipe is connected, said pipe passing through one of the journals, suitable packing whereby a tight joint is formed between the pipe and the journal, an arm secured to said pipe, and a projection on the journal-bearing with which the arm engages, substantially as described.

16. The combination with a revolving steam drying or heating cylinder or drum provided with journals, of a steam-inlet pipe, an air-outlet pipe, a pipe to which said air-outlet pipe is connected, said pipe passing through one of the journals, suitable packing whereby a tight joint is formed between the pipe and the journal, an arm secured to said pipe, a projection on the journal-bearing with which the arm engages, and a plurality of pipes connected to the air-outlet pipe and extending toward the surface of the cylinder, substantially as described.

17. The combination with a revolving steam drying or heating cylinder or drum having journals, of a steam-inlet pipe, an air-outlet pipe, a pipe passing loosely through one of the journals, the air-outlet pipe being connected at one end with said pipe by a sliding joint, a pipe passing through the other journal with which the other end of said air-outlet pipe is connected, suitable packing for forming a tight joint between said pipe and the journal, and means for preventing said pipe from turning with the journal, substantially as described.

18. The combination with a revolving steam drying or heating cylinder or drum having journals, of a steam-inlet pipe, an air-outlet pipe, a pipe passing loosely through one of the journals, the air-outlet pipe being connected at one end with said pipe by a sliding joint, a pipe passing through the other journal with which the other end of said air-outlet pipe is connected, suitable packing for forming a tight joint between said pipe and the journal, means for preventing said pipe from turning with the journal and a plurality of pipes connected to the air-outlet pipe and extending toward the surface of the cylinder, substantially as described.

19. The combination with a revolving steam drying or heating cylinder or drum having journals, of a steam-inlet pipe passing through one of the journals, a support to which said pipe is connected, a yielding joint between said support and the journal, an air-outlet pipe extending substantially across the cylinder, a pipe passing through the support and the steam-pipe, said pipe being connected to the air-outlet pipe by a sliding joint, a pipe passing through the other journal, and a suitable connection between said pipe and the air-outlet pipe, substantially as described.

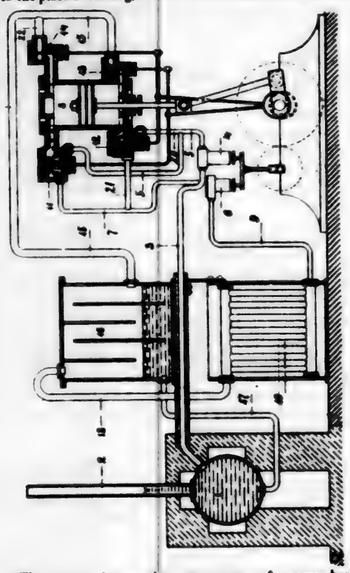
20. The combination with a revolving steam drying or heating cylinder or drum having journals, of a steam-inlet pipe passing through one of the journals, a support to which said pipe is connected, a yielding joint between said support and the journal, an air-outlet pipe extending substantially across the cylinder, a pipe passing through the support and the steam-pipe, said pipe being connected to the air-outlet pipe by a sliding joint, a pipe passing through the other journal, a suitable connection between said pipe and the air-outlet pipe, and a plurality of pipes connected to the air-outlet pipe and extending toward the surface of the cylinder, substantially as described.

21. The combination with a revolving steam drying or heating cylinder or drum having journals, of a steam-inlet pipe passing through one of the journals, a support to which said pipe is connected, a yielding joint between said support and the journal, a pipe for removing water of condensation, said pipe passing through the steam-pipe and being connected to the stationary support, an air-outlet pipe extending substantially across the cylinder, a pipe passing through the stationary support and the steam-pipe, said pipe being connected to the air-outlet pipe by a sliding joint, a pipe passing through the other journal, and a suitable connection between said pipe and the air-outlet pipe, substantially as described.

22. The combination with a revolving steam drying or heating cylinder or drum having journals, of a steam-inlet pipe passing through one of the journals, a support to which said pipe is connected, a yielding joint between said support and the journal, a pipe for removing water of condensation, said pipe passing through the steam-pipe and being connected to the stationary support, an air-outlet pipe extending substantially across the cylinder, a pipe passing through the stationary support and the steam-pipe, said pipe being connected to the air-outlet pipe by a sliding joint, a pipe passing through the other journal, a suitable connection between said pipe and the air-outlet pipe, and a plurality of pipes connected to the air-outlet pipe and extending toward the surface of the cylinder, substantially as described.

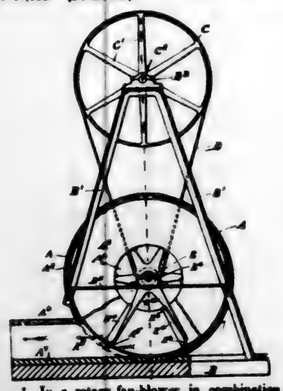
705,806. PROCESS OF VAPOR GENERATION. ADOLF SCHARPFF, Tientsin, China. Filed Aug. 21, 1900. Serial No. 27,560. (No specimens.)

Claim.—1. The process of generating steam or gases for power hereinbefore set forth, and consisting in mixing a medium having a high boiling-point and which is heated to a temperature below that point with a small quantity of another medium which has a boiling-point below the temperature of the first-named medium just prior to the introduction of said media into the motor, thereby vaporizing the said last-named medium, then drawing the media into a motor and operating said motor by the pressure of the vaporized medium, and then returning the first-named media to the place of heating, and so on in continuous succession.



2. The process of generating steam or gases for power hereinbefore set forth, and consisting in mixing a medium having a high boiling-point and which is heated to a temperature below said boiling-point with a small quantity of a medium which has a boiling-point below the temperature of the first-named medium just prior to the introduction of said media into the motor, thereby vaporizing the said last-named medium, then drawing said last-named medium into a motor and there operating said motor by the pressure of the vaporized medium, then removing the last-named medium from the said motor, and so on in continuous succession.

705,807. ROTARY FAN-BLOWER. FRANCKLYNE B. SCHERMERHORN and GEORGE R. MOSPETT, Jarilla, N. Mex. Filed July 5, 1901. Serial No. 67,118. (No model.)



Claim.—1. In a rotary fan-blower, in combination with a closed cylindrical chamber, having central openings in the sides thereof, and a peripheral discharge-opening, a shaft extending through said central openings, supported in journals, and provided with radial arms within said cylindrical chamber, and means for rotating said shaft and arms, a series of fan-blades secured to said arms at a suitable distance from said shaft, the sides and outer margins of said fan-blades in close contiguity to the inside of said chamber, said fan-blades having their ends turned up at an angle to the plane of their surfaces, and in the direction of rotation of the same, substantially as and for the purposes described.

2. In a rotary fan-blower having a cylindrical chamber, closed around the same and at the sides thereof, except at the center of said sides, and at some point of the cylindrical periphery, a shaft and radial arms adapted to rotate together, said shaft journaled to extend through said openings in said sides, and said arms radially extended therefrom within said chamber, in combination therewith a series of transversely-flat fan-blades secured to said radial arms, each of which has its peripheral margin turned forward in the direction of its rotation, at a bevel or obtuse angle from the plane surface of the body of said blades, substantially as and for the purpose described.

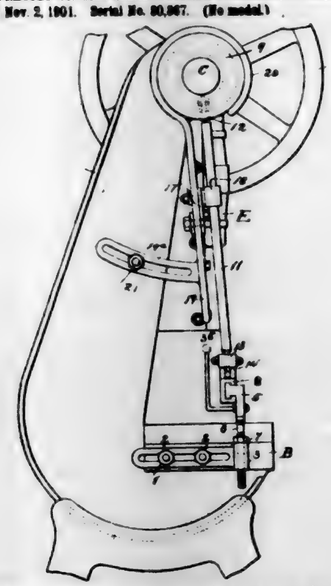
3. In a rotary fan-blower of the construction substantially as described, in combination with a cylindrical chamber having central openings in the flat sides thereof, and an exit from the curved periphery of said cylinder, a journaled shaft extended through said central openings, and means for rotating the same, and radial arms secured to said shaft and rotating therewith, together with a series of transversely-flat fan-blades secured to said arms, at a distance from said shaft corresponding to said central openings, and having their inner margins, parallel with said shaft, bent upward in a bevel, or at an obtuse angle in the direction of rotation of the same, substantially as described.

4. In a rotary blower a cylindrical chamber, central holes in the sides thereof, a peripheral exit-opening from said cylinder, a journaled shaft and radial arms within said chamber, means for rotating the same, and transversely-flat fan-blades secured to said arms having their ends, and transverse margins parallel with said shaft, turned up in the direction of rotation of said fan-blades, substantially as described.

5. In combination with the cylindrical chamber, substantially as described, shaft and radial arms within the same, and means for operating the same, a series of substantially flat fan-blades secured to said arms, and having their margins turned up in the direction of rotation thereof, substantially as described.

6. In combination with cylindrical chamber A, having central openings A' A', shaft E, radial arms, F^2 F^2 F^2 F^2, the transversely-flat fan-blades, F^2 F^2, having their margins turned up forward at an angle to the surfaces thereof, substantially as and for the purpose described.

705,808. AUTOMATIC FEEDING MECHANISM FOR STAMPING-PRESSES OR THE LIKE. GODFREY P. SCHRIEVE, Brooklyn, N. Y. Filed Nov. 2, 1901. Serial No. 80,867. (No model.)



Claim.—1. In a feeder for sheet material to a press, the combination with a reciprocating gripper device for seizing and drawing in the sheet, and means for opening and closing said gripper, of a cam on an arbor of the press, an operating-lever actuated by said cam and coupled to the gripper-carriage, and means for adjusting the fulcrum of said lever for varying the extent of movements of the gripper-carriage with a constant-operating cam.

2. In a feeder for sheet material to a press, the combination with a reciprocating gripper device for seizing and drawing in the sheet, and means for opening and closing said gripper, of a grooved operating-cam on an arbor of the press, a lever having a bearing at one end in the groove of said cam, and a universal-joint connection with an arm on the gripper-carriage, the said arm, a slotted fulcrum-plate adjustable radially about the operating-cam, a fulcrum-block mounted adjustably in the said slotted plate, and an eye on said block which forms a bearing for the operating-lever.

3. In a device for the purpose set forth the combination with a gripper, its carriage, the trackway for said carriage, and the hollow, slotted operating-cam on the arbor of the press, of the operating-lever 11, the adjustable fulcrum-block therefor, the eye on said block through which the lever plays, the slotted sleeve 38 on the arbor within the cam, the pin 40 in the lever, engaging the curved slot in the cam.

4. In a device for the purpose set forth, the combination with the adjustably-mounted guide-bar, the gripper-carriage slidably mounted thereon, and means for imparting a reciprocating movement to said carriage, of the fixed gripper-jaw on said carriage, the movable gripper-jaw on said carriage, the spring-latch 31, adapted to engage the movable gripper-jaw and hold it closed, the closing-lever 25, the draw-bar coupling this lever to the movable jaw, an adjustable stud for actuating said closing-lever, an adjustable detent for actuating the spring-latch to unlock it, and the gripper-opening spring.

5. In a feeding device for the purpose set forth, the combination with a reciprocating gripper device for drawing in the sheet, and automatic means for operating said gripper device to open and close its jaws, of a guide for the sheet to be fed, and an automatic limiting-stop device for the sheet whereby the latter can only be fed in by hand to a certain point.

6. In a feeding device for the purpose set forth, the combination with a reciprocating gripper device for drawing in the sheet, and automatic means for operating said gripper device to open and close its jaws, of a guide for the sheet to be fed, and an automatic limiting-stop device for the sheet, said device comprising a rock-shaft 44 over said guide, the stop-arm 45 on said shaft and having a nose 46 to engage a recess in the bottom plate of the guide, and the releasing-arm 47 on said shaft, the end of which arm is in the path of a part of the gripper, whereby the shaft is rocked by the gripper when the latter moves out to grip the sheet.

7. In a device for the purpose specified, the combination with the bearers 1, having each a socket 3, of the supporting guide-bar 5, provided with screw-threaded pins 6, to engage the sockets 3, and nuts 7 to rest on the said sockets for vertical adjustment of the bar 5.

8. In a device for the purpose specified, the combination with a movable gripper device for feeding the sheet, and the rotating cam 9, of the slotted fulcrum-plate 19, having a bearing 20 on the said cam and a slotted arm 19^a, the fulcrum-block 17, mounted in the slot in the plate 19 and provided with an eye 18, and the operating-lever 11, connected below to the gripper device and engaging the cam 9 at its upper end.

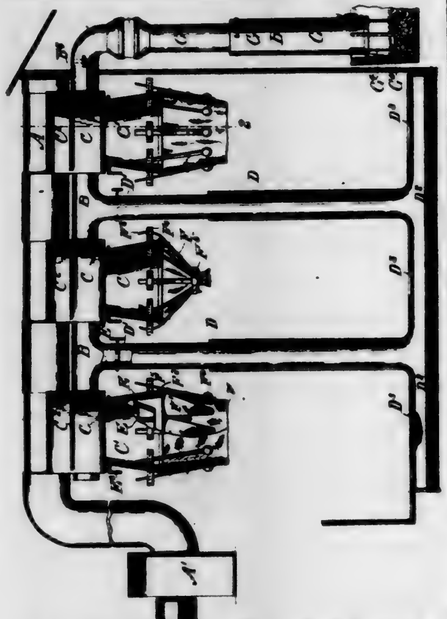
705,809. NON-REFILLABLE BOTTLE. CHARLES P. STARLIN and DANIEL J. MINTON, Columbus, Ohio. Filed Oct. 10, 1901. Serial No. 78,164. (No model.)

Claim.—In a non-refillable bottle, the combination with a bottle-neck having external threads and recesses formed vertically therethrough and having an internal recess 2, of a threaded cap adapted to be screwed onto the threaded portion of the bottle-neck and to close the mouth of the latter and a central tubular cap projection having a lower end flange, said tubular projection being provided with an outlet-opening and adapted to be contracted to permit its insertion within the bottle-neck, substantially as specified.

705,810. PNEUMATIC CONVEYER. JOHN W. SCHIFFER, Waco, Tex., assignor of one-half to Louise Eitel, Waco, Tex. Filed July 6, 1901. Serial No. 67,290. (No model.)

Claim.—1. A pneumatic conveyer comprising an air-pipe, an independent send-pipe beneath said air-pipe and communicating therewith by a discharge-opening in its under face, a delivery-chamber disposed upon

said seed-pipe, a section or casing within said chamber beneath said discharge-opening open at each end and spaced from said chamber, and a transfer-pipe communicating with the lower portion of a compartment and with said seed-pipe; substantially as specified.



2. A pneumatic conveyer comprising an air-pipe, an independent seed-pipe beneath said air-pipe and communicating therewith by a discharge-opening in its under face, a delivery-chamber disposed upon said seed-pipe, a section or casing within said chamber beneath said discharge-opening open at each end and spaced from said chamber, a transfer-pipe communicating with the lower portion of a compartment and with said seed-pipe, a cut-off valve at the upper portion of said transfer-pipe, and a valved inlet between said compartment and transfer-pipe; substantially as specified.

3. A pneumatic conveyer comprising an air-pipe, an independent seed-pipe beneath said air-pipe and communicating therewith by a discharge-opening in its under face, a delivery-chamber disposed upon said seed-pipe, a section or casing within said chamber beneath said discharge-opening open at each end and spaced from said chamber, a transfer-pipe communicating with the lower portion of a compartment, and with said seed-pipe, a cut-off valve at the upper portion of said transfer-pipe, a valved inlet between said compartment and transfer-pipe, a valved telescoping connection communicating with said seed-pipe, and a cut-off between said seed and air pipes; substantially as specified.

4. In a pneumatic conveyer, the combination with a compartment, of an air-pipe at the upper portion thereof, an independent seed-pipe beneath said air-pipe and communicating with said air-pipe by a discharge-opening in its under face, a delivery-chamber at the upper portion of said compartment communicating with said seed-pipe, a section or casing within said chamber beneath said discharge-opening open at each end and spaced from the chamber, a transferring-pipe extending beneath said compartment and having a valved opening communicating therewith, and a valved transfer-pipe connecting said seed-pipe with the pipe beneath said compartment; substantially as specified.

5. In a pneumatic conveyer, a delivery-receptacle, an air-pipe communicating therewith, a seed-pipe communicating with said receptacle by a discharge opening downward away from said air-pipe, and a section within said receptacle beneath the opening in said seed-pipe open at its upper and lower ends and spaced therefrom to permit the escape of air to said air-pipe; substantially as specified.

6. In a pneumatic conveyer, a delivery-receptacle, an air-pipe communicatingtherewith, a seed-pipe communicating with said receptacle by a discharge opening downward away from said air-pipe, a tapering section within said receptacle beneath the opening in said seed-pipe open at its upper and lower ends and spaced therefrom to permit the escape of air to said air-pipe, and a vertical partition in said section; substantially as specified.

7. In a pneumatic conveyer, a delivery-receptacle, an air-pipe communicating therewith, a seed-pipe communicating with said receptacle by a discharge opening downward away from said air-pipe, a tapering section within said receptacle beneath the opening in said seed-pipe open at its upper and lower ends and spaced therefrom to permit the escape of air to said air-pipe, a vertical partition in said section, a cut-off valve between said seed-pipe and section; substantially as specified.

8. In a pneumatic conveyer, a delivery-receptacle, an air-pipe communicating therewith, a seed-pipe communicating with said receptacle by a discharge opening downward away from said air-pipe, a tapering section within said receptacle beneath the opening in said seed-pipe open at its upper and lower ends and spaced therefrom to permit the escape of air to said air-pipe, a vertical partition in said section, a cut-off valve between said seed-pipe and section, and a cut-off valve between said seed and air pipes; substantially as specified.

9. In a pneumatic conveyer, a delivery-receptacle, an air-pipe communicating therewith, an independent seed-pipe communicating with said receptacle by a discharge opening downward away from said air-pipe, a tapering section within said receptacle beneath the opening in said seed-pipe open at its upper and lower ends and spaced therefrom to permit the escape of air to said air-pipe, a vertical partition in said section, a cut-off valve between said seed-pipe and section, a cut-off valve between said seed and air pipes, a flexible valve supported at the lower end of said delivery-receptacle; substantially as specified.

10. In a pneumatic conveyer, a delivery-receptacle, an air-pipe communicating therewith, a seed-pipe communicating with said receptacle and said air-pipe, a tapering section beneath said seed-pipe open at its upper and lower ends to permit the escape of air to said air-pipe, a vertical partition in said section, a cut-off valve between said seed-pipe and section, a cut-off valve between said seed and air pipes, a flexible valve supported at the lower end of said delivery-receptacle, and a series of tapering metallic sections secured to the inner face of said flexible valve; substantially as specified.

11. In a pneumatic conveyer, a delivery-receptacle, an air-pipe communicating therewith, a seed-pipe communicating with said receptacle and said air-pipe, a tapering section beneath said seed-pipe open at its upper and lower ends to permit the escape of air to said air-pipe, a vertical partition in said section, a cut-off valve between said seed-pipe and section, a cut-off valve between said seed and air pipes, a flexible valve supported at the lower end of said delivery-receptacle, a series of tapering metallic sections secured to the inner face of said flexible valve, an opening device for said flexible valve placed under tension in the closing of the valve; substantially as specified.

12. In a pneumatic conveyer, a delivery-receptacle, an air-pipe communicating therewith, a seed-pipe communicating with said receptacle and said air-pipe, a tapering section beneath said seed-pipe open at its upper and lower ends to permit the escape of air to said air-pipe, a vertical partition in said section, a cut-off valve between said seed-pipe and section, a cut-off valve between said seed and air pipes, a flexible valve supported at the lower end of said delivery-receptacle, a series of tapering metallic sections secured to the inner face of said flexible valve, a spring-arm extending upwardly from said flexible valve, and means supported by said receptacle for adjustably holding the upper end of said arm; substantially as specified.

13. In a pneumatic conveyer, a delivery-receptacle having an air-pipe communicating with the upper portion thereof, a seed-pipe beneath said air-pipe, and a series of tapering sections located beneath said seed-pipe and each other; substantially as specified.

14. In a pneumatic conveyer, a delivery-receptacle having an air-pipe communicating with the upper portion thereof, a seed-pipe beneath said air-pipe, a series of tapering sections located beneath said seed-pipe and each other, and a series of vertical partitions extending vertically through said tapering sections; substantially as specified.

15. In a pneumatic conveyer, a delivery-receptacle having an air-pipe communicating with the upper portion thereof, a seed-pipe beneath said air-pipe, a series of tapering sections located beneath said seed-pipe and each other, a series of vertical partitions extending vertically through said tapering sections, and a sectional valve located between said partitions and the delivery-opening from the seed-pipe; substantially as specified.

16. In a pneumatic conveyer, a delivery-receptacle having an air-pipe communicating with the upper portion thereof, a seed-pipe beneath said air-pipe, a series of tapering sections located beneath said seed-pipe and each other, a series of vertical partitions extending vertically through said tapering sections, a sectional valve located between said partitions and the delivery-opening from the seed-pipe, a slide-valve between said air and seed pipes, and a series of separate lugs for supporting and guiding said slide-valve; substantially as specified.

17. In a pneumatic conveyer, a delivery-receptacle, an air-pipe communicating therewith, a seed-pipe within said receptacle and communicating with said air-pipe, and a series of overlapping sections located beneath the discharge from said seed-pipe and spaced therefrom and from each other to provide openings at their upper and lower ends for the escape of air; substantially as specified.

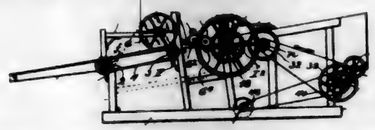
18. In a pneumatic conveyer, a delivery-receptacle, an air-pipe communicating therewith, a flexible valve supported at the lower end of said receptacle, and a series of metallic plates secured to the inner face of said valve to form a substantially continuous metallic surface when the valve is closed; substantially as specified.

19. In a pneumatic conveyer, a delivery-receptacle, an air-pipe communicating therewith, a flexible valve supported at the lower end of said receptacle, a series of tapering metallic plates secured to the inner face of said valve to form a substantially continuous metallic surface when the valve is closed, and spring-plates extending from said valve to said receptacle and placed under tension in the closing of the valve; substantially as specified.

705,311. CORN-HUSKING AND FODDER-SHREDDING MACHINE.

JOHN I. ALEXANDER and WILLIAM R. ALEXANDER, Hasselrigg, Ind., assignors of one-half to Edward T. Kenney, Indianapolis, Ind.

Filed May 22, 1901. Serial No. 61,329. (No model.)



Claim.—1. Two pairs of snapping-rolls, one pair mounted in a plane below that of the other pair, each pair comprising two rolls rotating in opposite directions, one roll of the upper pair, and one roll of the lower pair being mounted in movable bearings, and the other rolls in fixed or rigid bearings, and feeding devices having the range of the two pairs of snapping-rolls.

2. Two pairs of snapping-rolls, one pair mounted in a plane below that of the other pair, each pair comprising two rolls rotating in opposite directions, the upper one of the upper pair, and the lower one of the lower pair being mounted in movable bearings, and the other rolls in fixed or rigid bearings, and feeding devices having the range of the lower portion of one of the snapping-rolls in the fixed bearings and also having the range of the upper portion of the other one of the snapping-rolls in the fixed bearings.

3. Two pairs of snapping-rolls, one pair mounted in a plane below that of the other pair, each pair comprising two rolls rotating in opposite directions, one roll of the upper pair, and one roll of the lower pair being mounted in movable bearings, and the other rolls in fixed or rigid bearings, feeding devices having the range of the two pairs of snapping-rolls, and pulling-rolls in range of the two pairs of snapping-rolls.

4. A plurality of pairs of snapping-rolls mounted in different vertically-disposed planes, a pair of rolls in each plane in the rear of another plane, each pair comprising two rolls rotative in opposite directions, one roll of each pair being mounted in movable bearings, and feeding devices having the range of the plurality of pairs of snapping-rolls collectively.

5. Two pairs of snapping-rolls, one pair mounted in a plane below that of the other pair, each pair comprising two rolls rotative in opposite directions, one roll of the upper pair and one roll of the lower pair being mounted in movable bearings, a flexible feeding-apron mounted adjustably to the planes of the two pairs of snapping-rolls, and a feed-roller mounted above the feeding-apron whereby the apron and portions of the stalks thereon may be flexed and the stalks spread toward the two pairs of snapping-rolls.

6. Feeding apparatus comprising a flexible feeding-apron mounted adjustably in a longitudinal direction or forward and backward, a feed-roller mounted above and normally upon the flexible apron whereby the apron and stalks thereon may be flexed and the stalks thereby forced in their passage, and snapping-rolls mounted near the feed-roller and the delivery portion of the flexible feeding-apron.

7. Two pairs of snapping-rolls, one pair mounted in a plane below that of the other pair, each pair comprising two rolls rotating in opposite directions, one roll of the upper pair and one roll of the lower pair being mounted in movable bearings, and the other rolls in fixed or rigid bearings, a feeding apparatus comprising a pivoted frame having its range adjustable as between the two pairs of snapping-rolls, rollers mounted in the frame, a feed-apron mounted upon the rollers, and a feed-roller mounted above the feed-apron.

8. Feeding apparatus comprising a pivoted frame supported movably in a longitudinal direction, rollers mounted in the frame, a feed-apron mounted on the rollers, a feed-roller mounted above the feed-apron, and snapping-rolls mounted near the feed-roller and the rear end of the pivoted frame.

9. The combination of a feeding-apron, a frame supporting the apron and pivotally mounted in movable bearings whereby the frame may be moved longitudinally and also be elevated and depressed at its rear end, a movable feeding member mounted above the feed-apron, snapping-rolls mounted at the rear end of said frame, and shredders, with a combined carrier and separater whereby the fodder from the shredders and the loose grains from the corncobs may be cleaned and separated.

10. In a fodder-shredding machine, a carrier comprising an upper floor, grate-bars extending from the upper floor, a screen situated below the grate-bars, a lower floor extending from the screen, carrier-belts, driving and carrying rollers for the belts, and flights attached to the belts and sliding upon the upper floor and thence upon the grate-bars and also upon the screen and thence upon the lower floor, in combination with shredders mounted above the carrier, snapping-rolls, and feeding apparatus mounted near the snapping-rolls.

11. In a fodder-shredding machine, a carrier comprising an upper floor, grate-bars extending from the upper floor, a screen situated below the grate-bars, a lower floor extending from the screen, carrier-belts, driving and carrying rollers for the belts, flights attached to the belts and sliding upon the upper floor and thence upon the grate-bars and also upon the screen and thence upon the lower floor, an inclined floor situated below the screen, and a fan-blower projecting its blast above the inclined floor and against the under side of the screen, in combination with shredders mounted above the carrier, snapping-rolls, and feeding apparatus mounted near the snapping-rolls.

12. In a fodder-shredding machine, a pulling-roll mounted in stationary bearings, a companion pulling-roll mounted in movable bearings, a movable feeding apparatus, a lower snapping roll mounted substantially in range of the feeding apparatus between the same and the pulling-rolls and having its axis below a median line drawn between the pulling-rolls to the operative plane of the feeding apparatus, a lower companion snapping-roll mounted below the lower snapping-roll, an upper snapping-roll mounted substantially in range of the feeding apparatus and having its axis above each median line, and an upper companion snapping-roll mounted above the upper snapping-roll, in combination with shredders mounted at the sides of the pulling-rolls opposite the snapping-rolls.

13. In a fodder-shredding machine, the combination of a positive-feed pulling-roll mounted in stationary bearings, a companion pulling-roll mounted in movable bearings, a toothed driving-wheel attached to the shaft of the positive-feed pulling-roll, a lower positive-feed snapping-roll mounted in fixed bearings, a lower companion snapping-roll mounted in movable bearings, a toothed wheel attached to the lower positive-feed snapping-roll and driven by the said driving-wheel, a sprocket-wheel attached to the shaft of the positive-feed pulling-roll, a sprocket-wheel attached to the lower companion snapping-roll, a sprocket-chain connecting the said two sprocket-wheels, means whereby the two pulling-rolls may be driven in unison, an upper positive-feed snapping-roll mounted in fixed bearings in a plane above that of the lower positive-feed snapping-roll, an upper companion snapping-roll mounted in movable bearings, a toothed wheel attached to the upper positive-feed snapping-roll and meshing with the toothed wheel attached to the lower positive-feed snapping-roll, a sprocket-wheel attached to the shaft of the companion pulling-roll, a sprocket-wheel attached to the upper companion snapping-roll, and a sprocket-chain connecting said two last-described sprocket-wheels, with shredders mounted adjacently to the said pulling-rolls, and feeding apparatus mounted adjacently to said snapping-rolls opposite to said pulling-rolls.

14. In a fodder-shredding machine, the combination of a pulling-roll mounted in stationary bearings, a pulling-roll mounted in movable bearings, a rotative shaft mounted in fixed bearings, a toothed wheel secured to the rotating shaft, a toothed wheel connected operatively with the pulling-roll that is mounted in the fixed bearings and driving said wheel on said shaft, a shaft having the universal joints and connected with said rotative shaft and also with the pulling-roll that is mounted in the movable bearings, feeding apparatus, shredders mounted adjacent to the pulling-rolls, and snapping-rolls mounted adjacent to the pulling-rolls between the same and the feeding apparatus, with a main frame supporting the feeding apparatus, supplemental supports for the snapping-rolls and the pulling-rolls, and a housing for the shaft having the universal joints.

15. The combination of the main frame, the frame-bars secured to the main frame, an upper snapping-roll journaled at the tops of said bars in fixed bearings, a lower snapping-roll journaled at the lower sides of said bars in fixed bearings, a plurality of snapping-rolls journaled in movable bearings, one above the upper snapping-roll and counting therewith, and one below the lower snapping-roll and counting therewith, with feeding apparatus having the range of said counting rolls.

16. The combination, with a main frame, and snapping-rolls suitably mounted in the main frame, of a feed-apron frame mounted in the

main frame and movable longitudinally toward and from the snapping-rolls, rollers mounted in the feed-apron frame, a feed-apron mounted on the rollers, a feed-roll frame, and a feed-roll mounted in the feed-roll frame and normally riding upon the feed-apron between two of the rollers.

17. The combination, with the feeding apparatus, and the snapping-rolls comprising two pairs of rolls, one pair mounted in a plane below that of the other pair, of fluted pulling-rolls mounted at the rear of the two pairs of snapping-rolls or side opposite to the feeding apparatus, whereby the stalks may be gathered from the two planes of the snapping-rolls into one plane, with the shredders mounted at the rear of the pulling-rolls or side opposite to the snapping-rolls.

18. The combination of the fluted pulling-roll having the extended shaft, the toothed gear-wheel secured to the end of said shaft, the fluted pulling-roll having the flexible shaft, the toothed wheel secured to said flexible shaft and meshing with said toothed wheel on said extended shaft, the snapping-rolls mounted at the front of said pulling-rolls, and the shredders mounted at the rear of said pulling-rolls, with feeding apparatus having the range of the snapping-rolls and also of the said pulling-rolls, and means whereby the rolls may be driven.

19. The combination of the feed-apron frame pivoted between the ends thereof, the driving-shaft coinciding with the pivot for said frame, the feed-apron mounted on said frame, the feed-roll frame pivoted substantially on said driving-shaft, the feed-roll mounted in said feed-roll frame and connected with said driving-shaft, and locking devices for said apron-frame, with snapping-rolls, and means whereby said feed-apron and said shaft may be driven.

20. A combined carrier and separator comprising an upper floor, grate-bars extending from the upper floor, a screen situated below the grate-bars, a lower floor extending from the screen, carrier-belts, driving and carrying rollers for the belts, flights attached to the belts and moving in operation upon the upper floor and thence upon the grate-bars and returning upon the screen and thence upon the lower floor, an inclined floor situated below the screen, and a fan-blower having its blast-orifice directed between the inclined floor and the screen.

21. The combination of two pairs of snapping-rolls, one pair mounted in a plane below that of the other pair, each pair comprising two rolls rotating in opposite directions, one roll of each pair being mounted in movable bearings, feeding devices having the range of the two pairs of snapping-rolls, pulling-rolls in range of the two pairs of snapping-rolls, shredders mounted in range of the pulling-rolls, a combined carrier and separator beneath the shredders and comprising an upper floor, grate-bars extending from the upper floor, a screen situated below the grate-bars, a lower floor extending from the screen, carrier-belts, driving and carrying rollers for the belts, flights attached to the belts and moving in operation upon the upper floor and thence upon the grate-bars and returning upon the screen and thence upon the lower floor, an inclined floor situated below the screen, and a fan-blower having its blast-orifice directed between the inclined floor and the screen, with means whereby the husks and the accidentally-loosened grains of corn separated from the ears may be delivered together upon the upper floor of the combined carrier and separator, whereby the fodder and the husks and the loose grains may be cleaned and separated at one operation, the shredded stalks and the husks being discharged together at the ends of the grate-bars, and the loose grains discharged from the inclined floor.

705,812. FURNACE OR FORGE. JOHN ARMSTRONG, London, England. Filed May 28, 1901. Serial No. 62,271. (No model.)

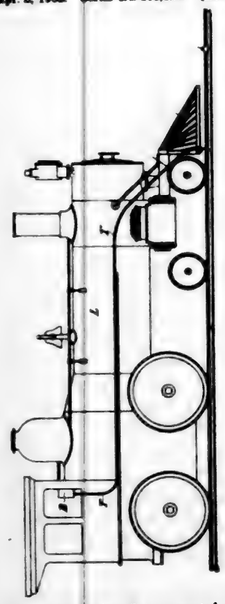
Claim.—1. The apparatus for heating metallic objects, consisting of a deep fire-box having a grate; a closed chamber below the grate; a device for passing a blast of air into said chamber below said grate; working or heating hearths very considerably above the grate having openings therein just big enough to comfortably admit the articles to be heated; and means for supplying fuel to the fuel-chamber without admitting air to the working chamber, whereby a deep layer of fuel can be used and there is always a pressure above that of the atmosphere in the furnace and thus the products of combustion pass out through the working holes when they are opened, instead of allowing air to enter thereat.

2. The combination of a deep combustion-chamber for fuel, a grate below same, means below the grate for supplying a strong draft through the grate, but at no other point, exit-passages from the combustion-chamber from the upper portion thereof into which articles to be heated can be inserted, means for dampening or plugging these passages, and means for supplying fuel to the fuel-chamber without admitting air to the working chamber, substantially as described, whereby a current of reducing-gas containing no free oxygen passes around the article to be heated.

3. The combination in a reheating-furnace, of a grate, a closed chamber below the grate, a device for supplying air under pressure into this closed chamber, with no escape therefrom but up through the fuel; a working chamber in the upper part; openings for admitting articles to be reheated and for drawing off the fumes at such openings; and means for supplying fuel to the fuel-chamber without admitting air to the working chamber and for maintaining a great depth of fuel above the grate, substantially as described, whereby a current of reducing-gas containing no free oxygen passes around the articles to be heated.

4. The combination with a portable reheating-furnace of downwardly-projecting flanges all around the furnace, and a tray with deep sides below and surrounding said flanges, the said flanges having parts cut away near the bottom for water to pass, and a blast-tube passing through said tray, whereby a water seal can be produced, and a blast admitted between the water and the grate, and thus the grate is kept cool and the complete furnace can be lifted out of the water seal when ashes are to be cleaned out.

705,818. RAILWAY-SIGNAL. WILLIAM S. BENNETT, New York, N. Y. Filed Apr. 2, 1902. Serial No. 101,124. (No model.)



Claim.—1. A signal-actuating clip constructed of thin sheet metal and a mass of soft metal inclosed thereby, said clip having extensions or arms for securing it to a railway-rail, substantially as described.

2. A signal-actuating clip constructed of thin sheet metal and a mass of soft metal inclosed thereby; said clip having extensions or arms for securing it to a railway-rail and inclined surfaces at its opposite sides, substantially as described.

3. A signal located in the cab of a locomotive; in combination with a flexible connection extending to the pilot of the locomotive and operatively connected with a releasing device carried by said pilot; together with a signal-actuating clip constructed of thin sheet metal, inclosing a mass of soft metal and provided with extensions or arms which secure it to the track in the path of the releasing device, all of said parts acting substantially as and for the purpose described.

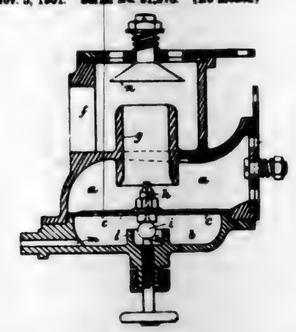
4. A signal located on a locomotive or car; a flexible connection between the signal, and a pivoted releasing device located beneath the locomotive or car; a protecting-tube which surrounds the flexible connection; in combination with a stationary releasing device located in or near the road-bed and in the path of the pivoted releasing device.

5. A signal located in the cab of a locomotive; a flexible connection, as a chain or cord extending from the signal to a point beneath the locomotive; a tube which surrounds and protects the flexible connection; a pivoted releasing device attached to the flexible connection, said pivoted releasing device being adjustable with relation to the signal so as to vary the tension of the flexible connection; in combination with a clip adapted to be attached to one of the rails, said clip being located in the path of the releasing device, substantially as described.

6. A signal located in the cab of a locomotive; a flexible connection extending from the signal to a point beneath the locomotive; a tube which surrounds and protects said flexible connection; a pivoted releasing device provided with adjustable means operatively attached to said flexible connection; in combination with a signal-actuating clip secured to the track and located in the path of the releasing device, substantially as described.

7. A signal located in the cab of a locomotive; a flexible connection extending from the signal to a point beneath the locomotive; a tube which surrounds said flexible connection; a pivoted operating device operatively connected to said flexible connection and means carried by the pivoted operating device for normally closing the end of the tube, substantially as described.

705,814. CARBURETER. FRANCIS C. BLAKE, London, England. Filed Nov. 5, 1901. Serial No. 81,270. (No model.)



Claim.—1. A double-acting feed device for use in petrol-engines comprising a flexible diaphragm forming the bottom of the suction-chamber and having a spout, petrol being intermittently fed into the suction-chamber first during the lift of the diaphragm and by reason of the suction action of the piston, and secondly by the return of the diaphragm to its original position as the suction action ceases.

2. A petrol-feed device, consisting of a flexible diaphragm forming the base of a suction-chamber and the cover for a petrol-chamber, said diaphragm having a spout delivering from the petrol-chamber into the suction-chamber, a valve located within said petrol-chamber and arranged to close said spout from underneath, said valve being mounted upon a screwed rod and adjustable from the exterior of the device, and said petrol-chamber being supplied from the petrol-tank.

3. In a petrol-feed device having a flexible diaphragm fitted with a jet, a hollow conical plug balanced loosely upon a rod adjustable from the exterior of the apparatus and arranged to close the jet.

4. A petrol-feed device, comprising a flexible diaphragm forming a cover for a petrol-chamber and fitted with a spout, a plug or valve arranged to be guided by entering the said spout from underneath and to close an adjustable hollowed rod communicating with the petrol-inlet, said plug allowing at all times access from the petrol-chamber to the jet and being mounted upon a spring within the petrol-chamber, and arranged to follow the rise and fall of the jet.

705,815. SAFETY ATTACHMENT FOR GAS-BURNERS. STEPHEN H. BLODGETT, Lincoln, Mass. Filed June 24, 1901. Serial No. 65,756. (No model.)

Claim.—1. The combination with a gas-burner provided with a valve controlling the flow of gas, of an arm loosely mounted on said valve, means to turn said valve in one direction and move said arm, a thermostat, a lever operated by said thermostat and provided with holding-fingers, one of which acts to hold said arm from closing the valve while the gas is being lighted and the other of which engages said arm after it is released from the first-mentioned finger and holds the said arm from closing the valve while the gas remains lighted, means to release said arm from said second finger when the gas-flame is extinguished, and means to return said arm to its normal position, substantially as described.

2. The combination with a gas-burner provided with a valve controlling the flow of the gas, of an arm loosely mounted on said valve, means to turn said valve in one direction and move said arm, a thermostat, a lever operated by said thermostat and moved into engaging position with said arm to hold the latter from returning to its normal position until released, means to disengage said lever from said arm when the gas-flame is extinguished, and means to return said arm to its normal position, substantially as described.

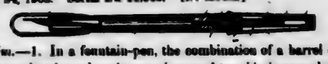
3. The combination with a gas-burner provided with a valve controlling the flow of gas from said burner, of means for automatically closing said valve, comprising a thermostat, a valve-actuating device operatively connected with said valve to move therewith in one direction when the valve is opened and to permit said valve to be moved in the opposite direction without corresponding movement of said actuating device, and means coöperating with said thermostat and with said valve-actuating device to hold said device while the gas is being lighted and to release said device and again engage it when the gas is lighted, substantially as described.

4. The combination with a gas-burner provided with a valve controlling the flow of the gas, a sleeve loosely mounted on said valve and provided with an arm, a thermostat, a lever actuated in one direction by said thermostat to place said lever into engaging position with said arms to hold the latter from moving in a reverse direction with said valve, and means independent of the thermostat for disengaging said lever from said arm, substantially as described.

5. The combination with a gas-burner provided with a valve for controlling the flow of gas, of an arm loose on said valve, means to turn said valve in one direction and move said arm, a thermostat, a substantially vertical lever pivoted at its upper end and acted upon by said thermostat to move the lower end of said lever into engaging position with the said arm, substantially as described.

6. A gas-burner having in combination a valve, a pin *l* on said valve, an arm *k* coöperating with said pin, a spring *m* to move said arm in a direction to close said valve, a lever 10 coöperating with said arm to hold it against the action of said spring, and a thermostat controlling the movements of said lever and effecting the disengagement of the said lever from said arm, substantially as described.

705,816. FOUNTAIN-PEN. JOHN BOVILL, Chicago, Ill. Filed Mar. 24, 1902. Serial No. 99,569. (No model.)



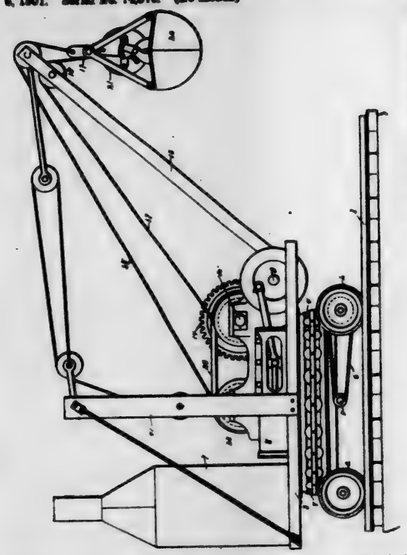
Claim.—1. In a fountain-pen, the combination of a barrel or fountain, a piston therein and a piston-rod secured to said piston and comprising two sections permanently connected together and relatively extensible, substantially as set forth.

2. In a fountain-pen, the combination of a barrel or fountain, a piston therein, and a piston-rod secured to said piston and comprising two sections having means at their meeting ends for holding them from being entirely separated, said sections being relatively extensible, substantially as set forth.

3. In a fountain-pen the combination of a barrel or fountain, a piston therein, a bushing secured in one end of said barrel, and a piston-rod passing through said bushing and comprising two sections permanently connected together and relatively extensible, substantially as set forth.

4. In a fountain-pen the combination of a barrel or fountain, a piston therein, and a piston-rod secured to said piston and comprising two telescoped sections permanently connected together and relatively extensible, the inner one of said sections having screw-threads at its outer end and the outer one of said sections having internal screw-threads at its inner end adapted to engage said first screw-threads, substantially as set forth.

705,817. EXCAVATING AND HOISTING APPARATUS. EARL H. BROWNING, Cleveland, Ohio. Filed July 23, 1900. Renewed Sept. 6, 1901. Serial No. 74,578. (No model.)



Claim.—1. In a device of the character described, a rotatable shaft, a drum normally loose on said shaft so that either may turn relatively to the other, means for locking the shaft and the drum together after a relative rotation of a predetermined amount, a clutch through which power is transmitted to the shaft to turn it and the drum in one direction, and means for applying power to the drum to turn it and the shaft in the opposite direction when the clutch is released.

2. In a device of the character described, a rotatable shaft having a threaded portion, a closed drum normally loose on said shaft so that either may turn relatively to the other, said drum surrounding the threaded portion of the shaft, a nut engaging said threaded portion and turning with the drum whereby the nut is caused to travel longitudinally of the shaft within the drum when there is relative rotation between the drum and the shaft, and stops formed on the drum to limit the travel of the nut and thus prevent further relative rotation between the drum and the shaft.

3. In a device of the character described, a pair of drums, means for driving one of the drums, and means controlled by said driven drum for first permitting the remaining drum to remain stationary and then turning the same after the driven drum has been turned a predetermined amount.

4. In a device of the character described, a bucket, a closing-drum for the bucket, a shaft to which said drum is secured, a dumping-drum for the bucket, a shaft upon which said dumping-drum is loosely mounted, means connecting said shafts to drive the same together, and means for connecting the dumping-drum and its shaft so that one is driven after the other has turned a predetermined amount.

5. In a device of the character described, a bucket, a closing-drum for the bucket, a shaft to which said drum is secured, a dumping-drum for the bucket, a shaft upon which said dumping-drum is loosely mounted, said shaft being threaded for a portion of its length, a nut upon said threaded portion of the shaft and loosely engaging with the drum to cause the nut to travel back and forth upon the shaft, means for driving said shafts together, and means for holding the dumping-drum while its shaft rotates until the nut moves into contact with the end of the drum to lock the drum to the shaft.

705,818. CELLULAR PRIMER-TRAY. HENRY S. BURNS and THOMAS G. REMBERT, New Haven, Conn., assignors to Winchester Repeating Arms Co., New Haven, Conn. Filed Mar. 24, 1902. Serial No. 99,776. (No model.)

Claim.—1. In a cellular primer-tray, the combination with a sheet-metal top plate formed with a plurality of cells each of which is downwardly extended by integral leaves which increase the isolation between the primers in the cells, and having its edges turned downward at a right angle to form side and end flanges, and a bottom plate located entirely within the said side and end flanges in position to prevent the primers from dropping through the said cells in the top plate.

2. In a cellular primer-tray, the combination with a sheet-metal top plate having its body portion formed with a plurality of cells and its edges turned downward to form side and end flanges the edges of which are provided with retaining-tongues, of a bottom plate located within the said side and end flanges and having the said tongues turned under its lower face whereby it is held in place.

3. As a new article of manufacture, a cellular primer-tray having a top plate formed with a plurality of cells and having its edges turned downward to form side and end flanges, and the said tray also having a bottom plate secured to the top plate in position to prevent the primers from dropping through the cells which are arranged in a plane at a right angle to the plane of the tray, in combination with a paper case receiving the tray and preventing the primers from dropping out of the upper open ends of the cells.

705,819. WATER-CLOSET BOWL. HIRAM T. BUSH, Detroit, Mich. Filed Oct. 12, 1899. Renewed May 17, 1902. Serial No. 107,636. (No model.)

Claim.—1. A water-closet bowl having a channeled flushing-rim equipped with large ports near the fluid-entrance to said rim for discharging cleansing fluid upon the rear wall of the bowl, smaller ports located at intervals around said rim, partition at the end of the channel in the rim and a large port adjacent to said partition.

2. A water-closet bowl having a passage for communicating with the pressure-pipe, said passage terminating in a channeled rim having a series of large ports near the inlet end; for discharging a large quantity of water upon the rear wall of the bowl; a series of small ports around the circumference of said rim; and a partition dividing the inlet and discharge ends of said rim.

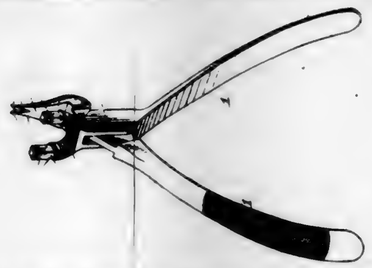
3. A water-closet bowl consisting of a hopper-shaped receptacle having a flushing-rim at its top, said rim being provided with a series of large ports or openings located near the inlet end of said rim for discharging a large quantity of water upon the rear wall of the bowl; a large port or opening located adjacent to the partition dividing the inlet and delivery portions of said rim and through which water passes to cleanse said partition; and a series of small ports or openings intermediate the large ports, or openings.

4. In combination, with a flushing-tank, a water-closet bowl having a rim provided with a circular channel or passage equipped with ports on its lower side; a partition located between the inlet and final discharge openings on said rim; and a series of large ports and small ports disposed substantially as set forth throughout said rim.

5. The herein-described water-closet bowl, having a rim or channel divided by a partition as set forth, said rim or channel being provided with a series of large ports having inclined walls; two series of small ports also having inclined walls; an intermediate large port or opening with inclined walls; and a large port with inclined walls located adjacent to the partition dividing the inlet and discharge ends of said channel.

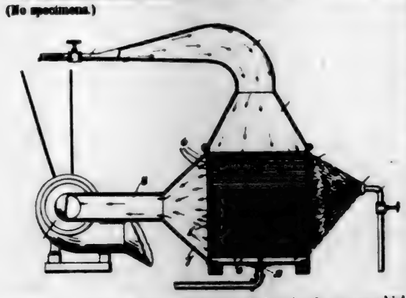
705,820. DENTAL FORCEPS. SEABURD H. B. COCHRANE, Canal Winchester, Ohio. Filed Apr. 19, 1902. Serial No. 103,894. (No model.)

Claim.—1. In a dental forceps, the combination of two pivoted members bearing handles, of a fulcrum-jaw formed on one of said members and comprising two prongs constructed to be set astride the jaw, and a lifting-jaw formed on the other of said members and comprising a single prong constructed to engage a tooth, substantially as described.



2. In a dental forceps, the combination of two members pivoted together and shaped to form handles, a fulcrum-jaw formed on one of said members and comprising two prongs constructed to be set astride the jaw, a flexible covering for said prongs, and a lifting-jaw consisting of a single prong constructed to engage a tooth-root, substantially as described.

705,821. ART OF CONDENSING STEAM OR COOLING FLUIDS. THOMAS M. COLWELL, Chicago, Ill.; Edward S. Colwell administrator of said Thomas M. Colwell, deceased. Filed Apr. 8, 1901. Serial No. 54,827. (No specimens.)

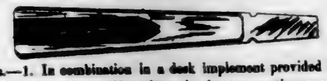


Claim.—1. The herein-described method of condensing steam which consists in introducing aqueous vapor at atmospheric pressure without compression into close propinquity to but separated from the steam or other body from which the heat is to be extracted, moistening the atmosphere containing said aqueous vapor prior to its introduction, reducing the atmospheric pressure of said aqueous vapor after introduction and finally rapidly removing the heat-laden aqueous vapor, substantially as set forth.

2. The method of condensing or cooling a fluid which consists in forming aqueous vapor and passing the same in a rapidly-flowing current into close propinquity to but separated from the fluid to be cooled or condensed and simultaneously expanding and rarefying said current and conducting away the heat-laden vapor, substantially as set forth.

3. The method of condensing or cooling a fluid which consists in forming aqueous vapor and passing the same in a rapidly-flowing current in close propinquity to but separated from the fluid to be cooled or condensed and simultaneously expanding the fluid to be cooled or condensed and the aqueous vapor and finally rapidly removing the heat-laden vapor from the presence of said fluid, substantially as set forth.

705,822. PENCIL-SHARPENER. FRANK A. CURTIS, Meriden, Conn. Filed Dec. 15, 1900. Serial No. 40,009. (No model.)

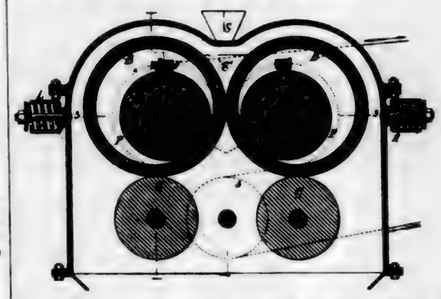


Claim.—1. In combination in a desk implement provided with a recess of V shape having a ridge along the bottom portion, removable plates with file-surfaces located opposite to each other on the walls of the recess, all substantially as described.

2. In combination in a desk implement provided with a recess of V shape having a ridge along the bottom portion, removable plates with file-surfaces located opposite to each other on the walls of the recess and less in length than the recess, all substantially as described.

3. In a desk implement provided with a recess of V shape which has means at the bottom thereof for the support of plates, plates with file-surfaces located opposite to each other on the walls of the recess and supported at the bottom thereof.

705,823. PULVERIZER. ROBERT CRUMBAUM, Brooklyn, N. Y. Filed May 11, 1896. Serial No. 591,042. (No model.)



Claim.—1. In a pulverizer, a crushing-ring and a crushing-roll within the ring adapted to revolve in touch with each other as described; yielding bearings for the shaft of said roll, a spring adapted to hold said roll in contact with said ring, suitable supporting means adapted to support said ring in the plane of its rotation, but leaving it free to move laterally, a casing inclosing the said roll and ring, and guide-collars arranged to act solely against the flanks of said ring upon opposite sides thereof, to limit the lateral displacement of the ring, and return it in correct relation to the casing.

2. In a pulverizer, two revolubly crushing-rings in peripheral contact with each other; a crushing-roll within each of said rings; yielding bearings to the shafts thereof; springs tending to hold said rolls in forcible contact with said rings; supporting-rollers under said rings and a casing inclosing said crushing rolls and rings, in combination with guide-rollers for said rings arranged to bear solely upon their flanks, upon opposite sides, to limit the lateral displacement of the rings and retain them in correct relation to the casing, substantially as shown and described.

3. In a pulverizer, the combination with a crushing-ring, a crushing-roll within the ring, and means for pressing the roll against the ring, of, two exterior supports for the ring making contact with it at points on opposite sides of its contact with the crushing-roll, consisting of a roller underneath the ring supporting its weight, and of a revolving surface bearing upon the periphery of the ring at a point above the internal point of contact of the ring with the crushing-roll.

4. In a pulverizer, the combination with two crushing-rings in peripheral contact with each other, crushing-rolls within the respective rings making contact therewith below the point of mutual contact of the rings, means for pressing each roll against its ring and thereby forcing the rings into contact, and supporting-rollers for the respective rings making contact therewith below their contact with the crushing-rolls, whereby each ring is confined at three points in the plane of its rotation, namely, by its contact with the other ring above, with the supporting-roller below, and with its crushing-roll between the other two.

5. In a pulverizer, the combination with a crushing-ring, a crushing-roll within the ring, and means for pressing the roll against the ring, of two exterior supports for the ring making contact with it at points on opposite sides of its contact with the crushing-roll, consisting of a roller underneath the ring supporting its weight, and a revolving surface bearing upon the periphery of the ring at a point above the internal point of contact of the ring with the crushing-roll, whereby the ring is confined at three points in the plane of its rotation, and lateral guides for the ring consisting of guide-rollers arranged to act against the flanks of said ring.

6. In a pulverizer, the combination with two crushing-rings in peripheral contact with each other, crushing-rolls within the respective rings making contact therewith below the point of mutual contact of the rings, means for pressing each roll against its ring and thereby forcing the rings into contact, and supporting-rollers for the respective rings making contact therewith below their contact with the crushing-rolls, whereby each ring is confined at three points in the plane of its rotation, namely, by its contact with the other ring above, with the supporting-roller below, and with its crushing-roll between the other two, and lateral guides for each of said rings, consisting of pairs of guide-rollers arranged to act against the flanks of said ring.

7. In a pulverizer, the combination with a crushing-ring, a crushing-roll within the ring, and means for pressing the roll against the ring, of an exterior support for the ring consisting of a roller in continuous peripheral contact therewith, mounted on a shaft having fixed bearings, said roller having a yielding material incorporated in it, adapted to cushion the vibration of the ring.

8. In a pulverizer, the combination with a crushing-ring, a crushing-roll within the ring, and means for pressing the roll against the ring, of an exterior support for the ring consisting of a yielding roller in continuous peripheral contact with the ring and constructed with a tread of compressible elastic material, adapted to cushion the vibration of the ring.

9. In a pulverizer, the combination with a crushing roll and ring, and a main casing inclosing them, of lateral guides for said ring consisting of guide-rollers arranged to roll against the flanks of said ring, projecting through slots in said casing, and bearings and casings for said lateral rollers located outside said main casing.

10. In a pulverizer, the combination with a crushing roll and ring, and a main casing inclosing them, of lateral guides for said ring consisting of guide-rollers arranged to roll against the flanks of said ring, projecting through slots in said casing, bearings for the journals of said rollers, and intervening dust-intercepting stuffing-boxes.

11. In a pulverizer, the combination with a crushing roll and ring, and a main casing inclosing them, of lateral guides for said ring consisting of guide-rollers arranged to roll against the flanks of said ring, projecting through slots in said casing, and casings for said guide-rollers formed in sections, including bearings for the journals thereof, and adapted to be bolted together and to be fastened to said main casing to close said slots.

12. In a pulverizer, the combination with a crushing-ring, a crushing-roll within the ring, and means for pressing the roll against the ring, means for supporting the ring against the pressure of said roll, and means for laterally guiding the ring, consisting of lateral rollers arranged to roll against the flanks of said ring, and constructed with a yielding tread adapted to elastically resist lateral displacement of the ring.

13. In a pulverizer, the combination of a crushing-ring, a crushing-roll within the ring, a casing inclosing them, a shaft for said roll, yielding bearings for said shaft, a frame connecting said bearings and including a cross-yoke having its ends free of springs, and a spring bearing upon said cross-yoke and arranged to press the crushing-roll against the ring, and means for directly regulating the tension of such spring, substantially as shown and described, whereby an equal pressure is brought to bear upon the respective bearings of said shaft, tending to preserve parallelism.

14. In a pulverizer, the combination of a crushing-ring, a crushing-roll within the ring, a casing inclosing them, a shaft for said roll, yielding bearings for said shaft, longitudinal slides for said bearings, a transverse yoke free of springs upon its ends rigidly connecting said slides, and a spring-bearing upon said yoke approximately in the direction of the crushing strain, and means for directly regulating the tension of such spring, substantially as shown and described, whereby the two ends of the crushing-roll shaft are caused to yield equally, and parallelism in its journals is maintained.

15. In a pulverizer, the combination of a crushing-ring, a crushing-roll within the ring, a casing inclosing them, a shaft for said roll, yielding bearings for said shaft, a frame connecting said bearings comprising slide-frames on each side formed rigidly with the bearings, a transverse yoke free of springs upon its ends, connecting said slide-frames; and a spring adapted to bear centrally upon said yoke; and means for directly regulating the tension of such spring, substantially as shown and described, whereby an equal pressure is brought to bear upon the respective journals of said shaft, and its parallelism is maintained.

16. In a pulverizer, the combination of a revoluble crushing-ring; a cylindrical crushing-roll within said ring; a continuous shaft to said crushing-roll; bearings for said shaft adapted to yield in unison radially to the roll; a metal hub unyieldingly attached to said shaft, a metal-working rim to said roll; and a rubber fabric or other elastic medium connecting said hub and said working rim; whereby the rim may yield both radially and circumferentially with relation to the shaft.

17. In a pulverizer, the combination of a revoluble ring, and a crushing-roll within said ring having a shaft, and constructed with a metal rim, an elastic yielding material embodied in its web, constructed of rings of such material applied from opposite sides, with holding-rings of rigid material sunk into the outer faces of said elastic rings, and fastening-bolts passed through from one rigid ring to the other to draw them together and thereby expand the elastic rings.

18. In a pulverizer, the combination of a revoluble crushing-ring, a crushing-roll within said ring, yielding bearings for the shaft of said roll, a casing inclosing said ring and roll, a feed-hopper with its spout extending into the upper space between the said ring and roll, and a shield mounted in said space and adapted to prevent the material from passing backwardly over the roll, the shield being formed integrally with the hopper-cast W and feed-channel V.

19. In a pulverizer, a revoluble ring, a crushing-roll within it, yielding bearings for the shaft of said roll, a casing inclosing said ring and roll, a feed-hopper adapted to deliver the material to be crushed into the space between said ring and roll, guard-plates flanking said space and extending between the spout of the hopper and the crushing-point between the ring and roll, adapted to prevent the spilling of the material outside the ring before it has acquired centrifugal force, said guard-plates formed with flanges fastened exteriorly to the casing, whereby the casing is narrowed, and the guard-plates rendered easy of access.

20. In a pulverizer, a revolving ring, a crushing-roll within it, a casing inclosing them, guard-plates flanking the spaces between said roll and ring wherein the crushing is effected adapted to be introduced through openings in the sides of the casing, and for attachment to the exterior of the casing, and the casing constructed with such openings and means for attachment.

21. The combination in a pulverizer embracing two crushing members, a casing within which they are mounted, guard-plates located to flank the junction of said crushing members where the feed for the same is delivered, a slot in the casing adapted to admit of the passage of such guard-plate from the outside to the inside of the casing, flanges upon said guard-plate adapted to remain outside of the casing, and seats for said flanges upon the outside of the casing.

22. In a pulverizer, a revolving ring, a crushing-roll within said ring mounted upon a shaft, guard-plates flanking the feed-spaces between said roll and said ring, a casing inclosing said parts, open at the top and bottom, and having openings and external seats for said guard-plates, a cap-piece closing the casing at the top, yielding bearings for said shaft, a supporting-roller for said ring, and bearings for said parts upon the outside of said casing and cap, whereby the inside of the casing and cap require no finish, and their construction with only one joint between them is attained.

23. In a pulverizer, the combination of a crushing-roll and its shaft, a casing, bearings for said shaft, means for guiding said bearings, a yoke connecting the two bearings, a single spring bearing centrally upon said yoke, a central spindle attached to said casing and passing through said yoke and spring, and a nut upon said spindle confining the spring, and whereby the tension of the spring is adjusted, and an equal pressure is exerted upon the respective bearings of said shaft.

24. In a pulverizer comprising a casing and crushing mechanism within it, the combination of a shaft extending through the casing, a bearing therefor outside the casing, and a stuffing-box around said shaft between said bearing and the inside of the casing, adapted to prevent access of dust to said bearing, and having openings through which to insert and remove the packing material.

25. In a pulverizer comprising a casing and crushing mechanism within it, the combination of a shaft extending through the casing, a bearing therefor outside the casing, an annular collar upon said shaft between the casing and bearing, and a stuffing-box around said shaft embracing said collar, and filled with cotton-waste or like material, whereby the dust is prevented from passing along the shaft beyond said collar.

26. In a pulverizer, a revolving cylindrical crushing-roll, combined with a reciprocal revolving part between which and said roll the crushing is effected, a continuous shaft fixedly attached to said roll, bearings for said shaft adapted to yield in unison radially to the shaft, a metal cylindrical hub fixed upon said shaft, a metal working rim to said roll, and a rubber fabric or other elastic medium connecting said hub and said working rim, whereby the rim may yield both radially and circumferentially with relation to the shaft.

27. In a pulverizer, a revolving crushing-roll, a yielding shaft upon which the roll is mounted, a metal hub upon said shaft, a metal crushing-rim for said roll, said hub and rim having coned faces, a rubber fabric connecting said hub with said rim, formed of two conical disks, and means for forcing said coned rubber-fabric disks into the space between said rim and hub, whereby the rim is mounted to yield circumferentially as well as radially.

28. In a pulverizer, a revolving crushing-roll, a yielding shaft upon which the roll is mounted, a metal hub upon said shaft having a coned and ribbed outer side, a metal crushing-rim for said roll having a coned and ribbed inner side, and a rubber fabric connecting said hub with said rim, formed of two conical disks, and means for forcing said coned rubber-fabric disks into the space between said rim and hub, whereby the rim is mounted to yield circumferentially as well as radially.

29. In a pulverizer comprising a crushing-roll and ring, a casing inclosing them, and means for lifting said ring consisting of a shaft insertible through said casing just within the upper part of the ring, and an eccentric portion adapted when the shaft is turned to engage and lift the ring.

30. The combination with a pulverizer of a feeding device comprising a chambered rotative cylinder, a hopper above said cylinder, the side wall *t* of which over the descending side of the cylinder terminates some distance above the cylinder to leave a free intervening space through

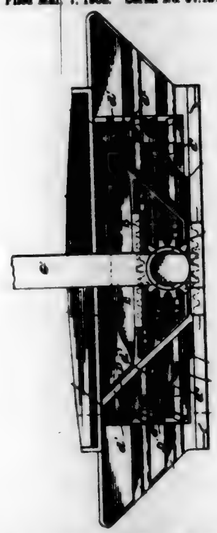
which pieces of stone may gravitate, and a yielding partition *t'* arranged lower down and adjacent to the descending side of the cylinder, adapted to limit the descent of the gravitating stone, and to yield when pieces of stone lodged in the cylinder project beyond its periphery.

31. The combination with a pulverizer of a feeding device comprising a chambered rotative cylinder, a hopper above said cylinder, the side of which on the ascending side of the cylinder is extended to form a shield over the latter covering its chambers and preventing entrance of stone thereinto until they have reached approximately the uppermost position, thereby avoiding the falling of stone into the ascending chambers of said cylinder, and the consequent necessity of lifting the weight of such stone, and said hopper formed with its side over the descending side of the cylinder, inclined toward the middle and terminating some distance above the cylinder to prevent the stone crowding upon the cylinder.

32. The combination with a pulverizer of a feeding-hopper; a chambered rotative cylinder adapted to receive the stone from the hopper; a shield over the rising side of said cylinder, preventing the stone from impeding its rotation; a shield over the descending side of said cylinder, and a yielding side to the cylinder-casing adjacent to the descending side of the cylinder, whereby the descending stone is prevented from jamming between the cylinder and its casing.

33. The combination with a pulverizer of a feed-hopper, a chambered rotative cylinder adapted to receive the stone from said hopper, and mounted in a dust-proof casing, a shield over the rising side and a shield over the descending side of said cylinder, together with the end aprons which prevent the jamming of grit and stone between the ends of the cylinder and its casing.

705,824. WOOD-CUTTING MACHINE. JOSEPH A. CRISMORE, Chicago, Ill. Filed Mar. 7, 1902. Serial No. 97,127. (No model.)



Claim.—1. In a machine for simultaneously forming miter and coping cuts, the combination with a cutting-blade conforming to the contour of the surface of a molding, of a base upon which the blade is guided having a vertical face adjacent to the path of movement of the blade corresponding to the cutting-surface of the blade, means for reciprocating said blade, and means for supporting the molding in the path of the blade.

2. In a machine for simultaneously forming miter and coping cuts, the combination with a horizontally-reciprocating cutting-blade having cutting edges at each end thereof conforming to the contour of the surface of a molding, of a support to which the blade is rigidly secured, a base upon which said support is guided, means for reciprocating said support, and adjustable means for supporting the molding in the path of the blade.

3. In a machine for simultaneously forming miter and coping cuts, an integral cutting-blade comprising vertically-alined portions conforming to the contour of the surfaces of a plurality of moldings.

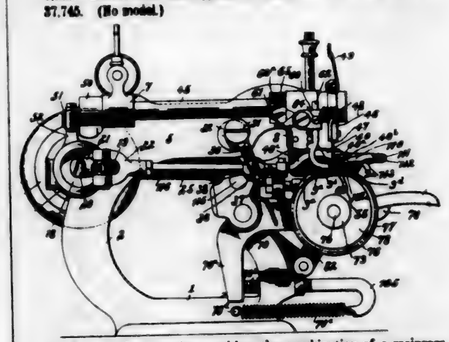
4. In a machine for simultaneously forming miter and coping cuts, the combination with a cutting-blade comprising vertically-alined portions conforming to the contour of the surfaces of a plurality of moldings, of a support to which said blade is rigidly secured, means for horizontally reciprocating said support, and means for supporting the molding in the path of the blade.

5. In a machine for simultaneously forming miter and coping cuts, the combination with a cutting-blade comprising portions conforming to the contour of the surfaces of a plurality of moldings, of a support to which said blade is rigidly secured, means for horizontally reciprocating said support, and means for supporting a molding in different horizontal planes in the path of the blade.

6. In a machine for simultaneously forming miter and coping cuts, the combination with a cutting-blade comprising portions conforming to the contour of the surfaces of a plurality of moldings, of a base upon which the blade is guided having a vertical face adjacent to the path of movement of the blade corresponding to the cutting-surface of the blade, means for reciprocating said blade, and means for supporting a molding in the path of movement of the blade.

7. In a machine for simultaneously forming miter and coping cuts, the combination with a cutting-blade comprising portions conforming to the contour of the surfaces of a plurality of moldings, of a base upon which the blade is guided having a vertical face adjacent to the path of movement of the blade corresponding to the cutting-surface of the blade, means for reciprocating said blade, a pivoted support swinging about a vertical axis adjacent to the plane of movement of the blade, and a plurality of seats carried by said support in different horizontal planes to receive a molding and locate the same in the desired vertical relation to the blade.

705,825. BLIND-STITCH SEWING-MACHINE. CHARLES A. DEARBORN, New York, N. Y., assignor, by mesne assignments, to Frederick W. Loroh. Original application filed Mar. 21, 1900, Serial No. 9,500. Divided and this application filed Nov. 26, 1900. Serial No. 37,745. (No model.)



Claim.—1. In a sewing-machine, the combination of a reciprocatory needle, suitable feed mechanism, and means for operating the needle and feed, with a looper-rod carrying a looper which cooperates with the needle, means for imparting a longitudinal reciprocatory movement and an axial oscillatory movement to said looper rod, a suspended rock-arm supported at a point above the horizontal plane of the looper-rod and capable of swinging toward and away from the path of the needle under the action of the looper-rod, and a universal-joint bearing connecting the looper-rod with the lower end of said rock-arm, substantially as set forth.

2. In a sewing-machine, the combination of a reciprocatory needle, suitable feed mechanism, and means for operating the needle and feed, with a looper-rod carrying a looper which cooperates with the needle, means for imparting a longitudinal reciprocatory movement and an axial oscillatory movement to said looper-rod, a rock-arm journaled upon the machine-frame and capable of swinging toward and away from the path of the needle, means for adjusting the journal of said rock-arm, and a universal-joint bearing connecting the looper-rod with said rock-arm, substantially as set forth.

3. In a sewing-machine, the combination of suitable feed mechanism, a reciprocatory needle arranged to reciprocate transversely to the line of feed, and means for operating the needle and feed, with a looper-rod arranged with its longitudinal axis approximately parallel with the line of feed, a looper carried by the looper-rod and adapted to cooperate with the needle, means for imparting a longitudinal movement and an axial oscillatory movement to said looper-rod, a rock-arm suspended from a point above the horizontal plane of the looper-rod and capable of swinging toward and away from the path of the needle under the action of the looper-rod, and a universal-joint bearing connecting the looper-rod with the lower end of said rock-arm, substantially as set forth.

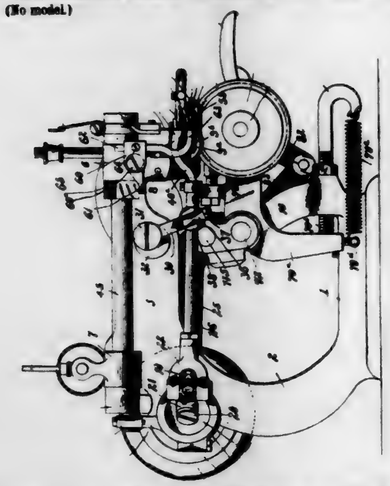
4. In a sewing-machine, the combination of suitable feed mechanism, a needle arranged to reciprocate transversely to the line of feed, and means for operating the needle and feed, with a looper-rod carrying at its forward end a looper which coöperates with said needle, an eccentric rotating device having a double-joint connection with the rear end of said looper-rod for operating it, a rock-arm suspended from a point above the horizontal plane of the looper-rod and capable of swinging toward and away from the path of the needle under the action of the looper-rod, and a universal-joint bearing connecting the looper-rod with the lower end of said rock-arm, substantially as set forth.

5. In a sewing-machine, the combination of suitable feed mechanism, with suitable stitch-forming mechanism including a needle rock-shaft, means for operating the rock-shaft, a rock-arm upon said rock-shaft, a needle mounted upon said rock-arm, an oscillatory needle-guide, and means operated by the needle rock-shaft for moving the needle-guide into and out of operative relation with the needle, substantially as set forth.

6. In a sewing-machine, the combination of suitable work-feeding mechanism, a needle, and a looper, with a loop-guiding part supported above the work adjacent to the path of the needle and adapted to engage the lower thread of the loop which is thrown over by the looper and cause said lower thread to move forward of the path of the needle and thereby insure the passage of the needle through the loop, substantially as set forth.

7. In a sewing-machine, the combination of a reciprocatory needle, and a combined reciprocatory and oscillatory looper, with a feed-finger 110 engaging the work upon its exposed surface adjacent to the path of the needle and having a loop-guiding upper surface over which the lower thread of the loop upon the looper slides to a position in front of the path of the needle, thereby insuring the passage of the needle through the loop, substantially as set forth.

705,326. **FEEDING MECHANISM FOR SEWING-MACHINES.** CHARLES A. DEARBORN, New York, N. Y., assignor, by mesne assignments, to Frederick W. Lorch. Filed Mar. 21, 1900. Serial No. 9,500 (No model.)



Claim.—1. In a blind-stitch sewing-machine, the combination of suitable stitch-forming mechanism including a needle, a stationary presser-foot, and suitable feed mechanism, of a yieldingly-mounted ridge-forming rib engaging the work beneath the presser-foot and over which the work is fed, and a spring device engaging the work directly above said ridge-forming rib adjacent to the path of the needle, substantially as set forth.

2. In a blind-stitch sewing-machine, the combination of a suitable stitch-forming mechanism, including a needle, a stationary presser-foot, and suitable feed mechanism, of a yieldingly-mounted ridge-forming rib engaging the work beneath the presser-foot and over which the work is fed, and a spring-finger formed with a needle guide or gate and engaging the work directly above the ridge-forming rib adjacent to the path of the needle, substantially as set forth.

3. In a blind-stitch sewing-machine, the combination of suitable stitch-forming mechanism, and a stationary presser-foot, with a ridge-forming rib constructed and arranged to engage the work beneath the presser-foot, and an upper feed device constructed and arranged to engage the upper exposed face of the work adjacent to said ridge-forming rib, substantially as set forth.

4. In a blind-stitch sewing-machine, the combination of suitable stitch-forming mechanism including a needle, and suitable feed mechanism, of a ridge-forming rib over which the work is fed, a spring-finger engaging the work directly over said ridge-forming rib adjacent to the path of the needle, and a movable support carrying said spring-finger and causing it to move forward intermittently in engagement with the work and in unison with the feed, substantially as and for the purpose set forth.

5. In a blind-stitch sewing-machine, the combination of suitable stitch-forming mechanism, with the upper and lower feed devices constructed and arranged to engage the work upon its upper and lower exposed faces respectively, a ridge-forming rib over which the work is fed, and a spring-finger mounted upon the upper feed device and engaging the work above the ridge-forming rib adjacent to the path of the needle, substantially as set forth.

6. In a blind-stitch sewing-machine, the combination of suitable stitch-forming mechanism, with the upper and lower feed devices constructed and arranged to engage the work upon its upper and lower exposed faces respectively, a ridge-forming rib over which the work is fed, a spring-finger mounted upon the upper feed device so as to engage the work above said rib adjacent to the path of the needle, and a needle guide or gate in said spring-finger through which the needle is projected into the work, substantially as set forth.

7. In a blind-stitch sewing-machine, the combination of suitable stitch-forming mechanism including a needle, a ridge-forming rib over which the work is fed, and suitable feed mechanism constructed and arranged to feed the work over said rib transversely to the path of the needle, a spring-finger, and a support for the finger, said spring-finger extending from its support in the direction of feed and engaging the work directly above the said rib adjacent to the path of the needle, substantially as set forth.

8 In a blind-stitch sewing-machine, the combination of suitable stitch-forming mechanism including a needle, a ridge-forming rib over which the work is fed, and suitable feed mechanism constructed and arranged to feed the work over said rib transversely to the path of the needle, a spring-finger, and a support for the spring-finger, said spring-finger extending from its support in the direction of feed and engaging the work above the said rib adjacent to the path of the needle, and a needle guide or gate formed in said spring-finger through which the needle is projected into the work, substantially as set forth.

9. In a blind-stitch sewing-machine, the combination of suitable stitch-forming mechanism, with a lower rotary feed device engaging the work upon its under exposed face, a ridge-forming rib over which the work is fed, an upper reciprocatory feed device engaging the upper exposed face of the work, and a spring-finger mounted upon the upper feed device, and engaging the work above said rib adjacent to the path of the needle, substantially as set forth.

10. In a blind-stitch sewing-machine, the combination of suitable stitch-forming mechanism including a reciprocatory needle arranged to operate in a path transverse to the direction of movement of the work, a lower feed device engaging the under exposed face of the work, a ridge-forming rib over which the cloth is fed, an upper reciprocatory feed device engaging the upper exposed face of the work and operating across the path of the needle, a spring-finger mounted upon the upper feed device and formed with a transverse needle guide or gate, said spring-finger extending from its support in the direction of feed and engaging the work above the ridge-forming rib adjacent to the path of the needle, and means for operating the upper and lower feed devices in unison, substantially as set forth.

11. In a sewing-machine, the combination of a machine-frame, suitable stitch-forming mechanism, a rigid presser-foot, a main rotary under feed device arranged to engage the under face of the work, a shaft upon which said under feed device is mounted, and an intermittent rotary feed mechanism upon said feed-shaft, with a reciprocatory feed-finger adapted to engage the upper exposed face of the work, a rocking frame upon which said feed-finger is mounted, means for operating said rocking frame, and means operatively connecting said rocking frame with said intermittent rotary feed mechanism, whereby the latter is operated by and in unison with the former, substantially as set forth.

12. In a sewing-machine, the combination of a machine-frame, suitable stitch-forming mechanism, a rigid presser-foot, a main rotary under feed device arranged to engage the under face of the work, a shaft upon which said under feed device is mounted, and an intermittent rotary feed mechanism upon said feed-shaft, with a suitable reciprocatory upper feed device, and operating mechanism operatively connected with the upper feed device and the intermittent rotary feed mechanism of the under feed device, whereby said feed devices will be operated in unison, substantially as set forth.

13. In a sewing-machine, the combination of suitable stitch-forming mechanism, with a stationary presser-foot, a yieldingly-mounted ridge-forming rib adapted to engage the work beneath the presser-foot, and a yieldingly-mounted feed device independent of the ridge-forming rib and arranged to engage the work beneath the presser-foot adjacent to the ridge-forming rib, substantially as set forth.

14. In a sewing-machine, the combination of suitable stitch-forming mechanism, and a rigidly-mounted presser-foot, with a ridge-forming rib arranged to engage the work beneath the presser-foot, a yieldingly-mounted feed device, arranged to engage the work beneath the presser-foot at one side of the ridge-forming rib, and an independent yieldingly-mounted work-supporting device engaging the work beneath the presser-foot at the opposite side of the ridge-forming rib, substantially as set forth.

15. In a sewing-machine, the combination of suitable stitch-forming mechanism, and a rigidly-mounted presser-foot, with a ridge-forming rib arranged to engage the work beneath the presser-foot, a yieldingly-mounted lower feed device arranged to engage the work beneath the presser-foot at one side of the ridge-forming rib, an independent yieldingly-mounted work-supporting device engaging the work beneath the presser-foot at the opposite side of the ridge-forming rib, and an upper feed device arranged to engage the work upon its upper face, substantially as and for the purpose set forth.

16. In a sewing-machine, the combination of suitable stitch-forming mechanism, and a rigid presser-foot, with two independently-yielding feed devices arranged to engage the work beneath the presser-foot, and a feed device arranged to engage the work upon its upper face, substantially as set forth.

17. In a sewing-machine, the combination of suitable stitch-forming mechanism, and a rigidly-mounted presser-foot, with a yieldingly-mounted lower feed device arranged to engage the work beneath the presser-foot at one side of the line of stitching, an independent yieldingly-mounted work-supporting device arranged to engage and support the work beneath the presser-foot at the other side of the line of stitching, and a suitable upper feed device arranged to engage the work upon its upper face, substantially as and for the purpose set forth.

18. In a sewing-machine, the combination of suitable stitch-forming mechanism, and a rigidly-mounted presser-foot, with yieldingly-mounted lower feed device arranged to engage the work beneath the presser-foot at one side of the line of stitching, an independent yieldingly-mounted work-supporting device arranged to engage and support the work beneath the presser-foot at the other side of the line of stitching, and a suitable upper feed device arranged to engage the work upon its upper face directly above the said yielding work-supporting device and upon the opposite side of the line of stitching from the lower feed device, substantially as and for the purpose set forth.

19. In a sewing-machine, the combination of suitable stitch-forming mechanism, and a rigid presser-foot, with a spring-supported main feed-frame, a main feed device carried thereby and arranged to engage the work beneath the presser-foot, of an auxiliary spring-supported frame, an auxiliary feed device carried thereby and arranged to engage the work beneath the presser-foot adjacent to the main feed device, and means for operating the main and auxiliary feed devices, substantially as set forth.

20. In a sewing-machine, the combination of suitable stitch-forming mechanism, with a spring-supported feed-frame, suitable main feed mechanism mounted upon said frame, an auxiliary spring-supported frame journaled upon said main feed-frame, an auxiliary feed device mounted upon said auxiliary frame, and means for operating said main and auxiliary feed devices, substantially as set forth.

21. In a sewing-machine, the combination of suitable stitch-forming mechanism, a rigid presser-foot, a yieldingly-mounted ridge-forming rib, a feed-shaft pivotally mounted at or near one end independently of the ridge-forming rib, a feed-roll mounted upon said feed-shaft, and a yielding support for the opposite end of said feed-shaft, substantially as set forth.

22. In a sewing-machine, the combination of suitable stitch-forming mechanism, and a rigidly-mounted presser-foot, with a yieldingly-mounted ridge-forming rib engaging the work beneath the presser-foot, a yieldingly-mounted work supporting and feeding device arranged upon one side of the ridge-forming rib beneath the presser-foot and adapted to yield with the ridge-forming rib, and another yieldingly-mounted work supporting and feeding device arranged beneath the presser-foot upon the opposite side of said rib and adapted to yield independently of the rib and the first-named work supporting and feeding device, substantially as set forth.

23. In a sewing-machine for blindstitching, the combination of suitable stitch-forming mechanism, and a rigid presser-foot, with a yieldingly-mounted ridge-forming rib or plate, and two independently-yielding feed devices arranged upon opposite sides of the ridge-forming rib or plate, said rib or plate and the two feed devices being arranged to engage the work beneath the presser-foot, and means for operating the feed devices, substantially as set forth.

24. In a sewing-machine for blindstitching, the combination of suitable stitch-forming mechanism, and a rigid presser-foot, with a yieldingly-mounted ridge-forming rib or plate, and two independently-yielding feed devices arranged upon opposite sides of the ridge-forming rib or plate, said rib or plate and the two feed devices being arranged to engage the work beneath the presser-foot, an upper feed device engaging the work above one of the yielding supported under feeding devices to one side of the ridge-forming rib, substantially as set forth.

25. In a sewing-machine for blindstitching, the combination of suitable stitch-forming mechanism, and a rigid presser-foot, with a yieldingly-mounted ridge-forming rib or plate, and two independently-yielding feed devices arranged upon opposite sides of the ridge-forming rib or plate, said rib or plate and the two feed devices being arranged to engage the work beneath the presser-foot, a spring device engaging the work above one of the yieldingly-mounted lower feed devices to one side of the ridge-forming rib, and an upper feed device engaging the work above the other yieldingly-mounted lower feed device on the other side of the ridge-forming rib, substantially as set forth.

26. In a sewing-machine for blindstitching, the combination of suitable stitch-forming mechanism, and a rigid presser-foot, with a yieldingly-mounted ridge-forming rib or plate, and two independently-yielding feed devices arranged upon opposite sides of the ridge-forming rib or plate, said rib or plate and the two feed devices being arranged to engage the work beneath the presser-foot, a spring device engaging the work above one of the yieldingly-mounted under feed members, another spring device engaging the work above the ridge-forming rib, and an upper feed device engaging the work above the other yieldingly-mounted under feed member, substantially as set forth.

27. In a sewing-machine for blindstitching, the combination of suitable stitch-forming mechanism, and a rigid presser-foot, with a yieldingly-mounted ridge-forming rib or plate, and two independently-yielding feed devices arranged upon opposite sides of the ridge-forming rib or plate, said rib or plate and the two feed devices being arranged to engage the work beneath the presser-foot, two spring devices engaging the upper exposed face of the work, one of said spring devices being arranged above one of the yieldingly-mounted feed devices, and the other spring device being arranged above the ridge-forming rib or plate, substantially as set forth.

28. In a sewing-machine for blindstitching, the combination of suitable stitch-forming mechanism, and a rigid presser-foot, with a spring-supported feed-frame, a feed-shaft journaled in said feed-frame, means for operating said shaft, a ridge-forming disk or circular plate secured to said shaft, a feed disk or wheel also secured to said shaft alongside of said ridge-forming disk or plate, said ridge-forming disk and feed disk or wheel being arranged to engage the work beneath the presser-foot, and an independently-yielding feed device arranged to engage the work beneath the presser-foot adjacent to said ridge-forming disk or plate, substantially as set forth.

29. In a sewing-machine for blindstitching, the combination of suitable stitch-forming mechanism, and a rigid presser-foot, with a spring-supported main feed-frame, a feed-shaft journaled in said feed-frame, means for operating said feed-shaft, a ridge-forming rib or plate mounted upon said shaft, a feed disk or wheel also mounted upon said shaft, an auxiliary spring-supported feed-frame mounted upon the main feed-frame, an auxiliary feed-shaft journaled in said auxiliary frame, a feed-wheel mounted upon said auxiliary shaft and supported adjacent to the ridge-forming rib or plate, and suitable gearing between the main feed-shaft and auxiliary feed-shaft, substantially as set forth.

30. In a sewing-machine for blindstitching, the combination of suitable stitch-forming mechanism, and a rigid presser-foot, with a spring-supported main feed-frame, a main feed-shaft journaled in said feed-frame and carrying an internal gear, means for operating said feed-shaft, a ridge-forming rib or plate mounted upon said shaft, a feed-disk or wheel also mounted upon said shaft, an auxiliary spring-supported feed-frame mounted upon the main feed-frame, an auxiliary feed-shaft journaled in said auxiliary frame, a feed-wheel mounted upon said auxiliary shaft and supported adjacent to the ridge-forming rib or plate, and a gear keyed to the auxiliary feed-shaft meshing with said internal gear of the main feed-shaft, substantially as and for the purpose set forth.

31. In a sewing-machine for blindstitching, the combination of suitable stitch-forming mechanism, and a rigid presser-foot, with a spring-supported main feed-frame, a feed-shaft journaled in said feed-frame, means for operating said feed-shaft, a ridge-forming rib or plate mounted upon said shaft, a feed disk or wheel also mounted upon said shaft, an auxiliary spring-supported feed-frame extending approximately parallel to the main feed-frame and pivotally mounted adjacent to one of its ends to the main feed-frame, a feed-wheel mounted upon the free end of said shaft adjacent to the ridge-forming rib or plate, a gear keyed to the opposite end of said auxiliary feed-shaft, and an internal gear keyed to the main feed-shaft adjacent to the pivotal support of the auxiliary feed-frame, said internal gear meshing with the gear on the auxiliary feed-shaft, substantially as and for the purpose set forth.

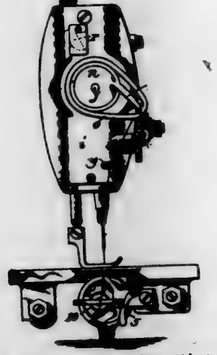
32. In a sewing-machine for blindstitching, the combination of suit-

able stitch-forming mechanism, and a rigid presser-foot, with a yieldingly-mounted ridge-forming rib or plate, and two independently-yielding feed devices arranged upon opposite sides of the ridge-forming rib or plate, said rib or plate and the two feed devices being arranged to engage the work beneath the presser-foot, one of said yieldingly-supported feed devices being formed of relatively high and low portions, the high portion of which engages the work adjacent to the ridge-forming rib or plate, substantially as and for the purpose set forth.

33. In a sewing-machine for blindstitching, the combination of suitable stitch-forming mechanism, and a rigid presser-foot, with a yieldingly-mounted ridge-forming rib or plate, a yieldingly-supported main feed wheel or roll engaging the work beneath the presser-foot at one side of the ridge-forming rib or plate, and a yieldingly-supported auxiliary feed wheel or roll engaging the work beneath the presser-foot on the other side of the ridge-forming rib or plate, said auxiliary feed wheel or roll comprising a relatively high conoidal part which engages the work adjacent to the ridge-forming rib or plate and a relatively low cylindrical part which engages the work adjacent thereto, substantially as set forth.

34. In a sewing-machine for blindstitching, the combination of suitable stitch-forming mechanism including a curved needle and operating mechanism to reciprocate it in an arc, a rigid presser-foot formed with an elongated opening in it, a ridge-forming rib or plate constructed and arranged to engage the work beneath the presser-foot and form a ridge in the work within the opening in the presser-foot, and a yieldingly-supported feed wheel or roll consisting of a relatively high conoidal portion and a relatively low cylindrical portion, the conoidal portion of said feed-roll engaging the work adjacent to the ridge-forming rib or plate under the opening in the presser-foot and the cylindrical portion of said feed-roll engaging the work under the presser-foot adjacent to its opening, substantially as set forth.

705,327. ROTARY TAKE-UP FOR SEWING-MACHINES. PHILIP DIEHL and MARTIN HEHLER, Elizabeth, N. J., assignors to The Singer Manufacturing Company, a Corporation of New Jersey. Filed May 7, 1901. Serial No. 59,119. (No model.)



Claim.—1. In a sewing-machine, the combination with a needle and its operating mechanism, of a revolving loop-taker, a rotary take-up, and means for imparting a regular or uniform rotary motion to said loop-taker and an irregular or differential rotary motion to said take-up.

2. In a sewing-machine, the combination with a needle and its operating mechanism, of a rotary loop-taker, a rotary take-up, and means for imparting a single rotation to said loop-taker at a regular or uniform speed and a single rotation to said take-up at an irregular or differential speed to each reciprocation of said needle.

3. In a sewing-machine, the combination with the stitch-forming devices thereof, of a rotary take-up comprising a take-up shaft mounted in the head of the machine and operatively connected with the needle-bar shaft, a disk or hub on said take-up shaft, a ring or guard offset from said disk or hub and of irregular oval form, and a take-up arm joining said ring or guard with said disk or hub.

4. In a sewing-machine, the combination with a needle and its operating mechanism, of a continuously-revolving hook, a thread-case supported by and arranged eccentric to the axis of said hook, a rotary take-up, and means for imparting a single rotation to said hook at a regular or uniform speed and a single rotation to said take-up at an irregular or differential speed to each reciprocation of said needle.

5. In a sewing-machine, the combination with a needle and its operating mechanism, of a rotary take-up comprising a rotary shaft and a take-up arm extending outward from the axis of said shaft and affording a longitudinal slideway or cast-off for the thread and on which arm the thread is in an outer position when the take-up action occurs and from which outer position the thread moves inward, and then again outward, when the said arm is reversed, during the thread-slackening operation.

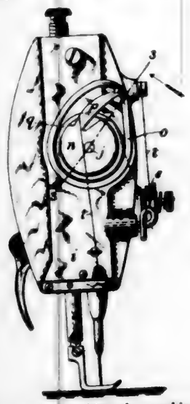
6. In a sewing-machine, the combination with a needle and its operating mechanism, of a rotary take-up comprising a rotary shaft and a take-up arm extending outward from the axis of said shaft and affording a longitudinal slideway or cast-off for the thread, and on which arm the thread is in an outer position when the take-up action occurs and from which outer position the thread moves inward and then again outward, when the said arm is reversed, during the thread-slackening operation, and a thread-guard surrounding said take-up arm.

7. In a sewing-machine, the combination with a needle and its operating mechanism, of a rotary take-up comprising a rotary shaft and a take-up arm extending outward from the axis of said shaft and affording a longitudinal slideway or cast-off for the thread, and on which arm the thread is in an outer position when the take-up action occurs and from which outer position the thread moves inward and then again outward on said arm, when the latter is reversed, during the thread-slackening operation, and a rotary guard fixed upon and supported by the outer end of said take-up arm.

8. In a sewing-machine, the combination with a needle and its operating mechanism, of a rotary shaft, two thread-eyes arranged adjacent thereto, a take-up arm extending outward from said shaft and located substantially in the plane of said thread-eyes and affording a longitudinal or in-and-out slideway for the thread and on which arm the thread is in an outer position when the take-up action occurs, and from which outer position the thread moves inward and then outward, when the arm is reversed, during the thread-slackening operation.

9. In a sewing-machine, the combination with a needle and its operating mechanism, of a rotary shaft, a take-up arm extending outward from said shaft and affording a longitudinal or in-and-out slideway for the thread, and on which arm the thread is in an outer position when the take-up action occurs, and from which outer position the thread moves inward and then outward, when the arm is reversed, during the thread-slackening operation, and means for maintaining the thread constantly around or on said take-up arm throughout each complete rotation of the same, while permitting it to slide freely lengthwise thereof.

705,328. TAKE-UP DEVICE FOR SEWING-MACHINES. PHILIP DIEHL, Elizabeth, N. J., assignor to The Singer Manufacturing Company, a Corporation of New Jersey. Filed June 26, 1901. Serial No. 66,063. (No model.)



Claim.—1. In a sewing-machine, the combination with a rotary take-up, of a stationary device arranged and operating out of the normal path of movement of the thread and adapted to catch, without severing, the loose end of the needle-thread as it is carried around by the take-up after accidental breakage between the tension and the work, thereby preventing the entangling of the thread with the take-up, and means for guiding the thread to said stationary device and take-up.

2. In a sewing-machine, the combination with a rotary take-up, of a thread-guard device for withdrawing or unthreading the needle-thread from the said take-up when the said thread accidentally breaks between the take-up and the work, and means for guiding the thread to said thread-guard device and take-up.

3. In a sewing-machine, the combination with a rotary take-up, of a stationary thread-guard located adjacent to said take-up and a thread-guide so arranged relative to said thread-guard and take-up that when the needle-thread accidentally breaks the loose end thereof will be wound up on said thread-guard.

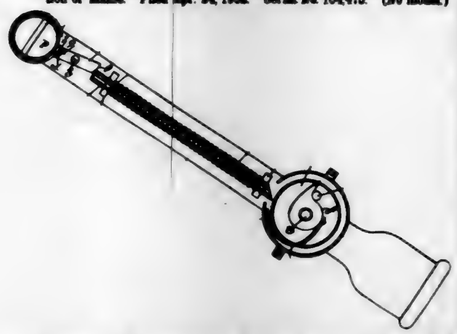
4. In a sewing-machine, the combination with a rotary take-up comprising a take-up arm on which the thread can slide out and in for the take-up and thread-slackening operations, of a stationary thread-controller serving to take up or control a part of the slack thread given up by the said take-up arm during the early part of the thread-slackening operation and during the time the needle is descending to enter the work.

5. In a sewing-machine, the combination with a rotary take-up, of a thread-guard ring or hub located adjacent to said take-up and outside or beyond the periphery of which said take-up extends, and thread-guiding means for directing the thread to the take-up and guard ring or hub, so that a loose end of needle-thread will be wrapped about said guard ring or hub and thus be withdrawn from said take-up to prevent its entanglement therewith.

6. In a sewing-machine, the combination with a rotary take-up comprising the ring or guard *o* and take-up arm *p*, of a thread-guard ring or hub *q* adjacent to said rotary take-up and outside or beyond the periphery of which a portion of said take-up arm extends.

7. In a sewing-machine, the combination with a rotary take-up comprising a take-up arm on which the thread can slide out and in for the take-up or stitch-tightening and the thread-slackening operations, of a stationary thread-guard hub adjacent to the path of movement of said take-up arm and which is arranged so as to control slack thread given up by or released from said take-up arm at the thread-slackening operation.

705,329. AUTOMATIC CUT-OFF FOR GAS-BURNERS. LOUIS F. DUCKER, Boston, Mass., assignor, by direct and mesne assignments, to Ducker Automatic Gas Cut-Off Company, Boston, Mass., a Corporation of Maine. Filed Apr. 24, 1902. Serial No. 104,475. (No model.)



Claim.—1. The combination with a gas bracket or arm provided with a valve controlling the flow of gas to the burner, a dog or arm loose on said valve, means on said valve to engage said dog or arm, a spring to move said dog or arm, of a thermostatically-operated sliding bolt to engage said dog or arm, and means to withdraw said sliding bolt from engagement with said dog or arm, substantially as described.

2. The combination with a gas bracket or arm provided with a valve controlling the flow of gas to the burner, a dog or arm loose on said valve, means on said valve to engage said dog or arm, a spring to move said dog or arm, of a sliding bolt to engage said dog or arm, a lever provided with a cam-shaped surface coöperating with said bolt, thermostatic means to turn said lever and move the bolt into the path of movement of the arm or dog, and means to withdraw the said bolt from the path of movement of said dog or arm, substantially as described.

3. The combination with a gas bracket or arm provided with a valve controlling the flow of gas to the burner, a dog or arm loose on said valve, means on said valve to engage said dog or arm, a spring to move said dog or arm, of a sliding bolt to engage said dog or arm, a cam-lever coöperating with said bolt, a second lever in engagement with said cam-lever, a thermostat to act on said second lever, and means to withdraw the sliding bolt from the path of movement of the dog or arm, substantially as described.

4. The combination with a gas-burner provided with a valve controlling the supply of gas to the burner, of a device movable in one direction with said valve and independent thereof to permit the valve to be moved in the opposite direction without moving said device, a sliding bolt coöperating with said device, a thermostat to effect movement of said bolt into the path of movement of said device, and means to move said bolt in the opposite direction, substantially as described.

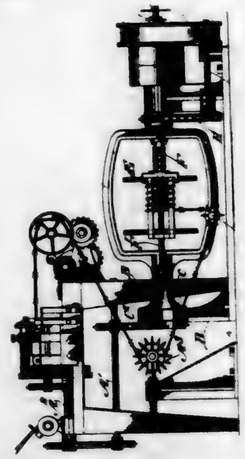
5. The combination with a gas-burner provided with a valve controlling the supply of gas to the burner, means to automatically return said valve from its open to its closed position, a sliding bolt coöperating with said means, and a thermostat to effect movement of said bolt to engage said means, substantially as described.

6. The combination with a gas-burner provided with a valve controlling the supply of gas to the burner, means to automatically return said valve from its open to its closed position, a sliding bolt coöperating with said means, a cam-lever to actuate said bolt, and a thermostat to actuate said cam-lever, substantially as described.

705,330. TREATMENT OF STEEL INGOTS FOR FORGING. CHARLES T. DUDLEY, Golden, Colo., assignor of one-fourth to William W. Dudley, Frank L. Browne, and William T. Norton, Washington, D. C. Filed Feb. 10, 1902. Serial No. 93,341. (No specimens.)

Claim.—The process of treating cast-steel ingots and the like previous to forging, which consists in cooling the cast ingot to a temperature below 550° centigrade, reheating the cooled ingot to a temperature between 750° centigrade and 850° centigrade, maintaining said reheating temperature for a period of from thirty to forty-five hours, and finally heating the ingot to forging temperature.

705,331. WIRE TWISTING AND REELING MACHINE. WILBER EMERY, Ashland, Ky. Filed Mar. 22, 1902. Serial No. 99,517. (No model.)



Claim.—1. In a twisting and reeling mechanism, the combination with a reel and a continuously-revolving twister around which the wire is passed on its way to the reel, of slipping driving connections between the twister and the reel, arranged to rotate the reel at a speed different from that required for take-up, so as to resist the pull of the wire, and adapted to slip as the tension attains a certain limit; substantially as described.

2. In a twisting and reeling mechanism, the combination with a reel and a continuously-revolving twister around which the wire is passed on its way to the reel, of driving and driven friction-pulleys suitably connected respectively with the twister and reel, and a belt passing around said pulleys adapted to drive the reel to take up or receive the wire with uniform tension and to slip as the tension attains a certain limit; substantially as described.

3. In a twisting and reeling mechanism, the combination with a reel and a continuously-revolving twister, of a driving-shaft having a friction-pulley thereon, a friction-pulley suitably connected with and driving the reel, and a belt passing around said pulleys adapted to drive the reel to take up or receive the wire with uniform tension and to slip as the tension attains a certain limit; substantially as described.

4. In a twisting and reeling mechanism, a reel, a continuously-revolving twister around which the wire is passed on its way to the reel, means for distributing the wire evenly on the reel actuated by a differential rotation of the reel and twister, and differential slipping driving connections between the twister and the reel; substantially as described.

5. In combination with a reel and a continuously-revolving spooler adapted to wind the wire thereon, slipping driving connections between

the spooler and the reel adapted to rotate the latter at a speed different from winding-speed and adapted to slip to permit independent action of the reel when the tension of the wire attains a certain limit; substantially as described.

6. In combination with a reel and a revolving spooler adapted to wind the wire thereon, a driving-shaft having a friction-pulley thereon, a friction-pulley suitably connected with the reel, and a belt passing around said pulleys, the arrangement being such that the reel is driven thereby at less than winding-speed, whereby the reel is continuously turned independently by pull of the wire and the belt caused to slip; substantially as described.

7. In combination with a reel and a continuously-revolving spooler carried by coaxial shafts, a counter-shaft driven from the spooler-shaft, and frictional connections between said counter-shaft and the reel-shaft driving the latter at less than winding-speed and slipping to permit independent turning of the reel by pull of the wire; substantially as described.

8. In combination with a reel and a continuously-revolving spooler carried by coaxial shafts, a counter-shaft driven from the spooler-shaft and having a friction-pulley thereon, a second friction-pulley on the reel-shaft, and a belt passing around said pulleys adapted to rotate the reel to take up the wire with uniform tension and to slip to permit independent action of the reel when the tension attains a certain limit; substantially as described.

9. In a reeling mechanism, a rotary reel and a continuously-revolving spooler having coaxial shafts, connections between said shafts for reciprocating the reel when the shafts are differently rotated, and differential driving connections between said shafts; substantially as described.

10. In a reeling mechanism, a rotary reel and a continuously-revolving spooler having coaxial shafts, connections between said shafts for reciprocating the reel when the shafts are rotated at different speeds, and differential slipping driving connections between said shafts normally rotating the reel-shaft at a different speed from that required for take-up and slipping to permit independent action of the reel to take up the wire with uniform tension; substantially as described.

11. In a reeling mechanism, a rotary reel and a continuously-revolving spooler having coaxial shafts, connection between said shafts for reciprocating the reel when the shafts are rotated at different speeds, a counter-shaft driven from the spooler-shaft having a friction-pulley thereon, a friction-pulley connected to the reel-shaft, said pulleys being in a different ratio from the driving connections between the spooler-shaft and counter-shaft, and a belt passing around said pulleys adapted to turn the reel to take up the wire with uniform tension and to slip to permit independent action of the reel when the tension attains a certain limit; substantially as described.

12. In a reeling mechanism, a rotary sleeve or hollow shaft carrying a revolving spooler, a reel-shaft journaled within said sleeve carrying a reel in proper relation to the spooler, connection between said sleeve and shaft for reciprocating the reel when the shafts are rotated at different speeds, a counter-shaft driven by suitable connections with the spooler-shaft, friction-pulleys on the reel-shaft and counter-shaft in a different ratio from that of the driving connections between the spooler-shaft and counter-shaft, the reel-shaft pulley being slidably but non-rotatably secured thereon and having a journal in the outer sleeve or spooler-shaft, and a belt passing around said pulleys driving the reel to take up the wire with uniform tension and slipping to permit independent action of the reel as the tension attains a certain limit; substantially as described.

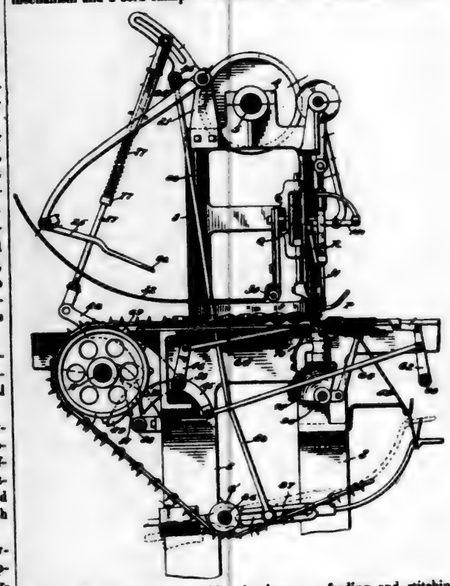
705,882. MACHINE FOR MAKING MATS FOR BOTTLE-COVERS, &c. VALENTINE FLOCKENSTEIN, St. Paul, Minn., assignor to the Northwestern Grass Twine Company, St. Paul, Minn., a Corporation of Iowa. Filed Oct. 22, 1900. Serial No. 33,910. (No model.)

Claim.—1. In a bottle-cover machine, the combination with feeding and stitching mechanism, means for actuating the same, and a cord-clamp arranged to hold the cord in position to be engaged by the stitching mechanism, of a cord-puller comprising a vibratory arm, a finger yieldingly connected thereto, and means for vibrating said arm, as and for the purpose set forth.

2. In a bottle-cover machine, the combination with feeding and stitching mechanism, means for actuating the same, and a cord-clamp arranged to hold the cord in position to be engaged by the stitching mechanism, of a cord-puller comprising a vibratory arm, a finger yieldingly connected thereto, a guide for said finger, and means for vibrating said arm, as and for the purpose set forth.

3. In a bottle-cover-making machine, a cord-puller comprising a vibratory arm, a hooked finger, means for yieldingly connecting said finger to said arm, and means for vibrating said arm, in combination with stitch-forming mechanism and a cord clamp or holder, as and for the purpose set forth.

4. In a bottle-cover-making machine, a cord-puller comprising a vibratory arm having a shoulder, a finger pivotally connected to said arm, a spring arranged to maintain said finger in engagement with said shoulder, and means for vibrating said arm, in combination with stitch-forming mechanism and a cord clamp or holder, as and for the purpose set forth.



5. In a machine for making bottle-covers, feeding and stitching mechanism, and means for actuating the same, in combination with a rock-shaft, a crank-arm for rocking the same, a pivotally-mounted arm, means for periodically rocking the same, a tube connected to said crank-arm and provided with a transverse slot, a rod connected to said pivoted arm and arranged to telescope into said tube and having a pin operating in said slot, a spring interposed between said rod and tube, and a cord-puller actuated by said rock-shaft, as and for the purpose set forth.

6. In a machine for making bottle-covers, feeding and stitching mechanism, and means for actuating the same, in combination with a cord-clamp arranged to hold the cord in position to be engaged by the stitching mechanism, a rock-shaft, a cord-puller, a vibratory arm for providing slack in the cord between the cord-clamp and the cord-supply, and connections between said arm and shaft, whereby when the latter is rocked to advance the cord-puller to engage the slack portion of the cord and vibratory arm is also actuated, as and for the purpose set forth.

7. In a machine for making bottle-covers, feeding and stitching mechanism, and means for actuating the same, in combination with a cord-clamp arranged to hold the cord in position to be engaged by the stitching mechanism, a counterbalanced vibratory arm arranged to engage the cord at a point intermediate the cord-clamp and cord-supply to provide slack therein, a cord-puller, and connections intermediate said cord-puller and arm to vibrate the latter, as and for the purpose set forth.

8. In a machine for making bottle-covers, feeding and stitching devices, and means for actuating the same, in combination with a cord-clamp, a pivotally-mounted arm arranged to engage the cord, a cord-puller, a rock-shaft therefor, a crank-arm for rocking said shaft, and a rod connected to said crank and pivoted arms, said rod having loose connection to permit of movement thereof relative to said arms, as and for the purpose set forth.

9. In a machine for making bottle-covers, feeding and stitching devices, and means for actuating the same, in combination with a cord-clamp, a pivotally-mounted arm arranged to engage the cord, a cord-puller, a rock-shaft for actuating the same, a crank-arm mounted on said shaft and provided with a pin or projection, a rod having an elongated slot in which said pin or projection is received, said rod being connected at its other end to said pivoted arm, as and for the purpose set forth.

10. In a machine for making bottle-covers, feeding and stitching devices, and means for actuating the same, in combination with a cord-clamp, a pivotally-mounted arm arranged to engage the cord, a cord-puller, actuating means therefor, and a rod connected at one end to the cord-puller-actuating means and adjustably connected at the other end to said pivoted arm, as and for the purpose set forth.

11. In a machine of the class described, a rock-shaft, a spring arranged to exert its tension to rock said shaft in one direction, a stop for locking said shaft against rotation under the influence of said spring, stitch-forming mechanism, a cord-clamp, means actuated by said shaft for operating said clamp, and means for tripping said stop, as and for the purpose set forth.

12. In a machine of the class described, a rock-shaft, means normally tending to rock said shaft in one direction, a stop for restraining the rocking of said shaft, stitch-forming mechanism, a cord clamp and cutter, a crank-arm carried by said shaft and connected to said cord clamp and cutter, and means for tripping said stop, as and for the purpose set forth.

13. In a machine of the class described, a rock-shaft, means normally tending to rock said shaft in one direction, an arm mounted on said shaft and provided with a pin, a holding-arm adapted to engage said pin to lock said shaft against rotative movement, stitch-forming mechanism, a cord clamp and cutter, means operated by said shaft for actuating said clamp and cutter, and means for releasing said holding-arm from engaging relation with respect to said pin, as and for the purpose set forth.

14. In a machine of the class described, a rock-shaft, a cord-clamp, means actuated by said shaft for opening and closing said clamp, means normally tending to rock said shaft in a direction to close said clamp, a trip for locking said shaft in position to hold said clamp open, and means for releasing said trip, in combination with stitch-forming mechanism, as and for the purpose set forth.

15. In a machine of the class described, a rock-shaft, a cord-clamp, means actuated by said shaft for opening and closing said clamp, means normally tending to rock said shaft in a direction to close said clamp, a trip for locking said shaft in position to hold said clamp open, means for releasing said trip, and means for positively forcing said clamp to extreme closed position, in combination with stitch-forming mechanism, as and for the purpose set forth.

16. In a machine of the class described, a rock-shaft, a cord-clamp, means actuated by said shaft for opening and closing said clamp, means for positively rocking said shaft in a direction to close said clamp, a spring arranged to oppose said rocking means, a trip for holding said shaft against the action of said spring, means for releasing said trip, and means for positively rocking said shaft to the limit of its movement to close said clamp, in combination with stitch-forming mechanism, as and for the purpose set forth.

17. In a machine of the class described, a cord clamp and cutter, a cord-puller, a rotating shaft, means actuated therefrom for operating said clamp and cutter, and means actuated by said rotating shaft for rocking said rock-shaft, in combination with stitch-forming mechanism, as and for the purpose set forth.

18. In a machine of the class described, a rotating shaft, a wheel mounted thereon, a pin or projection carried by said wheel, a cam-arm arranged to be engaged and rocked by said pin or projection, a rock-shaft, a coöperating cam-arm mounted thereon, a cord-clamp, and connections operated by said rock-shaft for actuating said cord clamp and cutter, in combination with stitch-forming mechanism, as and for the purpose set forth.

19. In a bottle-cover-making machine, feeding and stitching devices, means for actuating the same, and a cord-clamp arranged to hold the cord in position to be engaged by the stitching mechanism, in combination with a rock-shaft, a cord-puller connected thereto and operated therefrom and arranged to engage the cord at a point between the cord-clamp and the cord-supply, an arm also connected to said rock-shaft, a cam-shaft, a pivotally-mounted arm arranged to be engaged by a cam on said shaft whereby it is periodically rocked, and connections between said pivotally-mounted arm and the arm on said rock-shaft for rocking the latter to actuate said cord-puller, as for the purpose set forth.

20. In a bottle-cover-making machine, feeding and stitching mechanism, means for actuating the same, and a cord-clamp arranged to hold the cord in position to be engaged by the stitching mechanism, in combination with a cord-puller arranged to engage the cord at a point between the cord-clamp and the cord-supply, a rock-shaft having an arm, to which said cord-puller is connected, a cam-shaft, a pivotally-mounted forked arm, the cam on said cam-shaft operating within the fork of said arm whereby said arm is positively rocked in both directions, and connections between said arm and rock-shaft for rocking the latter to operate the cord-puller, as and for the purpose set forth.

21. In a bottle-cover-making machine, feeding and stitching mechanism, means for actuating the same, and a cord-clamp arranged to hold the cord in position to be engaged by the stitching mechanism, in combination with a cord-puller operating to engage the cord at a point between said cord-clamp and the cord-supply, a rock-shaft having an arm to which said cord-puller is connected, a cam-shaft, a pivotally-mounted forked arm, a cam on said shaft operating within the fork of said arm, and yielding connections between said arm and rock-shaft, as and for the purpose set forth.

22. In a bottle-cover-making machine, feeding and stitching mechanism, means for actuating the same, and a cord-clamp arranged to hold the cord in position to be engaged by the stitching mechanism, in combination with a rock-shaft having an arm, a cord-puller connected to said arm and arranged to engage the cord at a point between the cord-clamp and cord-supply, a cam-shaft, means for rotatively actuating the same, a pivotally-mounted arm arranged to be periodically engaged and rocked by a cam on said shaft, and yielding connections between said pivoted arm and rock-shaft for rocking the latter to operate the cord-puller, as and for the purpose set forth.

23. In a machine for making bottle-covers, feeding and stitching mechanism, means for actuating the same, and a cord-clamp arranged to hold the cord in position to be engaged by the stitching mechanism, in combination with a cord-puller arranged to engage the cord at a point between the cord-clamp and the cord-supply, a main drive-shaft for actuating said stitching and feeding mechanism, a counter-shaft rotatively actuated from said main drive-shaft, a rock-shaft having an arm to which said cord-puller is connected, a cam-wheel mounted upon said counter-shaft, said cam-wheel provided with cam projections, a pivotally-mounted forked arm, the cam projections upon said wheel operating within the fork of said arm to positively rock the same to the extreme limits of its movement in both directions, and connections between said pivoted arm and said rock-shaft for rocking the latter to operate the cord-puller, as and for the purpose set forth.

24. In a machine for making bottle-covers, feeding and stitching mechanism, means for actuating the same, and a cord-clamp arranged to hold the cord in position to be engaged by the stitching mechanism, in combination with a cord-puller arranged to engage the cord at a point between the cord-clamp and the cord-supply, and means for vibrating said cord-puller and operating to actuate said cord-puller in advance of the operation of the stitching mechanism, and means interposed between the cord-supply and the cord-puller for providing slack in the cord to be yielded up to said cord-puller, as and for the purpose set forth.

25. In a machine for making bottle-covers, feeding and stitching mechanism, means for actuating the same, and a cord-clamp arranged to hold the cord in position to be engaged by the stitching mechanism, in combination with a rock-shaft, a cord-puller connected to said shaft and arranged to engage the cord at a point between the cord-clamp and the cord-supply, a vibrating arm also arranged to engage the cord at a point between the cord-clamp and cord-supply, connections between said vibrating arm and said rock-shaft for actuating the former to provide a slack in the cord to be taken up by the cord-puller, and means for rocking said shaft, as and for the purpose set forth.

26. In a machine for making bottle-covers, feeding and stitching mechanism and means for actuating the same, in combination with a cord-clamp arranged to hold the cord in position to be engaged by the stitching mechanism, an arm arranged to engage the cord at a point between said clamp and the cord-supply to provide slack in the cord, a rock-shaft, connections between said shaft and arm for vibrating the latter, a cord-puller also connected to said rock-shaft and operating to engage the slack portion of the cord to form a loose end therein in advance of the operation of the stitching mechanism, and means for operating said rock-shaft, as and for the purpose set forth.

27. In a machine for making bottle-covers, feeding and stitching devices and means for actuating the same, in combination with a cord-clamp arranged to hold the cord in position to be engaged by the stitching mechanism, an arm arranged to engage the cord at a point between said clamp and the cord-supply, a rock-shaft having a crank, a rod respectively connected to said crank and arm for vibrating the latter, whereby when said rock-shaft is rocked said arm is vibrated to provide slack in the cord, a cord-puller also connected to said rock-shaft and arranged to engage the slack portion of the cord to draw the same out in position to form a free end, and means for rocking said rock-shaft, as and for the purpose set forth.

28. In a machine for making bottle-covers, a cord-clamp comprising a stationary guide having a finger or projection extending laterally from the end thereof, and a slide having a hook formed in the plane of the body thereof and operating in a plane parallel with the plane of said finger or projection, said hook projecting in the opposite direction with respect to said finger, and means for reciprocating said slide, whereby said hook is drawn past said finger to clamp the cord between said guide-finger and the hook of said slide, as and for the purpose set forth.

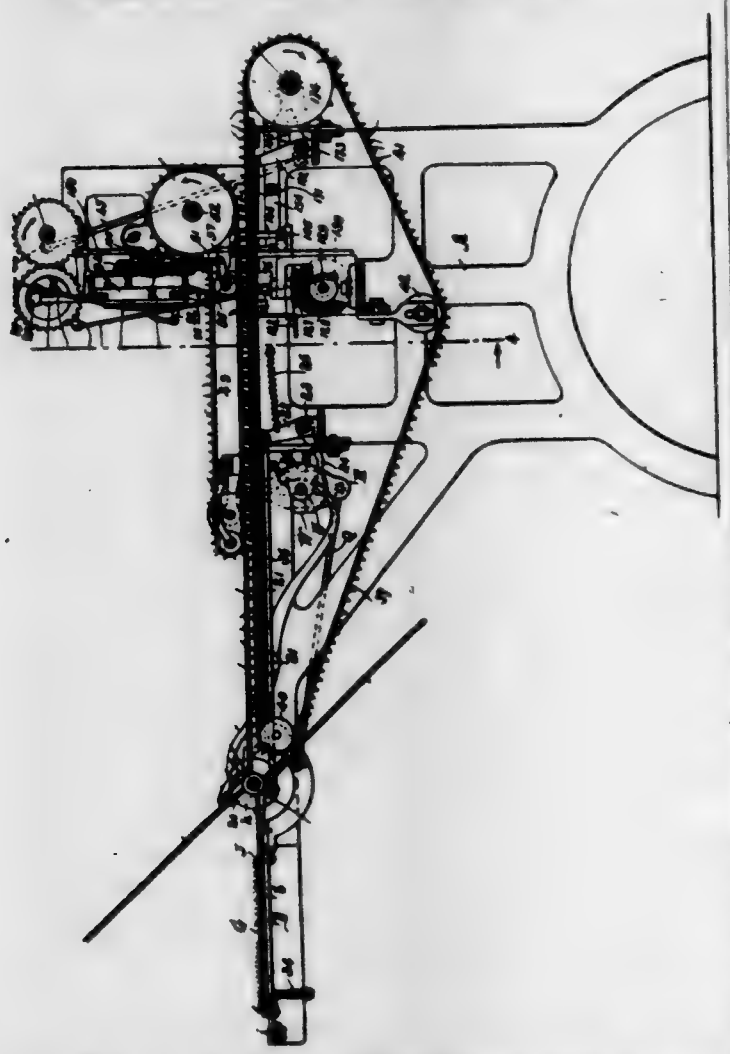
29. In a machine for making bottle-covers, a cord-clamp comprising a stationary guide having a lateral finger extending from the end thereof, a cutter pivotally mounted on said guide, and a reciprocatory slide operating in a plane parallel with respect to the plane of said finger and provided with a hook projecting in a direction opposite to the direction of said finger, said slide also provided with pins or projections arranged to engage said cutter to rock the same, and means for moving said slide whereby the cord is engaged by the hook therein and is drawn

under said finger and clamped and said cutter is rocked to sever the cord as and for the purpose set forth.

30. In a bottle-cover-making machine, the combination with feeding and stitching mechanism, means for actuating the same, and a cord-clamp arranged to hold the cord in position to be engaged by the stitching mechanism, of a cord-puller arranged to engage the cord at a point between said clamp and the cord-supply, and means operating in advance of the actuation of the stitching mechanism for moving said cord-puller to pull out a portion of the cord to form a loose end, as and for the purpose set forth.

705,333. MACHINE FOR MAKING MATS FOR BOTTLE-COVERS, &c. VALENTINE FLECKENSTEIN, St. Paul, Minn., assignor to the Northwestern Grass Twine Company, St. Paul, Minn., a Corporation of Iowa.

Filed Apr. 5, 1898. Serial No. 711,329. (No model.)



Claim.—1. In a machine for making packing covers, mats and the like, the combination with the stitching mechanism and the feeding devices, of a stationary table adapted to receive the material in sufficient quantity to form a single cover or mat, means for clamping such material, and means for moving said clamp to transfer the clamped material to said feeding devices, and means for releasing said clamp to deposit the material upon the feeding devices, as and for the purpose set forth.

2. In a machine for making packing-covers and the like, the combination with the stitching mechanism and feeding devices, of a table adapted to receive the material in the form of a single mat, pivotally-mounted and relatively movable clamping-arms for grasping such mat, means for moving said arms relatively to each other to clamp such mat, means for swinging said arms about their pivotal support to transfer such mat to the feeding devices, and means for releasing said clamping-arms to deposit the mat upon the feeding devices, as and for the purpose set forth.

3. In a machine for making packing-covers and the like, the combination with the stitching and feeding devices, of a table adapted to receive a sufficient quantity of the material in the form of a mat to form a single cover, adjustable stops for regulating the width of such mat, and means for bodily transferring such mat to and depositing the same upon the feeding devices, as and for the purpose set forth.

4. In a machine for making packing-covers and the like, the combination with the stitching and feeding devices, of a series of slats arranged to form a table for receiving and supporting a sufficient quantity of the material to form a single cover in the form of a mat of uniform thickness and suitable width, clamping-arms arranged to operate between said slats for clamping said mat, and means for rocking said arms, whereby the said mat is transferred to the feeding devices, and means for releasing said clamping-arms to deposit the mat upon said feeding devices, as and for the purpose set forth.

5. In a machine for making packing-covers and the like, the combination with the stitching and feeding devices, of a table adapted to receive the material in sufficient quantity to form a single cover in the form of a mat, a rock-shaft journaled adjacent to said table, clamp-arms arranged in coöperating pairs and mounted thereon and adapted to clamp said mat, and means for rocking said shaft whereby the mat is bodily transferred to said feeding devices, and means for opening and closing said coöperating pairs of clamp-arms to clamp and release the mat, as and for the purpose set forth.

6. In a machine of the class described, a table adapted to receive the material in sufficient quantity to form a single mat, a stitching mechanism and feeding devices, in combination with a transferring device for the material, comprising a rock-shaft, clamping-arms mounted thereon in coöperating pairs, means for relatively moving the members of the pairs of clamping-arms to clamp and release the material, and means for periodically rocking said shaft to effect the transfer and delivery of the material, whereby each mat is separately clamped and transferred from said table to said feeding devices and deposited thereon for presentation to the stitching devices, as and for the purpose set forth.

7. The combination with stitching and feeding devices, and a table adapted to receive the material in sufficient quantity to form a single mat, of a transferring mechanism including a rock-shaft, hubs mounted thereon to rotate therewith, each carrying a clamping-arm, coöperating hubs loosely mounted on said shaft and carrying coöperating clamping-arms, means for rotarily displacing said loosely-mounted hubs to open and close said clamping-arms, and means for rocking said shaft whereby such mat is clamped and transferred from said table to said feeding devices and deposited thereon for presentation to the stitching devices, as and for the purpose set forth.

8. The combination with stitching and feeding devices, and a table adapted to receive the material in sufficient quantity to form a single mat, of a transferring mechanism including a rock-shaft, a series of clamping-arms mounted thereon to rotate therewith, a coöperating series of clamping-arms loosely mounted on said shaft for independent rotative movement thereon relative to said first-mentioned series of arms, means for moving said loosely-mounted arms to close upon and to open with respect to said first-mentioned arms, and means for rocking said shaft whereby such mat is clamped and transferred from said table to said feeding devices and deposited thereon for presentation to the stitching devices, as and for the purpose set forth.

9. The combination with stitching and feeding devices, and a table adapted to receive the material in sufficient quantity to form a single mat, of a transferring mechanism including a rock-shaft, a series of clamping-arms mounted thereon to rotate therewith, a coöperating series of clamp-arms loosely mounted on said shaft, means normally tending to close said loosely-mounted arms upon the first-mentioned arms, a stop-catch for holding said loosely-mounted arms in open position, means for releasing the same, and means for rotating said shaft whereby such mat is clamped and transferred from said table to said feeding devices and deposited thereon for presentation to the stitching devices, as and for the purpose set forth.

10. The combination with stitch-forming mechanism and feeding mechanism of a transferring-shaft, hubs mounted thereon to rotate therewith, and carrying clamp-arms, coöperating hubs loosely mounted upon said shaft and carrying coöperating arms, springs arranged to normally act to close said loosely-mounted arms upon the first-mentioned arms, a stop for maintaining said loosely-mounted arms in open position, means for releasing said stop, and means for rotating said shaft, as and for the purpose set forth.

11. The combination with stitch-forming mechanism and feeding mechanism of a transferring-shaft, clamp-arms carried thereby to rotate therewith, coöperating clamp-arms loosely mounted on said shaft, a rod connected to move with said shaft and arranged to engage said loosely-mounted arms, a spring connected to said rod and normally acting to close said loosely-mounted arms upon the first-mentioned arms, a stop for maintaining said rod in retracted position, means for releasing said stop, and means for rocking said shaft, as and for the purpose set forth.

12. The combination with a table adapted to receive the material in sufficient quantity to form a single mat, a stitching mechanism, feeding devices for presenting the material to said stitching mechanism, and a transferring-shaft, of a series of stationary, and a coöperating series of relatively movable, clamp-arms, carried by said shaft, springs normally acting to close said movable arms upon the relatively stationary arms, a stop for holding said arms in open position, a cam for periodically releasing said stop, and means for relatively moving said shaft, whereby each mat is clamped and transferred from said shaft to said feeding devices and deposited thereon for presentation to the stitching mechanism, as and for the purpose set forth.

13. The combination with stitch-forming mechanism and feeding mechanism of a transferring-shaft, a series of stationary clamp-arms and a coöperating series of relatively movable clamp-arms carried by said shaft, a rod connected to said movable clamp-arms, a disk mounted on said shaft and connected to said rod, and provided with a shoulder, a spring operating upon said rod to close said movable arms upon said relatively stationary arms, a pawl arranged to engage said shoulder, a lever for operating said pawl, a cam for actuating said lever, and means for rocking said shaft, as and for the purpose set forth.

14. The combination with a table adapted to receive the material in sufficient quantity to form a single mat, a stitching mechanism, feeding devices for presenting the material to said stitching mechanism, and a transferring-shaft, of a series of stationary clamp-arms, and a coöperating series of relatively movable clamp-arms carried by said shaft, means for periodically opening and closing said movable arms relative to said stationary arms, means for locking said shaft against rotation while said clamp-arms are in open position, and means for rotating said shaft when said arms are closed, whereby such mat is clamped and transferred from said table to said feeding devices and deposited thereon for presentation to the stitching mechanism, as and for the purpose set forth.

15. The combination with stitch-forming mechanism and feeding mechanism of a transferring-shaft, a series of stationary hubs and a coöperating series of relatively movable hubs mounted on said shaft, a pair of oppositely-projecting clamp-arms carried by each hub, said hubs being arranged in coöperating pairs, means for holding the hubs of each pair rotatively displaced against a tension, whereby the clamp-arms of one hub are in open position relative to the arms of the other hub, means for periodically releasing said holding means, and means for rotating said shaft a half-revolution when said holding means are released, as and for the purpose set forth.

16. In a machine of the class described, stitch-forming mechanism and feeding mechanism, in combination with a transferring mechanism including a shaft, clamp-arms carried thereby, means for rotatively moving said shaft, and a support for the arms when in position to receive the material to be clamped, said support being yieldingly mounted to permit the arms to pass by it, as and for the purpose set forth.

17. In a machine of the class described, stitch-forming mechanism and feeding mechanism, in combination with a transferring mechanism including a shaft, clamp-arms carried thereby, means for rotatively moving said shaft, a lever arranged to project into the path of said arms, and a spring for yieldingly holding said lever in position, whereby said arms are permitted to pass by said lever and then to be supported thereby, as and for the purpose set forth.

18. In a machine of the class described, a table adapted to receive the material to be operated on, a pivotally-mounted clamp having clamping-arms arranged to grasp a sufficient amount of the material to form a single mat, an endless feed-carrier, means for moving said clamp-arms into position to transfer the mass of material bodily to, and to deliver the same upon, said carrier, a stitching mechanism, a main drive-shaft, and means actuated from said main drive-shaft for operating these several parts, as and for the purpose set forth.

19. In a machine of the class described, a main drive-shaft, a counter-shaft having sprocket-gears thereon, means for imparting a step-by-step rotation to said counter-shaft from the main drive-shaft, feed-carriers arranged to be engaged and actuated by said sprocket-gears, an auxiliary counter-shaft carrying sprocket-gears, auxiliary feed-carriers actuated thereby and arranged over and coöperating with said first-mentioned carriers to feed the material, and gearing actuated by said first-mentioned counter-shaft for actuating said auxiliary counter-shaft, in combination with clamping-arms arranged to receive the material in sufficient quantity to form a single mat, means for actuating said clamping-arms to transfer such material to and deposit the same upon said carrier, and stitch-forming mechanism past which the carrier operates, as and for the purpose set forth.

20. In a machine of the class described, a stitching mechanism and a clamping and transferring mechanism arranged to successively receive and transfer the material, in sufficient quantities to form single mats or covers, to feed devices for presentation to said stitching mechanism, in combination with feed devices comprising a feed-carrier, a coöperating auxiliary carrier, said carriers adapted to engage and feed the material between them, and a presser-roll arranged to hold said carriers steadily to their work adjacent to the stitching mechanism, and means for actuating said carriers, as and for the purpose set forth.

21. In a machine of the class described, a stitching mechanism comprising a reciprocating frame, a needle carried thereby, in combination with a pin or rod, a support therefor, said support also connected to said frame, a link connected to said support and pin or rod, means for reciprocating said frame, and means connected to said link for relatively reciprocating said pin or rod, as and for the purpose set forth.

22. In a machine of the class described, a stitching mechanism including a reciprocating frame, a needle mounted thereon and having an inclined opening through the shank thereof, a pin or rod arranged to operate through said opening, a pivoted link connected to said pin or rod, said link being pivotally mounted upon said frame, means for reciprocating said frame, and independent means for rocking said link, as and for the purpose set forth.

23. In a machine of the class described, a stitching mechanism including a needle having a hooked end, and an inclined opening through the shank thereof, a pin operating through said opening, a frame carrying said needle and pin, a crank-arm for reciprocating said frame, and a rod having a slot engaging said crank-arm, said rod connected to said pin, whereby relative movement is imparted to said needle and pin, as and for the purpose set forth.

24. In a machine of the class described and in combination with stitch-forming mechanism, a reciprocating frame, a needle carried thereby, an arm supported on said frame, a lever connected to said arm, a pin carried by said lever and arranged to coöperate with the needle, a driving-crank for said frame, and a rod having a slot engaging said crank, said rod connected to said pin-supporting lever, as and for the purpose set forth.

25. In a machine of the class described, a reciprocating frame, a series of needles carried thereby, a series of arms also supported on said frame, a lever connected to each arm, a pin supported by each lever and arranged to coöperate with its corresponding needle, a rod connecting all of said levers, a driving-crank for said frame, and a pitman having slotted connection with said driving-crank and connected to said rod, as and for the purpose set forth.

26. In an apparatus of the class described, a main shaft, a counter-shaft, gearing for actuating the latter from the former, comprising a loose gear mounted on said counter-shaft and provided in the hub thereof with a pocket or recess, a wheel mounted on to rotate with said counter-shaft, and a clutch-lever carried by said wheel, said lever carrying a pin adapted to be received in said pocket, whereby said gearing is clutched to rotate with said counter-shaft, said lever provided with a tailpiece whereby it may be rocked into and out of position for the pin thereon to enter said pocket, a lever for engaging said tailpiece, said lever provided with a stop arranged to engage said wheel, whereby when said lever is actuated said gear is unclutched and said wheel is coincidently arrested, a stitching mechanism actuated from said counter-shaft, and means for actuating said lever, as and for the purpose set forth.

27. In an apparatus of the class described, a stitching mechanism, a shaft for actuating the same, a main drive-shaft for rotating said first-mentioned shaft, including a loosely-mounted gear having a pocket in the hub thereof, a wheel fixed upon said shaft, said wheel provided with a shoulder, a clutch-lever pivoted upon said wheel and having a pin adapted to be received in said pocket, a lever arranged when actuated to disengage said clutch-lever from said pocket, said lever provided with a projection arranged to engage the shoulder on said wheel, whereby, simultaneously with the disengagement of said clutch-lever, said wheel is arrested, and means for actuating said lever, as and for the purpose set forth.

28. In an apparatus of the class described, a stitching mechanism, actuating mechanism therefor including a clutch, a spring normally acting to release said clutch, a lever, a stop arranged to support said lever in position to hold said spring retracted, a stitching-thread-severing mechanism, means normally acting to move said severing mechanism to sever the thread, a latch for maintaining said severing mechanism in retracted position, means for releasing said stop, whereby said clutch is unclutched, and means actuated by the movement of said lever, when released, for releasing said latch, whereby said severing mechanism is actuated, and means for restoring all these parts to their initial positions, as and for the purpose set forth.

29. In a machine of the class described, the combination with a table arranged to receive thereon the material to be operated on, a clamping and transferring device comprising coöperating clamping-arms arranged to receive therebetween from the table a sufficient quantity of material to form a single mat, an endless carrier, means for revolving said clamping-arms to bodily transfer the mass of material to form a single mat from the table and deliver the same onto said carrier, a stitching mechanism, means for actuating the same, and means for imparting a step-by-step feed to said carrier to present the material to the action of said stitching mechanism, as and for the purpose set forth.

30. The combination with coöperating clamp-arms adapted to receive therebetween the material in sufficient quantity to form a single mat, a carrier, means for moving said clamp-arms to transfer said material to said carrier, means for opening and closing said clamp-arms to clamp and release said material, means for holding said clamp-arms in stationary position and against movement during the initial movement of said carrier to enable said carrier to properly receive said material, a stitching mechanism past which said carrier operates, and means for actuating these several parts, as and for the purpose set forth.

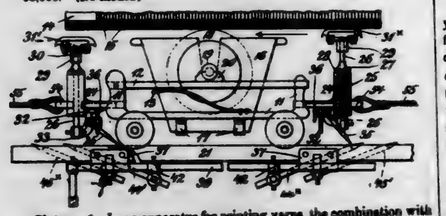
31. The combination with clamping-arms arranged in coöperating pairs, means for opening and closing the coöperating members of said pairs of arms to receive and clamp therebetween the material in sufficient quantity to form a single mat, a feed-carrier having projecting pins, means for moving said pairs of clamping-arms, with the material clamped therebetween, into position for the pins on said carrier to engage said material, means for holding said clamping-arms in stationary position during the initial movement of said carrier, a stitching mechanism past which said carrier operates, and means for actuating these several parts, as and for the purpose set forth.

32. The combination with clamping-arms arranged in coöperating pairs, a shaft upon which said arms are mounted, means for relatively moving the members of said pairs of arms to open and close the same, means for rocking said shaft to swing said clamping-arms into position to deposit the material clamped therebetween, a carrier to which said arms deliver, means for holding said clamping-arms in delivering position during the initial movement of said carrier, an auxiliary carrier arranged in parallel relation with respect to and over and above said first-mentioned carrier, said carriers forming a passage therebetween to receive the material, a stitching mechanism to which said carriers deliver, and means for actuating the several parts, as and for the purpose set forth.

33. The combination with a feed-carrier, of an auxiliary carrier arranged in parallel relation with respect thereto, and over said first-mentioned carrier, thereby forming a passage between said carriers, clamping-arms adapted to receive and clamp therebetween a sufficient quantity of the material to form a single mat, means for actuating said clamping-arms to deliver the material clamped therebetween upon the upper surface of said carrier and at a point in advance of said auxiliary carrier, means for holding said clamping-arms in delivering position during the initial movement of said carrier, a stitching mechanism to which said carrier delivers, and means for actuating these several parts, as and for the purpose set forth.

34. The combination with stitching and feeding devices, of a transferring mechanism comprising coöperating clamping-arms adapted to receive therebetween the material in sufficient quantity to form a single cover, a shaft upon which said clamp-arms are mounted, means for relatively moving said clamp-arms to open and close the same, a drive-gear mounted on said shaft, a pawl for actuating said drive-gear, means for actuating said pawl to impart periodic rotation through definite distances to said shaft, whereby said clamp-arms are successively moved to receiving and delivering positions, a carrier to which said arms deliver, and a stitching mechanism past which said carrier operates, as and for the purpose set forth.

705,384. APPARATUS FOR COLORING YARNS. ALFRED FORHANDER, New York, N. Y., assignor to the Carpet Yarn Printing Company, a Corporation of New York. Filed Feb. 14, 1902. Serial No. 93,969. (No model.)



Claim.—1. In an apparatus for printing yarns, the combination with the yarn-drum, the color-carriage and the color-wheel, of a scraper, a spring having a seat stationary with reference to the color-carriage for forcing the scraper toward the drum, and means for withdrawing the scraper from the drum and thereby increasing the strain upon the spring.

2. In an apparatus for printing yarns, the combination with the yarn-drum, the color-carriage and the color-wheel, of a scraper, a spring having a seat stationary with reference to the color-carriage for confining the scraper in contact with the yarn on the drum, and means for holding the scraper at a distance from the yarn on the drum and for simultaneously holding said spring under greater strain than is imparted to it while confining the scraper in contact with the yarn.

3. In an apparatus for printing yarns, the combination with the yarn-drum, the color-carriage and the color-wheel, of a scraper, a spring having a seat stationary with reference to the color-carriage for forcing the scraper toward the drum, means for withdrawing the scraper from the drum and thereby increasing the strain upon the spring, and means for adjusting such strain upon the spring.

4. In an apparatus for printing yarns, the combination with the yarn-drum, the color-carriage and the color wheel, of a scraper, a spring for forcing the scraper toward the drum, means for holding the scraper at a distance from the yarn on the drum and for simultaneously holding said spring under greater strain than is imparted to it while so confining the scraper in contact with the yarn, and appliances for releasing said spring from such increased strain after the scraper has passed underneath the drum.

5. In an apparatus for printing yarns, the combination with the yarn-drum, the color-carriage and the color-wheel, of a scraper, means for placing said scraper in a position lower than the yarn on the drum while said scraper is ahead of the color-wheel and for so maintaining it on its return trip until after it passes underneath said drum, and mechanism for forcing the scraper upward and against the yarn after it has passed underneath the drum.

6. In an apparatus for printing yarns, the combination with the yarn-drum, the color-carriage and the color-wheel, of a scraper, means for holding said scraper in an elevated position while it travels behind the color-wheel and underneath the drum and for afterward maintaining it in an elevated position until after the direction of the travel of the carriage has been reversed and said scraper has thereby been placed ahead of the color-wheel, and mechanism for lowering said scraper after such reversal.

7. In an apparatus for printing yarns, the combination with the yarn-drum, the color-carriage and the color-wheel, of a scraper, a post upon which it is mounted, a spring placed around said post and adapted to actuate the same, a casing surrounding said spring and a portion of said post, and a cap fitted around said post and tightly secured to the upper portion of said casing and serving as a guide for said post.

8. In an apparatus for printing yarns, the combination with the yarn-drum the color-carriage and the color-wheel, of a bracket on the carriage, a scraper, a support for the same movably mounted upon said bracket, a lever for actuating said support, and means for confining said lever in contact with the under side of the bracket in two different positions corresponding with the operative and a non-operative position of the scraper.

9. In an apparatus for printing yarns, the combination with the yarn-drum, the color-carriage and the color-wheel, of a scraper, a support for the same, a guide along which said support slides, a rocking lever for raising and lowering the support, a tripper for actuating said lever, and a spring for enforcing operative contact between the lever and the tripper.

10. In an apparatus for printing yarns, the combination with the yarn-drum, the color-carriage and the color-wheel, of a scraper, a support for the same, a guide along which said support slides, a rocking lever for raising and lowering the support, a tripper for actuating said lever, and a spring for enforcing operative contact between the scraper and the yarn, and between the lever and the trippers.

11. In an apparatus for printing yarns, the combination with the yarn-drum, the color-carriage and the color-wheel, of bracket 24, a scraper, post 26 supporting the same, spring 25, stud 32, link 33, lever 35 and means for actuating said lever, substantially as specified.

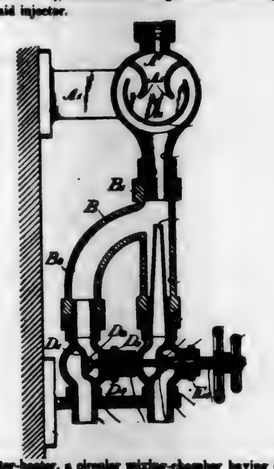
12. In an apparatus for printing yarns, the combination with the yarn-drum the color-carriage and the color-wheel, of a scraper, a support for the same adapted to be raised and lowered, and a stationary tripping device, and a movable tripping device, one for raising the scraper and the other for lowering said scraper, and elastic means for permitting said support to engage with one of said tripping devices while moving in one direction without actuating the scraper, and for enforcing movement of the scraper as said support engages with said tripping device while moving in the opposite direction.

13. In an apparatus for printing yarns, the combination with the yarn-drum, the color-carriage and the color-wheel, of a scraper, a support for the same adapted to be raised and lowered, and a tripping device, and means for permitting said support to engage with said tripping device while moving in one direction without actuating the scraper and for enforcing movement of the scraper as said support engages with said tripping device while moving in the opposite direction.

14. In an apparatus for printing yarns, the combination with the yarn-drum, the color-carriage and the color-wheel, of a scraper, means mounted upon the carriage for raising and lowering the same, a shaft revolubly mounted placed along the track, a cross-bar attached to said shaft, and an inclined tripper for actuating the means for raising the scraper attached to said cross-bar, and treadle mechanism for revolving said shaft and for placing said actuating device in an inoperative position.

705,385. WATER-HEATER. JOSEPH FOSTER, Brooklyn, N. Y. Filed Jan. 23, 1902. Serial No. 90,742. (No model.)

Claim.—1. In a water-heater, a circular mixing-chamber having oppositely-arranged inlet and outlet, a deflecting-plate parallel to the wall of said mixing-chamber opposite said inlet, curved guiding-plates extending outward from the wall of said mixing-chamber on either side of said outlet, said guiding-plates extending around the ends of said deflecting-plate to cause impingement of water against said deflecting-plate, an injector connected with the inlet of said mixing-chamber and provided with a heating-nozzle in line with said inlet to discharge water against said deflecting-plate, a curved water-passage communicating with said heating-nozzle, and interlocking water and heating valves controlling the supply of fluids to said injector.



2. In a water-heater, a circular mixing-chamber having diametrically-arranged inlet and outlet, a deflecting-plate concentric with the wall of said mixing-chamber opposite said inlet, curved guiding-plates extending outward from the wall of said mixing-chamber on either side of the outlet of the same, said guiding-plates extending around the ends of said deflecting-plate to cause impingement of the water against said deflecting-plate, an injector connected with the inlet of said mixing-chamber and interlocking valves to govern the admission of water and heating fluid to said injector.

3. In a water-heater, a circular mixing-chamber having diametrically-arranged inlet and outlet, there being a concentric deflecting-plate in said mixing-chamber opposite said inlet and curved guiding-plates extending from the wall of said mixing-chamber around the ends of said deflecting-plate, a water-valve and a heating-valve connected to said mixing-chamber and an interlocking water-handle and heating-handle to govern said valves.

4. In a water-heater a circular mixing-chamber having a concentric deflecting-plate opposite the inlet of said chamber and guiding-plates extending out from the wall of said mixing-chamber around the ends of said deflecting-plate to cause eddies in the space between said guiding-plates, the outlet of said mixing-chamber being situated between said guiding-plates and an injector connected with the inlet of said mixing-chamber and provided with a heating-nozzle in line with said inlet.

5. In a water-heater, a mixing-chamber, an injector in line with the inlet of said mixing-chamber and interlocking apparatus for the admission of fluids to said injector in varying proportions.

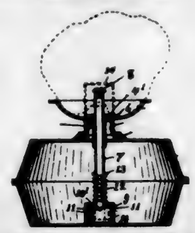
6. In a water-heater a circular mixing-chamber having diametrically-arranged inlet and outlet, a deflecting-plate concentric with the wall of said mixing-chamber opposite said inlet, curved guiding-plates extending outward from the wall of said mixing-chamber on either side of the outlet of the same, said guiding-plates extending around the ends of said deflecting-plate to cause impingement of water against said deflecting-plate and an injector connected with the inlet of said mixing-chamber the heating-nozzle of said injector being in line with said inlet.

7. In a water-heater, a mixing-chamber provided with an inlet and an outlet, an injector connected with the inlet of said mixing-chamber and provided with a heating-nozzle in line with said inlet, adjustable valves to control the supply of fluids to said injector, an incurved deflecting-plate opposite the inlet of said mixing-chamber against which the fluid from said injector impinges and guiding-plates extending around the ends of said deflecting-plate to cause eddies in the space between said guiding-plates to thoroughly mix the fluid issuing from the outlet of said mixing-chamber.

8. In a water-heater, a mixing-chamber having an inlet and outlet, an injector connected to said inlet and having a heating-nozzle in line with the same, an incurved deflecting-plate opposite the inlet in said mixing-chamber against which fluid from said injector impinges and guiding-plates extending around the ends of said deflecting-plate to thoroughly mix the fluid issuing from the outlet of said mixing-chamber.

9. In a water-heater, a mixing-chamber having an inlet, a curved deflecting-plate opposite said inlet and guiding-plates coöperating with said deflecting-plate to produce eddies in said mixing-chamber, an injector connected to said inlet and having a steam-nozzle in line with the same to cause hot water to impinge upon said deflecting-plate, and interlocking valves to control the supply of steam and water to said injector.

705,386. DISPENSING-CAN. FREDERICK M. FURBER, Haverhill, Mass. Filed Apr. 17, 1902. Serial No. 103,336. (No model.)



Claim.—1. A device for the purpose described comprising a closed can, a liquid-receiving cup above said can, a reciprocating tubular nozzle in said can the discharge end of which extends through the bottom of said cup, means operated upon reciprocation of said nozzle for expelling the liquid therethrough, and a discharge-passage leading from the bottom of said cup to the can, substantially as described.

2. A device for the purpose described comprising a closed can, a reciprocating tubular nozzle which extends through the top thereof, a piston secured to the lower end of said nozzle, a relatively fixed cylinder in which said piston is located having an unobstructed inlet thereto at its upper end, and being closed at its lower end, a spring which is interposed between said piston and cylinder and normally holds said piston above said inlet, substantially as described.

3. A device for the purpose described comprising the closed can, a spring-pressed tubular nozzle which is adapted to reciprocate through the top of said can, a liquid-expelling device which is connected to the lower end of said nozzle, a cup which is arranged on the upper end of said can, and through the bottom of which said nozzle protrudes, and a liquid-tight connection between the bottom of said cup and the top of the can which completely encircles the aperture through which said nozzle passes, substantially as described.

4. A device for the purpose described comprising the closed can, a spring-pressed tubular nozzle which is adapted to reciprocate through the top of said can, a liquid-expelling device which is connected to the lower end of said nozzle, a circular cup which is arranged on the upper end of said can and through the middle of the bottom of which said nozzle extends, a liquid-tight connection between the bottom of said cup and the top of the can which encircles the aperture through which the nozzle passes, and a discharge-passage which leads from the bottom of said cup to said can within said connection, substantially as described.

5. A device for the purpose described comprising a can, a screw-cap for closing the top thereof, a cup which is secured to the top of said cap, a tubular guide which is secured to and passes through said cup, a spring-pressed tubular nozzle which is arranged in said guide, the upper end of the nozzle being located in said cup and the lower end in said can and a liquid-expelling device which is connected to the lower end of said nozzle, substantially as described.

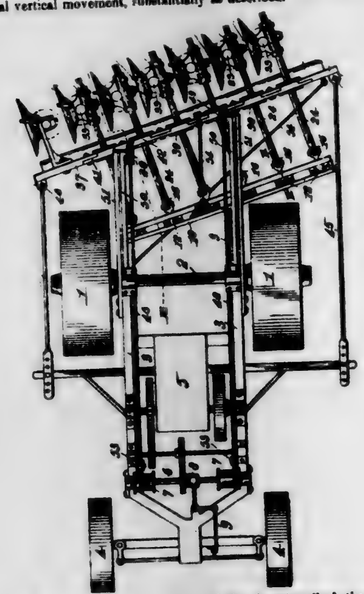
6. A device for the purpose described comprising the closed can, a tubular nozzle which passes through the top of said can and is guided to reciprocate in an upright position therein, a cylinder which rests on the bottom of said can, said cylinder being closed at its lower end and provided with a spring-support and inlets to the can at its upper end, a piston in said cylinder, said nozzle extending through said support and piston and being secured to the latter, a stop on said nozzle and a spring interposed between said stop and said spring-support, substantially as described.

705,387. MOTOR-PLOW. RICHARD J. GATLING, St. Louis, Mo. Filed Sept. 6, 1901. Serial No. 74,580. (No model.)

Claim.—1. In an agricultural implement of the character described, the combination of a drag member, a series of plows independently connected to said drag member, journals on which said plows are mounted, oil-wells carried by said journals, and weights mounted on said oil-wells adapted to hold said plows depressed, substantially as described.

2. In an agricultural implement of the class described, the combination with a drag member, of a series of draw-rods independently connected to said drag member, a guide-bar in which said draw-rods are ar-

ranged to move vertically, and disk plows carried by said draw-rods independently of each other, whereby said plows are rendered capable of individual vertical movement, substantially as described.



3. In an agricultural implement of the class described, the combination with a drag member, of a series of draw-rods, plows carried by said draw-rods independent of each other, a guide-plate, and vertically-movable slide-boxes arranged in said guide-plate and in which said draw-rods are seated for vertical movement independent of each other, substantially as described.

4. In an agricultural implement of the class described, the combination with a drag member, of a series of draw-rods independently connected to said drag member, a series of plows independently connected to said draw-rods, a slotted guide-plate, slide-boxes loosely seated in the slots in said plate and adapted for vertical movement therein, said slide-boxes being arranged to receive and guide said draw-rods and permit the vertical movement of said plows, substantially as described.

5. In an agricultural implement of the class described, the combination with a drag member, of a series of draw-rods connected to said member, plows carried by said draw-rods, a guide-plate, slide-boxes in said guide-plate in which said draw-rods are seated, and weights supported by said plows adapted to depress the plows into the ground, substantially as described.

6. In an agricultural implement of the class described, the combination with a drag member, of a series of draw-rods, plows carried by said rods, a guide-plate in which said draw-rods are mounted, and a deflector carried by said guide-plate, substantially as described.

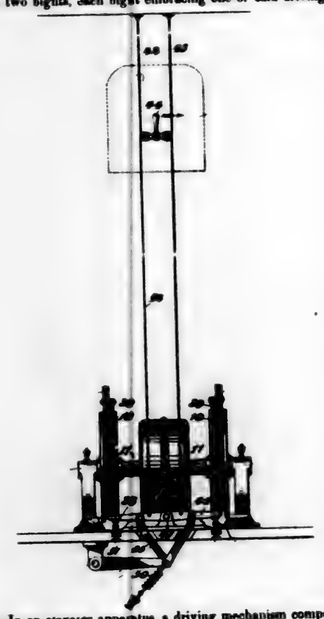
7. In an agricultural implement of the class described, the combination of a drag member, a series of journal-boxes mounted on said drag member, swivels having stems mounted in said journal-boxes, arms carried by said swivels, an adjustable slide mounted on said journal-boxes and provised with sockets adapted to receive said swivel-arms, draw-rods connected to said swivels, and plows carried by said draw-rods, substantially as described.

8. In a motor-driven implement, the combination of a motor for propelling the same, of a drag member, of a series of earth-engaging implements carried by said drag member, weights for depressing said drag member and means operated by said motor for raising said member.

9. In a motor-plow, the combination of a motor, of a drag member, of a series of plows carried by said drag member, of weights carried by each of said plows for depressing the same, of ropes for raising said plows, and drums operated by said motor, said drums adapted to wind said ropes and raise said plows.

705,888. ELEVATOR. EDWIN R. GILL, New York, N. Y., assignor, by mesne assignments, to Otis Elevator Company, a Corporation of New Jersey. Filed Dec. 16, 1899. Serial No. 740,522. (No model.)

Claim.—1. In an elevator apparatus, a driving mechanism comprising two expansible pulleys, each of which comprises a driving-disk, a bearing-disk divided into sectors sliding radially on said driving-disk, and an independently-rotatable brake-disk operating to change the diameter of said bearing-disk; in combination with an endless driving-cable arranged in two bights, each bight embracing one of said driving-pulleys.



2. In an elevator apparatus, a driving mechanism composed of two expandible pulleys, each comprising a bearing member and an independently-rotating brake member operating to contact said bearing member when retarded; in combination with gearing connecting said brake members for opposite movement and means for applying retarding pressure to one or the other brake member at will.

3. In an elevator apparatus, a driving-motor having a rotating member and attached main driving-shaft, a two-part driving-pulley having one part expandible, two brake-disks sleeved on said shaft, which operate the expanding part of said pulley, gearing on the rotating part of said motor joining said sleeves for independent contrary rotation thereon, and means for operating said brake-disks.

4. In an elevator, a driving mechanism, comprising two pulleys one of which is expandible and comprises a brake-disk for controlling its effective diameter; in combination with brake mechanism, and means operated by said expandible part for relieving the pressure on said brake.

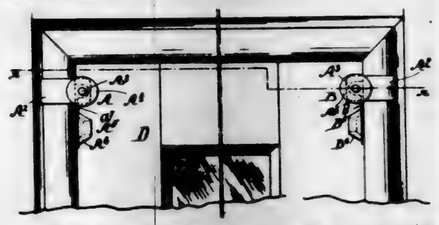
5. In an elevator, a driving mechanism, comprising two pulleys one of which is expandible and comprises a brake-disk for controlling its effective diameter; in combination with a brake mechanism, an operating-lever adapted to apply pressure thereto, a disk moving in and out with the periphery of the expanding pulley, and means controlled by said disk for relieving the pressure on said brake.

6. In an elevator, a driving mechanism, comprising two pulleys one of which is expandible and comprises a brake-disk for controlling its effective diameter; in combination with a brake shoe and lever, an operating-lever therefor having a movable fulcrum, a support for said fulcrum and a disk moving in and out with the periphery of the expanding pulley affording an abutment for said support.

7. In an elevator, a driving mechanism comprising two pulleys each of which is expandible and comprises a brake-disk for controlling its effective diameter, and gearing between said disks insuring opposite movement thereof; in combination with a brake for each brake-disk, a brake-lever for operating each brake, and a tipping bar adapted to press on both levers and arranged to depress one lever while permitting the other to rise.

705,839. ROLLER-BRACKET FOR WINDOW SHADES AND CURTAINS. FRANCIS A. CRONESO, Baltimore, Md., assignor of one-half to Charles B. Houghton, Baltimore, Md. Filed Nov. 23, 1901. Serial No. 83,536. (No model.)

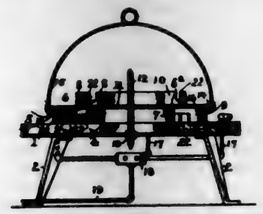
Claim.—1. In a bracket for shade and curtain rollers, the combination with a jaw carrying a threaded horizontal rod of a second jaw sliding freely on said rod, an adjusting-nut outside of said second jaw and in threaded engagement with the rod for causing the jaws to clamp the guide-strip of a window-frame, and a journal-bearing having a portion in threaded engagement with the rod to horizontally adjust the bearing along the same.



2. In a bracket for shade and curtain rollers, the combination with a jaw carrying a threaded horizontal rod, of a second jaw sliding freely on the latter, an adjusting-nut outside of said second jaw and in threaded engagement with the rod, for causing the jaws to clamp the guide-strip of a window-frame, a head in threaded engagement with the rod for adjustment along the same and suspending a bearing-box.

3. In a bracket for shade and curtain rollers, the combination with an angular jaw comprising portions a, a', toothed or serrated at their inner sides, an outer ear integrally projecting from the portion a, a threaded horizontal rod connected with said ear, a second jaw comprising portions a^{10}, a^{11}, correspondingly toothed or serrated, said second jaw having a similarly-projecting ear through which the rod freely passes, and a nut for causing the portions a, a^{10}, to clamp the guide-strip and inwardly move the portions a', a^{11}, to do likewise.

705,840. TIRE-HEATER. JACOB GOSS, Toledo, Ohio. Filed Mar. 26, 1902. Serial No. 100,102. (No model.)



Claim.—1. In a tire-heater, the combination with a table or hearth for supporting the tire, of a reversible cover having in its opposite faces annular heating-channels adapted for closely confining the heat around tires on the hearth, and means for heating the channels and tires, substantially as described.

2. In a tire-heater, the combination with a table or hearth for supporting the tire, of a reversible cover having in its opposite faces heating-channels of different diameters adapted for closely confining the heat around tires of different diameters and means for heating the tires and channels, substantially as described.

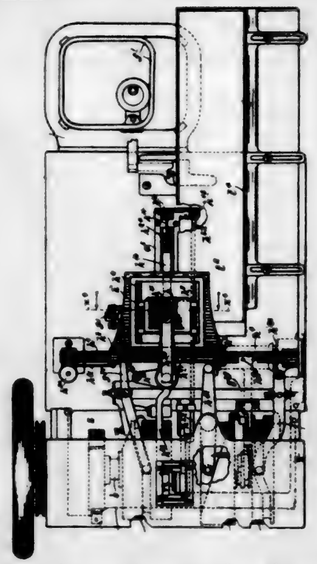
3. In a tire-heater, the combination with a table or hearth for supporting the tire, of a reversible cover having in its opposite faces annular heating-channels, a swinging bale pivotally connected with said cover and means for centering the cover and holding it in place on the hearth, substantially as described.

4. In a tire-heater, the combination with a table or hearth for supporting the tire, of a cover having annular heating-channels and a spindle secured centrally thereto for engagement with a central opening in the table, substantially as described.

5. In a tire-heater, the combination with a table or hearth for supporting the tire, of a removable cover having annular heating-channels of different diameters adapted for closely confining the heat around tires of different diameters and means for heating said channels, substantially as described.

6. In a tire-heater, the combination with a table or hearth for supporting the tire and containing heat-retaining material, of a removable cover having annular heating-channels of different diameters adapted for closely confining the heat around tires of different diameters and means for heating said channels, substantially as described.

705,841. TYPE CASTING AND SETTING MACHINE. GEORGE A. GOODSON, Minneapolis, Minn. Filed Nov. 23, 1901. Serial No. 83,360. (No model.)



Claim.—1. A representative pattern or dummy for controlling the actions of a type casting or setting machine, which pattern contains normal representations for the normal selections of character-type and, when necessary for the given composition, also contains the representation of a shift-action for coöperation to secure a different selection of character-type, substantially as described.

2. In a type casting or setting machine, the combination with a die-selecting carriage, of a bank or set of stops, for variably intercepting said carriage to make the desired selection, and a shift-action device operative to shift said bank of stops for multiplying the stopping positions available to said carriage from said bank of stops, substantially as described.

3. In an automatic type casting or setting machine, controlled by a pattern or dummy representing the desired composition, the combination with a die-selecting carriage, of a bank or set of stops under the control of said pattern, for variably intercepting said carriage to make the desired selection, and a shift-action device also controlled by said pattern and operative to shift said bank of stops for multiplying the stopping actions available to the carriage from said stops, substantially as described.

4. In a type casting or setting machine, the combination with a two-way movable die-carriage having the dies thereon arranged in rows in two directions, of two corresponding banks or sets of stops, for variably intercepting said carriage, one set of stops serving to select the row, and the other set thereof serving to select the individual die of the row, and shift-action mechanism operative to shift at least one of said banks of stops, for multiplying the stopping positions available to said carriage from said stops, substantially as described.

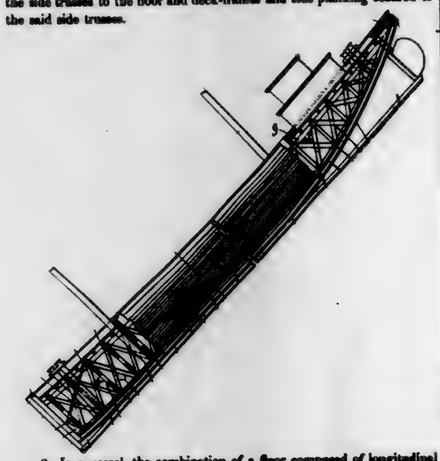
5. In an automatic type casting and setting machine controlled by a pattern or dummy representing the desired composition, the combination with a two-way movable matrix-carriage, having the matrices arranged thereon in rows in two directions, of two corresponding banks or sets of stops under the control of said pattern, for variably intercepting said carriage to select the desired matrix, and a shift-action device also controlled by said pattern and operative to shift at least one of said banks of stops, for multiplying the stopping positions available to said carriage from said stops, substantially as described.

6. The combination with a bank of magnets and armature-levers, of a bank of stops including movable members subject to said armature-levers, and a shift-action device operative to shift the position of said bank of stops relative to said armature-levers but maintaining the same subject thereto in both of the shift positions substantially as described.

705,842. CONSTRUCTION OF SHIPS. RICHARD T. GREEN, Everett, Mass. Filed Feb. 1, 1902. Serial No. 92,095. (No model.)

Claim.—1. In a vessel, the combination of a floor composed of lon-

gitudinal parallel floor-timbers and an outer planking or skin, chime-legs at the bilge edges of the floor, substantially parallel with the floor-timbers in the middle body of the vessel and curved inward at the bow, the ends of the floor-timbers being secured to the chime-legs when the latter curve inward, side trusses, mounted on the chime-legs and extending upward to the deck-frames, deck-frames, knees secured to the stanchions of the side trusses to the floor and deck-frames and side planking secured to the said side trusses.



2. In a vessel, the combination of a floor composed of longitudinal parallel floor-timbers and an outer planking or skin, chime-legs at the bilge edges of the floor, substantially parallel with the floor-timbers in the middle body of the vessel and curved inward at the bow, the ends of the floor-timbers being secured to the chime-legs when the latter curve inward, side trusses, mounted on the chime-legs and extending upward to the deck-frames, deck-frames, and side planking secured to the said side frames.

3. In a vessel, the combination of a floor composed of parallel longitudinal floor-timbers, an outer skin secured to the floor-timbers, vertical longitudinal side trusses, side planking secured thereto, and an external stem and an after dead-wood secured to the outside of the vessel independently of the water-excluding skin or planking.

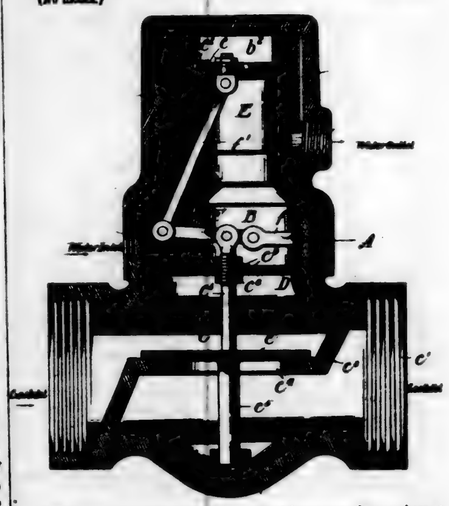
4. In a vessel, the combination of parallel longitudinal floor-timbers, chime-legs, substantially parallel to the floor-timbers in the middle body of the vessel, and bent inward to a stemson, and the chime-legs secured to the stemson, substantially as described.

705,843. CARD-INDEX. GEORGE G. HAKES, Ilion, N. Y. Filed June 19, 1901. Serial No. 65,215. (No model.)

Claim.—1. A card-index comprising a frame having a series of parallel rods pivotally mounted one above the other, spring-clamps carried by said rods, removable index-cards longitudinally mounted in said clamps, a finger carried by the lower rod and means to normally hold said finger upon the back of the cards, substantially as described.

2. A card-index, consisting of a frame, a series of parallel rods mounted one above the other in said frame, card-holding devices carried by the rods, cards removably mounted in said devices, a finger carried by the lower rod to normally engage the cards' backs, and a spring connected to said finger and to the frame to hold the finger in the proper position.

705,844. AUTOMATIC VALVE. CHARLES W. HALL, Jr., and BENNET J. BERWALD, Bradford, Pa. Filed Oct. 23, 1901. Serial No. 80,327. (No model.)



Claim.—1. An automatic valve comprising among its members, a water-chamber, a gas-chamber, a diaphragm separating said chambers, said water-chamber being provided with an inlet and outlet, a piston working in said chamber and adapted to normally close said outlet, when at one extreme of movement, and to be moved to open said outlet by the pressure of water in the chamber, said gas-chamber being provided with an inlet, an outlet, and a controlling-valve connected to said diaphragm adapted to be held in closed position by the pressure of gas in said chamber, and the pressure of water on said diaphragm, and connections from said piston to said gas-controlling valve, substantially as described.

2. An automatic valve comprising among its members, a water-chamber, a gas-chamber, a diaphragm separating said chambers, said water-chamber being provided with an inlet and outlet, a piston working in said chamber and adapted to normally close said outlet, when at one extreme of movement, and to be moved to open said outlet by the pressure of water in the chamber, said chamber having an auxiliary passage from the outlet to the side of the piston opposite that exposed to the water-pressure and a relief-vent in said piston adapted to communicate with said passage, said gas-chamber being provided with an inlet, an outlet and a controlling-valve connected with said diaphragm and held normally in closed position by the gas-pressure in said chamber and the pressure of water on said diaphragm, and connections between said piston and said gas-valve, substantially as described.

3. An automatic valve comprising among its members a water-chamber, provided with an inlet and outlet, a piston in said chamber normally closing said outlet, and adapted to be moved by the pressure of water below the piston to open said outlet, said chamber being provided with an auxiliary passage from the other side of the piston to said outlet, a normally open relief-valve in said piston, adapted to be closed by the pressure of water below the piston, a gas-chamber, a diaphragm separating the gas-chamber from the water-chamber, a gas-controlling valve in the gas-chamber connected with said diaphragm and held normally closed by the pressure of the gas from the main and the pressure of water on said diaphragm, and connections between said gas-valve and the piston in the water-chamber for opening the gas-valve, and a connection between said diaphragm and said gas-valve, substantially as described.

4. An automatic valve comprising among its members, a water-chamber and a gas-chamber each provided with independent inlets and outlets and a diaphragm separating said chambers, said water-chamber having a cylinder, a piston working therein and arranged to close the outlet when at one extreme of movement, said water-chamber having an auxiliary passage from said cylinder, above the piston, to said outlet, a relief-valve in said piston held normally open by its weight and adapted to be closed by pressure of water in the chamber, a gas-valve in said gas-chamber normally held closed by the gas-pressure in said chamber and the pressure of water on said diaphragm, a lever connected to said gas-valve, and also connected to said piston, and connections between said diaphragm and the gas-valve, substantially as described.

705,845. RAIL-JOINT. GEORGE L. HALL, Brooklyn, N. Y. Filed Feb. 14, 1902. Serial No. 94,001. (No model.)

Claim.—1. An insulated rail-joint, comprising a rail-chair having a bridge-plate and a bolt-plate, insulating material between the rail ends and said bridge-plate, a metal band separate from said chair and opposing said bolt-plate and extending across the joint, two insulating-blocks one between said bolt-plate and the rail ends and the other between said band and the rail ends and both extending across the joint, a plurality of bolts extending through the bolt-plate, insulating-blocks, rail ends, and band, insulating-bushings adapted to insulate every of said bolts passing through one of the rail ends from both said bolt-plate and said band, and means for maintaining the rail ends from contact with each other.

2. An insulated rail-joint comprising a rail-chair having a spike-plate for spiking said chair to the tie, a bridge-plate and a bolt-plate, insulating material between the rail ends and said bridge-plate, a metal band separate from said chair and opposing said bolt-plate and extending across the joint, two insulating-blocks one between said bolt-plate and the rail ends and the other between said band and the rail ends and both extending across the joint, a plurality of bolts extending through the bolt-plate, insulating-blocks, rail ends, and band, insulating-bushings adapted to insulate every of said bolts passing through one of the rail ends from both said bolt-plate and said band, and means for maintaining the rail ends from contact with each other.

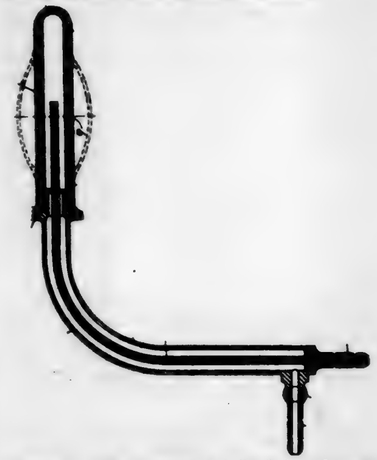
3. An insulated rail-joint comprising a rail-chair having a bridge-plate and a bolt-plate, insulating material between the rail ends and said bridge-plate, means for holding said insulating material in proper position on said bridge-plate independent of the other parts of the joint, a metal band separate from said chair and opposing said bolt-plate and extending across the joint, two insulating-blocks one between said bolt-plate and the rail ends and the other between said band and the rail ends and both extending across the joint, a plurality of bolts extending through the bolt-plate, insulating-blocks, rail ends, and band, insulating-bushings adapted to insulate every of said bolts passing through one of the rail ends from both said bolt-plate and said band, and means for maintaining the rail ends from contact with each other.

4. An insulated rail-joint comprising a rail-chair having a spike-plate for spiking said chair to the tie, a bridge-plate and a bolt-plate, insulating material between the rail ends and said bridge-plate, means for holding said insulating material in proper position on said bridge-plate independent of the other parts of the joint, a metal band separate from said chair and opposing said bolt-plate and extending across the joint, two insulating-blocks one between said bolt-plate and the rail ends and the other between said band and the rail ends and both extending across the joint, a plurality of bolts extending through the bolt-plate, insulating-blocks, rail ends, and band, insulating-bushings adapted to insulate every of said bolts passing through one of the rail ends from both said bolt-plate and said band, and means for maintaining the rail ends from contact with each other.

5. An insulated rail-joint comprising a rail-chair having a bridge-plate and a bolt-plate, insulating material between the rail ends and said bridge-plate, means for holding said insulating material in proper position consisting of a tongue of the same adapted to be inserted in a mouth in the bridge-plate, a metal band separate from said chair and opposing said bolt-plate and extending across the joint, two insulating-blocks one between said bolt-plate and rail ends and the other between said band and the rail ends, and both extending across the joint, a plurality of bolts extending through the bolt-plate, insulating-blocks, rail ends, and band, insulated bushings adapted to insulate every of said bolts passing through one of the rail ends from both said bolt-plate and said band, and means for maintaining the rail ends from contact with each other.

6. An insulated rail-joint comprising a rail-chair having a spike-plate for spiking said chair to the tie, a bridge-plate and a bolt-plate, insulating material between the rail ends and said bridge-plate, means for holding said insulating material in proper position consisting of a tongue of the same adapted to be inserted in a mouth in the bridge-plate, a metal band separate from said chair and opposing said bolt-plate and extending across the joint, two insulating-blocks, one between said bolt-plate and the rail ends and the other between said band and the rail ends, and both extending across the joint, a plurality of bolts extending through the bolt-plate, insulating-blocks, rail ends, and band, insulating-bushings adapted to insulate every of said bolts passing through one of the rail ends from both said bolt-plate and said band, and means for maintaining the rail ends from contact with each other.

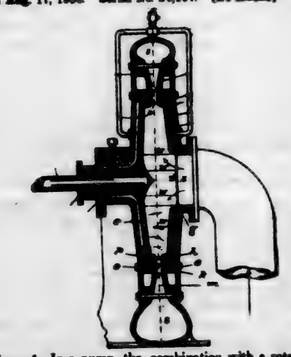
705,846. DILATOR. JONATHAN B. HAMILTON, Sioux Falls, S. D. Filed Nov. 2, 1901. Serial No. 80,868. (No model.)



Claim.—1. A dilator comprising a hollow body, an inner open-end tube, an extension-barrel detachably secured to said body, said barrel being formed with openings intermediate of its extremities, a flexible cover or sleeve for said barrel, and an inelastic insertion in said sleeve adjacent to its ends.

2. A dilator, comprising a hollow body portion, an inner hollow end tube, an extension-tube detachably secured to said body portion, said tube being provided with side openings, an elastic sleeve inclosing said extension-tube, inelastic portions adjacent to the ends of said tube, a circumferential flange upon said body adjacent to the inner end of said sleeve, and an outturned portion upon the end of said sleeve bearing against said flange.

705,847. CENTRIFUGAL PUMP. ELIJO G. HARRIS, Rolla, Mo. Filed Aug. 17, 1900. Serial No. 27,167. (No model.)



Claim.—1. In a pump, the combination with a rotary propelling-wheel having a central inlet and a contracted annular discharge-outlet, of a casing therefor, said casing inclosing a chamber between itself and the said propelling-wheel, which chamber is normally closed against the admission of fluid thereto, but into which chamber a passage leads from the said propelling-wheel contracted discharge-outlet, whereby, when the pump is operating, the pressure in said chamber may be maintained, at or below atmospheric pressure.

2. In a pump, the combination with a rotary propelling-wheel having a central inlet and a contracted annular discharge-outlet, of a casing therefor, said casing inclosing a chamber between itself and the said propelling-wheel, which chamber is normally closed against the admission of fluid thereto, and said casing having an outwardly-flaring receiving-throat opposite the discharge-outlet; the said pump having means therein for producing a rarefied condition of the fluid within said inclosed chamber.

3. In a pump, the combination with a rotary propelling-wheel having a central inlet, and an annular discharge-outlet so contracted that the velocity-head at the point of delivery will be not less than the head at the discharge-outlet against which the pump works, of a casing therefor, said casing inclosing a chamber between itself and the said propelling-wheel, which chamber is normally closed against the admission of fluid thereto, but into which chamber a passage leads from the said propelling-wheel contracted discharge-outlet, whereby, when the pump is operating, the pressure in said chamber may be maintained, at or below atmospheric pressure.

4. In a pump, the combination with a rotary propelling-wheel having a central inlet, and an annular discharge-outlet so contracted that the velocity-head at the point of delivery will be greater than the head at the discharge-outlet against which the pump works, of a casing therefor, said casing inclosing a chamber between itself and the said propelling-wheel which chamber is normally closed against the admission of fluid thereto, but into which chamber a passage leads from the said propelling-wheel contracted discharge-outlet, whereby, when the pump is operating, the pressure in said chamber may be maintained, by eduction, below atmospheric pressure.

5. In a pump, the combination with a rotary propelling-wheel having a central inlet and a contracted annular discharge-outlet, of a casing therefor, said casing inclosing a chamber between itself and the said propelling-wheel, which chamber is normally closed against the admission of fluid thereto, and said casing having an outwardly-flaring receiving-throat opposite the said discharge-outlet; and a valved inlet to said chamber.

6. In a pump, the combination with a rotary propelling-wheel having a central inlet, a contracted discharge-outlet, vanes, and a passage of undiminished cross-sectional area from its inner to its outer end, leading from the inner limits of the vanes to the line of discharge, of a casing for said wheel.

7. In a pump, the combination with a rotary propelling-wheel having a central inlet, a contracted discharge-outlet, and vanes, and provided with a passage leading from the inner limit of the vanes to the line of discharge, having substantially the same cross-sectional area throughout, of a casing for said wheel.

8. In a pump, the combination with a rotary propelling-wheel having a central inlet, a contracted annular discharge-outlet, and vanes, and provided with a passage leading from within the inner limits of the vanes to the line of discharge, having substantially the same cross-sectional area throughout, of a casing for said wheel having an outwardly-flaring receiving-throat opposite the discharge-outlet of the wheel, the contraction of said outlet being so proportioned that the velocity-head at the point of delivery will be not less than the head at the discharge-outlet against which the pump works.

9. In a pump, the combination with a rotary propelling-wheel having a central inlet and a contracted discharge-outlet, of a casing therefor, and a tube, as shown, leading from the interior of the wheel to the line of discharge.

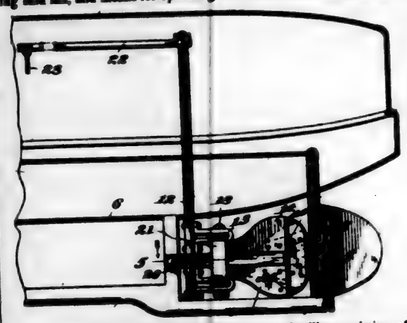
10. A pump, comprising an inclosing casing and a rotary propelling-wheel therein, said wheel having a central inlet, vanes and a contracted annular outlet formed of two detachable rings set on the wheel, and the casing having an outwardly-flaring annular throat, substantially as described.

705,848. OSCILLATING PROPELLER. CHRISTOPHER HAYES, Junee, New South Wales, Australia. Filed Nov. 23, 1901. Serial No. 83,611. (No model.)

Claim.—1. Propelling mechanism for life-boats or the like consisting of a fan composed of springy cores, a sheathing on either side of the same, having a space or opening between the plates thereof, a propeller-post, a double-looped piece secured thereto, and carrying said fan, spring-buffers on either side of said fan, a band encircling said spring-buffers and carried in said looped pieces, a mechanism for operating said fan, substantially as described.

2. Propelling mechanism for life-boats or the like consisting of a fan of a springy core, a sheathing on either side thereof having a space or opening between the plates of said sheathing, a propeller-post supporting said fan, spring-buffers secured on either side of said fan, and mechanism for operating said fan, substantially as described.

3. Propelling mechanism for life-boats or the like consisting of a fan composed of a springy core, a sheathing on either side thereof having a space or opening between the plates of said sheathing, means for supporting said fan, and means for operating the same, substantially as described.

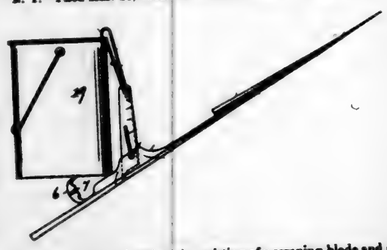


4. Propelling mechanism for life-boats or the like consisting of a fan composed of a springy core, a sheathing on either side of said core, having a space or opening between the plates of said sheathing, and means for operating said fan, substantially as described.

5. Propelling mechanism for boats consisting of a fan, a propeller-post, a propeller-post lever secured thereto, a cable secured to said lever, a drum adapted to wind and unwind said cable, a shaft carrying said drum, partially-toothed cog-wheels carried on said shaft, a power-shaft above said drum, partially-toothed cogs carried on said shaft, substantially as described.

6. Propelling mechanism for boats consisting of a fan, a propeller-post, means for rocking the same consisting of a drum and cable, a shaft carrying said drum, a large and small cog-wheel having teeth on half their peripheries, a power-shaft above said drum, a large and small cog-wheel carried on said shaft and having teeth on half their peripheries, a pinion-wheel interposed between the two smaller cog-wheels, the whole arranged whereby the drum is rocked, substantially as described.

705,849. PAINTER'S TOOL. GUSTAV HENDERSON, Woodside, N. Y. Filed Mar. 28, 1902. Serial No. 100,037. (No model.)



Claim.—1. A painter's tool consisting of a scraping-blade and a handle therefor terminating in a transverse handhold provided with lateral bifurcations forming extracting-claws.

2. A painter's tool consisting of a scraping-blade a handle therefor and a hinged upwardly-projecting member provided with a hook at its upper end forming a pot-holder.

3. A painter's tool consisting of a scraping-blade, a handle therefor, a hinged upwardly-projecting member provided with a hook at its upper end forming a pot-holder and means for raising or lowering the hook.

4. A painter's tool consisting of a scraping-blade, a handle therefor, a hinged upwardly-projecting member provided with a hook at its upper end forming a pot-holder, and means for preventing the rotation of the pot-holder when in an upright position.

5. A painter's tool consisting of a scraping-blade, a handle therefor terminating in a transverse handhold provided with lateral bifurcations forming extracting-claws and a hinged upwardly-extending pot-holder.

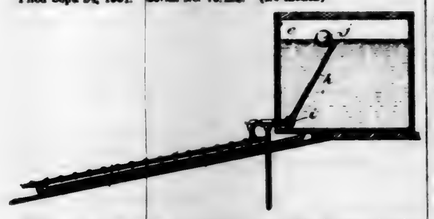
6. A painter's tool consisting of a scraping-blade, a handle therefor terminating in a transverse handhold provided with lateral bifurcations forming extracting-claws, a hinged upwardly-extending pot-holder and means for raising or lowering the latter.

7. A painter's tool consisting of a scraping-blade, a handle therefor terminating in a transverse handhold provided with lateral bifurcations forming extracting-claws, a hinged upwardly-extending pot-holder and means for preventing the rotation of the pot-holder when in an upright position.

8. A painter's tool consisting of a scraping-blade, a handle therefor terminating in a transverse handhold, an upwardly-extending pot-holder and a sheath for the latter when not in use.

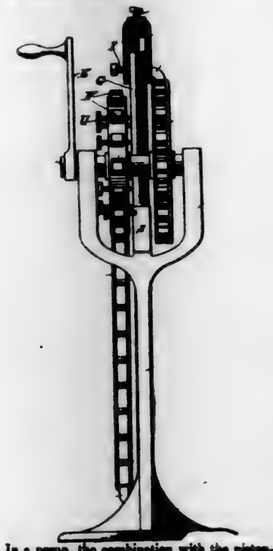
9. A painter's tool consisting of a scraping-blade, a handle therefor a hinged pot-holder extending upwardly therefrom, and means for maintaining the pot-holder in an upright position.

705,850. SOLAR HEATER. PHILIP G. HUBERT New York, N. Y. Filed Sept. 24, 1901. Serial No. 76,422. (No model.)



Claim.—A solar heater comprising a broad thin heating-chamber having its top and bottom plates so spaced as to spread the water therein into a thin film, thereby causing the entire amount of water to come into close proximity to the one or the other of the plates, a tank, a pipe leading from the lower portion of the tank to the heating-chamber, a pipe leading from the heating-chamber to the upper portion of the liquid in the tank, and a draw-off pipe connected with the pipe leading from the heating-chamber to the tank, the said pipe leading from the heating-chamber to the tank being provided with a swing-section supported by a float within the tank.

705,851. PUMP. WILL J. HUGHES, St. Louis, Mo. Filed July 13, 1901. Serial No. 68,153. (No model.)



Claim.—1. In a pump, the combination with the piston-rod, of an operating-shaft, a sprocket-wheel carried thereby, a chain attached to said wheel and to the piston-rod, a stop disposed adjacent to said wheel, and a plurality of independently-adjustable pins carried by the wheel and adapted to be adjusted to contact with the stop and limit the rotation of the shaft, substantially as described.

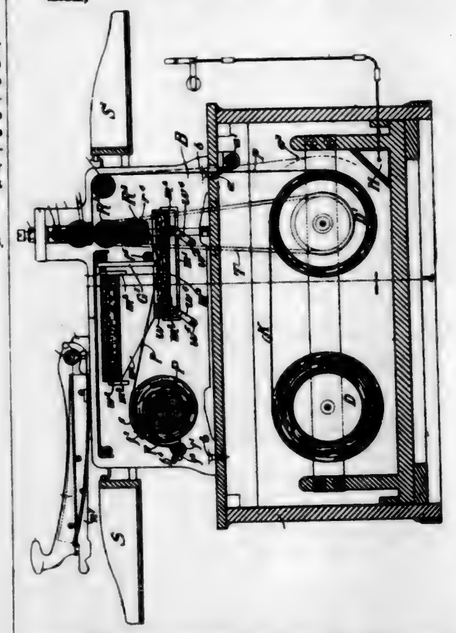
2. In a pump, the combination with the piston-rod, of an operating-shaft, a cap upon the end of the said rod, an adjusting-screw carried by said cap, a clamping-screw carried thereby, a collar adjustable upon said rod, a clamping-screw carried by said rod, and flexible connections between said collar and cap and the shaft, said connections being adapted to be reversely wound upon said shaft, when the latter is rotated, substantially as described.

3. In a pump, the combination with the piston-rod, of an operating-shaft, an operative connection between said shaft and said piston, a wedge-shaped stop mounted independently of the shaft and adjustable relatively thereto, and a member carried by the shaft and adapted to contact with said stop to limit the rotation of the shaft, substantially as described.

4. In a pump, the combination with the piston-rod, of an operating-shaft, a sprocket-wheel carried thereby, a chain attached to said wheel and to the piston-rod, a stop disposed adjacent to said wheel, and a plurality of independently-adjustable pins carried by the wheel and adapted to be adjusted to contact with the stop and limit the rotation of the shaft, substantially as described.

5. The combination of a forked standard, an operating-shaft journaled in both arms of said fork, fixed sprocket-wheels on said shaft, a piston operated by said sprockets, adjustable pins borne by said sprocket-wheels, and an upright portion of said standard between the arms of said fork with which said pins are adapted to engage, substantially as described.

705,852. ROLLER COPYING-PRESS. DAVID B. HUSTER, Cambridge, Mass., assignor to Library Bureau, Boston, Mass., a Corporation of Massachusetts. Filed Oct. 8, 1901. Serial No. 77,953. (No model.)



Claim.—1. In a copying-press, the combination with a paper-roll and copying-rolls, of a water-pan, a closed tank supported over the pan, and a water-supply pipe depending from the tank into the pan.

2. In a copying-press, the combination with a paper-roll and copying-rolls, of a water-pan, a movable support therefor, whereby the pan may be vertically shifted, a closed tank, supported on and over the pan and movable therewith, and a water-supply pipe depending from the tank into the pan.

3. In a copying-press, the combination with a paper-roll and copying-rolls, of a water-pan, a supporting-frame therefor, consisting of rocker-arms whereon the tank rests, rock-shafts for the said arms, parallel cranks and an operating-rod, whereby the pan may be vertically shifted.

4. In a copying-press, the combination with a paper-roll and copying-rolls, of a water-pan, a supporting-frame therefor consisting of rocker-arms, slide connections between the rocker-arms and the pan, a bracket whereon the pan rests when lowered, vertical guides for the pan, and connections whereby the rocker-arms may be actuated to raise or lower the pan in its guides.

5. In a copying-press, the combination with a paper-roll and copying-rolls, of a water-pan, and an immersing-guide consisting of a rod provided with resilient arms, and supports for the said arms whereby the guide is held by the spring-pressure of the said arms.

6. In a copying-press, the combination of a paper-roll and copying-rolls, of a water-pan and an immersing-guide consisting of a U-shaped

resilient wire with a straight lower portion, and supports for the arms of the U whereby the guide is held by the spring-pressure of the said arms.

7. In a copying-press, the combination with a paper-roll and copying-rolls, of a water-pan, an immersing-guide consisting of a rod provided with resilient arms and supports for the said arms whereby the guide is held by the spring-pressure of the said arms, and a back-stop for the guide.

8. The combination in a copying-press, of a water-pan, supports thereon for a supply-tank, the supply-tank, a water-passage, open at the bottom extending downward from the supply-tank to a point within the water-pan.

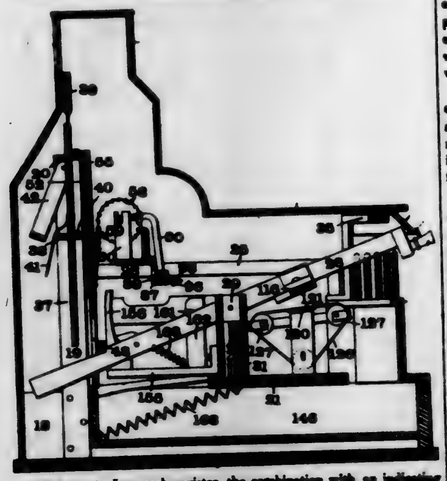
9. The combination in a copying-press, of a water-pan, supports thereon for a supply-tank, the supply-tank, a water-passage, open at the bottom, extending downward from the supply-tank to a point within the water-pan and a valve, secured to the supply-tank, normally spring-pressed to a position of closure against the water-passage opening, substantially as described.

10. The combination in a copying-press, of a water-pan, a supply-tank supported thereby, a water-passage from the tank to the pan, a vertically-movable support for the pan, means for moving said support vertically, a valve for the water-passage, normally spring-pressed to a position of closure, and means whereby the said valve is opened against its spring-pressure upon lifting the water-pan.

11. The combination in a copying-press, of a paper-roll, copying-rolls, a water-pan, an immersing-guide for the paper suspended over the water-pan, and means for vertically changing the relative positions of the water-pan and immersing-guide whereby the pan and paper may be made to coact, or not, at will.

12. The combination in a copying-press, of a paper-roll, copying-rolls, a water-pan, a supply-tank carried thereby, a water-passage from the tank to the pan, a valve, controlling the water-passage, and normally spring-pressed toward a position of closure, an immersing-guide, means for vertically changing the relative positions of the water-pan and immersing-guide, and means, correlated with the said relative vertical movement, whereby the water-passage valve is opened as the pan and immersing-guide approach each other, substantially as described.

705,858. CASH-REGISTER. OSCAR W. EDWARDS, St. Louis, Mo. Filed Oct. 22, 1900. Serial No. 33,804. (No model.)



Claim.—1. In a cash-register, the combination with an indicating device, of a lever for actuating said indicating device, a sliding member provided with notches of varying length coöperating with said lever, adding mechanism actuated by said sliding member, and an arm carried by said sliding member and adapted to engage with said lever to return said sliding member to its normal position.

2. In a cash-register, the combination with indicating devices, of a lever actuating said indicating devices, a sliding member provided with notches varying in length and coöperating with said lever, adding mechanism, and a toothed member carried by said sliding member and engaging with said adding mechanism.

3. In a cash-register, the combination with indicating devices, of a lever actuating said indicating devices, a sliding member provided with notches of varying length coöperating with said lever, adding mechanism, and a toothed member pivotally mounted on said sliding member and engaging with said adding mechanism.

4. In a cash-register or the like, the combination with a plurality of adding-wheels, of a pivoted lever adapted to actuate said adding-wheels, a pawl engaging with one of said adding-wheels, carrying mechanism for transferring the amount to be carried, and means operated by said transferring mechanism for actuating said pawl.

5. In a cash-register or the like, the combination with adding mechanism, of a plurality of adding-wheels, a pivoted lever actuating said adding-wheels, a pawl for one of said adding-wheels, carrying mechanism for transferring from one of said adding-wheels to another, means operated by said carrying mechanism for actuating said pawl, and connections for actuating said pawl by the movement of said lever.

6. In a cash-register, the combination with a plurality of indicators arranged in groups, of a pivoted lever adapted to move in one direction to determine the indicator to be displayed and in another direction to operate and display said indicator, and a printing device carried by said lever and provided with characters arranged in groups corresponding to said groups of indicators.

7. In a cash-register, the combination with adding mechanism, of a plurality of movable members adapted to actuate said adding mechanism, a pivoted lever movable in one direction to determine the amount to be added and in another direction to operate one of said movable members, and a printing device carried by said lever and provided with groups of characters corresponding to the movable members.

8. In a cash-register, the combination with a plurality of indicators arranged in groups, of an adding mechanism, a plurality of movable members adapted to actuate said adding mechanism, a pivoted lever movable in one direction to determine the indicator to be displayed and the amount to be added and in another direction to display said indicator and operate one of said movable members, and a printing device carried by said lever and provided with groups of characters corresponding to the indicators and movable members.

9. In a cash-register, the combination with a plurality of indicators, of operating means for actuating said indicators, a cash-drawer, a lever for releasing said cash-drawer, locking mechanism for said lever, and connections actuated by said operating means for releasing said locking mechanism.

10. In a cash-register, the combination with a plurality of indicators, of a lever movable in one direction to determine the indicator to be displayed and in another direction to operate and display said indicator, a cash-drawer, a lever for releasing said cash-drawer, locking devices for said latter-named lever, and connections actuated by said first-named lever for releasing said locking devices.

11. In a cash-register, the combination with a plurality of indicators, of a movable member adapted to actuate any desired indicator, a movable frame actuated by said movable member, a detent for locking said movable frame, means for releasing said detent, a printing device including paper-feeding mechanism, and connections for actuating said paper-feeding mechanism through the movement of said frame.

12. In a cash-register, the combination with a plurality of indicators of a movable member adapted to actuate any desired indicator, a movable frame actuated by said movable member, a detent for locking said movable frame, means for releasing said detent, a printing device including an inking-ribbon, and connections for feeding said inking-ribbon through the movement of said frame.

13. In a cash-register, the combination with a plurality of indicators, of a movable member adapted to actuate any desired indicator, a movable frame actuated by said movable member, a detent for locking said movable frame, means for releasing said detent, a printing device including paper-feeding mechanism and inking-ribbon, and connections for actuating said paper-feeding mechanism and inking-ribbon through the movement of said frame.

14. In a cash-register, the combination with an indicating device, of operating means for actuating said indicating device, a cash-drawer, a lever for releasing said cash-drawer, locking mechanism for said lever, and means carried by said drawer for releasing said locking mechanism.

15. In a cash-register, the combination with an indicating device, of operating means for actuating said indicating device, a cash-drawer, a lever for releasing said cash-drawer, locking mechanism for said lever, connections actuated by said operating means for releasing said locking mechanism, and means carried by said cash-drawer for releasing said locking mechanism.

705,854. ATTACHMENT-HOLDER FOR SEWING-MACHINES. FREDERICK JACOB, Jr., Newark, N. J. Filed Apr. 18, 1902. Serial No. 103,503. (No model.)

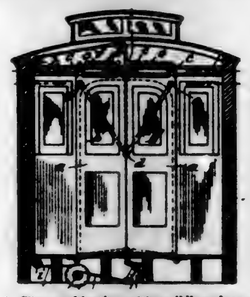
Claim.—1. A clamping device comprising a socket provided with a diametrical slot, a screw arranged transversely to the slot and provided with a tapered inner end adapted to cross said slot, and an attachment-piece formed to enter said slot in the socket and provided with a tapered recess adapted to be engaged by the tapered end of the screw; all for the purpose of drawing the attachment-piece upwardly within the slot and forcing the same against the wall of the socket laterally, substantially as described.

2. A clamping device comprising a socket provided with a diametrical slot and with a longitudinal bore, a screw arranged at right angles to the slot and provided with a tapered inner end adapted to cross said slot, and an attachment-piece provided with a tapered recess adapted to be engaged by the tapered end of the screw and with a curved contact-surface adapted to engage with the wall of the socket; all for the purpose of drawing the attachment-piece upwardly within the slot and forcing the same against the wall of the socket laterally, substantially as described.

3. A clamping device comprising a socket provided with a diametrical slot and with a longitudinal bore, a screw arranged at right angles to the slot and provided with a tapered inner end adapted to cross said slot, and an attachment-piece provided with a tapered recess adapted to be engaged by the tapered end of the screw and with a curved contact-surface diverging from its top and adapted to engage with the wall of the socket; all for the purpose of drawing the attachment-piece upwardly within the slot and forcing the same against the wall of the socket laterally, substantially as described.

4. A clamping device comprising a socket provided with a diametrical slot and with a longitudinal bore, a screw arranged at right angles to the slot and provided with a tapered inner end adapted to cross said slot, and an attachment-piece provided with a tapered recess adapted to be engaged by the tapered end of the screw and with one or more inclined contact-surfaces adapted to engage with the wall of the socket, substantially as and for the purpose set forth.

705,855. AUTOMATIC DOOR OPENING OR CLOSING APPARATUS. JOSEPH S. JOHNSON, New York, N. Y. Filed Oct. 17, 1901. Serial No. 79,098. (No model.)



Claim.—1. The combination with a sliding door, of a toggle-joint device for opening said door, foot-pedals and a bell-crank subject to the tread of persons passing through the door, a motion-multiplying drum connected with said bell-crank, and a cord and guide-pulleys therefor, said cord connecting said drum and the toggle-joint device for operating it, and means for automatically closing the door and resetting the pedals.

2. The combination with a pair of sliding doors, of a pair of toggle-joint rods respectively fulcrumed on the doors for opening them, foot-pedals and a bell-crank subject to the tread of persons passing through the doors, a motion-multiplying drum connected with the bell-crank, a cord and guide-pulleys therefor, said cord connecting said drum and toggle-joint device for operating it, and means for automatically closing the doors and resetting the pedals.

3. The combination with a pair of sliding doors, of a pair of toggle-joint rods respectively fulcrumed on the doors within interior spaces of the upper portions of said doors for opening them, foot-pedals and a bell-crank subject to the tread of persons passing through the doors, a motion-multiplying drum connected with the bell-crank, a cord and guide-pulleys therefor, said cord connecting said drum and toggle-jointed arms for operating them, and means for automatically closing the doors and resetting the pedals.

4. The combination with a pair of sliding doors, of a pair of toggle-joint rods respectively fulcrumed on the doors within interior spaces of the upper portions of said doors for opening them, foot-pedals and a bell-crank subject to the tread of persons passing through the doors, a motion-multiplying drum connected with the bell-crank, a cord and guide-pulleys therefor, said cord connecting said drum and toggle-jointed arms for operating them, and means for automatically closing the doors and resetting the pedals, said means consisting of coiled springs located at the upper ends of the doors and suitably connected for closing them.

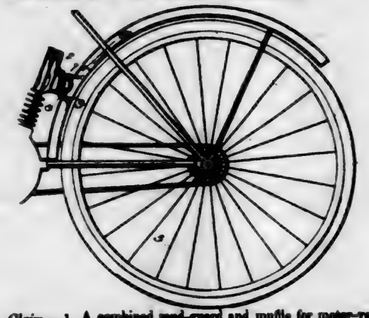
705,856. SHOE-FASTENER. ALBERTO T. JORDAN, Portland, Me., assignor of one-half to George W. Brown, Cape Elizabeth, Me. Filed Nov. 16, 1901. Serial No. 82,489. (No model.)

Claim.—1. In a shoe-fastener, a series of lace-holders permanently secured to one side of the shoe, a series of eyelets permanently secured to the other side of the shoe and a series of lace-holders having the same general configuration as said eyelets and adapted to be detachably secured in said eyelets.

2. In a shoe-fastener, a series of lace-holders permanently secured to one side of the shoe and a series of lace-holders adapted to be detachably secured to the other side, a plurality of the detachable holders being united by a rigid bond.

3. In a shoe-fastener, a series of lace-holders permanently secured to one side of the shoe, a series of eyelets secured to the other side of the shoe and a series of lace-holders having the same general configuration as said eyelets and having a prong adapted to engage the under edge of said eyelets, whereby said holders are detachably secured in said eyelets.

705,857. COMBINED MUFFLE AND MUD-GUARD FOR MOTOR-VEHICLES. ROBERT M. KEATING, Middletown, Conn., assignor to the R. M. Keating Motor Company, Middletown, Conn., a Corporation. Filed Dec. 23, 1901. Serial No. 86,837. (No model.)



Claim.—1. A combined mud-guard and muffle for motor-vehicles, composed of a front section consisting of a hollow cast-metal tube provided with means for attachment to the frame and for coupling to the engine-exhaust, and a rear section consisting of a curved sheet-metal tube connected to the front tube by a suitable joint, substantially as described.

2. A combined mud-guard and muffle for motor-vehicles, consisting of a front section in form of a cast-metal tube with interior baffle-plates extending from the sides, and a rear section in form of a sheet-metal tube, substantially crescent-shaped in cross-section, and having internal baffle-plates extending across the tube and provided with perforations.

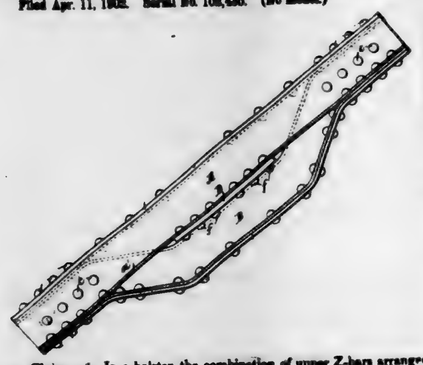
3. The combination of the mud-guard muffle having a projecting socket, with the engine-exhaust having a threaded opening, and a screw-threaded joint-coupling tube extending both into the muffle and the exhaust-pipe.

4. The combination with the engine having a threaded exhaust-pipe, and the hollow mud-guard muffle having a projecting socket, of a nut attachable to such socket, and a threaded joint-coupling tube engaging with the exhaust of the engine and the socket of the muffle.

5. In a muffle and mud-guard, a sheet-metal tube, crescent-shaped in cross-section, and having perforated internal baffle-plates extending across the tube.

6. The sheet-metal mud-guard and baffle-plate, composed of perforated cross-partitions in outline substantially of the form of the completed tube, and the tube-plates surrounding such partitions and having a lap-joint at the edges.

705,858. TRUCK-BOLSTER. HERBERT R. KETTELEY, Buffalo, N. Y. Filed Apr. 11, 1902. Serial No. 102,426. (No model.)



Claim.—1. In a bolster, the combination of upper Z-bars arranged with their webs vertically, lower Z-bars arranged with their webs vertically, the flanges of said upper and lower Z-bars being superposed at the ends of the bolster, and upper and lower tie-plates, substantially as set forth.

2. In a bolster, the combination of upper Z-bars arranged with their webs vertically, lower Z-bars arranged with their webs vertically and beside the webs of the upper Z-bars at the ends of the bolster, the flanges of said upper and lower Z-bars being superposed at the ends of the bolster, rivets or the like connecting the webs and the flanges of said Z-bars at the ends of the bolster, and upper and lower tie-plates, substantially as set forth.

3. In a bolster, the combination of upper Z-bars arranged with their webs vertically and their upper flanges extending toward each other, lower Z-bars arranged with their webs vertically and beside the webs of the upper Z-bars and with their upper flanges extending toward each other beneath the upper flanges of the upper Z-bars at the ends of the bolster, and upper and lower tie-plates, substantially as set forth.

4. In a bolster, the combination of upper Z-bars arranged with their webs vertically, lower Z-bars arranged with their webs vertically, the flanges of said upper and lower Z-bars being superposed at the ends of the bolster, upper and lower tie-plates, and a plate arranged between the upper and lower Z-bars at the center of the bolster, substantially as set forth.

705,859. PLAYING-BALL. ELIAKIM KENDRALL, Boston, Mass. Filed May 9, 1902. Serial No. 106,549. (No model.)

Claim.—1. A playing-ball comprising a hard thin shell provided throughout with perforations, a thin skin of soft rubber covering said shell, and a cover of wear-resisting material upon said rubber layer, said hard shell being close to the periphery of the ball.

2. A playing-ball comprising a hard thin shell provided throughout with perforations, a thin skin of soft rubber covering said shell, and a casing of gutta-percha holding said rubber layer under compression, said hard shell being close to the periphery of the ball.

3. A playing-ball comprising a thin tempered-steel shell, a thin skin of soft rubber covering said shell, the latter being provided throughout with perforations, and a shell of gutta-percha upon said rubber layer, said steel shell being close to the periphery of the ball.

4. A playing-ball comprising a hard thin shell provided throughout with perforations; soft rubber forming a thin covering upon said shell and extending into said perforations; and a shell of gutta-percha holding said rubber layer under compression.

5. A playing-ball comprising a soft-rubber sphere around which is embedded a hard perforated shell; portions of the rubber passing through the perforations, and the rubber also forming a facing for said shell.

6. A playing-ball comprising a soft-rubber sphere around which is embedded a thin perforated metal shell; portions of the rubber passing through the perforations, and the rubber also forming a facing for said shell; all of said rubber being integral.

7. A playing-ball comprising a perforated tempered steel shell; a soft rubber filling therein; and a soft-rubber facing for said shell.

8. A playing-ball comprising a thin tempered-steel shell provided with perforations; a filling therein consisting of springy solid material; and a facing or layer of soft rubber upon said shell; portions of at least one of said filling and facing elements entering said perforations.

9. A playing-ball comprising a soft-rubber sphere around which is embedded a hard perforated shell; portions of the rubber passing through the perforations, and the rubber also forming a facing for said shell; and a casing of gutta-percha upon said soft-rubber facing.

10. A playing-ball comprising a soft-rubber sphere around which is embedded a metal perforated shell; portions of the rubber passing through the perforations, and the rubber also forming a facing for said shell; and a shell of hard material holding said rubber facing under compression.

11. A playing-ball comprising a soft-rubber sphere around which is embedded a hard perforated shell; portions of the rubber passing through the perforations, and the rubber also forming a facing for said shell; and a shell of plastic material holding said layer under compression.

12. A playing-ball comprising a hard shell provided throughout with perforations; and springy material filling said shell and extending through said perforations and also forming a facing upon said shell; said facing being integral with the filling.

13. A playing-ball comprising a soft-rubber sphere around which is embedded a hard perforated shell; portions of the rubber passing through the perforations and also forming a facing for said shell; and a casing of gutta-percha holding said facing under compression.

14. A playing-ball comprising a sphere of soft rubber, and a perforated metal shell embedded around said sphere at the peripheral portion thereof.

15. A playing-ball comprising a solid sphere of soft rubber, and a perforated metal shell embedded within the surface of said sphere and close to said surface.

705,860. FIREPROOF FLOOR CONSTRUCTION. GEORGE R. KING, New Brighton, N. Y. Filed May 8, 1901. Serial No. 59,212. (No model.)

Claim.—1. A lintel for fireproof building construction embodying a metallic part having a metallic web and two horizontal webs fastened together, the whole incased in cement-like material, the upper edge of the lintel being on a line with the floor and its under edge on a line with the ceiling and having shoulders on its sides for the support of the filling-blocks.

2. A lintel for fireproof building construction embodying a metallic truss incased in cement-like material, the truss embodying a vertical web having a metallic rod incorporated in it, and two horizontal webs attached to the sides of the vertical web, whereby the metal at about the central portion of the vertical web is made of triple thickness, each of the horizontal webs having a metallic rod incorporated in it.

3. In fireproof building construction the combination of lintels extending from floor-beam to floor-beam, having shoulders at their upper edges, and blocks of fireproof material of the same depth as the lintels, having surfaces at their upper ends adapted to rest upon said shoulders, whereby the upper surface of the blocks and lintels and floor-beams will all be on the line of the floor-surface, and the under edges of the lintels and blocks on the line with the ceiling.

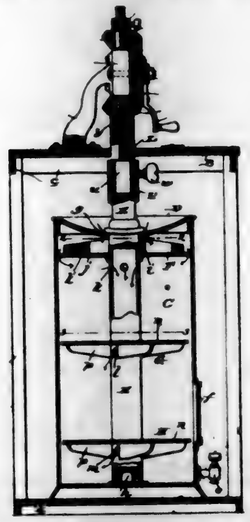
4. In fireproof building construction the combination of lintels projecting from floor-beam to floor-beam, their lower edges having projecting ledges or parts, fireproof blocks held against the under edges of the floor-beams by said projecting parts of the lintels, blocks made of fireproof material adapted to fill the space from lintel to lintel and be supported by them, the blocks which are next to the floor-beams having one end shaped to engage with the main floor-beams and fill the space between their flanges, and having also a projecting ledge or tongue adapted to hold the said blocks or plate against the under edge of the floor-beams.

5. In fireproof building construction, in combination with the main floor-beams, lintels spanning the space between them, and one-piece blocks adapted to be supported on the lintels and to fill the entire space from one to the other, said blocks having the same depth as the lintels so that their upper surfaces form the floor-line and their lower surfaces the ceiling-line.

6. In fireproof building construction the combination with the main floor-beams of lintels embodying a metallic truss incased in cement-like material, and blocks made of fireproof material supported on the lintels and extending from top to bottom thereof so that the upper surfaces of the blocks and lintels are on a line with the floor, and their under surfaces on a line with the ceiling.

7. The combination, in fireproof building construction, of lintels connecting the main floor-beams, and fireproof blocks supported upon the lintels, each extending from lintel to lintel and from its upper to its lower edge or side.

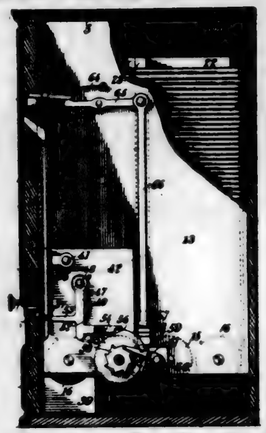
705,861. CREAM-SEPARATOR AND CHURN. JOSEPH KLEIN, Cass City, Mich., assignor of one-half to William Ferguson, Cass City, Mich. Filed May 24, 1902. Serial No. 108,894. (No model.)



Claim.—1. In an apparatus for the purpose described, the combination of a can having a cover provided with an opening for the admission of air, an upright, hollow shaft arranged in the can, and having an opening adjacent to the cover for the admission of air and an opening, below said inlet-opening, for the exit of air, a damper arranged on said shaft above the air-inlet opening thereof, and comprising a flat horizontal disk, and curvilinear blades on the upper side of the same, and a damper arranged on the shaft adjacent to the air-exit opening, and comprising a flat, horizontal disk, and curvilinear blades on the under side of the same.

2. In an apparatus for the purpose described, the combination of a can having a cover provided with an opening for the admission of air, an upright hollow shaft arranged in the can, and having an opening adjacent to the cover for the admission of air, and an opening, below said inlet-opening, for the exit of air, a combined damper and air-suction device arranged on said shaft above the air-inlet opening thereof and below the air-inlet opening in the can-cover, and a combined damper and air-suction device arranged on the shaft adjacent to the air-exit opening thereof.

705,862. COIN-CONTROLLED DEVICE. JOHN D. KESSELER, Sioux City, Iowa, assignor of one-half to Burt Cronk, Sioux City, Iowa. Filed Oct. 5, 1901. Serial No. 77,962. (No model.)



Claim.—1. In a package-vending machine, package-delivery mechanism embodying a feed-roll, and actuating means therefor, in combination with a locking-dog engaging the feed-roll, and a coin-chute comprising a hinged section adapted to be operated upon by the coin and to swing the locking-dog out of engagement with the feed-roll, substantially as described.

2. In a package-vending machine, package-delivery mechanism embodying a feed-roll, and actuating means therefor, in combination with a spring-pressed locking-dog engaging the feed-roll, a coin-chute comprising a hinged section adapted to swing the locking-dog out of engagement with the feed-roll, and means for pressing a coin against the hinged section of the coin-chute for the purpose of swinging the latter and causing it to operate the locking-dog, substantially as described.

3. In a package-vending machine, package-delivery mechanism embodying a feed-roll, and actuating means therefor, in combination with a pivoted arm having an extension constituting a locking-dog engaging the feed-roll and another extension projecting toward the coin-chute, a coin-chute comprising a hinged section operatively engaged with one of the extensions of the pivoted arm, a spring for urging the pivoted arm toward the coin-chute and holding the locking-dog in engagement with the feed-roll, and a push-button arranged to press a coin against the hinged section of the coin-chute, for the purpose specified, substantially as described.

705,863. BOOK-SEWING MACHINE. FRIEDRICH KOHLER, Frauenfeld, Switzerland, assignor to Actiengesellschaft, vormals F. Martini & Co., Frauenfeld, Switzerland, a Firm. Filed Feb. 19, 1900. Serial No. 5,718. (No model.)

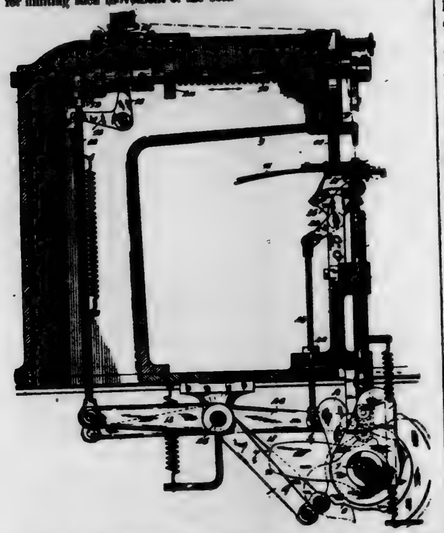
Claim.—1. In a book-sewing machine, the combination with a book-needle, a thread-supporting device, and a gripper, of means for operating the book-needle and the gripper so that the gripper takes from the needle the thread-loop formed by said needle and draws the same up and over the thread-supporting-device, a second gripper, mechanism for moving the same against the first gripper whereby the standing parts of the thread are pushed between the loop drawn up by the first gripper and a double loop is formed, means for drawing down a locking-thread, and means for passing the locking-thread through the said double loop.

2. In a book-sewing machine, the combination with the needle mechanism, of two grippers, and a toothed segment upon which one of the grippers is secured, of a pinion engaging said segment, to which pinion the other gripper is secured, and means for moving said segment about its axis, whereby the grippers are moved in opposition to each other to form a double loop, and means for drawing the thread through said double loop, substantially as described.

3. In a book-sewing machine, the combination with a book-needle, means for drawing down a locking-thread, a thread-supporting device, two grippers, and means for moving the grippers in opposition to each other and reciprocating the book-needle to form a double loop around the thread-supporting device, of means for withdrawing the thread-supporting device from the loop, whereby the latter is set free, and means for simultaneously drawing the locking-thread through the loop.

4. In a book-sewing machine, the combination with the thread-supporting device, a book-needle, means for taking the thread from the book-

needle and winding it around the thread-supporting device to form a double loop, means for drawing down a locking-thread, a gripper-needle, and means for moving the latter to and fro through said double loop, of a bolt on which the thread-supporting device is mounted, plate-springs on the bolt in frictional contact with the gripper-needle, whereby the movement of said needle tends to cause a movement of the bolt, and stop devices for limiting such movement of the bolt.

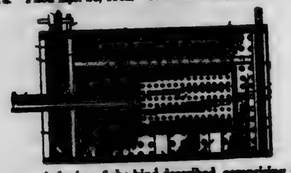


5. In a book-sewing machine, the combination with a needle mechanism, a thread-supporting device, and a gripper with a hook on its end and projections at each side of the same, of means for moving the needle and the gripper so that the projections of the gripper will take up the end of the loop from the needle and draw the same around the thread-supporting device to form a double loop and will cause the hook of the gripper to draw back the loop and upon the completion of the knot formation and means to draw a locking-thread through the double loop.

6. In a book-sewing machine, the combination with a knot-forming device, a rotatable carrier for the thread-spool, and a tension-spring adapted to bear on said carrier to hold the same stationary, of a slide adapted to engage under the end of the spring to lift it from the carrier, and means actuated by the knot-forming device to operate said slide.

7. In a book-sewing machine, the combination with a knot-forming device, a rotatable carrier for the thread-spool, a tension-spring for said spool-carrier, a slide having two studs, a shaft, a disk on the shaft and projecting between the two studs, and means actuated by the knot-forming device for moving said shaft axially, whereby the slide releases the spring from the rotatable carrier.

705,864. **STRAINER FOR MINE-PUMPS.** JACOB RUHL, Greensburg, Pa. Filed Apr. 26, 1902. Serial No. 104,534. (No model.)



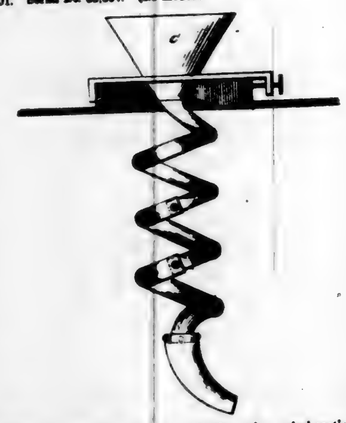
Claim.—1. A device of the kind described, comprising a perforated box or casing having guideways formed in the ends thereof, a sliding door arranged in one end thereof and having a series of apertures produced therein, a strainer arranged within the casing, a hose or pipe connected to the strainer, and means arranged in the forward end of the box or casing for firmly clamping the hose in position, substantially as shown and described.

2. In a device of the kind described, the combination of a box or casing having its sides provided with apertures, a strainer arranged within the said box or casing, hooks arranged within the box and adapted for engagement with the said strainer, legs arranged within the casing upon which is adapted to rest the said strainer, the sliding door arranged in one end of the casing and having a series of perforations formed therein, a hose connected to the strainer, a stationary block held in the forward end of the casing, a sliding block arranged above the said stationary block and adapted for engagement with the hose, and a screw arranged in the top of the casing and adapted for engagement with the block, and means for holding the said screw in its adjusted position, substantially as shown and described.

3. An improved strainer attachment for suction-pumps comprising a box or casing having its sides perforated, a strainer held within said box or casing, a door slidably retained in one end of the casing and having a series of apertures produced therein, a hose connected to the said strainer, a block arranged in the forward end of the box and having a recess produced in the upper face thereof, guides arranged adjacent the said block, a movable block held in the said guides and having a recess produced in the lower face thereof which is adapted to register with the recess in the first-named block, a screw operating in the said box or casing and adapted for engagement with the said movable block, arms carried by the screw and a pin arranged upon the casing and adapted for engagement by one of the said arms of the screw, and means arranged within the box or casing for holding the said strainer in position, substantially as shown and described.

4. A device of the kind described, the combination of a box or casing, a strainer held therein, a hose connected to the strainer, a clamp carried by the box or casing and engaging the said hose, a sliding door arranged in the casing opposite the said clamp and a prop or brace engaging the said casing and mine for holding the said casing in position, substantially as shown and described.

705,865. **CHUTE.** CHARLES LAW, Pittston, Pa. Filed Nov. 27, 1901. Serial No. 83,897. (No model.)



Claim.—1. In a chute, a series of telescoping spiral sections, substantially as shown and described.

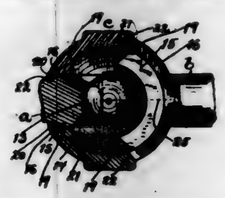
2. In a chute, a hopper, a series of telescoping cylindrical spiral sections and a revolving spout, substantially as shown and described.

3. In a chute, a hopper connected to a series of telescoping cylindrical spiral sections and a revolving spout upon the free end of the last section, substantially as shown and described.

4. In a chute, a breech supporting a hopper, the said hopper communicating with a series of cylindrical telescoping spiral sections, set-screws for locking the said sections together, and a revolving spout mounted upon the end of the chute, substantially as shown and for the purpose set forth.

705,866. **SHAFT-COUPLING.** ISADOR LEHMAN, Cleveland, Ohio. Filed Dec. 30, 1901. Serial No. 87,049. (No model.)

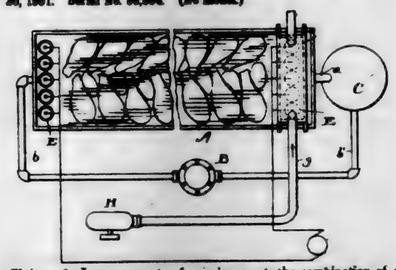
Claim.—1. The combination, of a casing or shell c made in sections and having two internal walls 20 and 21 arranged in different planes, respectively, at right angles to each other and extending partially around the center of the said shell, which shell is provided, in each of the said walls, with a slot 22 extending along the wall; means for holding the sections of the shell or casing together, and two shaft-sections extending through the slot 22 in the different aforesaid walls, respectively, and provided, respectively, with a head 15 contained within the aforesaid shell, and a shoulder 16 extending along and affording bearing for the wall through which the respective shaft-section extends, and the head of one of the shaft-sections having its inner end shaped as required to form the segment of a ball whose center is coincident with the center of the aforesaid shell, and the head of the other shaft-section having a cavity or recess 14 open at the sides of the head and having its wall 13 arranged concentrically of the center of the shell and engaged by the aforesaid segment of a ball, substantially as and for the purpose set forth.



2. The combination, with two shaft-sections a and b having their adjacent ends provided with heads 15, of a casing or shell c embracing and having bearing upon the said heads and establishing operative connection between the said shaft-sections and composed of two halves or sections, and each half or section having a pair of registering ears 12 at one side of the shell and a single ear 10 at the opposite side of the shell with the last-mentioned ear of the said half or section interposed between and registering with the ears of the pair of ears of the other half or section, and means for securing the registering ears together.

3. The combination, with two shaft-sections a and b having their adjacent ends provided with heads 15, of a casing or shell c embracing and having bearing upon the said heads and establishing operative connection between the said shaft-sections and composed of two halves or sections, and each shell-section having a pair of registering internally-screw-threaded ears 12 at one side of the shell and a single internally-threaded ear at the opposite side of the shell, with the last-mentioned ear of the said shell-section interposed between and registering with the ears of the pair of ears of the other shell-section, a screw extending into and engaging the registering ears of the shell-sections at each side of the shell, and another screw engaging a correspondingly-threaded hole formed partially in the first-mentioned screw and partially in one of the ears engaged by the said first-mentioned screw, substantially as and for the purpose set forth.

705,867. **APPARATUS FOR CURING MEAT.** JOHN C. LINCOLN, Cleveland, Ohio, assignor to B. B. Gaines, Cleveland, Ohio. Filed Dec. 20, 1901. Serial No. 86,684. (No model.)



Claim.—1. In an apparatus for curing meat, the combination of a tank containing a brine curing solution, negative electrodes immersed in the brine at one end of the tank and suitably connected with one pole of an electric generator, positive electrodes immersed in the brine near the opposite end of the tank and suitably connected with the other pole of the generator, with a gas-tight box open at its lower side which is placed over the upper ends of said positive electrodes with its lower edge immersed in the brine and thereby sealed, inlet and outlet pipes connected with said box, and means for creating a forced circulation of air through said box.

2. In an apparatus for curing meat, the combination of a tank, negative electrodes immersed in the brine at one end of the tank and suitably connected with one pole of an electric generator, porous cups immersed in the brine at the other end of the tank, and positive electrodes in said porous cups electrically connected with the other pole of the generator, with a gas-tight box open on its lower side which is placed over the upper ends of said positive electrodes and the porous cups in which they are contained with its lower edges immersed in the brine and thereby sealed, inlet and outlet pipes connected with said box, and means for creating a forced circulation of air through said box.

3. In an apparatus for curing meat, a tank having inlet and outlet pipes by means of which the brine may be caused to circulate through said tank, negative electrodes immersed in the brine at one end of the tank and suitably connected with one pole of an electric generator, porous cups in the other end of the tank, positive electrodes in said porous cups, electrically connected with the other pole of the generator, and a gas-tight box open on its lower side placed over the upper ends of said positive electrodes and the porous cups in which they are contained and having its edges immersed in the brine and thereby sealed, inlet and outlet pipes connected with said box and a blower connected with the inlet-pipe.

705,868. **KEY-RING.** JOHN R. LOMAS, Westhaven, Conn. Filed Mar. 24, 1902. Serial No. 99,702. (No model.)

Claim.—1. In a key-ring, the combination with a bail, of a sheet-metal housing for the reception of the ends of the bail, one end of which is pivoted to the plates, and a manually-operable lever located within the said housing and coacting with the inner edge of the free end of the bail for forcing the same into its locked position in which it engages with a fixed point within the housing.

2. In a key-ring, the combination with a bail, of two plates together constituting a housing and receiving the ends of the bail one end of which is pivoted to them and the other notched, a lever located within the housing and coacting with the free end of the bail, and a retaining or locking pin mounted in the said plates and engaged by the notched end of the bail when the same is sprung into position for such engagement by the said lever.

3. In a key-ring, the combination with a bail having its ends separated from each other, of a sheet-metal housing exposing two large plane surfaces for the application of advertising or other kindred matter, the said housing being adapted to receive the ends of the bail one end of which is pivoted to it; and a manually-operable lever located within the said housing and coacting with the inner edge of the free end of the bail for forcing the same into its locked position in which it engages with a fixed point within the housing.

705,869. **SAFETY DEVICE FOR STEAM-BOILERS.** FREDERICK J. MANLEY, Allegheny, Pa. Filed Nov. 30, 1901. Serial No. 84,259. (No model.)

Claim.—1. The combination with a battery or series of steam-boilers, of separate pipes communicating with a main steam-line and automatically-operating check-valves on the boiler-pipes constructed and adapted to allow the passage of steam to the main under ordinary conditions and to automatically close under back pressure from the main when the pressure from the boiler ceases, said check-valves being provided with means for manually closing them against their seats, substantially as described.

2. The herein-described combined automatic, and hand-operable, shut-off steam-valve comprising the valve-casing D, having partition E, formed with the opening F, and valve-seat F' of the check-valve, having upwardly and downwardly extending guided stems, and an adjusting-screw, whereby the valve may be positively closed, regardless of the direction of the steam-pressure, substantially as described.

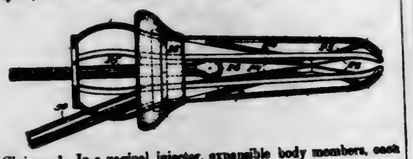
705,870. **HORSE-CANOPY.** ANDREW J. MAPES, Paris, Ill. Filed Mar. 14, 1902. Serial No. 98,167. (No model.)

Claim.—1. The combination, in a canopy for horses, of the standards carrying the main frame-bar, said frame-bar having a block A at each extremity, provided with lateral extensions, with arms B pivoted intermediate their ends to said extensions, springs D attached at one end to one end of said arms and at the other end to the blocks A, cords E

attached to the other ends of said arms, and means for guiding and fastening said cords, as set forth.

2. In a canopy-support, the frame carrying pivoted arms to which the canopy is attached, springs for throwing said arms normally outward, means for controlling the outward movement of said arms and holding the same in a closed position upon the frame, and means for supporting the frame upon a vehicle above the horse, whereby the action of the animal under the cover will give resilient motion to the spring-supported canopy thereby creating a constant air movement beneath the canopy, as set forth.

705,871. VAGINAL INJECTOR. ANDREAS ANDERSON and MARTIN R. S. R. PACKNESS, Denver, Colo. Filed Feb. 16, 1901. Renewed Apr. 3, 1902. Serial No. 101,222. (No model.)



Claim.—1. In a vaginal injector, expansible body members, each having its forward portions formed of an inner and outer section, the inner section being formed with inclined planes, a tie member for the outer portions of the body members, an irrigating or injecting tube slidable in the tie member, and an expanding member carried by the said tube and arranged for engagement with the inclined planes of the inner sections of the body members, for the purpose specified.

2. In a vaginal injector, expansible body members having their extremities curved inwardly and each provided with an inwardly-extending member having oppositely-inclined inner surfaces, spaced tie members to which the inner ends of the body members are rigidly secured, an irrigating or injecting tube slidable in the tie members, and an expanding member carried by the tube and adapted for engagement with the rear inclined surfaces of the body members, as set forth.

3. A vaginal injector, consisting of tie members, body members secured at their outer ends in the said tie members, and having their extremities curved inwardly, each of the said members having their forward portions formed of an inner and outer section, the inner sections having oppositely-inclined surfaces at their inner portions, an injector or irrigating-tube held to slide through the tie members, the said tube being provided with a spray-nozzle at its forward end, and a disk carried by said tube, adapted for engagement with the inclined portions of the body members, as described.

4. A vaginal injector, consisting of tie members, body members secured at their outer ends in the said tie members, the forward ends of the said body members being free and their extremities curved inwardly, the said body members at their free portions having oppositely-inclined surfaces at their inner portions, an injector or irrigating-tube held to slide through the tie members, the said tube being provided with a spray-nozzle at its forward end, a disk carried by said tube, adapted for engagement with the inclined portions of the body members, a stop limiting the forward movement of the said tube, a conical pad extending across the outer faces of the body members adjacent to the forward or inner tie member, the said pad and forward or inner tie member constituting a receptacle for liquid, and an outlet-tube connected with the inner or forward tie member, through which the liquid introduced by the device may be discharged, for the purpose set forth.

5. In a vaginal injector, the combination, with an outer tie member and an inner tie member, the outer tie member being provided with a series of peripheral openings and a hub, the inner or forward tie member having also peripheral openings and a band which covers the openings, together with a central opening and a side opening, and a series of body members having their outer ends secured in the peripheral apertures of the outer tie member, which body members also enter the peripheral openings in the inner or forward tie member and are held in position by the band portion of said member, the body members being outwardly arched between the outer and inner or forward tie member, the free ends of the body members having their forward extremities downwardly and inwardly curved and provided at their inner portions with oppositely-directed inclined planes, of a tube held to slide in the tie members, terminating at its forward end in a sprinkling-nozzle, a disk carried by the forward portion of the tube, adapted to engage with the inclined walls of the body members at their front portions, and an outlet-tube for liquid connected with the inner or forward tie member, extending downward and outward between the body members, for the purpose set forth.

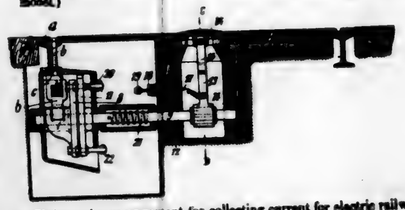
705,872. PRISM-GLASS FOR SKYLIGHTS. GEORGE E. ANDROVETTE, Brooklyn, N. Y. Filed Mar. 20, 1902. Serial No. 99,061. (No model.)

Claim.—1. Prism-plates provided with flat marginal surfaces on their prism-faces, and grooves in said prism-faces between the flat marginal surfaces and adjacent prisms, and a channel-plate the side members of which enter grooves in adjacent prism-plates, said channel-plate being adapted to be cemented to the prism-plates, as set forth.

2. As an improved article of manufacture, a prism-plate having a flat marginal surface at is prism-face, and grooves in said prism-face at opposite sides and located between the flat marginal surfaces and adjacent prisms, said plate being also provided with flanges upon its smooth face at opposite edges, which flanges are at right angles to the groove and incline from their outer edges downward to meet the plain smooth face of the panel, as described.

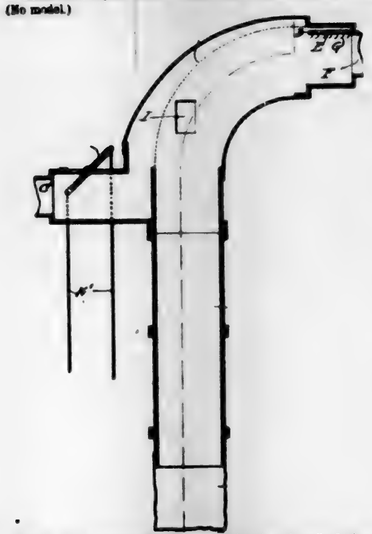
3. The combination with prism-plates having a flat marginal surface at their prism-faces, and grooves in said prism-faces adjacent to the flat marginal surfaces, the said plates being also provided with tapering edges and with flanges upon their smooth faces at opposite edges, inclining from said edges downward to the smooth faces of the plates, which flanges are at right angles to the said grooves, of inverted-T beams, the webs of which extend upward between the flanged edges of opposing prism-plates, a packing within the spaces between the edges of the prism-plates and the webs of the beams, extending to the tops of said webs and to an engagement with said flanges, a channel-plate, the side members of which enter the grooves in adjacent prism-plates, and packing in the spaces between the grooved edges of the prism-plates, which packing extends to the channel-plates, as set forth.

705,873. ELECTRIC RAILWAY. WALTER BERENS and JEAN P. TIBON, Paris, France. Filed Oct. 10, 1901. Serial No. 78,247. (No model.)



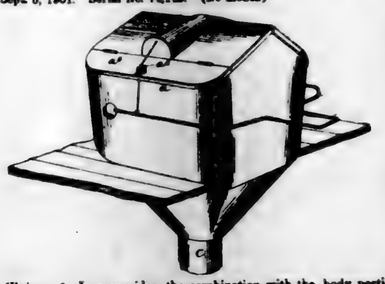
Claim.—An arrangement for collecting current for electric railways comprising a plurality of depressible spring-pedals *b*, contact-breaking commutators, shafts 9 carrying the same, disks mounted on said shafts and adapted to be operated by said pedals, a two-armed spring-pressed lever having a projection or pawl at one end adapted to engage each disk, a connection from one arm of each lever to the preceding disk and a connection from the other arm to the succeeding disk whereby the placing in circuit of one commutator involves the placing out of circuit of the preceding and succeeding commutators, substantially as described.

705,874. COTTON ELEVATOR AND SEPARATOR. CRADDOCK R. BENEFIELD, Alpika, Miss. Filed Mar. 5, 1901. Serial No. 49,851. (No model.)



Claim.—In a pneumatic elevator of the class described, the combination with the chute, a screen, a cotton-receiving pipe, of a series of bars arranged horizontally and with their inner ends diverging, the same being provided with hooks, substantially as shown and described, whereby the cotton is spread laterally and distributed in the manner specified.

705,875. CUSPIDOR. JACOB BOOTH, Reynoldsville, Pa. Filed Sept. 3, 1901. Serial No. 74,169. (No model.)



Claim.—1. In a cuspidor, the combination with the body portion, having the rectangular cut-away portion at the top, and provided with lateral upwardly-inclined seats meeting at the center, of the twin covers having the straight rear edges hinged to the edges of said cut-away portion, and resting upon said seats when closed, said covers when open having inwardly-inclined walls converging toward the hinged rear edges thereof, a bifurcated operating-lever pivoted at its inner end to one end portion of the cuspidor, and having a forward treadle extension at the opposite end portion of the cuspidor, and short chains or cords connecting raised portions of said covers with intermediate portions of the branches of said lever, substantially as specified.

2. In a cuspidor, the combination with the body, of the rectangular twin covers hinged thereto, the bifurcated operating-lever having lateral parallel arms embracing said body, and pivoted at their free ends at one end of the body, and the pedal extension of said lever projecting beyond the other end of said body, closing-springs, and chains or cords connecting said arms and covers, substantially as specified.

3. A cuspidor having a base provided with a recess, in which it is seated, means for raising the cuspidor out of such recess, and for returning it to normal position, substantially as specified.

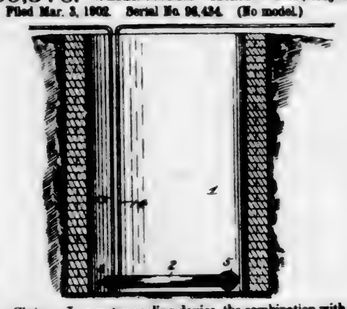
4. A cuspidor having a base provided with a recess, in which it is seated, a lever, and means for raising the cuspidor from such recess upon operation of said lever, substantially as specified.

5. A cuspidor having a base provided with a recess, in which it is seated, a lever having a cord connection with the cuspidor, and arranged to raise the same from the recess upon operation thereof, substantially as specified.

6. A cuspidor having a base provided with a recess, in which it is seated, a lever having a cord connection with the cuspidor, and arranged to raise the same from said recess upon operation thereof, the cover for the cuspidor, and means for automatically opening the same upon raising of the cuspidor, substantially as specified.

7. A cuspidor having a base provided with a recess, in which it is seated, a lever having a cord connection with the cuspidor, and arranged to raise the same from its recess upon operation thereof, the cover for the cuspidor, the lever having a limiting cord attachment, and a cord connection with said cover, and arranged to open said cover upon raising of the cuspidor, substantially as specified.

705,876. WATER-COOLER. GEORGE W. BOLE, Grayadar, W. Va. Filed Mar. 3, 1902. Serial No. 96,434. (No model.)



Claim.—In a water-cooling device, the combination with supply and discharge pipes; of an open-center chambered body formed of sections and adapted to be submerged in the water of a cistern or well, said sections having at their opposite ends connecting flanges and lugs, and water inlet and discharge nipples adjacent to the lugs and connecting with said pipes, a partition-plate interposed between the ends of the sections provided with the lugs and provided with connecting lugs, and bolts passing through the flanges and lugs and connecting the parts together, substantially as described.

705,877. DIE OR STAMP HOLDER. WILLIAM J. BUCHANAN, Huntington, Ind. Filed Mar. 19, 1902. Serial No. 99,011. (No model.)

Claim.—1. In a die or stamp holder, the combination with the holder adapted to carry the stamp or die; of a handle provided with a ball-seat, and a contractible ball carried by said holder adapted to enter said ball-seat, and means for normally retaining said handle in an upright position.

2. In a die or stamp holder, the combination with the holder carrying the die or stamp; of a handle provided with a vertical bore, and a ball-seating, at its lower end, a plug carried by said holder having a contractible ball adapted to enter said ball-seat, and a spring adapted to enter the bore of said handle adapted to normally retain said handle in a vertical position.

3. In a die or stamp holder, the combination with the holder carrying the die or stamp, and a ball carried by said holder; of a handle provided with a vertical bore, a ball-seating at its lower end to receive said ball, and a spring carried by said holder, adapted to enter said bore and normally retain said handle in a vertical position.

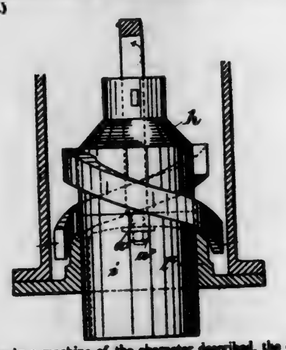
4. In a die or stamp holder, the combination with the holder carrying the die or stamp, and a ball carried by said holder provided with a vertical slot to allow said ball to contract; of a handle provided with a ball-seat upon its lower end to receive said ball, and means for normally retaining said handle in a vertical position.

5. In a die or stamp holder, the combination with the holder carrying the die or stamp, and a ball carried by said holder provided with a

vertical slot to allow said ball to contract; of a handle provided with a ball seat upon its lower end to receive said ball, and a spring secured in a perforation in said ball, and extending upwardly into the bore of said handle to normally retain the same in a vertical position.

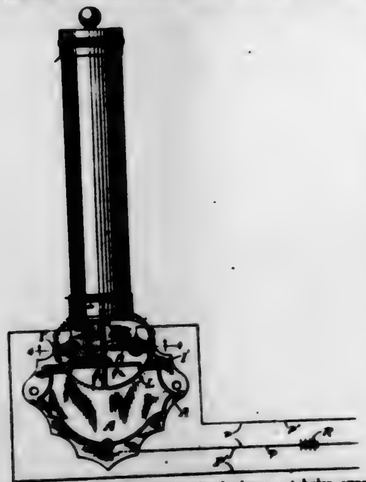
6. In a die or stamp holder, the combination with the holder carrying the stamp or die, and a ball carried by said holder provided with a vertical slot, allowing the sides of said ball to contract; of a handle provided with a vertical bore, a ball-seat formed at the bottom of said bore, provided with a contracted opening through which said contractible ball is adapted to pass, and a spring secured in said ball, and having an enlarged end extending up into said bore to normally retain said handle in a vertical position.

705,378. PROFILE-TOOL FOR MAKING PIPE-MOLDS. FRANZ BENEDIKT, Bulmke, Germany. Filed Feb. 26, 1902. Serial No. 96,610. (No model.)



Claim.—In a machine of the character described, the combination with a flask having a ring-shaped guide, a non-rotary mold-block movable through the guide, a pressing-block surrounding and having a rotary connection with the mold-block and movable up and down therewith, and spirally-disposed strips secured to the pressing-block, each strip embracing about one-half the diameter of the block and spaced therefrom throughout the greater portion of its length.

705,379. THERMOSTATIC CIRCUIT-CLOSER. ALBERT H. BOYD, Oakpark, Ill. Filed Feb. 5, 1902. Serial No. 92,748. (No model.)

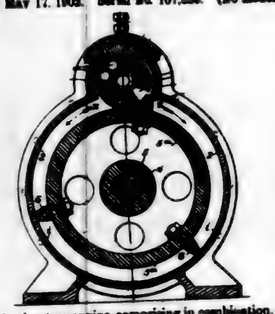


Claim.—1. In a thermostatic circuit-closer a tubular expansible member, a base to which the expansible member is secured, an expansible member consisting of a compound bar within the tubular expansible member, an L-shaped base to the compound bar, an additional base on which said L-shaped base is movably mounted, such additional base attached to the tubular expansible member to be moved by the expansion and contraction of such member, electric terminals, a circuit-closer between the electric terminals, such circuit-closer attached to the compound bar, means to yieldingly maintain the circuit-closer in electrical contact with one of the terminals, and means to adjust and to indicate the adjustment of the compound bar and circuit-closer attached thereto; substantially as described.

2. In a thermostatic circuit-closer, a tubular expansible member, a base to which the expansible member is secured, an expansible member consisting of a compound bar within the tubular expansible member, an L-shaped base to the compound bar, an additional base on which such L-shaped base is movably mounted, such additional base attached to the tubular expansible member to be moved by the expansion and contraction of such member, electric terminals, a circuit-closer between the electric terminals, such circuit-closer attached to the compound bar, an adjustable sleeve in the base of the tubular expansible member, a temperature-adjusting arm one end whereof is screw-threaded, such screw-threaded end fitting into corresponding screw-threads in the adjustable sleeve, and a rod fitting loosely at the lower end thereof in the adjustable sleeve to rest on the temperature-adjusting arm and at the upper end thereof attached to one arm of the L-shaped base of the compound bar; substantially as described.

3. In a thermostatic circuit-closer, a tubular expansible member, a base to which the expansible member is secured, an expansible member consisting of a compound bar within the tubular expansible member, an L-shaped base to the compound bar, an additional base on which such L-shaped base is movably mounted, such additional base attached to the tubular expansible member to be moved by the expansion and contraction of such member, electric terminals, a circuit-closer between the electric terminals, such circuit-closer attached to the compound bar, an adjustable sleeve in the base of the tubular expansible member, a temperature-adjusting arm one end whereof is screw-threaded, such screw-threaded end fitting into corresponding screw-threads in the adjustable sleeve, and a rod fitting loosely at the lower end thereof in the adjustable sleeve to rest on the temperature-adjusting arm and at the upper end thereof adjustably attached to one arm of the L-shaped base of the compound bar, and a collar provided with marks thereon at the lower end of the tubular expansible member; substantially as described.

705,380. ROTARY ENGINE. GEORGE CARBADY, Vancouver, Canada. Filed May 17, 1902. Serial No. 107,529. (No model.)



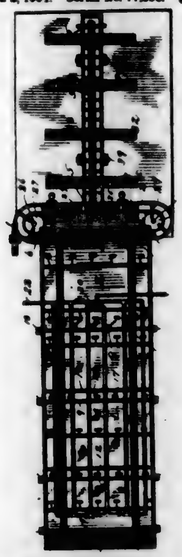
Claim.—1. A rotary engine, comprising in combination, a cylindrical casing, a piston-wheel rotatable therein, having radial piston-blades, a tubular rotary valve member, adapted to roll on the periphery of the piston-wheel, said valve member having a socket for receiving and coöperating with the piston-blades, a hollow spindle connected with the steam-supply, upon which the aforesaid valve is rotatably mounted, said spindle having a rotary motion independent of the movement of the valve, and having a port for communicating with the socket in the said valve, a closing-piece bearing on the valve opposite its line of contact with the piston-wheel, exhausts in the piston-chamber, one at each side of the rotary valve, a casing common to both exhausts, and a shiftable valve within the casing for controlling the two exhausts to open and close them alternately.

2. In an engine of the class described, having a valve through which steam is admitted rotatable on the periphery of the bladed wheel; a closing-piece on the valve opposite the line of contact; a dovetailed recess in the casing adapted to receive such closing-piece; strips of lead or similar joint material in the edges of such closing-piece; and means whereby the closing-piece may be tightened down on its edge joints and on the valve.

3. In an engine as described having a valve rotatable on its own axis on the bladed operative wheel and means for imparting rotation thereto from the operative shaft; a hollow spindle through which steam may be admitted to the valve; a steam connection on the spindle to which the steam-supply pipe is connected; a lever by means of which such spindle may be turned to direct its internal steam-port; a nut on the spindle whereby the joints of the steam connection may be drawn close; and a collar on the spindle to oppose the pull of the nut.

4. In an engine as described, the combination with the annular steam-casing, the piston-wheel, carrying radially-projected piston-blades, a valve rotatable upon its own axis, and rotatably engaging the periphery of the piston-wheel, means for imparting rotation to the valve from the drive-shaft, said valve having a socket for coöperating with the piston-blades, and for feeding live steam into the piston-chamber, a hollow steam-feed spindle, upon which the socketed valve is rotated, said spindle having a port adapted to coöperate with the socket in the valve, said spindle having rotary motion independent of the valve, and a lever means for adjusting the said spindle, all being arranged substantially as shown and described.

705,381. SALT-MAKING APPARATUS. JOHN S. CLARKE, St. Clair, Mich., assignor of one-half to Maria Josephine Clarke, St. Clair, Mich. Filed Oct. 2, 1901. Serial No. 77,296. (No model.)



Claim.—1. A salt-drainer comprising a pan, an inclined drain-board at one end thereof, an endless chain, a transversely-disposed rake attached to the chain and adapted to bear upon the pan and the board, and an agitating device flexibly secured to the rake.

2. A salt-grainer comprising a pan having its rear end inclined to form a draining-board; transverse shafts supported in bearings outside of the pan and above the top edges thereof, sprocket-wheels on said shafts, endless chains passing around said sprocket-wheels, transversely-disposed rakes attached to said chains, and loosely-depending agitating devices attached to the rakes.

3. In a salt-grainer, the combination with a pan provided with an upwardly-inclined draining-board, transverse shafts supported in bearings outside of the pan and above the top edges thereof, transversely-disposed rakes slotted at their lower edges, agitating devices loosely depending from the rakes, a transversely-arranged receptacle to receive the salt from the draining-board, a conveyer within said receptacle, a receiving-bin below said receptacle divided into independent compartments, and a longitudinally-disposed conveyer above said bin.

4. The combination in a salt-grainer, of a brine-pan, a rake therefor having its upper and lower edges slotted, means for operating the rake, hooks mounted in the slots in the upper edge of the rake, and adapted to engage the operating means to secure the rake thereto, agitating devices flexibly connected to the rake, a receptacle to receive the salt from the brine-pan, a conveyer within the receptacle, a receiving-bin below the receptacle, and a movable conveyer mounted upon the receiving-bin to deposit the salt at different points therein.

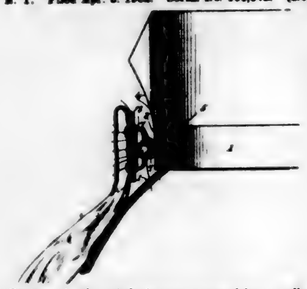
5. In a salt-grainer, the combination with a pan provided with an inclined draining-board; of transverse shafts, endless chains mounted thereon, transversely-disposed rakes secured to said chains, an agitating device flexibly connected to the rakes, a transversely-arranged receptacle to receive the salt from the draining-board, a conveyer within said receptacle, a receiving-bin below the receptacle and divided into independent compartments, and a laterally-movable, longitudinally-disposed conveyer mounted upon the bin and adapted to convey the salt from said receptacle to the bin-compartments.

6. In a salt-grainer, the combination with a brine-pan, of a rake therefor having the lower edge thereof slotted, agitating devices flexibly connected to the rake near the lower edge thereof and intermediate the slots, means for operating the rake, and means for securing the rake to the operating means.

7. In a salt-grainer, a rake therefor having its lower and upper edges slotted, agitating devices connected with the rake, and securing-hooks in the slots on the upper edge of the rake.

8. The combination in a salt-grainer, of a brine-pan, a rake therefor having its upper and lower edges slotted, means for operating the rake, hooks mounted in the slots in the upper edge of the rake, and adapted to engage the operating means to secure the rake thereto, agitating devices flexibly connected to the rake, a receptacle to receive the salt from the brine-pan, and provided with a plurality of discharge-openings, a conveyer within the receptacle, a deflector interposed between the receptacle and the brine-pan, a receiving-bin below the receptacle, and a movable conveyer mounted upon the receiving-bin to deposit the salt at different points therein.

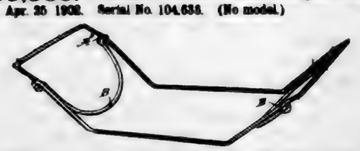
705,382. NECKTIE-FASTENER. JAMES A. CLINTON, Brooklyn, N. Y. Filed Apr. 8, 1902. Serial No. 101,872. (No model.)



Claim.—1. A necktie-fastener, comprising a collar-button provided with a boss, and a member provided with fastenings, whereby it may be secured upon the necktie, said member consisting of a flat plate surmounted by an annular dome, and a spring-plate provided centrally with a hollow bulb for engaging said boss, said spring-plate being mounted upon said dome, and said bulb constituting a concavity therein, said spring-plate being further provided with slots radiating from said bulb for the purpose of yielding slightly when said boss is forced into said concavity.

2. A necktie-fastener, comprising a collar-button provided with a boss, a member provided with fastenings whereby it may be secured upon the necktie, said member consisting of a flat plate surmounted by an annular dome, a spring-plate provided centrally with a hollow bulb for engaging said boss, said spring-plate being mounted upon said dome, said bulb constituting a concavity therein, said spring-plate being further provided with slots radiating from said bulb for the purpose of yielding slightly when said boss is forced into said concavity, and a resilient washer disposed between said spring-plate and said dome.

705,388. CARRIER. JUDSON G. COFFAN, Compton, Cal. Filed Apr. 25, 1902. Serial No. 104,636. (No model.)



Claim.—1. A carrier having a frame, consisting of spaced side rails having straight bottom portions, upwardly and outwardly extending end portions, and cross-bars integrally connecting the side rails with each other at the ends, to form handles for the frame, as set forth.

2. A carrier, having a frame, consisting of spaced side rails having straight bottom portions, upwardly and outwardly extending end portions, cross-bars integrally connecting the side rails with each other at the ends, to form handles for the frame, and bails provided on the end portions of the side rails, as set forth.

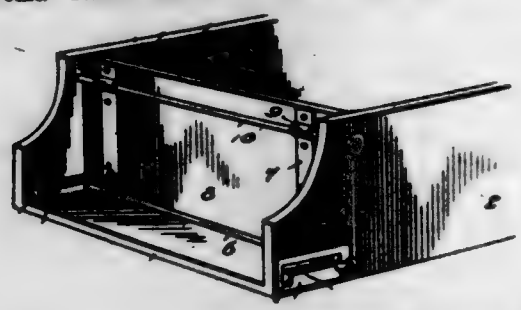
3. A carrier, having a frame, consisting of spaced side rails having straight bottom portions, upwardly and outwardly extending end portions, cross-bars integrally connecting the side rails with each other at the ends, to form handles for the frame, and bails provided on the end portions of the side rails, adapted to swing between the side rails to an inner or outer position relative to the frame, as set forth.

4. A carrier, having a frame, consisting of spaced side rails having straight bottom portions, upwardly and outwardly extending end portions, cross-bars integrally connecting the side rails with each other at the ends, to form handles for the frame, bails provided on the end portions of the side rails, adapted to swing between the side rails to an inner or an outer position relative to the frame, and means on the bail-bearings, engaged by the bails, for holding the latter locked in a folded position, as set forth.

705,884. BED-SLAT HOLDING MEANS. ALEXANDER R. COOPER, Milam, Tex. Filed Jan. 2, 1902. Serial No. 88,198. (No model.)

Claim.—The combination of side rails of a bedstead having inner ledges with sockets and vertical slots communicating with the said sockets, slotted metallic members fitted over portions of the ledges and in the sockets and having tongues secured against the under edges of the ledges and rails, and slats having metallic plates secured to the under sides of the opposite extremities thereof and provided with downwardly-extending tongues flush with the ends of the slats to removably engage the slots in the ledges communicating with the sockets.

705,885. END-GATE FOR WAGONS. GIDEON S. COOVER, Bournesville, Ohio. Filed Mar. 20, 1902. Serial No. 99,127. (No model.)



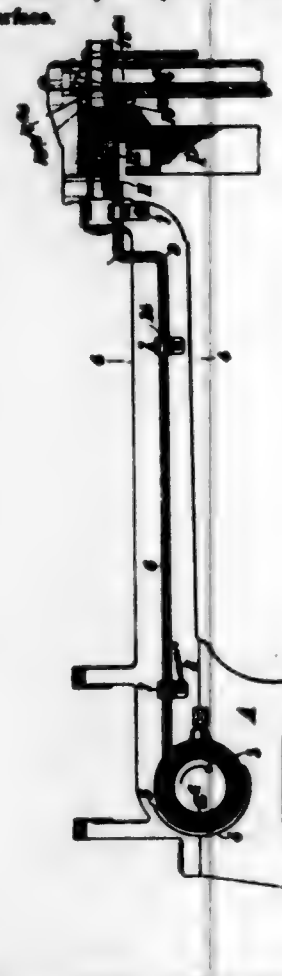
Claim.—1. The combination of a wagon-body having horizontal slots in its sides terminating in front and rear recesses, an end-gate, a removable rod engaging the body, sides, and the gate, a rod adjustably mounted in the said slots and serving as a pivot for the end-gate, said latter rod normally resting in a recess of each slot, and wings for the end-gate.

2. The combination of a wagon-body having horizontal slots in its sides provided with enlarged terminal recesses, an end-gate, and a rod adjustably mounted in the slots of the body and serving as a pivot for the gate, said rod normally resting in a recess in each slot.

3. The combination of a wagon-body having horizontal slots in the rear terminals of the sides thereof provided with end recesses, an end-gate having straps secured thereon, a rod engaging the said straps and serving as a pivot for the gate, said rod normally engaging a recess in each slot in the sides, a securing-rod also removably engaging the straps and the sides, and a supporting-chain secured to the gate and adapted to be adjustably held by the body.

705,886. ALINING MECHANISM FOR LINOTYPE-MACHINES. ALFRED H. CHURCHMAN, London, England, assignor to the Mergenthaler Linotype Company, New York, N. Y. Filed Feb. 28, 1902. Serial No. 96,726. (No model.)

Claim.—1. The combination with the detent, detent-disengager and disengager-rod of the first elevator of a Mergenthaler linotype-machine, of a cam-surface incorporated with the cam that raises the first elevator; push-rod actuated thereby; and finger held by the disengager-rod in position to be rocked by the push-rod when the latter is actuated by the said cam-surface.

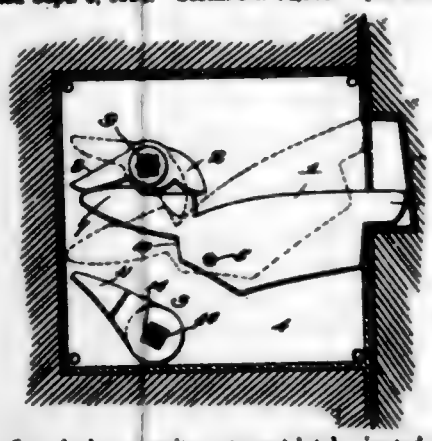


2. The combination with the detent, detent-disengager and disengager-rod of the first elevator of a Mergenthaler linotype-machine, of a cam-surface incorporated with the cam that raises the first elevator; main push-rod actuated thereby; front portion of push-rod supported by the vise-frame; and finger held by the disengager-rod in position to be rocked by the front portion of the push-rod when the main portion of it is actuated by the cam-surface.

3. In a linotype-machine, the first elevator, a device for locking the same down momentarily to relieve the matrix-cam from friction during the justifying action, and a positively-acting device independent of the justifying mechanism to effect the disengagement of said detent after the justifying action.

4. In a linotype-machine, the combination of the first elevator for supporting the line of matrices, a locking device x^{61} to hold the elevator down during the action of the justifying devices, a cam 4 and connections from said cam to positively disengage the locking device.

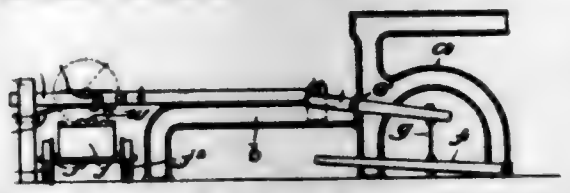
705,887. COMBINED LOCK AND LATCH. JAMES B. COX, Canton, N. Y. Filed Sept. 6, 1901. Serial No. 74,565. (No model.)



Claim.—In a lock, a gravity-actuated latch pivoted intermediate of its ends for rocking movement, and provided at one end with an enlarged counterweight terminating in a bolt and at its other end with an arm or projection provided on its upper side with a curved bearing-surface terminating in a square shoulder, and on its under side with a curved bearing-surface also terminating in a square shoulder disposed back of the shoulder of the upper surface, a two-arm latch-lifter having cam projections coacting with the curved upper surface and with the square shoulder of the latch whereby to rock the same in either direction, and a single

locking-tumbler to engage with the square shoulder of the said arm or projection, the tumbler being provided with spindles which project through the lock-casing, each of the spindles being formed with means to be engaged by a key, substantially as and for the purpose specified.

705,888. APPARATUS FOR REMOVING ROLLS OF MATERIAL FROM PAPER-MACHINES. MARK A. CRAFT, Lincoln, Me., assignor of one-half to Nathaniel M. Jones, Lincoln, Me. Filed Nov. 23, 1901. Serial No. 84,060. (No model.)



Claim.—1. The combination with bearings for a removable winding-mandrel, of tracks extending outwardly from said bearings and adapted to support the end portions of the mandrel, and means for raising the mandrel from its bearings to permit the transference of the mandrel to the tracks, the said tracks being separated by a space adapted to receive a roll of paper wound upon the mandrel.

2. The combination with bearings for a removable winding-mandrel, of tracks extending outwardly from said bearings and adapted to support the end portions of the mandrel, and levers fulcrumed near said bearings and extending under the end portions of the mandrel when the latter is supported by said bearings, said levers being movable to raise the mandrel from the bearings and permit its transference to said tracks.

3. The combination with bearings for a removable winding-mandrel, of tracks extending outwardly from said bearings and adapted to support the end portions of the mandrel, levers fulcrumed near said bearings and extending under the end portions of the mandrel when the latter is supported by said bearings, and means for moving said levers to raise the mandrel from the bearings and permit its transference to the tracks.

4. The combination with bearings for a removable winding-mandrel, of tracks extending outwardly from said bearings and adapted to support the end portions of the mandrel, primary levers fulcrumed near said bearings and having shorter arms extending under the end portions of the mandrel, and secondary levers fulcrumed below said primary levers and connected with the longer arms thereof.

5. The combination with bearings for a removable winding-mandrel, of tracks extending outwardly from said bearings and adapted to support the end portions of a mandrel and a roll wound thereon, a locking device at the end of one of said tracks adapted to engage one of the end portions of the mandrel, and means for removing said roll endwise from the mandrel.

6. The combination with bearings for a removable winding-mandrel, of tracks extending outwardly from said bearings and adapted to support the end portions of the mandrel, a way extending substantially at right angles with said tracks and located below their outer ends, and a carriage movable on said way and adapted to receive from said tracks a roll containing said mandrel.

7. The combination with bearings for a removable winding-mandrel, of tracks extending outwardly from said bearings and adapted to support the end portions of the mandrel, a way extending substantially at right angles with said tracks and located below their outer ends, a carriage movable on said way and adapted to receive from said tracks a roll containing said mandrel, means for locking a mandrel contained in a roll supported by said carriage, and means for moving the carriage endwise to withdraw the roll from the locked mandrel.

8. The combination with bearings for a removable winding-mandrel, of tracks extending outwardly from said bearings and adapted to support the end portions of the mandrel, a way extending substantially at right angles with said tracks and located below their outer ends, a carriage movable on said way and adapted to receive from said tracks a roll containing said mandrel, means for locking a mandrel contained in a roll supported by the carriage, and power mechanism for moving the carriage and roll away from the locked mandrel, said mechanism comprising a power-driven shaft, normally inoperative connections between said shaft and the carriage, and means for making said connections operative to move the carriage.

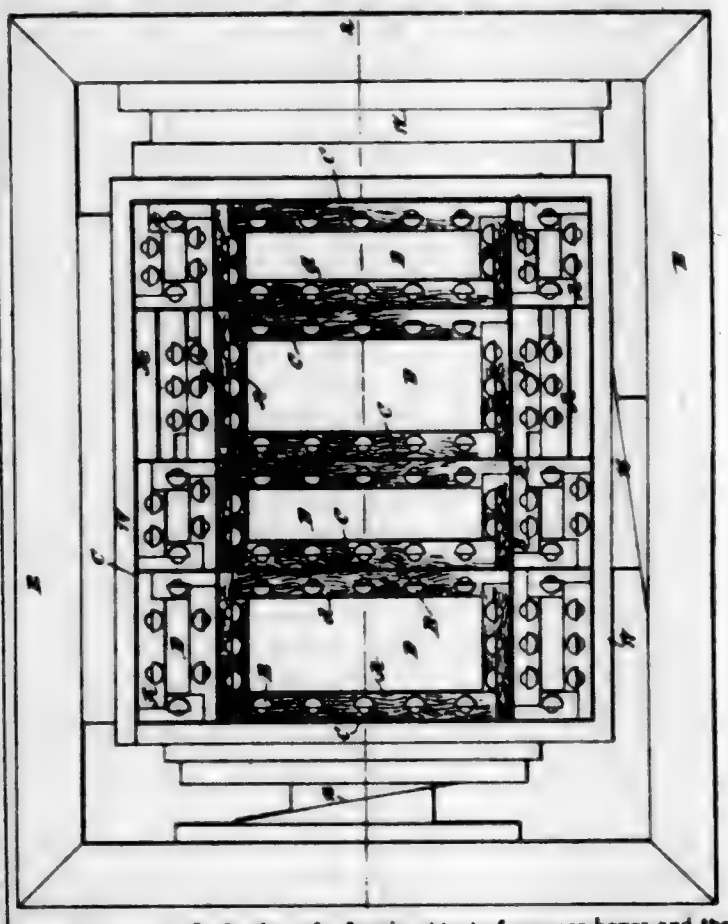
9. The combination with bearings for a removable winding-mandrel, of tracks extending outwardly from said bearings and adapted to support the end portions of the mandrel, a way extending substantially at right angles with said tracks and located below their outer ends, a carriage movable on said way and adapted to receive from said tracks a roll containing said mandrel, means for locking a mandrel contained in a roll supported by the carriage, and power mechanism for moving the carriage and roll away from the locked mandrel, said mechanism comprising a power-driven shaft having a friction member, a winding-drum having a complemental friction member, means for engaging and separating said friction members, a rope engaged with said drum and with the carriage, and suitable guiding means for said rope.

10. The combination with bearings for a removable winding-mandrel, of tracks extending outwardly from said bearings and adapted to support the end portions of a mandrel and a roll wound thereon, a locking device at the end of one of said tracks adapted to engage one of the end portions of the mandrel, and means for removing said roll endwise from the mandrel, said locking device having provisions for automatically conforming to the height of the mandrel, and means for moving the carriage to withdraw the roll from the engaged mandrel.

11. The combination with bearings for a removable winding-mandrel, of tracks extending outwardly from said bearings and adapted to support the end portions of the mandrel, a way extending substantially at right angles with said tracks and located below their outer ends, a carriage movable on said way and adapted to receive from said tracks a roll containing said mandrel, an extension of one of said tracks, said extension having a recess formed to engage a shoulder on one of the end portions of the mandrel, and means for moving the carriage to withdraw the roll from the engaged mandrel.

12. The combination with bearings for a removable winding-mandrel, of tracks extending outwardly from said bearings and adapted to support the end portions of the mandrel, a way extending substantially at right angles with said tracks and located below their outer ends, a carriage movable on said way and adapted to receive from said tracks a roll containing said mandrel, a hinged extension of one of said tracks, said extension having a recess formed to engage a shoulder on one of the end portions of the mandrel, means for yieldingly supporting said hinged extension to enable it to conform automatically to the height of the mandrel, and means for moving the carriage to withdraw the roll from the engaged mandrel.

705,889. FURNITURE FOR FORMING PAPER-BOX BLANKS. JOSEPH T. CRAW, Jersey City, N. J., and FREDERICK SCHLEY, Brooklyn, N. Y. Filed Jan. 17, 1902. Serial No. 90,143. (No model.)



Claim.—1. In furniture for forming blanks for paper boxes and the like, a form, comprising four rectangular wooden pieces, each apertured and having one end straight and its other end recessed on its inner face, metal bushings in the apertures of the pieces, cork releasing devices having tapering heads and fitting in the apertures of the pieces, and a score rule or knife secured to the outer face of each piece with one end flush with the straight end of the piece, and its other end projecting beyond the recessed end of said piece, the pieces being arranged with the straight end of one piece entering the recess of the adjacent piece, whereby the pieces are prevented from splitting or warping and the rules or knives will be brought together at the corners forming well-defined angular interlocking corners, as set forth.

2. In furniture for forming blanks for paper boxes and the like, a

form, comprising four rectangular pieces each apertured and having one end straight and its other end recessed on its inner face, cork releasing devices having tapering heads and fitting in the apertures of the pieces, and a score rule or knife secured to the outer face of each piece with one end flush with the straight end of the piece and its other end projecting beyond the recessed end of said piece, the pieces being arranged with the straight end of one piece entering the recess of the adjacent piece, as set forth.

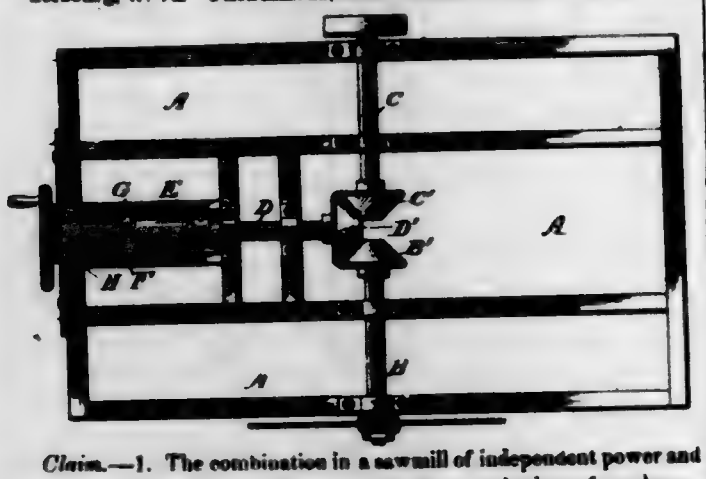
3. In furniture for forming blanks for paper boxes and the like, a form, comprising four rectangular pieces, each provided with apertures, cork releasing devices having tapering heads and fitting in the apertures of the pieces, and a score rule or knife secured to the outer face of each piece with one end flush with one end of the piece and its other end projecting beyond the other end of said piece, as set forth.

4. In furniture for forming blanks for paper boxes and the like, a form, comprising four rectangular pieces, each provided with apertures, yielding releasing devices in the apertures of the pieces, and a score rule or knife adjustably secured to the outer face of each piece, one end of the rule or knife being flush with one end of the piece and its other end projecting beyond the other end of said piece, as set forth.

5. Furniture for forming blanks for paper boxes and the like, comprising a frame, and a plurality of rectangular forms clamped in the frame, each form comprising rectangular pieces each apertured and having one end straight and its other end recessed on its inner face, cork releasing devices having tapering heads and fitting in the apertures of the pieces, and score rules or knives at the sides of the pieces, the rules or knives, each having one end flush with the straight end of the piece and its other end projecting beyond the recessed end of said piece, as set forth.

6. In furniture for forming blanks for paper boxes and the like, the combination with a form having score rules or knives and provided with apertures, of cork releasing devices in the apertures of the form, said releasing devices being semicircular in cross-section and having tapering heads, as set forth.

705,890. FRICTIONAL GEARING. WILLIAM D. DAILEY, Parkersburg, W. Va. Filed Mar. 22, 1902. Serial No. 99,434. (No model.)



Claim.—1. The combination in a sawmill of independent power and driven shafts having frictional gears at the inner ends thereof as shown, an intermediate similar gear adapted to connect the power-shaft and driven shaft and means for adjusting the intermediate gear into and out of operative connection with the power-shaft and driven shaft, substantially as described.

2. In a mill of the character stated independent power and driven shafts having at their ends frictional gears as stated, a right-angle shaft, an intermediate similar gear supported by and rigid with the right-angle shaft, a fixed screw and means connecting it with the right-angle shaft, said means being adapted in operation to adjust the said right-angle shaft and its gear out of and into operative connection with the gearing on the power and driven shafts, substantially as described.

3. The combination with two independent shafts having gearing as specified, of a right-angle shaft and an intermediate gear supported at the end of said right-angle shaft as shown, the latter resting in bearings permitting endwise movement of the said shaft as specified, a sliding box having permanent but loose connection with one end of the right-angle shaft, a fixed screw adapted to enter a threaded opening in the said box, means for locking the screw against turning in either direction and a hand-wheel at the outer end of the screw all substantially as shown and for the purpose set forth.

705,891. CABLE-CLIP. EUGENE R. DAVIS, Cardington, Ohio. Filed June 2, 1902. Serial No. 110,991. (No model.)

Claim.—1. A cable-grip, consisting of a link, a strap and a lever-cam hook, substantially as specified.

2. The combination with a cable and strap of a link, and a lever-cam hook, substantially as specified.

3. The combination with a spring-link, of a lever-cam hook, and a strap forming a cable-grip, substantially as specified.

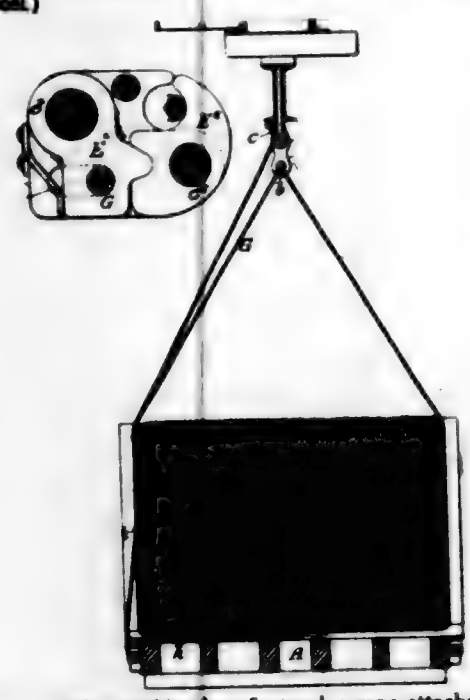
4. The combination with a link, a strap and a lever-cam hook, having cam heads, connected by a bearing-bar, and adapted to engage said link, and lock the same upon the strap end, substantially as specified.

705,892. PESSARY. DAYTE B. DE WALTOFF, Brooklyn, N. Y. Filed Jan. 5, 1901. Serial No. 42,305. (No model.)

Claim.—1. A surgical appliance, comprising a rigid, central cup-shaped body portion surrounded by a rigid, closed, hollow rim of substantially circular cross-section, joining the body in an easy curve on one face and at an obtuse angle on the opposite face, and of such cross-section as to afford a broad circumferential bearing-surface.

2. A surgical appliance, comprising a rigid, central cup-shaped body portion surrounded by a rigid, closed, hollow rim of substantially circular cross-section, joining the body portion in an easy curve, the central cup-shaped portion being perforated and the hollow rim being of such cross-section as to afford a broad bearing-surface, substantially as described.

705,893. CANE-SLING. JAMES M. DODGE, Philadelphia, Pa., assignor to the Link Belt Engineering Company, Philadelphia, Pa., a Corporation of Pennsylvania. Filed Aug. 29, 1901. Serial No. 73,723. (No model.)



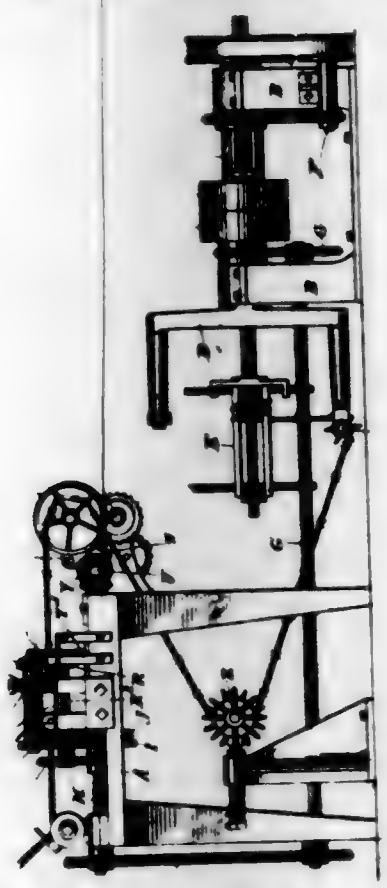
Claim.—1. The combination of a head, a rope attached to said head and having an eye, a shaft on said head, an arm on said shaft, a rope on said arm having a hook at its opposite end arranged to engage with the eye of the other rope, a trip-rope secured to said head and to the hook, said trip-rope being of such a length that it will be slack while the sling is carrying the load, and on the release of the shaft it will be drawn taut so as to trip the hook and release the load, substantially as described.

2. The combination of a head, a series of blocks carried by the head, a shaft, a series of arms on the shaft, a sling-rope attached to each block, and a second sling-rope attached to each arm of the shaft, hooks connecting the sling-ropes, trip-ropes hung from the blocks and connected to the hooks, and trip mechanism for the shaft, substantially as described.

705,894. BARBED-WIRE MACHINE. WILBUR EMERY, Ashland, Ky. Filed Mar. 22, 1902. Serial No. 99,518. (No model.)

Claim.—1. In a barbed-wire machine, the combination with means for intermittently feeding a pair of strand-wires, of means for simultaneously feeding a pair of barbing-wires from opposite directions and directing their ends between said strand-wires, and means for coiling the ex-

tremities of said barbing-wires around the strands and severing said coiled extremities during the intervening periods of rest; substantially as described.



2. In a barbed-wire machine, the combination with means for intermittently feeding a strand-wire, and mechanism for successively advancing the extremity of a barbing-wire across the same as previously advanced portions thereof are severed, of a continuously-rotating member carrying a pivoted coiling-finger, means for moving and maintaining said finger at proper intervals in position to engage and wrap said extremity around the strand-wire, means for severing the barb, and means for periodically releasing said finger to disengage and escape the points of the barb; substantially as described.

3. In a barbed-wire machine, the combination with means for supporting a strand-wire, of a rotary coiling-head carrying a pivoted finger, and means for moving and maintaining said finger at intervals in position to engage and coil the barbs about the strand-wire and for periodically moving said finger outward to disengage the finished barbs; substantially as described.

4. In a barbed-wire machine, a rotary coiling-head having an axial bore for the strand wire or wires, a pivoted finger carried by said head having its point adapted to engage and coil the barbs around the strand or strands, and a cam engaging said finger maintaining it at intervals in position to coil the barbs and periodically releasing the same to escape the finished barbs; substantially as described.

5. In a barbed-wire machine, a rotary coiling-head having an axial opening for the strand wire or wires and longitudinally slotted, a coiling-finger pivoted in said slot having its forward point projecting beyond the face of the head for engaging the barbing-wire, and a cam in contact with the base of said finger maintaining its point inward for intervals to coil the barbs and periodically releasing the seam to disengage and escape the barbs; substantially as described.

6. In a barbed-wire machine, the combination with means for supporting a strand-wire, of a continuously-rotating coiling-head, a pivoted oscillatory finger carried thereby, means for maintaining said finger pressed inward at intervals to engage and coil the barbs around the strand, and means for periodically permitting said finger to swing outward by centrifugal force to disengage and escape the barbs; substantially as described.

7. In a barbed-wire machine, a coiling-head and an adjacent cam-wheel adapted to rotate at different speeds, said head carrying a pivoted oscillatory coiling-finger engaged by the cam and periodically moved inward to coil the barbing-wire around the strand and outward to escape the barbs; substantially as described.

8. In a barbed-wire machine, a coiling-head and an adjacent cam-wheel adapted to rotate continuously at different speeds, and a pivoted oscillatory coiling-finger carried by said head, said finger being periodically engaged by the cam and pressed inward to coil the barbing-wire around the strand and periodically released to disengage and escape the points of the barbs; substantially as described.

9. In a barbed-wire machine, the combination with means for intermittently feeding the strand wire or wires and advancing in opposite directions across the same the extremities of a pair of barbing-wires, of a rotary coiling-head having an axial strand-wire opening, oppositely-pivoted coiling-fingers carried thereby, and means for periodically moving said fingers inward to wrap said extremities about the strand wire or wires and outward to disengage and escape the points of the barbs; substantially as described.

10. In a barbed-wire machine, the combination with means for intermittently feeding the strand wire or wires and advancing in opposite directions across the same the extremities of a pair of barbing-wires, of a coiling-head and an adjacent cam through which the strands are axially threaded, said head and cam being continuously rotatable at different speeds, and a pair of oscillatory coiling-fingers pivoted in said head at opposite sides of its axis, said fingers being engaged by said cam and periodically moved inward to coil the barbing-wires around the strand or strands and outward to escape the barbs; substantially as described.

11. In a barbed-wire machine, the combination with means for intermittently feeding the strand wire or wires and advancing in opposite directions across the same the extremities of a pair of barbing-wires, of a coiling-head and an adjacent cam through which the strands are axially threaded, said head and cam being continuously rotatable at different speeds, and a pair of oscillatory coiling-fingers carried by said head, said fingers being periodically engaged by the cam and pressed inward to coil the barbing-wires around the strand or strands and periodically released and permitted to move outward by centrifugal force to escape the barbs; substantially as described.

12. In a barbed-wire machine, a rotatable coiling-head having an axial bore to receive the strand wire or wires, and a pair of oscillatory coiling-pins secured on removable pivots; substantially as and for the purpose described.

13. In a barbed-wire machine, a guide for the strand wire or wires, an inner rotatable sleeve inclosing the same carrying a coiling-head through which the strand wire or wires are threaded, an outer sleeve rotatable at a different speed from the other carrying an annular cam in proximity to the head, and a coiling-finger pivoted in said head, said finger being periodically engaged by the cam to maintain its forward extremity in engagement with the barbing-wire and periodically released to disengage the finished barb; substantially as described.

14. In a barbed-wire machine, the combination with means for intermittently feeding the strand wire or wires and advancing a pair of barbing-wires across the same from opposite sides of the machine, and mechanism for coiling the successively-advanced extremities of the barbing-wires around the strand wire or wires during the intervening intervals of rest, of the shearing mechanism comprising upper fixed knives and lower coöperating movable knives between which the barbing-wires are guided, a slide secured to said movable knives for operating them simultaneously, and a cam upon which said slide is supported adapted to reciprocate said slide; substantially as described.

15. In a barbed-wire machine, the combination with means for intermittently feeding the strand-wire, the barbing mechanism, and means for intermittently feeding a barbing-wire, of a clamping device distinct from said feeding mechanism adapted to positively grip and hold the barbing-wire against movement in either forward or backward direction during the coiling operation; substantially as described.

16. In a barbed-wire machine, the combination with strand-wire feeding and barbing mechanism, and means for intermittently feeding the barbing-wire, of means distinct from but actuated by the devices for stopping the barbing-wire feed for positively clamping said barbing-wire during the intervals of rest to prevent its displacement by the barbing mechanism or movement in either direction during such intervals; substantially as described.

17. In a barbed-wire machine, a pair of oppositely-rotating rollers between which the barbing-wire is gripped and fed into the machine, means for separating said rollers at intervals so as to feed the wire intermittently, and a clamping device actuated simultaneously with separation of the rollers for holding the barbing-wire in rigid position during the barbing operation; substantially as described.

18. In a barbed-wire machine, a pair of oppositely-rotating rollers between which the barbing-wire is gripped and fed into the machine, means for separating said rollers at intervals so as to feed the wire intermittently, and a clamping device actuated by separation of the rollers for holding the wire rigidly during the barbing operation; substantially as described.

19. In a barbed-wire machine, a pair of oppositely-rotating rollers between which a wire is gripped and fed into the machine, means for separating said rollers at intervals to feed the wire intermittently, gripping members between which the wire is guided, and a suitable connection between one of said members and one of said rollers whereby when the rollers are separated said members are caused to grip and hold the wire; substantially as described.

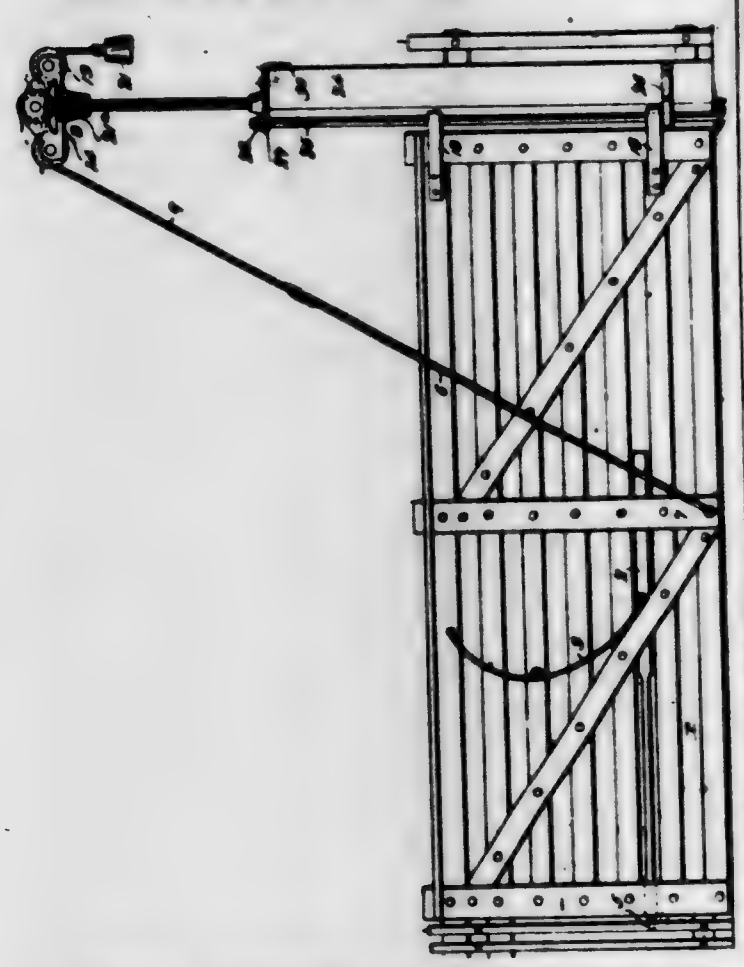
20. In a barbed-wire machine, a pair of oppositely-rotating rollers between which a wire is gripped and fed into the machine, one of said rollers having a segmental peripheral shoulder for separating the rollers at intervals and thus feeding the wire intermittently, gripping members between which the wire is guided, and suitable connections between said members and rollers whereby when the latter are separated said members are caused to grip the wire; substantially as described.

21. In a barbed-wire machine, a pair of oppositely-rotating rollers which grip and feed a wire into the machine, means for separating said rollers at intervals to feed the wire intermittently, a strap passing over one of said rollers having its ends spring-actuated to force the rollers together, and gripping members between which the wire is guided, one of which is connected with said strap so as to be forced toward the other to grip the wire when the rollers are separated; substantially as described.

22. In a barbed-wire machine, a pair of oppositely-rotating wire-feeding rollers, means for separating them at intervals to feed the wire intermittently, gripping members between which the wire is guided, and suitable connections between said rollers and members whereby when the former are separated the latter are forced together to grip and hold the wire, substantially as described.

23. In a barbed-wire machine, a pair of oppositely-rotating wire-feeding rollers, one of which is fixed and the other adapted to be separated therefrom, means for separating the latter at intervals to feed the wire intermittently, and fixed and movable clamping members between which the wire is guided, the movable member being connected with the movable roller so as to move toward the fixed member when the rollers are separated and clamp the wire, substantially as described.

705,895. GATE. WILLIAM FULLER, Sowerville, Ind. Filed Nov 25, 1901. Serial No. 83,698. (No model.)



Claim.—1. The combination with a vertically-movable gate, and a post arranged adjacent thereto and supporting a head bearing friction devices, of a weight-bearing flexible connection associated with the gate and engaging the said devices in reversely-disposed loops the exective relation between the friction devices and the flexible connection being such that with a counterpoise of less weight than the gate, the latter may be held at any desired vertical adjustment.

2. The combination with a vertically-adjustable gate, and a post arranged adjacent thereto and supporting a horizontally-movable head bearing a plurality of rotatable friction devices, of a weight-bearing flexible connection associated with the gate and engaging by reversely-disposed loops with the said devices.

3. The combination with a gate, and a post arranged adjacent thereto and supporting a horizontally-movable head bearing a plurality of rotatable friction devices, of a bail pivotally connected to the gate, and a weight-bearing flexible connection associated with the bail and engaging by reversely-disposed loops with the said devices.

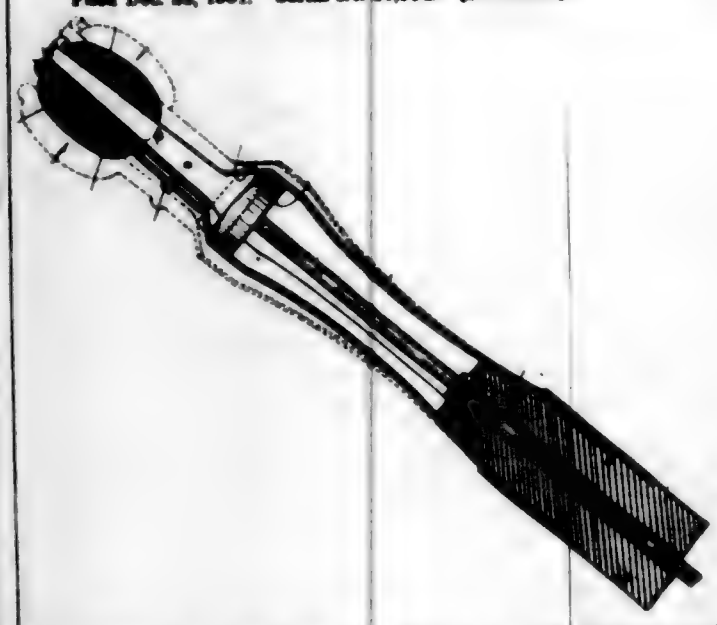
4. The combination with a gate, and a post arranged adjacent thereto and supporting a head bearing a plurality of sheaves, of a bail pivotally connected to the gate, and a weight-bearing flexible connection secured to the bail and passed in reversely-disposed loops around the sheaves.

5. The combination with a gate, and a post arranged adjacent thereto and supporting a swiveled head bearing a plurality of sheaves, of a bail pivotally connected to the lower portion of the gate near the center thereof, and a weight-bearing flexible connection secured to the bail and passed in reversely-disposed loops around the sheaves.

6. The combination with a gate, of a post, a head carried by the upper portion thereof and adapted for movement in a horizontal plane about a vertical axis, a plurality of sheaves carried by the head, a pivoted bail carried by the gate, and a weight-bearing flexible connection secured to the bail and passed in reversely-disposed loops around the sheaves.

7. The combination with a post, of a cap-plate supporting an upright, a head carried by the upper portion of the upright and movable thereon in a horizontal plane, said head bearing a plurality of rotatable friction devices, a gate-support disposed in parallel relation to the post and rigidly secured to the cap-plate, a gate mounted for sliding movement on the said support, a pivoted bail carried by the gate, and a weight-bearing flexible connection secured to the bail and passed in reversely-disposed loops around the friction devices.

705,896. GUN-CLEANER. GEORGE H. GARRISON, Bucoda, Wash. Filed Dec. 28, 1901. Serial No. 87,584. (No model.)



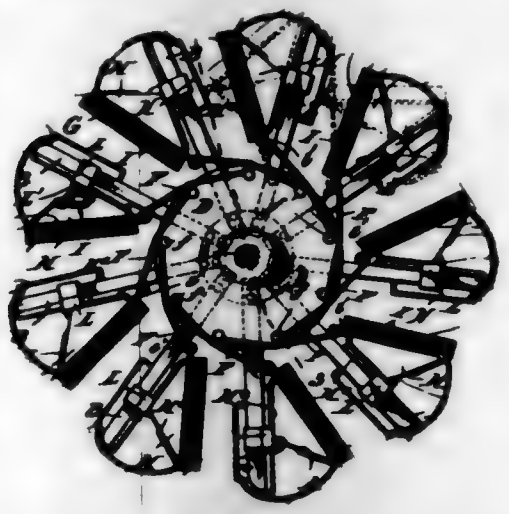
Claim.—1. A gun-cleaner comprising a rod, spring-fingers on said rod, means for forcing the spring-fingers outward, pad-sections consisting of layers of material pressed together, a holder for each section, consisting of a plate having a tongue portion formed in the plate for engaging with one edge of the material and a reduced tongue portion at the end for engaging at the opposite edge of the material, and means for securing the holding-plate to its spring-finger, substantially as specified.

2. A gun-cleaner comprising a rod, spring-fingers on the end of said rod, the said spring-fingers having hook ends, pad-sections consisting of layers of wire-cloth, and a holder for each section, consisting of a plate having tongue members for engaging opposite edges of the material, the end of said plate being adapted to engage with the hook of the spring-finger, and a screw passing through the shank of the plate and engaging with the finger, substantially as specified.

705,897. PADDLE-WHEEL. JOHN J. GRAHAM, Imperial, Pa. Filed Mar. 15, 1902. Serial No. 98,333. (No model.)

Claim.—1. The combination in a paddle-wheel substantially as described, of the shaft, the arms provided at their outer ends with the bearing-plates, the adjusting-wheels arranged to turn freely on the shaft, the paddle-blades, the triangular rocking blocks secured at their bases to the paddle-blades and provided in their apices with sockets or mortises, bands passed around said blocks and lying in the base of the said sockets and extending beyond the inner ends of the blocks, the links connecting such extensions of the bands with the adjusting-wheels, the clips passed beneath the bands at the base of the sockets in the rocking blocks and provided with perforated ears, and the clasps embracing the arms and bearing-plates and having lugs pivotally connected with the lugs of the clips, all substantially as and for the purpose set forth.

2. The combination in a paddle-wheel with the arms and the blades having a rocking connection therewith, of the swinging connecting-links jointed at one end to the paddle-blades, and the keeper-bails secured on the arms and engaged by the other ends of the swinging connecting-links, substantially as set forth.



3. The combination with the arms and the paddle-blades, of the rocking blocks having their broad sides secured to the paddle-blades and pivoted at their apices in connection with their respective arms and having their faces adjacent to their apices arranged to abut the arms in the different adjustments of the blades, and connecting devices whereby the adjustment of one blade will effect a corresponding adjustment of the other blades, substantially as set forth.

4. The combination with the paddle-blades and the rocking blocks, made triangular and provided in their apices with sockets or mortises, straps passed around the said blocks and lying in the base of said mortises, the clips secured by said straps within the base of the mortises, the arms and the clasps embracing said arms and pivoted to the clips, substantially as set forth.

5. The combination with the arms, and the bearing-plates thereon, of the paddle-blades, the rocking blocks made triangular and provided in their apices with sockets or mortises, and pivotal connections between the socket-blocks and the arms and arranged in the sockets or mortises of the rocking blocks, substantially as set forth.

705,898. TOY HORN. FRANKLIN J. GUSTINE, New Orleans, La. Filed Dec. 20, 1901. Serial No. 86,696. (No model.)

Claim.—1. In a device of the character described, the combination, with the body of the horn, of a diaphragm, a movable mouthpiece and a screen or netting attached to said body and adapted to press said diaphragm with spring-pressure against said mouthpiece.

2. In a device of the character described, the combination, with the body of the horn, of a diaphragm, a screen or netting attached to said body behind said diaphragm and bent on itself to form a spring and a mouthpiece in proximity to said screen.

3. In a device of the character described, the combination with the body of the horn, of a screen or netting fastened at one end to said body and bent upon itself to form a spring, a mouthpiece and a diaphragm yieldably held against the end of said mouthpiece by said screen.

4. In a device of the character described, the combination with the body of the horn, of a screen or netting fastened at one end to said body and bent on itself to form a spring, a movable mouthpiece, means to limit the amount of its movement and a diaphragm held by said screen against said mouthpiece.

5. In a device of the character described, the combination with the body of the horn, of a screen or netting attached thereto, a movable hollow mouthpiece cut away at one end and a diaphragm yieldingly held by said screen against one end of said mouthpiece.

6. In a device of the character described, the combination with the body of the horn, bell-shaped at one end and provided with an open-ended perforated enlargement at the other end, a cap for closing the open end of said enlargement, a mouthpiece movably mounted in said cap and provided with means for limiting the extent of the movement of said mouthpiece, said mouthpiece being hollow and cut away at one end and enlarged at the other end, a screen or netting attached at one end to said body and bent upon itself to form a spring and a diaphragm yieldably held between said screen and one end of said mouthpiece.

705,899. FAN ATTACHMENT FOR ROCKING-CHAIRS. EDGAR O. M. HAMBRACKER, Altoona, Pa. Filed Nov. 16, 1901. Serial No. 82,531. (No model.)

Claim.—1. The combination in a fan attachment for chairs, of supporting and holding means between the fan and its driving devices, the said means involving a telescoping rod having a flexible section as shown, fan-holding means telescoping as stated and adapted to be revolved around the fan-support, a motor employing a spiral spring having one end fixedly connected with the fan-support and the other end adapted to be wound through clutches connecting it with driving devices, and means such as a rigid rod extending from the floor with yielding bearings thereon substantially as described.

2. The combination in a fan attachment for chairs of adjustable supporting and holding means substantially as shown, the supporting means adapted to be rotated, as stated, and the holding means adapted to be revolved around the supporting means as described, a motor employing a spiral spring, the latter connecting the driving devices and the fan-supporting devices as specified, means such as clutch devices between the lower end of the spring and its driving devices, one of said clutch devices being adapted to wind the lower end of the spring and another to hold it against unwinding, while the upper end of the spring rigid with the fan-supporting devices is permitted continuous rotary motion substantially as described.

3. The combination in a fan attachment for chairs of a motor employing a spiral spring, means such as clutches, one for winding the spring and the other for holding it against unwinding, and a pivoted locking device adapted to be adjusted into engagement with driving means holding it against operation substantially as described.

4. The combination in a fan attachment for chairs, of a motor employing a spiral spring, means for winding the spring and holding it against unwinding substantially as described, a tubular case inclosing the spring and having hinged and pivotal connection at its lower end with the chair, said hinged and pivotal connection of the case adapting it to be adjusted from an operative or vertical position to an inclined or folded position as set forth.

5. A fan-motor employing a spiral spring, one end of which is connected with fan-supporting devices, and the other end connected with winding mechanism, consisting of a spiral rod having means for rotating it, and a clutch device adapted for intermittent connection of the spring and spiral rod as set forth.

6. The combination in a fan attachment, of a motor employing a clutch device and spiral spring as stated, a tubular inclosing case as shown, adjusting means connecting the case at its lower end with the chair, and means for securing the case in an operative or vertical position substantially as described.

7. The combination in a fan attachment for chairs, of a motor employing a clutch device and spiral spring, a tubular inclosing case as shown, adjusting means connecting the lower end of the case and chair, and a rest device at the back of the chair for supporting the case when in an inoperative position as set forth.

8. The combination with a motor device employing a spiral spring and driving means as described, of upper and lower clutch devices between the driving means and spring, the upper clutch device consisting of two members in which one member is rigid with the spring and having winding motion thereon while the other member is fixed and adapted to hold the spring as wound, and the lower clutch device consisting of separable members, one member rigid with the lower member of the upper clutch device and the other member rigid with and supported by peculiar driving means extending to the floor, the said driving means being adapted in operation to move the lower member of said lower clutch device into and out of engagement with its upper member, substantially as described, and for the purpose set forth.

9. In a fan device for chairs, the combination with a motor supported

and inclosed as shown, and motor-driving devices operated by a rocking motion of the chair substantially as described, of a rotatable tube projecting into the motor-case, a fan-supporting rod telescoping into the said tube, and means on the tube for forming a rigid connection with the fan-supporting rod substantially as described.

10. In combination with a motor mechanism substantially as described, a telescoping fan-carrying rod having at its upper end a flexible section permitting of deflection of said upper end, and a holding-rod having a hinged and swiveled connection with said telescoping rod above the flexible section thereof as set forth.

11. In a fan-motor, a casing having a hinge-support at its lower end and a detachable support at its upper end, the said casing provided with end castings closing the same, and with an intermediate casting which, with the end castings, forms a support for the motor mechanism as set forth.

12. In a fan attachment, the combination of a fan, a carrying-rod, a supporting-rod having a hinged and swiveled connection with the fan-carrying rod, a spiral rod, a power-spring, clutch mechanism for connecting said spring and spiral rod, and means for operating the latter as set forth.

13. A fan attachment for chairs, consisting of a casing supported at the top and lower ends as set forth, a motor inclosed by said casing, said motor consisting of a spiral rod, clutch mechanism connecting the latter with a power-spring, means for operating the spiral rod, and means such as a rod adapted to be adjusted for holding the fan-rod to an adjusted position as set forth.

14. In a fan-motor substantially as described, the combination with the driving and driven devices, of a bracket, consisting of a casting E having at its upper end a disk *q* adapted to support the power-spring and clutch mechanism, and which, with a lower casting, forms a support for a driving spiral, its clutch member and a sliding block, the latter adapted to be moved up and down by mechanism substantially as described.

705,400. BARREL. OTTO P. HALLOCK, Mattituck, N. Y. Filed Aug. 28, 1901. Serial No. 73,518. (No model.)

Claim.—As an improved article of manufacture, the barrel herein described composed of a series of flat staves having straight side edges, and tapered from the top down, the bottom having a flat edge surrounded by the staves, each of which is secured to its edge by a single nail, and a series of flexible connections for the staves, consisting of two strands of wire which are arranged as shown and crossed between adjacent staves, in the manner shown.

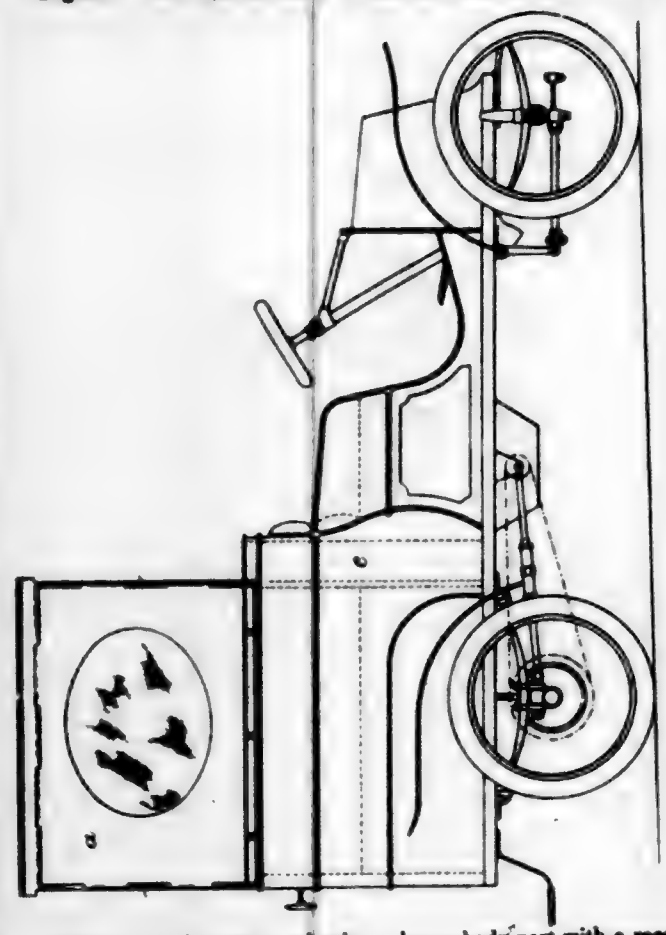
705,401. SWINGING GATE. SEPTIMA HAMILTON, Endicott, Wash. Filed Apr. 18, 1902. Serial No. 103,509. (No model.)

Claim.—1. In a swinging gate, the combination with the gate members having latches and keepers, and provided at their upper ends with the inwardly-extending heads, of a centrally-fulcrumed lever having suitable means for operating the same, links pivoted to the lever and having sliding engagement with the heads of the gate members, and connections between the individual links and the latches on the separate gate members, whereby the sliding movement of the links will be first communicated to the latches in order to raise the latter, and the links will thereafter operate the members of the gate.

2. In a swinging gate, the combination with hinge-posts united by a cross-bar, and gate members hinged to said posts and provided with latches and keepers, of the arms or heads attached to the members of the gate, a double-armed lever pivoted centrally on said cross-bar of the hinge-posts, slotted links pivoted to the end portions of the lever and extending loosely across the heads of the gate members, studs fastened to the heads of the gate members and fitting loosely in the slots of the links, wires or cables attached to the latches and having branch connections with the links, and operating wires or cables attached to the double-armed lever.

705,401

705,402. MOTOR-CAR. WILLIAM C. HOLLOWAY, Westminster, England. Filed Apr. 18, 1902. Serial No. 103,606. (No model.)

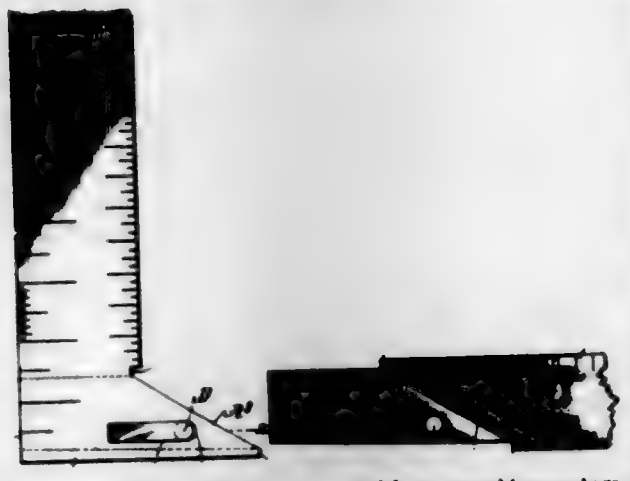


Claim.—1. A motor-car having a lower body part with a recess or recesses and an upper part which is composed of portions adapted to be folded flat upon each other, and as thus folded to be lowered into such recess or recesses, substantially as described.

2. A motor-car having a lower body part with a recess or recesses and an upper part consisting of roof and wall portions connected together and adapted to be folded flat upon each other and as thus folded to be lowered in such recess or recesses, substantially as described.

3. A motor-car having a lower body part with a recess or recesses and an upper part composed of a roof portion and wall portions provided with windows, said portions being adapted to be folded flat upon each other and as thus folded to be lowered into such recess or recesses, substantially as described.

705,408. SEPARABLE SQUARE. CHARLES L. F. HOOKER and MARTIN C. HOOKER, Boca, Cal. Filed Oct. 9, 1901. Serial No. 78,068. (No model.)

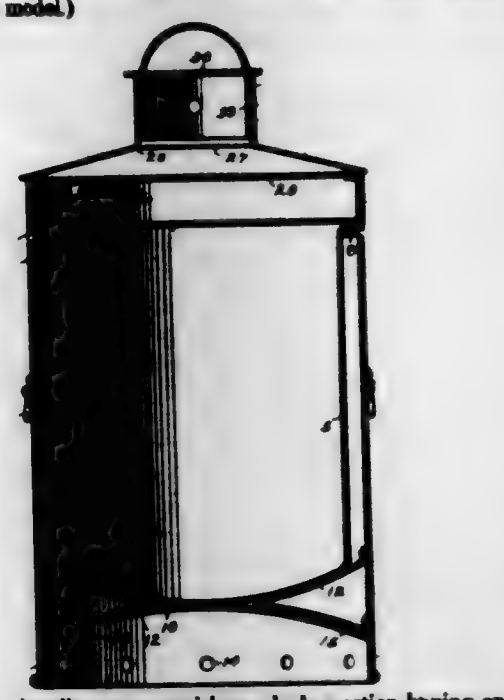


Claim.—1. A separable square, comprising separable members, of which one is formed with a socket and the other with a tenon for engaging the socket, the members having registering apertures formed in the socket and tenon and a locking device comprising a spring secured in a recess on the outer face of the socket, and a lug on the free end of the spring adapted to pass into the registering apertures, the said lug having a beveled portion for the purpose set forth.

2. A separable square having separable members, of which one is formed with a socket having an extension formed with a beveled top, and the other member having a tenon for engaging the socket, the inner end of the tenon member being beveled to be seated on the beveled top of the extension, the said tenon member having a shoulder for engaging a recess in the inner end of the socket member, and a shoulder adapted to abut against the end of the extension of the socket member, and a locking device for locking the tenon in position in the socket, as set forth.

3. A separable square having separable members, of which one is formed with a socket having an extension formed with a beveled top, and the other member having a tenon for engaging the socket, the inner end of the tenon member being beveled to be seated on the beveled top of the extension, the said members having registering apertures formed in the socket and the tenon and a flat spring secured at one end in a recess on the outer face of the socket member, and provided at its free end with a lug adapted to engage said registering apertures, the said lug being beveled at its forward end, as set forth.

705,404. MILK-CAN. CHARLES M. HOPKINS, Union City, and EDWARD H. DORR, Spartanburg, Pa. Filed May 24, 1901. Serial No. 61,749. (No model.)



Claim.—1. A milk-can comprising a body portion having an outwardly-extending flange at its upper end, a casing inclosing the body portion and extending thereabove, an internal flange upon the casing upon which the flange of the body rests, and a closure for the body engaged with the casing.

2. A milk-can comprising a body portion having an outwardly-extending flange at its upper end, a casing inclosing the body portion and extending thereabove, and separated from the body at its sides to form an interspace, said casing having an inwardly-directed projection upon which the flange of the body rests, and a closure for the body engaged with the upper end of the casing.

3. A milk-can comprising a body portion, a casing for the body portion separated therefrom by an interspace and having an internal flange engaged with a flange on the body, said body having a downwardly-extending convex bottom below which the casing extends, and a dished disk secured at its center to the bottom of the body and having its periphery secured to the casing below the bottom of the body.

4. A milk-can comprising a body portion having a downwardly-projecting convex bottom and an annular flange at its upper end, a casing extending above and below the body portion and having an interior flange upon which the flange of the body is secured, a dished disk secured at its central portion against the under face of the bottom of the body and having its periphery secured to the inner face of the casing below its center, the casing having perforations below the disk, and the disk having perforations, and a closure for the body.

5. A milk-can comprising a body portion having a downwardly-projecting convex bottom, a casing for the body extending below the bottom of the body and secured to the upper portion of the body, a dished disk secured at its central portion against the under face of the bottom of the body and having its periphery secured to the inner face of the casing below the center of the disk, and V-shaped plates disposed between the disk and the bottom of the body and secured at their ends to the casing.

6. A milk-can comprising a body portion and a closure, said closure including a top having a flange for engagement with the body and a central screen-covered opening, lugs upon the interior of the flange, a notched disk removably disposed upon the lugs and having a central screen-covered opening, a flange encircling the opening in the top and having perforations, and a cap-plate for the flange having a perforated flange for engagement with the flange surrounding the opening of the top, said perforations of the flanges being adapted to aline.

7. A milk-can having a casing and a body or receptacle provided with a downwardly-convexed bottom located above the plane of the lower side of the casing to provide a downwardly-extending wall portion, and an upwardly-convexed bracing-disk arranged within said downwardly projecting wall portion, in contact at its center with the center of the bottom of the receptacle and secured at its periphery to the wall portion, the casing being spaced from the receptacle to permit circulation of air between the parts, and the casing and disk being provided with perforations, substantially as and for the purpose specified.

705,405. WINDOW-OPENER. JOHN HORSFIELD, Chicago, Ill. Filed Apr. 3, 1902. Serial No. 101,337. (No model.)

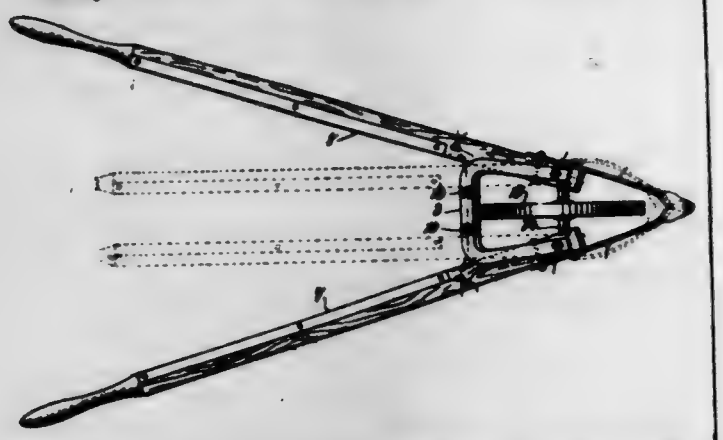
Claim.—1. A frame a bracket on said frame, a cross-arm pivoted to said bracket, a sash pivoted in said frame, a rod secured to said sash coacting with said cross-arm, a spring to be given a tension by the movement of said rod in the opening of the sash, and a catch coacting with said rod to lock the sash.

2. In combination with a frame and pivot-window, a bracket on said frame, a cross-arm pivoted to said bracket, a rod slidably engaging lugs or bearings on said arm and secured to said window-sash by a ball-and-socket hinge, a spring on said rod engaging one of the bearings on said arm and an adjustable pin or stop on said rod, a spring-pressed catch in one of said lugs adapted to engage notches on said rod, and a bell-crank on said rod.

3. In combination, a frame, a pivoted sash in said frame, a bracket on said frame, a cross-arm, provided at its ends with bearings, pivoted to

said bracket, a rod, secured to said sash by a universal-joint hinge, adapted to engage with said bearings on the cross-arm, a spring engaging with said rod and said cross-arm, a fusible metal catch or pin adapted to hold said rod in adjustable positions, arms on said rod and cords secured to said arms whereby said rod may be turned to operate the catch and drawn down to open the window.

705,406. WHEELBARROW. WILL A. HOUSE and WILLIAM F. HOUSER, Covington, Ky. Filed Nov. 18, 1901. Serial No. 82,858. (No model.)



Claim.—1. A wheelbarrow, comprising handles, a yoke-plate, pivot-bolts passing through said yoke-plate and through the handles, eyes formed on the ends of said bolts, a wheel having its axle-bearings in said eyes, and a spring-yielding connection between the forward ends of the handles, substantially as specified.

2. A wheelbarrow, comprising handles, a yoke-plate, pivot-bolts passing through said yoke-plate and through the handles, eyes formed on the ends of said bolts, a wheel having its axle-bearings in said eyes, spring-plates extended forward from the handles, and pivotal connections between said plates, substantially as specified.

3. A wheelbarrow, comprising handles, spring-yielding connections between the forward ends of the handles, yoke-plates engaging against the upper and lower sides thereof, said plates being bolted together, pivot-bolts passing through the handles and through said plates, eyes on said bolts, and a wheel having its axle-bearings in said eyes, substantially as specified.

4. A wheelbarrow, comprising handles, yoke-plates engaging against the upper and lower sides thereof at the forward ends, bolts passing through openings in the cross-bars of said yoke-plates, tubes or sleeves surrounding the bolts between the plates, pivot-bolts passing through said yoke-plates and through the handles, eyes on said pivot-bolts, a spring-yielding connection between the forward ends of the handles and a wheel having its axle-bearings in said eyes, substantially as specified.

5. A wheelbarrow comprising a wheel, handles supported by the wheel and arranged to move toward and from each other, and a spring connection between the forward ends of the handles for moving them in one direction, substantially as specified.

705,407. PNEUMATIC STACKER. EDWARD HUBER and JACOB W. MILLER, Marion, Ohio. Filed Apr. 12, 1902. Serial No. 102,630. (No model.)

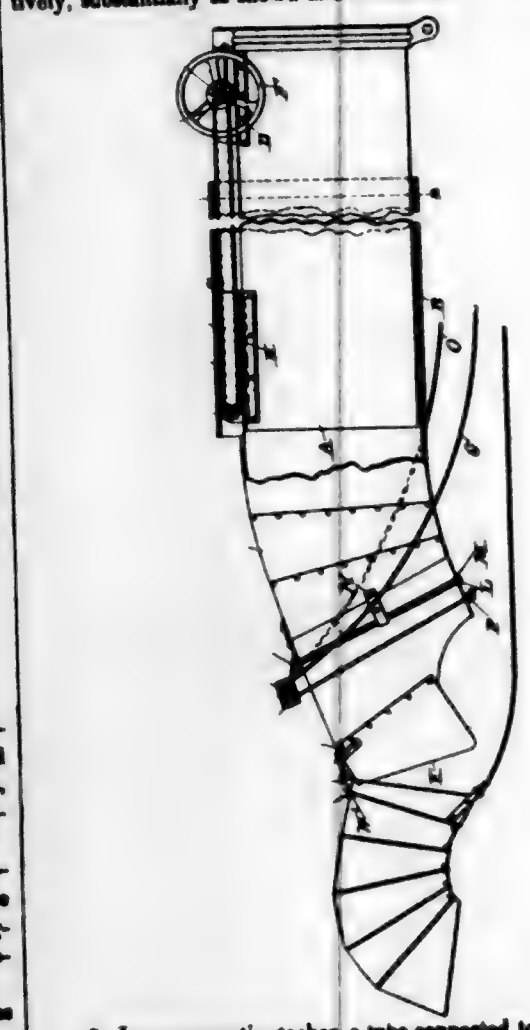
Claim.—1. In a pneumatic stacker, telescoping tubes and a boxing on the slidable tube to cover the means for operating the movable tube, substantially as shown and described.

2. In a pneumatic stacker, a tube connected to a threshing-machine or other suitable machinery, a tube surrounding said tube and adapted for longitudinal adjustment thereon, means to actuate said adjustable tube, and a boxing on said movable tube to cover said actuating means, substantially as shown and described.

3. In a pneumatic stacker, a hood hinged to the delivery end thereof, and a coil-spring wrapped around the pintle of the hinge and having its free ends secured to the hood and delivery end respectively, substantially as shown and described.

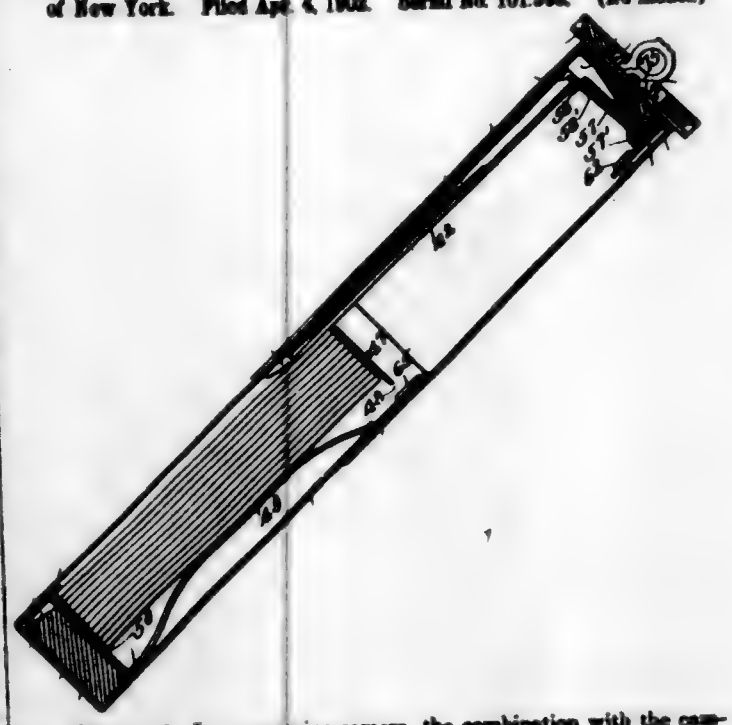
4. In a pneumatic stacker, telescoping tubes, a boxing on the slidable tube to cover the means for operating the movable tube, a hood hinged to the delivery end of said movable tube, and means to normally hold said hood thrown back from the mouth of said delivery end, substantially as shown and described.

5. In a pneumatic stacker, a tube connected to a threshing-machine, a tube surrounding said tube and adapted for longitudinal adjustment thereon, means to actuate said adjustable tube, a boxing on said movable tube to cover said actuating means, a hood hinged to the delivery end of said outer tube, and a coil-spring wrapped around the pintle of the hinge and having its free ends secured to the hood and delivery end respectively, substantially as shown and described.



6. In a pneumatic stacker, a tube connected to a threshing-machine, a tube surrounding said tube and adapted for longitudinal adjustment thereon, brackets mounted at the ends of said stationary tube, a sprocket-wheel journaled in each bracket, an endless chain running around said sprocket-wheels, means to actuate said chain, a boxing on said movable tube to inclose said chain, a belt connecting a link in said chain with said boxing, the delivery end of said movable tube formed separate from said tube and adapted to swing thereon, a hood hinged to said delivery end, and a coil-spring wrapped around the pintle of the hinge and having its free ends secured to the hood and delivery end respectively, substantially as shown and described.

705,408. MAGAZINE-CAMERA. CHARLES R. HUTCHINS, JOHN A. ROBERTSON, and ALBERT MUTSCHLER, Rochester, N. Y., assignors to Rochester Optical and Camera Company, Rochester, N. Y., a Corporation of New York. Filed Apr. 4, 1902. Serial No. 101,393. (No model.)



Claim.—1. In a magazine-camera, the combination with the camera-casing having a transverse magazine-chamber therein, of a magazine-

casing slidably arranged in said chamber and open at one end only, a stationary exposing-tray removably arranged in said chamber and within the magazine-casing, a plate-holder carrier slidably arranged in the exposing-tray and movable with the magazine-casing, and means for transferring a plate-holder from the front of the carrier to the rear of the exposing-tray when the magazine-casing and carrier are drawn out from the magazine-chamber, substantially as described.

2. In a magazine-camera, the combination with the camera-casing having a transverse magazine-chamber therein, of a magazine-casing slidably arranged in said chamber and open at its inner end only, a stationary exposing-tray removably arranged in said chamber and within the magazine-casing, a plate-holder carrier slidably arranged in the exposing-tray and movable with the magazine-casing, means for transferring a plate-holder from the front of the carrier to the rear of the exposing-tray when the magazine-casing and carrier are drawn out from the magazine-chamber, and means for introducing said plate-holder into the rear part of the plate holder carrier when the latter is moved back into the magazine-chamber, substantially as described.

3. In a magazine-camera, the combination with the camera-casing having a transverse magazine-chamber therein, of a magazine-casing slidably arranged in said chamber and open at its inner end only, a stationary exposing-tray removably arranged in said chamber and within the magazine-casing, a plate-holder carrier slidably arranged in the exposing-tray, means for detachably locking the carrier to the magazine-casing, and means for transferring a plate-holder from the front of the carrier to the rear of the exposing-tray when the magazine-casing and carrier are drawn out from the magazine-chamber, substantially as described.

4. In a magazine-camera, the combination with the camera-casing having a transverse magazine-chamber therein, of a magazine-casing slidably arranged in said chamber and open at its inner end only, a stationary exposing-tray removably arranged in said chamber and within the magazine-casing, a plate-holder carrier slidably arranged in the exposing-tray and movable with the magazine-casing, means for locking the exposing-tray in the magazine-chamber, and means for transferring a plate-holder from the front of the carrier to the rear of the exposing-tray when the magazine-casing and carrier are drawn out from the magazine-chamber, substantially as described.

5. In a magazine-camera, the combination with the camera-casing having a transverse magazine-chamber therein, of a magazine-casing slidably arranged in said chamber and open at its inner end only, a stationary exposing-tray removably arranged in said chamber and within the magazine-casing, a plate-holder carrier slidably arranged in the exposing-tray and movable with the magazine-casing, a removable cover detachably connected to the plate-holder carrier and slidably arranged in the front of the exposing-tray, and means for transferring a plate-holder from the front of the carrier to the rear of the exposing-tray when the magazine-casing and carrier are drawn out from the magazine-chamber, substantially as described.

6. In a magazine-camera, the combination with the camera-casing having a transverse magazine-chamber therein, of a magazine-casing slidably arranged in said chamber and open at its inner end only, a stationary exposing-tray removably arranged in said chamber and within the magazine-casing, a plate-holder carrier slidably arranged in the exposing-tray, means for locking said carrier to the magazine-casing, means for locking the exposing-tray in the magazine-chamber, a cover detachably connected to the plate-holder carrier and slidably arranged in the front of the exposing-tray, and means for transferring a plate-holder from the front of the carrier to the rear of the exposing-tray when the magazine-casing and carrier are drawn out from the magazine-chamber, substantially as described.

7. In a magazine-camera, the combination with the camera-casing having a transverse magazine-chamber therein, of a magazine-casing slidably arranged in said chamber and open at its inner end only, a stationary exposing-tray open at its front and at its outer end, a removable sliding cover normally closing the open front of said tray, said tray being removable from the magazine-chamber, a plate-holder carrier open at its front and slidably arranged in the exposing-tray, means for locking the carrier to the magazine-casing, means for locking the said cover to the carrier, means for retaining a plate-holder in the front of the exposing-tray when the magazine-casing and the carrier are drawn out, means for automatically releasing said plate-holder and moving it bodily to the rear of the exposing-tray when the carrier is withdrawn from the tray, and means for transferring said plate-holder to the rear of the carrier when the latter is returned to the tray, substantially as described.

8. In a camera the combination with the camera-casing having a transverse magazine-chamber therein, of a magazine-casing slidably arranged in said chamber and open at its inner end only, a stationary exposing-tray removably arranged in said chamber and within the magazine-casing, a plate-holder carrier slidably arranged in the exposing-tray and movable with the magazine-casing, means for transferring a plate-holder from the front of the carrier to the rear of the exposing-tray when the magazine-casing and carrier are drawn out, an indicator, and means carried by said magazine-casing for controlling the indicator, substantially as described.

9. In a magazine-camera, the combination with the camera-casing having a transverse magazine-chamber therein, of a magazine-casing slidably arranged in said chamber and open at its inner end only, a stationary exposing-tray open at its front and at its outer end, a removable sliding cover normally closing the open front of said tray, said tray being removable from the magazine-chamber, a plate-holder carrier open at its front and slidably arranged in the exposing-tray, means for locking the exposing-tray to the magazine-casing, means for locking the said cover to the carrier, means for retaining a plate-holder in the front of the exposing-tray until the magazine-casing and the carrier are drawn out, means for automatically releasing said plate-holder and moving it bodily to the rear of the exposing-tray when the carrier is drawn out from the tray, means for transferring said plate-holder to the rear of the carrier when the latter is returned to the tray, and means for preventing the entire withdrawal of the magazine-casing from the magazine-chamber, substantially as described.

10. In a magazine-camera, the combination with the camera-casing having a transverse magazine-chamber therein, of a stationary exposing-tray removably arranged in said chamber and comprising a casing open at its front and at one end, a plate-holder carrier comprising a casing having an open front, a cover normally closing said front and slidably arranged in the front of the exposing-tray, the said carrier being slidably arranged in the exposing-tray, means for drawing out said carrier from the tray, means for retaining a plate-holder in the front of the exposing-tray until the carrier is drawn out, means for shifting said plate-holder to the rear of the exposing-tray when said carrier is drawn out, and means for transferring said plate-holder to the rear of the carrier when the latter is returned to the tray, substantially as described.

11. In a magazine for cameras, the combination with an exposing-tray comprising a rectangular casing open at its front and one end, of a correspondingly-shaped plate-holder carrier slidably arranged in said tray and comprising a rectangular casing open at its front and provided at its inner end with an aperture for the passage therethrough of a plate-holder, a cover attached to the carrier and covering the front thereof, said carrier and cover being slidably arranged in the exposing-tray, means for retaining a plate-holder in the front of the exposing-tray until the carrier is drawn out, means for shifting said plate to the rear of the tray when the carrier is drawn out, and means for pushing the plate-holder into the rear of the carrier through said aperture when the carrier is returned to the exposing-tray, substantially as described.

12. In a magazine for cameras, the combination with an outer rectangular casing forming an exposing-tray and open at the front and one end, of a plate-holder carrier comprising a rectangular casing having a plate-holder aperture in its inner end, said carrier being slidably arranged in the exposing-tray, and means on the closed end of the exposing-tray for temporarily supporting the inner end of the foremost plate-holder while the plate-holder carrier is being withdrawn from the tray, substantially as described.

13. In a magazine for cameras, the combination with an outer rectangular casing forming an exposing-tray and open at the front and one end, of a plate-holder comprising a rectangular casing having a plate-holder aperture in its inner end, said carrier being slidably arranged in the exposing-tray and spring-fingers on the closed end of the exposing-tray arranged to project between the foremost plate-holder and the plate-holders in rear thereof as the carrier is withdrawn from the exposing-tray and hold said foremost plate-holder, substantially as described.

14. In a magazine for cameras, the combination with a rectangular outer casing forming an exposing-tray and open at the front and one end, of a plate-holder carrier comprising a rectangular casing having a plate-holder aperture in its inner end, said carrier being slidably arranged in the exposing-tray and spring-fingers on the closed end of the exposing-tray arranged to project between the foremost plate-holder and the plate-holders in rear thereof as the carrier is withdrawn from the exposing-tray, and means for automatically forcing said plate-holder out of engagement with said fingers when the carrier is fully drawn out of the exposing-tray, substantially as described.

15. In a magazine for cameras, the combination with a rectangular outer casing forming an exposing-tray and open at the front and one end, of a plate-holder carrier comprising a rectangular casing having a plate-holder aperture in its inner end, said carrier being slidably arranged in the exposing-tray, spring-fingers on the closed end of the exposing-tray arranged to project between the foremost plate-holder and the plate-holders in rear thereof as the carrier is withdrawn from the exposing-tray, and a spring for automatically forcing said plate-holder out of engagement with said fingers when the carrier is fully drawn out of the exposing-tray, substantially as described.

16. In a magazine for cameras, the combination with a rectangular

outer casing forming an exposing-tray and open at the front and one end, of a plate-holder carrier comprising a rectangular casing having a plate-holder aperture in its inner end, said carrier being slidably arranged in the exposing-tray, spring-fingers attached to the closed end of the exposing-tray and arranged to project between the foremost plate-holder and the plate-holders in rear thereof as the carrier is withdrawn from the exposing-tray and hold said foremost plate-holder, and springs arranged to force said plate-holder out of engagement with the lug when the carrier is drawn out of the exposing-tray, substantially as described.

17. In a magazine for cameras, the combination with a rectangular outer casing forming an exposing-tray and open at the front and one end, of a plate-holder carrier comprising a rectangular casing having a plate-holder apertured in its inner end, said carrier being slidably arranged in the exposing-tray, two spring-fingers on the closed end of the exposing-tray arranged to project between the foremost plate-holder and the plate-holders in rear thereof as the carrier is withdrawn from the exposing-tray, and springs attached to said closed end between said fingers and constructed to force said plate-holder out of engagement with the fingers when the carrier is drawn out of the exposing-tray, substantially as described.

18. In a magazine for cameras, the combination with an outer casing forming an exposing-tray and open at the front and at one end, of a plate-holder carrier comprising a casing having a plate-holder aperture in its inner end said carrier being slidably arranged in the exposing-tray, two spring-fingers on the closed end of the exposing-tray arranged to project between the foremost plate-holder and the plate-holders in rear thereof as the carrier is withdrawn from the exposing-tray, springs attached to said closed end and constructed to force the plate-holder out of engagement with the fingers when the carrier is drawn out of the exposing-tray, and offset portions at the rear ends of the spring-fingers, substantially as described.

19. In a magazine for cameras, the combination with an outer casing forming an exposing-tray and open at the front and one end, said casing having inwardly-projecting flanges at its top and bottom and an open front, and provided with projections on the under side of said flanges near the open end of said casing, spring-fingers on the closed end of the exposing-tray arranged to project between the foremost plate-holder and those in rear thereof as the carrier is withdrawn from the tray, a plate-holder carrier comprising a casing having a plate-holder aperture in its inner end, said carrier being slidably arranged in the exposing-tray, springs for feeding the plate-holders forward in the carrier, springs for forcing the plate-holders out of engagement with said projection, and springs for forcing the plate-holder to the rear of the exposing-tray when the carrier is drawn out, substantially as described.

20. In a magazine for cameras, the combination with an outer casing forming an exposing-tray and open in front and at one end, of an inner casing forming a plate-holder carrier and having a plate-holder aperture in its inner end, said carrier being slidably arranged in the tray, means for transferring the plate-holders, one at a time, from the front of the carrier to the rear of the tray and from the latter to the rear of the carrier, and guide-strips projecting beyond the inner face of the outer end of the plate-holder carrier, substantially as and for the purpose specified.

21. In a magazine for cameras, the combination with an outer casing forming an exposing-tray and open in front and at one end, of an inner casing forming a plate-holder-carrier aperture in its inner end, said carrier being slidably arranged in said tray, means for transferring the plate-holders, one at a time, from the front of the carrier to the rear of the tray and from the latter to the rear of the carrier, and spring-fingers attached to the closed end of the tray and projecting in front of the back of the latter and in proximity thereto, substantially as and for the purpose specified.

22. In a magazine for cameras, the combination with an outer casing forming an exposing-tray and open in front and at one end, of an inner casing forming a plate-holder carrier and having a plate-holder aperture in its inner end, the said carrier being slidably arranged in said tray, means for transferring the plate-holders, one at a time, from the front of the carrier to the rear of the tray and from the latter to the rear of the carrier, and a spring-plate projecting inwardly from the edge of the outer end of the plate-holder carrier, substantially as and for the purpose specified.

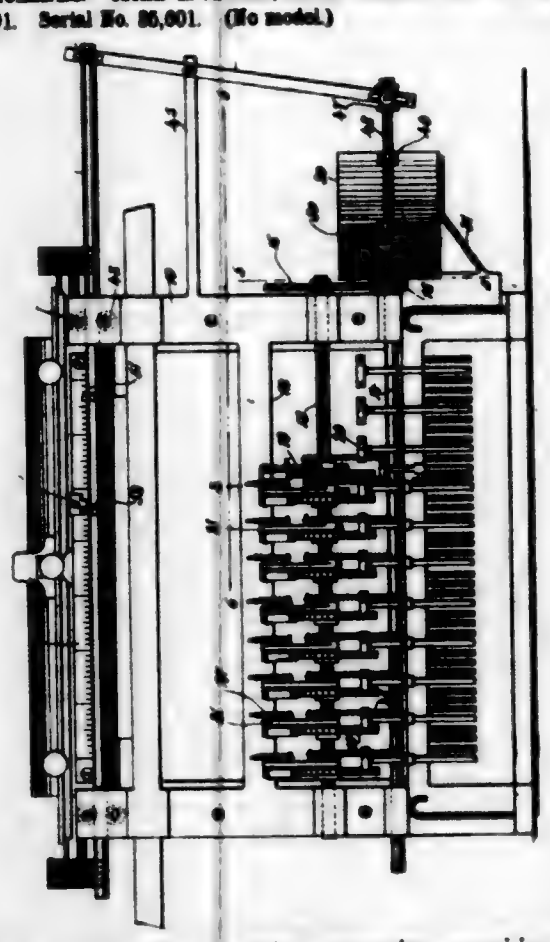
23. In a magazine for cameras, the combination with an outer casing forming an exposing-tray and open in front and at one end, of an inner casing forming a plate-holder carrier and having a plate-holder aperture in its inner end, said carrier being slidably arranged in said tray, means for transferring the plate-holders, one at a time, from the front of the carrier to the rear of the tray and from the latter to the rear of the carrier, spring-fingers attached to the closed end of the tray and projecting in front of the back of the latter and in proximity thereto and projections formed on the back of the carrier near the edge of its open end, substantially as and for the purpose specified.

24. In a magazine for cameras, the combination with an outer casing forming an exposing-tray and open in front and at one end, of an inner casing forming a plate-holder carrier, and having a plate-holder aperture in its inner end, said carrier being slidably arranged in said tray, means for transferring the plate-holders, one at a time, from the front of the carrier to the rear of the tray and from the latter to the rear of the carrier, an inclosing casing open at one end only and slidably arranged over the tray, and carrier, and means for locking the carrier to the inclosing tray, substantially as described.

25. In a magazine for cameras, the combination with an outer casing forming an exposing-tray and open in front and at one end, of an inner casing forming a plate-holder-carrier aperture in its inner end, said carrier being slidably arranged in said tray, means for transferring the plate-holders, one at a time, from the front of the carrier to the rear of the tray and from the latter to the rear of the carrier, an inclosing casing open at one end only and slidably arranged over the tray-carrier, a cover slidably connected to the outer end of the inclosing casing and projecting laterally in rear to the outer end of the latter, and a bolt carried by said laterally-projecting portion of said plate and projecting into the interior of the inclosing casing, said bolt being adapted to be projected into a perforation in the back of the carrier, to lock the latter to the inclosing casing, substantially as described.

26. In a magazine-camera, the combination with an outer casing forming an exposing-tray and open in front and at one end, of an inner casing forming a plate-holder carrier and slidably arranged in said tray, springs arranged to move the plate-holders forward in the carrier, springs for moving the plate-holders, one at a time, rearward in the exposing-tray, means for retaining the foremost plate-holder in the front portion of the tray until the carrier has been drawn out, a cover slidably arranged in the front of the tray, and means for locking said cover to the outer end of the carrier, substantially as described.

705,409. ACCOUNTING ATTACHMENT FOR TYPE-WRITING MACHINES. OSCAR L. INGRAM, Walla Walla, Wash. Filed Dec. 12, 1901. Serial No. 85,601. (No model.)



Claim.—1. An attachment for a type-writer, comprising a series of numeral-disks, a shaft on which said disks are loosely mounted, a device carried by the shaft for engaging with any one of said disks to cause a rotary motion of the same, actuating devices having connection with the type-writer finger-levers for imparting rotary motion to said shaft, and means carried by the type-writer carriage for causing a longitudinal movement of the shaft, the carriage also having a longitudinal movement independently of the shaft.

2. An attachment for a type-writing machine, comprising a series of numeral-disks, a shaft having rotary and longitudinal movement relatively to said disk, each of said disks having a series of notches radiating from the shaft, a single lug on the shaft for engaging in any one of the notches of a disk, a driving-shaft, a gear connection between the driving-shaft

and the first-named shaft, actuating connections between said driving-shaft and the finger-levers of the type-writing machine, and means controlled by the machine-carriage for moving the first-named shaft longitudinally to carry the lug from one end to the other of the series of disks.

3. An attachment for a type-writing machine comprising a frame attached to the machine, an actuating-shaft mounted in said frame, a stop-bar on said frame, a series of ratchet-wheels attached to the shaft, angle-arms mounted to swing on the shaft adjacent to the ratchet-wheels, pawls carried by said angle-arms for engaging with the ratchet-wheels, the said angle-arms having rearward extensions arranged consecutively in different horizontal planes for engaging with the rear side of the stop-bar and having upper projections for engaging with the front of the stop-bar, spring connections between the arms and the stop-bar, finger-levers, connections between the arms and the finger-levers, a shaft mounted to rotate and to move longitudinally in the frame, gear-wheel connections between the two shafts, numeral-disks loosely mounted on the last-named shaft, and means carried by the shaft for causing rotary movements of the disks, substantially as specified.

4. An attachment for a type-writing machine, comprising a frame attached to the machine, an actuating-shaft mounted in said frame, a stop-bar on said frame, a series of ratchet-wheels attached to the shaft, angle-arms mounted to swing on the shaft adjacent to the ratchet-wheels, pawls carried by angle-arms for engaging with the ratchet-wheels, the said angle-arms having rearward extensions arranged consecutively on different horizontal planes for engaging with the rear side of the stop-bar and having upper projections for engaging with the front of the stop-bar, spring connections between the arms and the stop-bar, finger-levers, spring connections between the arms and the finger-levers, the last-named springs being stronger than the first-named springs, a shaft mounted to rotate and to move longitudinally in the frame, gear-wheel connections between the two shafts, numeral-disks loosely mounted on the last-named shaft, each numeral-disk having a series of notches radiating from the shaft, a lug carried by the shaft for engaging in any one of the notches in the disk, and means for moving said shaft longitudinally.

5. An attachment for a type-writer, comprising a shaft mounted on the type-writer frame, means actuated by a finger-lever of the type-writer for rotating said shaft, the said means permitting a further downward movement of the lever after the stopping of the shaft upon its complete movement, a series of numeral-disks loosely mounted on the shaft, means for causing a movement of any one of the disks with the shaft, and retarding devices for the disks.

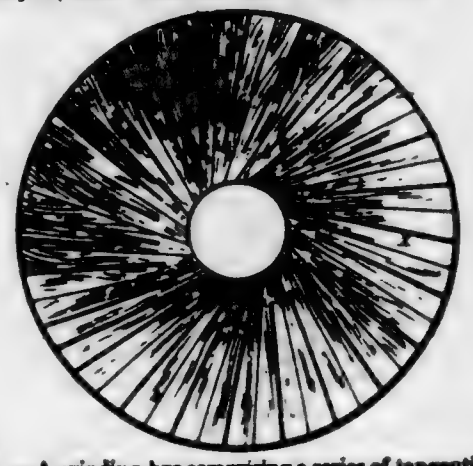
6. An attachment for a type-writing machine, comprising a shaft supported on the machine-frame and having a longitudinal movement, means actuated by the finger-levers of the machine for rotating said shaft, a series of numeral-disks mounted loosely on the shaft, each of said numeral-disks having a series of notches radiating from the shaft, a lug on the shaft for engaging a notch in the disk, ratchet-wheels carried by certain of the disks, arms mounted to swing on the shaft adjacent to the disks, pawls carried by the arms for engaging with the ratchet-wheels, cam-lugs on the arms, and a pin carried by each disk for engaging with the cam-lug connecting with the next disk of the series.

7. An attachment for a type-writing machine, comprising a shaft having a longitudinal movement on the frame of the machine, means actuated by the finger-levers of the machine for rotating said shaft, a draw-bar movable on the upper portion of the frame, lugs adjustable on said bar, a lug attached to the machine-frame and with which said first-named lugs are designed to engage, a lever connecting said rod with said shaft, and a series of numeral-disks mounted on the shaft and actuated thereby.

8. An attachment for a type-writing machine, comprising a shaft mounted to move longitudinally on the machine-frame, means actuated by the finger-levers of the machine for imparting rotary motion to the shaft, a casing, a series of numeral-disks mounted loosely on the shaft within the casing, means for causing a rotary movement of the disks, one independently of another, by said shaft, a cross-head with which said shaft has rotary connection, guide-arms extended from the ends of said cross-head through guides on the casing, a lever connecting with the said cross-head, a bar movable lengthwise at the upper portion of the machine-frame, and with which the upper end of the lever connects, lugs adjustable on said rod, and a lug on the machine-frame adapted to be engaged by the first-named lugs.

9. An attachment for a type-writing machine, comprising a shaft having a longitudinal movement in the frame, a pinion through which said shaft may move, the shaft being also adapted to rotate with the pinion, an actuating-shaft, a gear-wheel on said actuating-shaft and engaging with the pinion, means for connecting the finger-levers of the machine for causing varying degrees of rotary movement to the actuating-shaft, numeral-disks mounted loosely on the longitudinally-movable shaft, each of said disks having a series of notches radiating from the shaft, a lug on the shaft for engaging in a notch in a disk, a cross-head with which said shaft has rotary connection, guide-rods extending from said cross-head, a casing in which the numeral-disks are arranged, guides on said casing for the guide-rods, a finger carried by one of the guide-rods, the said finger being opposite the lug on the shaft, and means controlled by a movement of the machine-carriage for moving the shaft longitudinally.

705,410. **BUR FOR MILLS.** JOSEPH JOSEPHSON, Omaha, Nebr. Filed May 20, 1901. Serial No. 61,957. (No model.)



Claim.—A grinding-bar comprising a series of tangentially-arranged sector-shaped sections having inclined grooves extending inwardly from the periphery to a point near the axis of the bar, plates carried in said grooves whereby their upper edges are presented to form ribs, a binding-ring holding said ribs and sections in place, and nibs projecting from the outer ends and lower edges of said ribs to hold said binding-ring in place.

705,411. **NECK-YOKE.** EDWARD D. JURY, Clearfield, Pa. Filed Mar. 3, 1902. Serial No. 96,437. (No model.)

Claim.—1. A neck-yoke comprising a bar having diagonally-projecting arms formed with coacting hooks at their inner ends to produce a lap-ring, substantially as set forth.

2. A neck-yoke comprising a bar, the ends of which are bent to form eyes and diagonally-projecting underlying arms, the ends of said arms being formed with opposing hooks which overlap each other to form a lap-ring, substantially as set forth.

3. A neck-yoke comprising a bar having diagonally projecting and yielding arms provided with coacting members to engage a ring, said members being separable by the yielding action of the arms, substantially as and for the purpose set forth.

705,412. **FASTENING DEVICE FOR ACCOUNT OR SALES BOOKS.** LOREN A. KEITH, Mansfield, Ohio. Filed Mar. 13, 1901. Serial No. 50,973. (No model.)

Claim.—1. The combination with a sales or account book, of a pair of holders having their outer terminals pivoted in lines parallel with the sides of the back portion of the said book and transversely foldable inwardly over the book and outwardly from the latter.

2. The combination with a sales or account book, of a pair of movably-mounted holders having their outer terminals pivoted in lines parallel

with the side edges of the back portion of the book and transversely foldable inwardly over and outwardly from said book to terminally engage the leaves of the latter, the inner free terminals of the holders having direct contact with the leaves and provided with extremities of loop form.

3. The combination with a sales or account book, of a pair of holders each pivotally connected with the book at its outer extremity and both transversely foldable inwardly over and outwardly from the face of the book in arcs of circles which are described in planes at right angles to the said face of the book and provided with bearing-terminals to bear on a portion of the book.

4. The combination with a sales or account book, of a plate removably applied to one end of the book, and resilient holders pivotally connected at their outer terminals to the plates and having their pivots parallel with the sides of the book, whereby they are adapted to swing transversely thereof, said holders being detachably interlocked with the plate at points between their ends, substantially as described.

5. The combination with a sales or account book, of a supporting device removably applied to one end thereof and independent of the back portion of the book, and resilient holders movable inwardly over and outwardly from the book in arcs of circles at an angle to the latter, the outer terminals of the holders being pivoted to the said device, whereby the device and holders may be simultaneously applied to and removed from the book.

6. The combination with a sales or account book, of a supporting device removably applied to the back portion of the book at one end and provided with outwardly-extending projections, and resilient holders movably attached at their outer terminals to the said supporting device and adapted to have their inner free terminals removably engage the said projections.

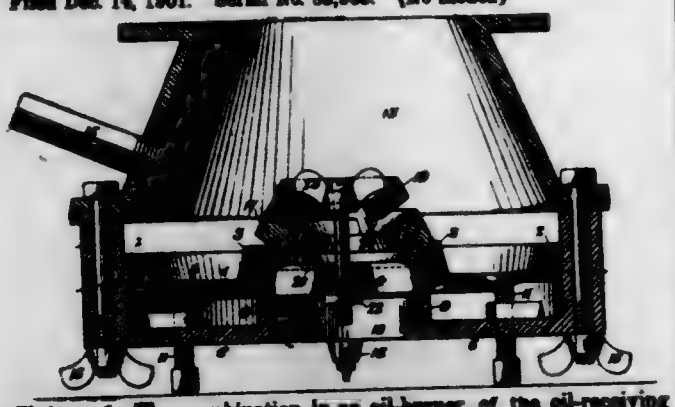
7. The combination with a sales or account book, of a pair of loop resilient wire-holders having their outer terminals pivoted adjacent to the side edges and their free portions movable inwardly over and outwardly from the face of the book in arcs of circles at an angle to the latter.

8. The combination with a sales or account book, of a pair of resilient wire-holders which are looped and have their outer terminals pivotally connected adjacent to the side edges of the book and the opposite terminals bent to provide extended bearing means, the said holders being movable inwardly toward and outwardly from the face of the book in arcs of circles at an angle to the latter.

9. The combination with a sales or account book, of supporting means removably applied to the back portion thereof and having projecting tongues at the center, and a pair of yielding holders having their outer terminals pivoted to the said means adjacent to side edges of the book and comprising resilient loops to lock over the said tongues, the terminals of the holders opposite to those forming the pivot means being arranged to clamp the leaves of the book.

10. The combination with a supporting-back or analogous device, of a pad composed of separable leaves, a manifolding-sheet, the ends of the pad and one end of said sheet being formed with opposite perforations therethrough, studs or posts held by the back or analogous device and with which the perforated portions of the leaves and sheet engage, and a pair of holders having their outer terminals pivoted in a plane parallel with the longitudinal plane of the back or analogous device and transversely foldable inwardly toward and outwardly from the sheet and leaves in arcs of circles at an angle to the plane of the latter.

705,418. OIL-BURNER. JOHN W. LEWELLEN, Philadelphia, Pa. Filed Dec. 14, 1901. Serial No. 85,905. (No model.)



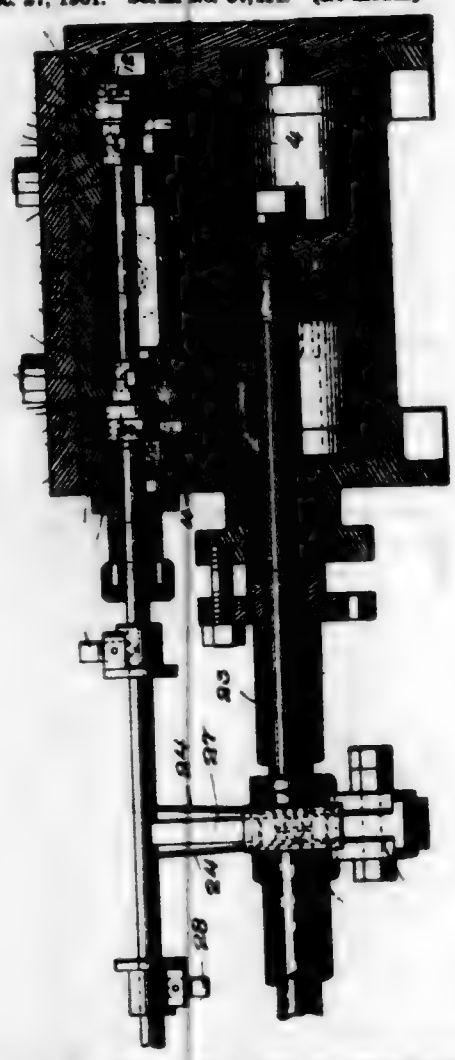
Claim.—1. The combination in an oil-burner, of the oil-receiving pan having a central opening for the passage of air, with a casing containing said pan and also having a central air-passage, said casing forming, beneath the pan, a dead-air chamber, substantially as specified.

2. An oil-burner having an oil-receiving pan with inner and outer raised rims, the inner rim surrounding an air-passage, a deflecting ring or rings mounted above the inner rim of the pan and serving to direct the air outwardly into the burning vapor arising from the oil in the pan, and a hood mounted above the pan and providing between its lower edge and the top of the pan an opening for the inflow of air, substantially as specified.

3. The combination in an oil-burner, of an oil-receiving pan having a central air-passage through it, a casing for said pan also having a central air-passage and forming a dead-air chamber beneath the pan, and a hood mounted on said casing so that its lower edge is above the top of the pan and provides a space for the inflow of air, substantially as specified.

4. The combination in an oil-burner, of an oil-receiving pan having an inner rim surrounding an air-passage, and one or more deflecting-rings mounted above said rim so as to provide spaces for the outflow of air from the central passage, the supporting-legs being tapered at their outer portions so as to permit a flow of air around the entire circumference of the rim, substantially as specified.

705,414. VALVE-GEAR. ROBERT T. LOVE, Stewarton, Scotland. Filed Dec. 27, 1901. Serial No. 87,411. (No model.)



Claim.—1. In a direct-acting engine, a cylinder provided with ports and a valve-casing having steam inlet and exhaust ports, a valve of two different diameters at each port for controlling the entrance of a motive power to and its exit from the cylinder, a smaller portion of each valve communicating with the inlet and the larger portion with the exhaust, and means for operating the valves.

2. In a direct-acting engine, a cylinder provided with ports and a valve-casing having steam inlet and exhaust ports, a valve of two different diameters at each port for controlling the entrance of a motive force to and its exit from the cylinder, a smaller portion of each valve communicating with the inlet and the larger portion with the exhaust, means for operating said valves, and means for balancing them during a portion of said operation.

3. In a direct-acting engine, a cylinder provided with ports and a valve-casing having steam inlet and exhaust ports, a valve of two different diameters at each port for controlling the entrance of a motive force to and its exit from the cylinder, a smaller portion of each valve communicating with the inlet and the larger portion with the exhaust, and yielding means for operating said valves.

4. In a direct-acting engine, a cylinder provided with ports and a valve-casing having steam inlet and exhaust ports, a valve of two different diameters at each port for controlling the entrance of a motive force to and its exit from the cylinder, a smaller portion of each valve communicating with the inlet and the larger portion with the exhaust, means for mechanically moving said valves a portion of their length and the rest of their length by said motive force.

5. In a direct-acting engine, a cylinder provided with ports and a valve-casing having steam inlet and exhaust ports, a valve of two different diameters at each port, and springs for operating the valves, said valves each having its smaller portion communicating with the inlet and the larger portion communicating with the exhaust and being balanced during a portion of their operation.

6. In a direct-acting engine, a cylinder provided with ports and a valve-casing having steam inlet and exhaust ports, a valve of two different diameters at each port, and adjustable means for yieldingly operating said valves, each having its smaller portion communicating with the inlet and the larger portion communicating with the exhaust.

7. In a direct-acting engine, a cylinder provided with ports, a valve of two diameters for each port, the smaller portion of each valve communicating with the inlet and the larger portion communicating with the exhaust, and means for operating said valves.

8. In a direct-acting engine, a cylinder provided with ports, a cylindrical valve for each port, each valve being of two diameters and having ports in its periphery which communicate with the opposite ends, respectively, of the valve, and means for reciprocating said valves over the ports so as to admit a motive force to and permit its escape from the cylinder.

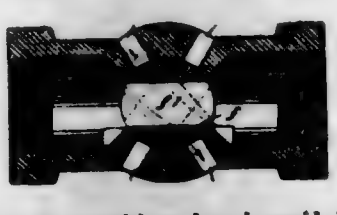
9. In a direct-acting engine, a cylinder provided with ports, a piston therein, the rod of which is provided with a cross-head, springs on the cross-head, a valve of two diameters for each port, a rod connected with said valves, and stops adjustably secured to said valve-rod on opposite sides of and in position to be engaged by said springs.

10. In a direct-acting engine, a cylinder provided with ports, a steam-chest communicating with said ports and a valve-casing having steam inlet and exhaust ports, two valves each of two different diameters in said chest, one for each port, each having its smaller portion communicating with the inlet and the larger portion communicating with the exhaust, and means for operating the valves.

11. In a direct-acting engine, a cylinder provided with ports, a valve-chamber provided with a steam-chest and two supplemental steam-chests, one for each port, a valve of two different diameters for each supplemental chest, each valve being provided with means for controlling the entrance of steam to and its exit from the cylinder, and means for operating said valves.

12. In a direct-acting engine, a cylinder provided with ports, a valve-chamber provided with a steam-inlet, exhaust, a steam-chamber and two supplemental steam-chests, and a channel for establishing communication between said steam-chests, the ports and the exhaust, a valve in each channel at each supplemental chest provided with ports for communicating with the inlet and exhaust, yielding means for operating the valves and balancing them during a portion of their movement.

705,415. **AIR-BRAKE ATTACHMENT.** THOMAS C. MAHON, Lake Charles, La., assignor of two-thirds to Charles Smith and Archie Pierce Sale, Lake Charles, La. Filed Feb. 19, 1901. Serial No. 47,981. (No model.)

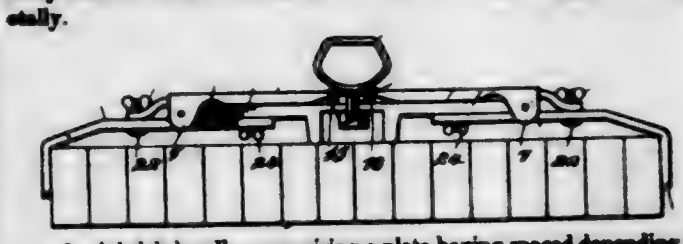


Claim.—1. A cock, comprising a barrel provided with two ports at each side of the longitudinal axis of the cock, and a plug mounted in the barrel and provided with a single port adapted when the plug is turned in one direction to close the ports of the barrel and establish communication between opposite ends of the barrel, and when turned in another direction to establish communication between both ends of the barrel and two opposite ports of the barrel, as set forth.

2. In an air-brake system, the combination with a truck, and a train-pipe, of a cock arranged in the train-pipe and comprising a barrel having two openings on each side, and a plug mounted in the barrel and provided with a single transverse port, a cross-arm connected with the plug, and a flexible connection between the ends of the arms and the truck, as set forth.

705,416. **BRICK-HANDLER.** JULIUS H. MARTIN and GEORGE P. MARTIN, David City, Nebr. Filed Nov. 16, 1901. Serial No. 82,603. (No model.)

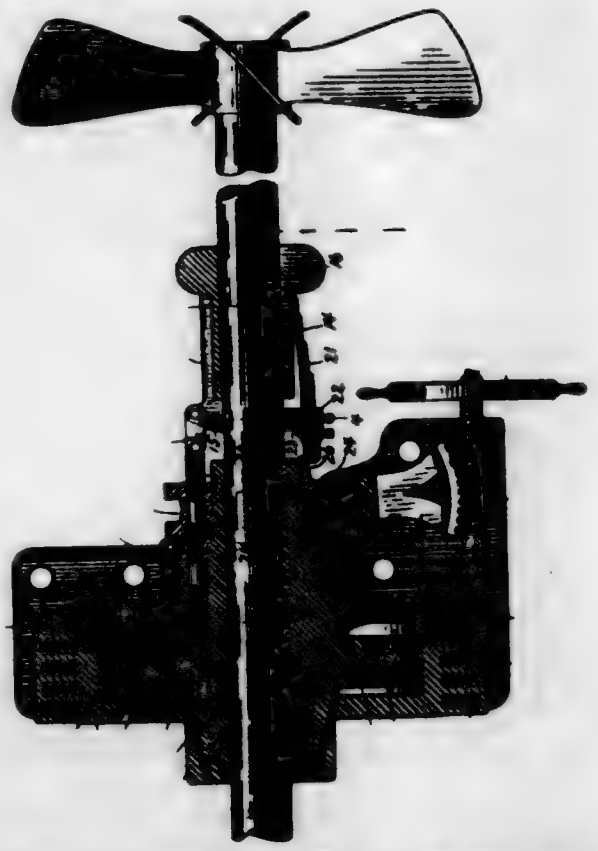
Claim.—1. A brick-handler comprising a main plate having depending ears at each end thereof, a member pivoted between the ears at each end of the plate and having their inner ends disposed mutually adjacent, a cam mechanism for moving the members pivotally, and jaws adjustably connected with the members for movement with respect thereto toward and away from each other depending from the members in the plane of pivotal movement thereof for movement therewith toward and away from each other as the members are correspondingly moved pivotally.



2. A brick-handler comprising a plate having spaced depending ears at each end thereof, latches pivoted between the ears and having their inner ends mutually adjacent, a shaft passed through the plate and having a head provided with cam-faces against which the inner ends of the latches rest for movement thereby when the shaft is rotated, jaws having stems adjustably connected against the under sides of the latches, and plates disposed between the latches and the first-named plate and having their outer ends adjustably connected with the corresponding jaw-stems.

3. A brick-handler comprising a main plate, separate members pivoted to the main plate for movement in a common plane, said members having depending jaws at their outer ends projecting in the plane of pivotal movement of the members, and a cam mechanism mounted upon the main plate and operatively connected with the members for moving them pivotally.

705,417. **GOVERNOR FOR PROPELLER-SHAFTS.** WILLIAM R. MAY, Newton, Mass. Filed Oct. 7, 1901. Serial No. 77,765. (No model.)



Claim.—1. The combination with a propeller-shaft, of a friction-clutch adapted to resist the rotation of the shaft and comprising a fixed member having an internal friction-face surrounding the shaft, and a movable member connected with the shaft and surrounded by the fixed member, and clutch-operating mechanism actuated by the rotation of the shaft.

2. The combination with a propeller-shaft, of a fixed friction-clutch member having an internal friction-face surrounding the shaft, a movable clutch member connected with the shaft, and comprising oscillatory levers having friction-faces, and centrifugal connections between the said shaft and levers.

3. The combination with a propeller-shaft, of a fixed casing surrounding the shaft and having an internal friction-face substantially concentric with the shaft, and a liquid-circulating conduit adjacent to said internal face, said conduit having an inlet and an outlet, a movable clutch member within the casing adapted to frictionally engage said internal face, and centrifugal connections between the shaft and the movable clutch member.

4. The combination with a propeller-shaft, of a friction-clutch adapted to resist the rotation of the shaft, connections between the shaft and the clutch mechanism comprising centrifugally-controlled members, and

means for preventing centrifugal movement of said members whereby said connections may be made inoperative.

5. The combination with a propeller-shaft, of a friction-clutch comprising a fixed outer member and an inner member which is movable with the shaft, a governor-shaft geared to the propeller-shaft, centrifugal governor-arms pivoted to said shaft, and connections between said arms and the inner clutch member.

6. The combination with a propeller-shaft, of a friction-clutch comprising a fixed outer member and an inner member which is movable with the shaft, a governor-shaft adjacent to the propeller-shaft, a movable yoke or frame supporting the governor-shaft, gearing connecting the governor-shaft with the propeller-shaft, said gearing including two friction members, one mounted on the propeller-shaft and the other on the movable frame, said members being separable by a movement of the frame, means for moving the frame, centrifugal governor-arms pivoted to the governor-shaft, and connections between said arms and the inner clutch member.

705,418. BURNER FOR THE REMOVAL OF HARDENED MASSES IN FURNACES OR THE LIKE. HERMANN A. R. MEISEL, Crousthal, Germany, assignor to Otto-Müssener Bergwerks Actien Verein, Crousthal, Westphalia, Germany. Filed Apr. 14, 1902. Serial No. 102,886. (No model.)

Claim.—1. In a burner, the combination of concentric pipes for conveying fuel and oxygen, yielding material surrounding the outer pipe at its delivery end, and a covering of hard refractory non-conducting material surrounding said yielding material, substantially as described.

2. In a burner, the combination of concentric pipes for conveying fuel and oxygen, means for centering the inner pipe in the outer pipe, a circular layer of yielding material surrounding the delivery end of the outer pipe and a circular covering of hard refractory non-conducting material surrounding said yielding material, substantially as described.

705,419. SAFETY ATTACHMENT FOR GAS-COCKS. ALVA M. MERRILL, Brooklyn, N. Y. Filed Nov. 1, 1901. Serial No. 80,512. (No model.)

Claim.—1. The combination with a gas-fitting, provided with the usual valve-seat and having stop-shoulders at the lower end thereof, and a notch or opening opposite one of said shoulders, of a plug-cock fitted to turn in the seat and provided with a hole and a spring-actuated bolt having sliding connection in the hole in the plug-cock in position to simultaneously engage one stop-shoulder and enter the notch or opening.

2. The combination with a gas-fitting, having the valve-seat therein, and provided with stop-shoulders, and a notch or opening adjacent to the valve-seat and in alinement with one shoulder, of a plug-cock fitted to the seat, said cock having a barrel therein and a hole extending therethrough parallel with the barrel and in a plane with the stop-shoulders, a U-shaped bolt extending through the barrel and hole, one end of the bolt having a push-button thereon, a spring in the barrel arranged to force the bolt outwardly when not hindered by the wall of the valve-seat, the opposite end of the bolt being adapted to enter the notch or opening in the fitting in alinement with one of the shoulders and the U-shaped end to engage one of the stop-shoulders when the cock is closed whereby to lock it against accidental turning.

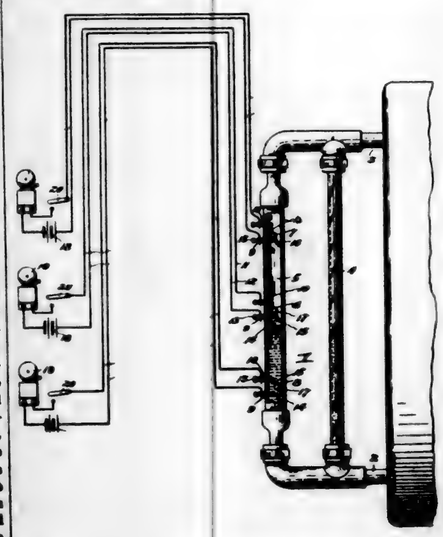
705,420. NUT-LOCK. RICHARD HUGHES and JOHN BWELL, Jr., Denver, Colo. Filed Nov. 2, 1901. Serial No. 80,943. (No model.)

Claim.—1. A nut-lock, comprising a pawl having a yielding head formed by bending the metal of the pawl in substantially U shape, and then bending the same at right angles to the tongue of the pawl, the said pawl being seated in a recess corresponding in shape thereto formed in a nut so as to project inwardly therefrom and engage the threads of a bolt, the said threads being provided with notches, the said pawl engaging the notches and locking the nut when it is screwed into place but being capable of yielding without breaking when the nut is forcefully turned for unscrewing it, substantially as described.

2. A nut-lock, comprising a pawl made of flat metal and having a doubled portion at one end for forming a yielding head, the said pawl and head engaging a recess formed of corresponding shape in the nut to be locked, the said recess also having a flaring portion at its inner end to accommodate the point of the lock when folded one way or the other, the structure being such that the lock may engage notches on the threads of a bolt for locking the nut in place but the said nut can be removed by force, the yielding head of the lock permitting of necessary longitudinal movement thereof in its socket, and the flaring inner end of the socket or recess permitting of the doubling back of the pawl, substantially as described.

3. A nut-locking mechanism, comprising a nut having a recess formed therein with an enlarged end and a flaring end, a pawl having a yielding head and adapted to fit into said recess, the construction being such that longitudinal movement of the pawl in the recess, away from the periphery of the bolt, is permitted, the said head occupying the enlarged portion of the recess, and a bolt provided with a series of notches on the periphery of its threads, the structure being such that the pawl will lock the nut in position but will yield under force for removing the same, the flaring end of the recess in the nut accommodating the folding back of the pawl due to such an operation, substantially as described.

705,421. WATER-LEVEL-TESTING DEVICE FOR BOILERS. HERMAN MOORE, Moundsville, W. Va. Filed Dec. 9, 1901. Serial No. 85,963. (No model.)

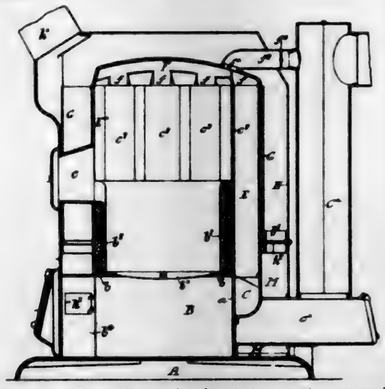


Claim.—1. In a device of the character described, the combination with a gage-tube; of local-circuit-closing connections attached thereto and comprising plugs having binding-posts for the attachment of the circuit-wires, one of said plugs being provided with a contact-piece forming a guide and the other with a pivoted contact-piece carrying a float, an electric circuit including the conducting-wires connected with said plugs, a bell in said circuit, and a normally open switch also in said circuit, substantially as specified.

2. In a device of the character described, the combination of a main gage-tube, an auxiliary gage-tube, connections between said tubes, local-circuit-closing devices mounted upon the auxiliary tube and having contacts thrown into and out of engagement by the rise and fall of the water in said tube, an electric circuit in which the said local-circuit-closing devices are included, a bell also included in said circuit, and a switch which is normally open and which is adapted to be closed to indicate by the sounding or non-sounding of the bell the position of the said local-circuit-closing devices and the level of the water within said tube, substantially as described.

3. In a water-level-testing appliance for steam-boilers, the combination with a gage-tube; of local-circuit-closing connections attached thereto and comprising plugs, one of said plugs having a contact-piece carrying a float and movable toward and from the other plug, an electric circuit in which the said local-circuit-closing devices are included, a bell in said circuit, and a switch also in said circuit and adapted to be closed to indicate by the sounding or non-sounding of the bell the position of the local-circuit-contact connections and the level of the water in the tube, substantially as specified.

705,422. HOT-AIR HEATER. MOSES B. MOORE, Pennington, N. J., and GEORGE W. LENDON, Philadelphia, Pa., assignors to the Pennington Foundry and Heater Company, Pennington, N. J., a Corporation of New Jersey. Filed Mar. 15, 1902. Serial No. 98,872. (No model.)



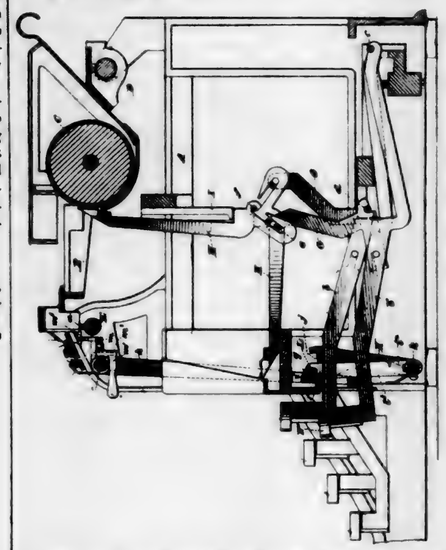
Claim.—1. The combination in a hot-air furnace, of a rectangular fire-box having sides formed of corrugations of different sizes, a cover for the same, a smoke-flue, a substantially circular casing closely surrounding the fire-box the external contour of the corrugated sides of the fire-box conforming to the shape of said casing and forming air-passages therewith, a stack connected with the smoke-flue, and a third casing surrounding the whole, the same having an inlet and an outlet for air to be used for heating, substantially as described.

2. The combination of a casing of polygonal section having corrugations upon its sides, the same forming alternate smoke and air passages, a conduit communicating with said smoke-passages, certain of said corrugations being of different size and shape from the others and arranged so that the casing as a whole is of substantially cylindrical form, with a second casing also of cylindrical form closely surrounding the first casing and its corrugations, substantially as described.

3. In a hot-air furnace, the combination of a fire-box having corrugated sides, a cover therefor having corrugated edges, plates covering certain of the corrugations in the sides of said fire-box and thereby forming flues, the corrugations of the cover registering with the corrugations of the fire-box and providing openings therefrom, a smoke-stack a smoke-flue extending around the lower part of the said fire-box and connected to passages therein, a second casing around the fire-box forming air-passages with certain others of the corrugations of the same and a third casing surrounding the whole and provided with an inlet for cold air and an outlet for the heated air, substantially as described.

4. In a hot-air furnace, the combination of an ash-box, a smoke-flue extending around the top thereof, a single casing having corrugated sides forming the fire-box and a cover supported by said fire-box, certain of the corrugations being constructed to form smoke-passages, the same being in communication with the interior of the casing and with the smoke-flue, a stack connected to said flue, a second casing surrounding the fire-box and forming air-passages with certain others of the corrugations of the sides thereof and a third casing surrounding the whole and having an inlet and an outlet for the air, substantially as described.

705,428. TYPE-WRITING MACHINE. WILLIAM W. MORRISON, Ellsworth, Me., assignor to the Wagner Typewriter Company, New York, N. Y., a Corporation of New York. Filed Dec. 17, 1900. Serial No. 40,099. (No model.)



Claim.—1. In a type-writing machine the combination of a movable carriage and the framing of the machine, with a stop and a trip element mounted on one of said parts, and located at different distances from the side of the machine, a stop element located on the other part and arranged to come into successive engagement with the trip and stop on the first-named part, one of the said elements being movable relatively to the part on which it is mounted, type-carriers, a locking mechanism for locking certain of said carriers while leaving others free to be operated, and an operative connection from the said movable element to the locking mechanism to bring the latter into action before the carriage is stopped positively.

2. In a type-writing machine the combination of a movable carriage and the framing of the machine, with a stop and a trip element on one of the said parts, a stop element on the other part arranged to come into engagement successively with the trip element and the stop of the other part at the end of a line, one of the said elements being movable on the part which carries it by the engagement of the said elements with each other, type-carriers, mechanism for locking certain of said carriers while leaving others free to be operated, and an operative connection from said movable element to the locking mechanism to bring the latter into action before the carriage is stopped positively.

3. In a type-writing machine, the combination with a movable carriage of a series of type-carriers, an adjustable line-stop for limiting the movement of said carriage, a scale cooperating with said line-stop and means controlled by said line-stop for automatically locking certain of said type-carriers out of action and leaving certain of said type-carriers free to be operated when the others are locked.

4. In a type-writing machine, the combination with a movable carriage of a series of type-carriers, an adjustable line-stop for limiting the movement of said carriage, means controlled by said line-stop for automatically locking certain of said type-carriers out of action and leaving certain of said carriers free to be operated when the other carriers are locked and hand-operated means for releasing the locked carriers without moving the carriage.

5. In a type-writing machine, the combination with a movable carriage of a series of type-carriers, an adjustable line-stop carried at the front of the machine for limiting the movement of said carriage, a scale cooperating with said line-stop, said scale being carried at the front of the machine, and means controlled by said line-stop for automatically locking certain of said type-carriers out of action and leaving certain of said type-carriers free to be operated when the others are locked.

6. In a type-writing machine, the combination of a movable carriage, an adjustable line-stop, means for locking certain of said type-carriers out of action and for permitting certain others to remain unlocked when the first-mentioned carriers are locked, intermediate mechanism between the

line-stop and the locking means for automatically operating the locking means when the carriage reaches the stop and for releasing the locked carriers when the carriage is moved away from the stop and hand-operated means for releasing the locking means without moving the carriage.

7. In a type-writing machine, the combination of a movable carriage, a series of type key-levers some of which have locking abutments thereon and others being devoid of such abutments, a line-stop, a locking-bar adapted to engage the abutments on the type key-levers to maintain the same against movement and intermediate mechanism between the line-stop and the locking-bar for automatically operating the locking-bar when the carriage reaches the line-stop.

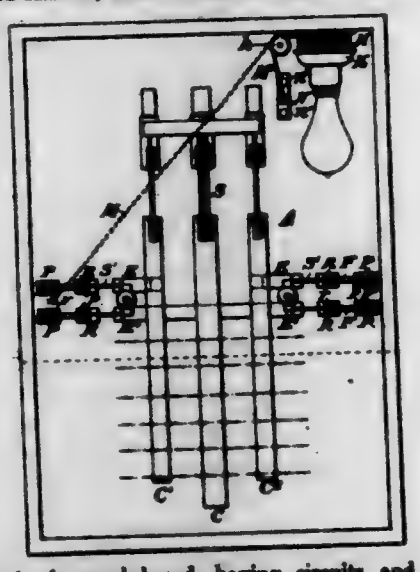
8. In a type-writing machine, the combination of a movable carriage, a series of type key-levers some of which have locking-abutments thereon and others being devoid of such abutments, a line-stop, a locking-bar adapted to engage the abutments on the type key-levers to maintain the same against movement and hand-operated means for releasing the locking-bar from engagement with the type key-levers.

9. In a type-writing machine, the combination with a movable carriage, of two coöperating parts, viz; a stop and a trip, one of the said last-mentioned parts being adjustably relatively to the other and one of them being carried on the carriage while the other is carried by the framing of the machine, and one of said parts being movable relatively to its support and being provided with a cam or engaging portion arranged to be engaged by the other part before the movement of the carriage is positively stopped, such engagement being effective to move said part relatively to its support, type-carriers, a locking mechanism for locking certain of said carriers while leaving others free to be operated, and an operative connection from said movable part to the locking mechanism to bring the latter into action before the carriage is stopped positively.

10. In a type-writing machine the combination of two component portions, viz; a movable carriage and the framing of the machine, with type-carriers, mechanism for locking certain of said carriers while leaving others free to be operated, coöperating parts on the framing of the machine and on the carriage to positively stop the latter, a trip element located on one of the said portions, a coöperating element on the other portion, one of the said elements being movable on the portion carrying it when the said elements engage each other before the carriage is positively stopped, and an operative connection from said movable element to locking mechanism, to bring the latter into action before the carriage is stopped positively.

11. In a type-writing machine the combination of a movable carriage and the framing of the machine, with type-carriers, mechanism for locking certain of said carriers while leaving others free to be operated, coöperating elements located respectively on the carriage and on the framing and operatively connected with the locking mechanism to bring the latter into action before the end of a line, and means for positively arresting the carriage after the locking mechanism has been operated.

705,424. ELECTRICAL-PANEL-BOARD ATTACHMENT. ERNST W. MÜLLER, Brooklyn, N. Y., assignor to Hubert Krantz, Brooklyn, N. Y. Filed Mar. 12, 1902. Serial No. 97,851. (No model.)



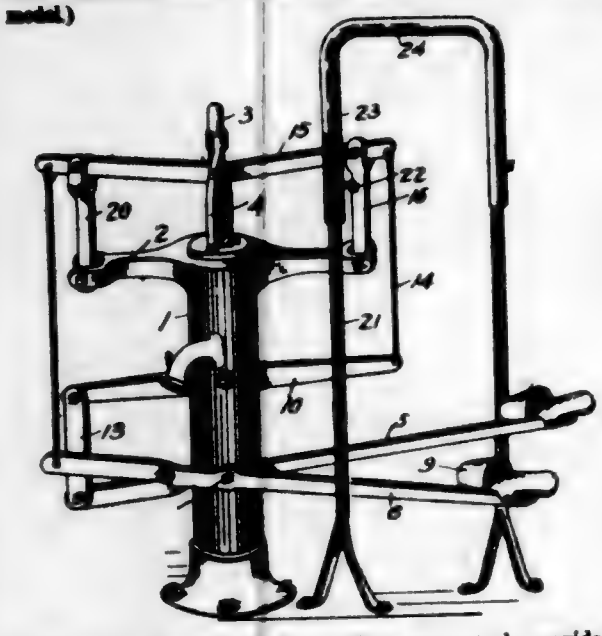
Claim.—1. A panel-board, having circuits and concealed fuses therein with an electric lamp, flexible conductors therefrom and a contact-plug on the conductors, adapted to be applied to the binding-posts of the said circuits to test the fuses, substantially as described.

2. A panel-board, having bus-bars, cross-bars, switches and concealed fuses in the cross-bar circuits with an electric lamp, flexible conductors therefrom and a contact-plug adapted to contact with exposed parts of the branch circuits beyond the fuses, substantially as described.

3. A panel-board having concealed fuses in its branch circuits and binding-posts in the circuits beyond the fuses, with a lamp fixed to the panel-board, flexible conductors connected up to the lamp-terminals and having at their other ends a contact-plug adapted to fit over the binding-posts in any of the branch circuits.

4. A panel-board having concealed fuses in its branch circuits with a lamp fixed to the panel, a spring-drum, flexible conductors wound on the drum and in connection with the lamp-terminals, a contact-plug connected to the other ends of the conductors and adapted to contact with exposed parts of the branch circuits beyond the fuses, substantially as described.

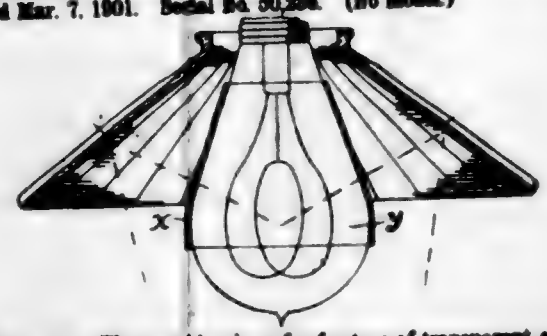
705,425. PUMP-ACTUATING MECHANISM. BENJAMIN MOORE, New Whatcom, Wash. Filed Sept. 20, 1901. Serial No. 75,973. (No model.)



Claim.—1. The combination with a pump-stock provided with a cross-head and a pump-rod, of pedal-levers pivoted to the pump-stock, levers pivotally connected to the cross-head and to the pump-rod, an intermediate lever, a link connecting one end of the intermediate with one of the pedal-levers, a second link connecting the other end of the intermediate lever to one of the levers connected to the pump-rod, and a third link for connecting the end of the other pedal-lever to the other lever which is connected to the pump-rod, substantially as set forth.

2. The combination with a pump-rod; of levers suitably fulcrumed and pivoted to the rod, pedal-levers, an intermediate lever, a link connecting one end of the intermediate lever with one of the pedal-levers, a second link connecting the other end of the intermediate lever to one of the levers pivoted to the pump-rod, and a third link connecting the other pedal-lever to the other lever pivoted to the pump-rod, substantially as specified.

705,426. DISPLAY-LIGHT. OTIS A. MYGATT, New York, N. Y. Filed Mar. 7, 1901. Serial No. 50,226. (No model.)



Claim.—1. The combination of a frustum of transparent glass having a smooth inner face and reflecting-facets on its outer face, an inner source of light, and an interposed colored stratum permeable to light, substantially as described.

2. The combination with a frustum of transparent glass having reflecting-facets on its outer face, of a light within said reflector, and an interposed stratum, permeable to light, and colored with a plurality of transparent colors.

3. The combination with a frustum of transparent glass having reflecting-facets on its outer face, of an inclosed artificial light, and a removable interposed cup of colored glass.

705,427. TUBULAR POLE OR SHAFT FOR VEHICLES. HARRY MCLOUGHLIN, Stapleton, N. Y., assignor to Barton E. Kingman, New York, N. Y. Filed Oct. 25, 1901. Serial No. 79,995. (No model.)

Claim.—1. The combination with the tubular shafts of a vehicle, each of which is made in two parts which taper in opposite directions, and a tubular cross-bar between said shafts, of tubular coupling-pieces for connecting the two parts of each of said shafts to each other and to said cross-bar, each of said coupling-pieces having a series of tongues or projections thereon integral with the body thereof and of smaller diameter than said body, one of said tongues or projections fitting within and secured to the forward part of one of said shafts, another of said tongues or projections fitting within and secured to the rear part of said shaft and the third of said tongues or projections fitting within and secured to the adjacent end of said cross-bar.

2. The combination with the tubular shafts of a vehicle, each of which is made in two parts which taper in opposite directions, and a tubular cross-bar between said shafts, of tubular coupling-pieces for connecting the two parts of each of said shafts to each other and to said cross-bar, each of said coupling-pieces having a series of contracted tongues or projections thereon integral with the body of the coupling-piece and forming a series of shoulders, one of said tongues or projections fitting within and secured to the forward part of one of said shafts, another of said tongues or projections fitting within and secured to the rear part of said shaft and the third of said tongues or projections fitting within and secured to the adjacent end of said cross-bar, each of the ends of the two parts of said shaft and the end of said cross-bar which is adjacent to said coupling-piece bearing against said shoulders.

3. The combination with the tubular shafts of a vehicle, each of which is made in two parts which taper in opposite directions, and a tubular cross-bar between said shafts, of tubular coupling-pieces for connecting the two parts of each of said shafts to each other and to said cross-bar, each of said coupling-pieces having a series of contracted tongues or projections thereon integral with the body of the coupling-piece and forming a series of shoulders, one of said tongues or projections fitting within and secured to the forward part of one of said shafts, another of said tongues or projections fitting within and secured to the rear part of said shaft and the third of said tongues or projections fitting within and secured to the adjacent end of said cross-bar, each of the ends of the two parts of said shaft and the end of said cross-bar which is adjacent to said coupling-piece bearing against said shoulders and the outer surfaces of the two parts of said shaft and of said cross-bar lying flush with the outer exposed surfaces of said coupling-piece.

4. The combination of two tubular parts, and a pivotal connection between the same, the said pivotal connection comprising a thimble extending through an opening in one wall of one of said parts, having a flange thereon outside said wall and bearing at its opposite end against the inner surface of the other wall of said part, a thimble extending through an opening in one wall of the other of said parts, having a flange thereon bearing against the flange on the other of said thimbles and bearing at its opposite end against the inner surface of the other wall of said part, a bolt connecting said parts and passing through said thimbles, and a nut upon one end of said bolt, as and for the purpose set forth.

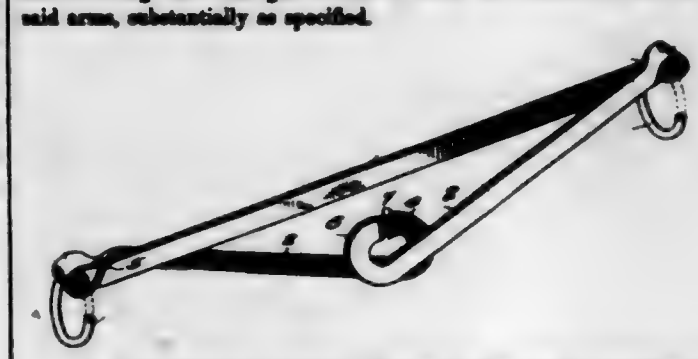
5. The combination of a tubular cross-bar connecting a pair of vehicle-shafts, a tubular whiffletree, and a pivotal connection between said parts, the same comprising a thimble extending through an opening in the upper wall of said cross-bar, having a flange outside said wall and bearing at its opposite end against the inner surface of the lower wall of said cross-bar, a thimble extending through an opening in the lower wall of said whiffletree, having a base-flange thereon bearing against the flange on the other thimble and bearing at its opposite end against the inner surface of the upper wall of said whiffletree, the adjacent surfaces of the flanges on said thimbles being provided with counterpart ribs and grooves, a bolt extending through said thimbles, and a clamping-nut upon one end of said bolt, as and for the purpose set forth.

705,428. NECK-YOKE. FRANK A. HAGUE and BENTON SMITH, Clearfield, Pa. Filed Apr. 3, 1902. Serial No. 101,944. (No model.)

Claim.—1. A neck-yoke comprising a bar having diagonally-projecting arms formed with coacting hooks at their inner ends to produce a lap-ring, means for limiting the outward movement of said arms to prevent separation of the hooks, substantially as and for the purpose set forth.

2. A neck-yoke comprising a bar, the ends of which are twisted to form eyes and coacting abutting shoulders and thence extended to provide diagonally-projecting arms, the ends of said arms being formed with opposing hooks which overlap each other to form a lap-ring, said shoulders acting to limit the outward movement of said arms, substantially as described.

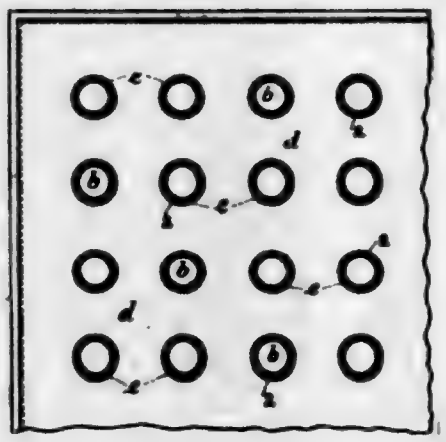
3. A neck-yoke comprising a bar having diagonally-projecting arms formed with coacting hooks at their inner ends to produce a lap-ring, said hooks having ends arranged to abut to limit the outward movement of said arms, substantially as specified.



4. A neck-yoke comprising a bar having diagonally-projecting arms formed with coacting hooks at their inner ends to produce a lap-ring, the ends of the bar being twisted to form eyes and coacting stop-shoulders, and the hooks having abutting ends coacting with said shoulders to limit the outward movement of said arms, substantially as set forth.

5. A neck-yoke comprising a bar having diagonally-projecting arms yieldable toward and from the bar and also laterally thereof, said arms being formed with coacting hooks at their inner ends to produce a lap-ring, substantially as set forth.

705,429. ELECTRIC-LIGHT SIGN. MORTIMER HORDEN, New York, N. Y., assignor to the Horden-Ritzner Electric Company, New York, N. Y., a Corporation of New York. Filed Apr. 14, 1902. Serial No. 102,926. (No model.)



Claim.—1. In an electric-light sign, the combination with a base or support and a series of lamp-sockets secured thereto, of a plate adapted to be connected to said base and having a series of apertures coinciding in position axially with said sockets, and tube-sections secured at one end to said plate concentric to the openings and receiving and surrounding the electric-lamp bulbs as secured to the sockets, substantially as specified.

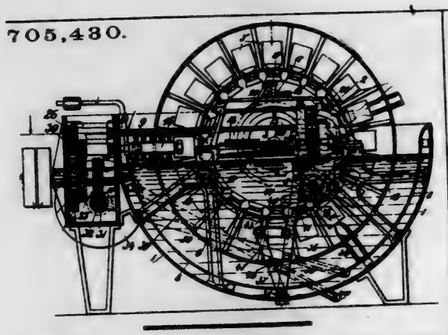
2. In an electric-light sign, the combination with a base or support and a series of lamp-sockets secured thereto, of a plate adapted to be connected to said base in a plane parallel therewith and having a series of circular apertures coinciding in position axially with said sockets and cylindrical tube-sections secured at one end to said plate concentric to the openings and receiving and surrounding the electric-lamp bulbs as secured to the sockets, substantially as specified.

3. In an electric light sign, the combination with a base or support, a series of lamp-sockets secured thereto and a series of electric-lamp bulbs therein, of a plate adapted to be connected to said base in a plane parallel therewith and about on line with the ends of the lamp-bulbs and having therein a series of apertures coinciding in position axially with said sockets, and tube-sections secured at one end to the under surface of said plate concentric to the openings and receiving end of a length to entirely surround the electric-lamp bulbs as secured to the sockets, substantially as specified.

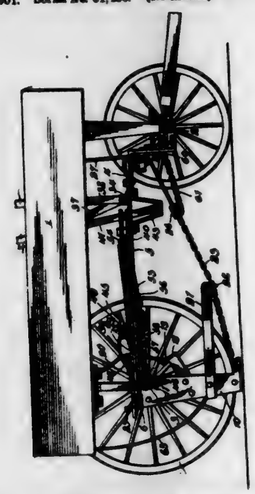
705,430. BOTTLE-WASHING MACHINE. JOHN H. W. OETMANN and CARL W. HEINEY, Hamburg, Germany. Filed Feb. 17, 1902. Serial No. 94,509. (No model.)

Claim.—In a bottle-washing machine, the combination with the vat, a rotary frame mounted therein having receptacles for the bottles, a slide-carriage, a guideway for imparting a forward-and-backward movement to the slide-carriage of a rinsing apparatus, a valve connected with a water-supply pipe, a lever coacting with the valve, and the said slide-carriage coacting with the valve to open and close the same, substantially as specified.

705,430.



705,431. VEHICLE-BRAKE. JEAN OSTEIG, Tempe, Ariz. Filed Nov. 7, 1901. Serial No. 81,480. (No model.)



Claim.—1. In a vehicle-brake, the combination with a running-gear, of a vertically-swinging brake-standard carried thereby and having a foot for engagement with the ground, independent controlling-levers having connections, respectively, with the outer free end of the standard and an intermediate point thereof, means for locking the standard in both its operative and inoperative positions, and a controlling-lever for the locking means.

2. In a vehicle-brake, the combination with a running-gear, of a vertically-swinging brake-standard having a foot for engagement with the ground, means for raising and lowering the standard, a locking-head carried by said standard, and a slidable locking-fork to engage the head and lock the standard.

3. In a vehicle-brake, the combination with a running-gear, of a vertically-swinging brake-standard having a foot for engagement with the ground, and also provided at its upper end with a substantially T-shaped locking-head, means for raising and lowering the standard, a spring-actuated locking-slide mounted upon the running-gear and having a fork to engage the T-shaped head, and a controlling device for the locking-slide.

4. In a vehicle-brake, the combination with a running-gear, of opposite vertically-swinging brake-standards having a cross-bar connecting the same and also provided with a foot for engagement with the ground, means for raising and lowering the standards, a slidable locking device mounted upon the running-gear and constructed to engage the cross-bar to hold the standards elevated, and controlling means for the locking-slide.

5. In a vehicle-brake, the combination with a running-gear, of opposite vertically swinging brake-standards having a cross-bar connecting the same, and also provided with feet for engagement with the ground, means for raising and lowering the standards, a forked spring-actuated locking-slide mounted upon the running-gear and constructed to be slid under the cross-bar and thereby support the standards in an elevated position, and a controlling device for the slide.

6. In a vehicle-brake, the combination with a running-gear, of opposite vertically-swinging brake-standards having a cross-bar connecting the same, and also provided with feet for engagement with the ground, means for raising and lowering the standards, a locking-head carried by the standards, a spring-actuated locking-slide mounted upon the running-gear and constructed for alternate engagement with the locking-head and the cross-bar to lock the standards in their operative and inoperative positions, and means for controlling the locking-slide.

7. In a vehicle-brake, the combination with a running-gear, of opposite swinging standards having feet for engagement with the ground, and also having a cross-bar connecting the same, and a T-shaped locking-head, means for raising and lowering the standards, a spring-actuated locking-slide mounted upon the running-gear and having a rear fork to engage the T-shaped head and lock the standards in their operative positions, and also provided with an intermediate forked portion to engage beneath the cross-bar of the standards and lock the same in an elevated position, and means for controlling the locking-slide.

8. In a vehicle-brake, the combination with a running-gear, of opposite vertically-swinging brake-standards having feet for engagement with the ground, a cross-bar connecting the standards, a T-shaped locking-head carried by the standards, a spring-actuated locking-slide mounted upon the running-gear, and provided with a rear forked end to engage the T-shaped slide and lock the standards in their operative position, and also provided with intermediate fork members to be slid under the cross-bar and lock the standards in an elevated position, and means for controlling the slide.

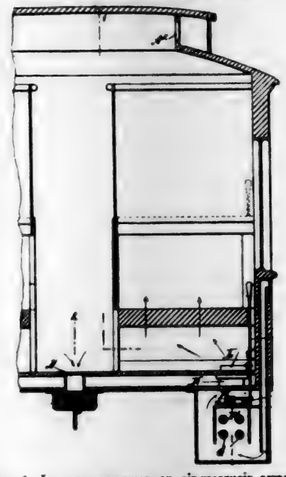
9. In a vehicle-brake, the combination with a vehicle-body, and the running-gear thereof, of a vertically-swinging brake-frame having feet for engagement with the ground, elevating-levers upon the body, flexible connections between the lower end of the brake-frame and one of the levers, and also between an intermediate portion of the frame and the other lever, slidable means for locking the brake-frame in its operative and inoperative positions, and a lever for controlling said locking means.

10. In a vehicle-brake, the combination with a vehicle-body and the running-gear thereof, of a vertically-swinging brake-frame having feet for engagement with the ground, a pulley mounted upon the forward portion of the running-gear, a corresponding pulley mounted in a slot in the bottom of the vehicle-body, a lever upon the body, a flexible connection extending between the lever and the free portion of the brake-frame, the intermediate portion of the connection being reeved through the pulleys, another lever upon the body, a guide-pulley mounted in a slot in the rear portion of the bottom of the vehicle, a flexible connection between an intermediate portion of the brake-frame and the second-mentioned lever, the intermediate portion of the connection running over the pulley at the rear of the vehicle, spring-actuated means for locking the brake-frame in its operative and inoperative positions, a controlling-lever for the locking means, and means for holding the lever at one limit to support the locking means out of engagement with the brake-frame.

11. In a vehicle-brake, the combination with a wagon-body, and the running-gear thereof, of a brake-frame swung from the rear axle and comprising opposite standards having lower terminal feet for engagement with the ground, cross-bars connecting the standards, a yoke-shaped cross-bar projecting in front of the standards, arms extended forwardly from each standard and having outer terminal guide-eyes, a T-shaped locking-head projected above the frame, a pair of elevating-levers fulcrumed upon the running-gear and working in corresponding slots in the bottom of the vehicle-body, corresponding guide-pulleys carried by the running-gear and in a slot in the bottom of the body, a flexible connection extending from one of the levers and reeved through the pulleys, and opposite flexible connections extending from the free ends of the respective standards through the guide-eyes at the outer ends of the arms thereof and connected to the first-mentioned flexible connection, a guide-pulley mounted in the slot in the rear portion of the bottom of the body, a flexible connection between the yoke-shaped cross-bar of the brake-frame and the other lever, the intermediate portion of the connection being reeved through the last-mentioned pulley, a locking-slide mounted upon the running-gear and comprising upper and lower members, the upper member having a forked rear end to engage the T-shaped locking-head of the brake-frame, a coiled spring embracing said upper member and connected at the opposite ends to the member and a portion of the running-gear, the lower member having a fork, the members of which are constructed to engage the under side of the yoke-shaped cross-bar of the brake-frame and support the same in an elevated position, and a lever fulcrumed upon the running-gear, working in a slot in the bottom of the vehicle and also connected to the locking-slide.

12. In a brake, the combination with the running-gear of a vehicle, of a vertically-swinging brake-standard mounted thereon and provided at its free end with a foot for engagement with the ground, means for supporting the standard in an inoperative position, means connected to the free end of the brake-standard for elevating the same, a guide located in rear of the brake-standard, and a rope or cable having one end connected to the brake-standard, its opposite end located in reach of the driver of the vehicle, and the intermediate portion of the rope or cable working through the guide to draw the standard downwardly and engage the foot with the ground.

705,432. PASSENGER-CAR. JAMES M. OSGOOD, Boston, Mass. Filed Nov. 18, 1897. Serial No. 658,884. (No model.)



Claim.—1. In a passenger-car, an air-reservoir arranged beneath the car and communicating with the outer air, a valved flue leading from the top of the reservoir into the car, a hot-air chamber arranged in the reservoir with its top and sides spaced from the top and sides of the reservoir and communicating with the same at its bottom, said chamber being provided with an opening in its top beneath the said flue, and a valve operated from the interior of the car, for controlling the said opening of the hot-air chamber, substantially as described.

2. In a passenger-car, an air-reservoir arranged beneath the car and communicating with the outer air, a flue leading from the top of the reservoir into the car, a register in said flue, a hot-air chamber arranged in the reservoir with its top and sides spaced from the top and sides of the reservoir and communicating with the same at its bottom, said chamber being provided with an opening in its top beneath the said flue, a valve for controlling the opening of the hot-air chamber, and means for operating the said valve from the interior of the car, substantially as described.

3. In a passenger-car, an air-reservoir arranged beneath the car and communicating with the outer air, a flue leading from the top of the reservoir into the car, a register in the flue, a hot-air chamber arranged in the reservoir with its top and sides spaced from the top and sides of the reservoir and communicating with the same at its bottom, said chamber being provided with an opening in its top beneath the said flue, a sliding valve between the tops of the reservoir and chamber for controlling the opening of the hot-air chamber, and means for operating the valve from the interior of the car, substantially as described.

4. In a passenger-car, an air-reservoir arranged beneath the car and communicating with the outer air, a flue leading from the top of the reservoir into the car, a register in the flue, a hot-air chamber arranged in the reservoir with its top and sides spaced from the top and sides of the reservoir and communicating with the same at its bottom, said chamber being provided with an opening in its top beneath the said flue, a valve for controlling the opening of the hot-air chamber, and means for operating the valve and register, substantially as described.

5. The combination with a passenger-car provided with a series of compartments, of an air-reservoir arranged beneath the car and divided into a series of sections corresponding to the compartments of the car, said reservoir communicating with the outer air, a flue connecting each section of the reservoir with a compartment of a car, registers in the said flues, a hot-air chamber in each section of the reservoir with its top and sides spaced from the reservoir and communicating with the same at its bottom, said chamber being provided with an opening in its top beneath the said flue, and a valve operated from the interior of the car, for controlling the opening of the said chamber, substantially as described.

6. The combination with a passenger-car provided with berths, each having an independent compartment, the upper berth being arranged with its head portion projecting over the foot portion of the lower berth, of a reservoir beneath the car and communicating with the outer air, and a valved flue leading from the reservoir to each berth-compartment below the berths, whereby the air will be made to pass over the occupants of the berths, substantially as described.

7. The combination with a passenger-car provided with berths each having an independent compartment, the upper berth being arranged with its head portion projecting over the foot portion of the lower berth, of a compartment-reservoir beneath the car and communicating with the outer air, a flue leading from each compartment of the reservoir to the berth-compartments below the berths, a register in the said flues, a hot-air chamber in each compartment of the reservoir, said chambers being each open at its bottom and provided with an opening in its top, valves for the openings of the said chambers, and means for operating said valves, substantially as described.

8. In combination with a parlor and sleeping car divided into sections for night use, with an upper and lower berth in each section overlapping each other, the lower berth projecting beyond the upper, providing a free space to the top of the car, with intermediate partitions between the two berths, giving to each berth an independent compartment within the section; an outer reservoir placed beneath the car containing an inner hot-air chamber with a free circulation of air, both divided into compartments, each compartment independently connected with the corresponding compartment in the car above, the air for the heat and ventilation circulating either around or through the hot-air chamber, or both at the same time, being controlled by slides, dampers or registers as it passes through the apertures of the hot-air chamber and through the registers of the car into the corresponding compartment above, the register of the lower berth being below the bed and connected by a lever for the use of the occupant of the berth, the air from the register flowing up between, around or through the vertical support of the upper berth and the foot of the lower berth, passing directly over the passenger through the space between the lower berth and the top of the car into the monitor and out into the external air; the register for the upper berth being placed below it, the air passing around it up into the monitor and out into the external air in the same manner as in the lower berth, all of the valves pertaining to heat and ventilation being under the control of the occupant of the berth, substantially as described.

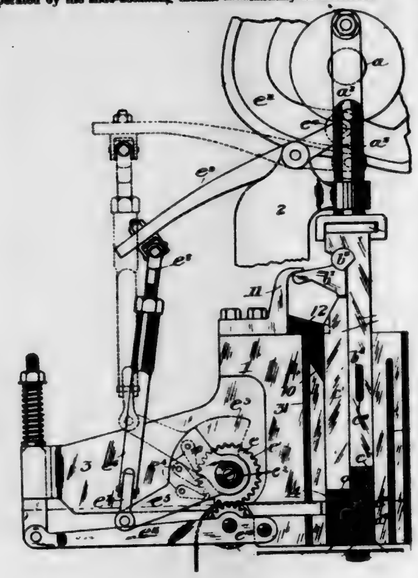
9. In combination with a parlor and sleeping car divided into sections for night use, with an upper and lower berth in each section overlapping with each other, the lower berth projecting beyond the upper, providing a free space to the top of the car, each berth being an independent compartment within the section; the car being provided with an outer reservoir containing an inner hot-air chamber with a free circulation of air either around or through the hot-air chamber, or both at the same time, being controlled by slides, dampers or registers as it passes through the apertures of the hot-air chamber through the register of the outer reservoir into the car, flowing through, around or up between the vertical support of the upper berth and the foot of the lower berth, passing directly over the passenger through the space between the lower berth and the top of the car into the monitor out into the external air; the register of the upper berth being placed beneath it, the air passing around it up into the monitor out into the external air in the same manner as in the lower berth, substantially as described.

705,433. STAPLE FORMING AND DRIVING MACHINE. GEORGE W. PACKER, Chicago, Ill., assignor to the Deering Harvester Company, Chicago, Ill. Filed Oct. 19, 1900. Serial No. 33,595. (No model.)

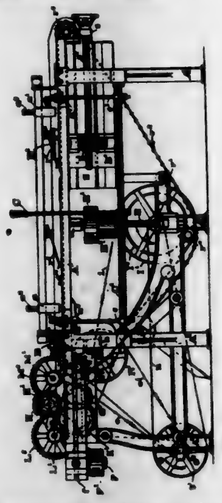
Claim.—1. In a stapling-machine, the combination of a supporting-frame having a beveled-face guiding-groove in its face and a wire-guiding slot terminating in said beveled face, a recessed cutting and forming slide operating in said guiding-groove, said slide having a coöperating beveled cutting-face and a grooved forming-fork, a driving-slide mounted in the recess in said forming-slide and having a rearwardly-projecting ribbed hammer-head operating in said grooved fork, a pin-and-slot connection between said forming and driving slides, a pivoted dog carried by the driving-slide and adapted to be engaged with and disengaged from said forming-slide, an anvil-bar pivoted in said frame and having a toe projecting in the path of said forming-fork, coöperating lugs on the forming-fork and anvil-bar to retract the latter when the staple has been formed, and operating means connected with the driving-slide whereby the several parts are successively operated to cut the wire, form the staple and drive the latter when formed, substantially as described.

2. In a stapling-machine, the combination of a supporting-frame having a beveled-face guiding-groove, a recessed cutting and forming slide opening in said groove, said slide having a forming-fork and a beveled cutting-face coöperating with the beveled face of the groove, a driving-slide mounted in the recess in said forming-slide and having a rearwardly-projecting hammer-head provided with lateral ribs engaging correspond-

ing slots in said forming-fork, an anvil-bar pivoted to said frame and adapted to engage the throat of said forming-fork, coöperating lugs on said forming-slide and anvil-bar to retract the latter from engagement with the fork, means to actuate the driving-slide, means to successively connect and disconnect the driving and forming slides, and a wire-feeding device operated by the slide-actuating means, substantially as described.



705,484. SLAT-FORMING MACHINE. GEORGE W. PACKER, Chicago, Ill., assignor to Deering Harvester Company, Chicago, Ill. Filed Feb. 5, 1900. Serial No. 4,089. (No model.)



Claim.—1. In a machine for producing a number of finished slats from a single piece of stock, the combination of a transversely-slotted bed or table, a cutter-head arranged to act upon the edge of said stock, manually-operated feeding means movable in the slots of the bed or table for presenting the material to said head, guides on the bed or table for directing the material into proper relation to the cutter-head as it is fed by the manually-operated means, pairs of cutters acting on opposite surfaces of the stock in the direction of its length, saws arranged to sever the stock on lines substantially parallel with and between the lines of separation made by the cutters, feeding mechanism for directing the stock to the cutters and saws, and devices separate from and actuated by the manually-operated feeding means for engaging the stock after it has been fed past the cutter-heads and delivering it to the said feeding mechanism.

2. In a machine for producing a number of finished slats from a single piece of stock, the combination of a transversely-slotted bed or table, a cutter-head arranged to act upon the edge of the stock, manually-operated feeding means reciprocal in the transverse slots of the bed or table for presenting the material to said cutter-head, pairs of cutters acting on opposite surfaces of the stock in the direction of its length, saws arranged to sever the stock on lines substantially parallel and between the lines of separation made by the cutters, feeding mechanism for directing the stock to the cutters and saws, transferring devices separate from and actuated by the manually-operated feeding means to deliver the stock to said feeding mechanism, and instrumentalities for elastically holding the stock upon the bed or table while being acted upon by the manually-operated feeding means and the transferring devices.

3. In a machine for producing a number of finished slats from a single piece of stock, the combination of a bed or table provided with transverse slots, cutter-heads arranged on said bed or table to act upon the ends of the stock slides movable transversely of said bed or table in said slots and provided at different points in their length with separate feeding and transferring devices, pairs of cutters disposed to act upon opposite surfaces of the stock lengthwise thereof, and feeding mechanism for directing the stock between said cutters, the separate feeding devices carried by the slides acting to pass the stock between the cutter-heads, and the transferring devices, adapted to engage said stock after it has passed the cutter-heads and transfer the stock to the said feeding mechanism.

4. In a machine for producing a number of finished slats from a single piece of stock, the combination of a bed or table, cutter-heads arranged thereon to act upon the ends of the stock, guides upon said bed for directing the stock to and past the heads, means for elastically holding the stock down upon the bed, a rock-shaft C' having an operating-lever C, reciprocating feed-bars sliding in grooves in the bed, and provided with fixed teeth c^3, c^3, and yielding teeth c^4, c^4, and arms c, c', projecting from the rock-shaft and connected to the feed-bars.

5. In a machine for producing a number of finished slats from a single stock, the combination of a bed or table, cutter-heads arranged thereon to act upon the ends of the stock, guides upon said bed for directing the stock to and past the heads, a rock-shaft C', having an operating-lever C, guides c^6, c^7 projecting from the bed, reciprocating feed-bars sliding in grooves in the bed, arms c, c' projecting from the rock-shaft and having slotted upper ends, and lugs c^4, c^4 on the feed-bars sliding in the guides c^6, c^7.

705,485. DUST-GUARD. JAMES S. PAYNE, Baltimore, Md., assignor to Metal Dust Guard Company of Baltimore City, a Corporation. Filed Dec. 26, 1901. Serial No. 87,274. (No model.)

Claim.—1. The improved dust-guard herein described, consisting of the packing-section having a circular opening, and the brace applied to the face of said section between the inner and outer edges thereof and having the central circular opening, and composed of segmental sections each made wider at one end than at the other and united together at their meeting ends with wide end to wide end and narrow end to narrow end, substantially as set forth.

2. The dust-guard herein described, comprising the packing-section and the frame or brace applied to the face thereof and composed of segmental sections connected to form a ring-like brace, substantially as set forth.

3. A dust-guard comprising a packing-section and a ring-like brace applied to the face of said section and composed of segmental sections overlapped at their ends and united together and to the packing-section, and corrugated longitudinally and provided at their inner and outer edges with portions projecting into the packing-section, whereby to compress the same, substantially as set forth.

4. A dust-guard comprising the packing-section, a brace applied to the face thereof and composed of segmental sections overlapping each other at their ends, and the rivets passing through said overlapping ends and through the packing-section, substantially as set forth.

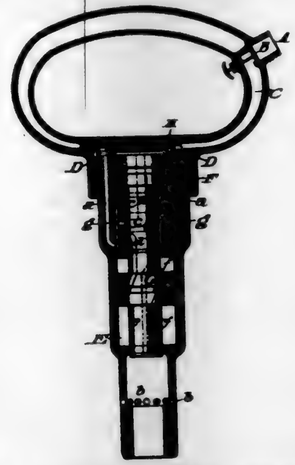
5. A dust-guard having a packing-section and the brace applied to the face of said packing-section and composed of segmental sections corrugated longitudinally and united at their ends, substantially as set forth.

6. A dust-guard comprising a ring-like packing-section and the brace applied to the face of the packing-section and provided at its edge with an inwardly-curving portion by which to compress the packing-section, substantially as set forth.

7. A dust-guard comprising a ring-like packing-section, and ring-like brace-frame applied to the opposite faces thereof and having flaring flanges or wings at their inner ends forming tapering recesses for the inner edges of the packing, substantially as set forth.

8. A dust-guard composed of the packing-section, and the ring-like brace or frame applied to the faces of the packing-section and composed of sections united together at their ends and made wider at one end than at the other and corrugated longitudinally, substantially as set forth.

705,486. AIR-TOOL. NINO PECORARO, Spezia, Italy. Filed Aug. 24, 1901. Serial No. 73,181. (No model.)



Claim.—1. In a pneumatic tool, a cylinder, a piston therein, shoulders upon the extremities of said piston, a valve movable on said piston, between said shoulders and provided with ports extending therethrough, inlet-ports in said cylinder, an inlet-passage *c* in said piston leading upwardly therethrough, an inlet-passage *d* therein leading downwardly therethrough, an exhaust-passage in said piston extending to the end thereof and having the ports *m* and *n* and an inlet-passage *f* in said piston for enabling said valve to be operated.

2. In a pneumatic tool, a cylinder, a piston therein, shoulders upon the extremities of said piston, one of said shoulders being integral with said piston, and the other of said shoulders in threaded engagement therewith, a locking-screw H holding said shoulder in position, a valve movable on said piston between said shoulders and provided with ports, inlet-ports in said cylinder, an inlet-passage *c* in said piston leading upwardly, an inlet-passage *d* therein leading downwardly, an exhaust-passage in said piston extending to the end thereof and having the ports *m* and *n*, and an inlet-passage *f* in said piston for enabling said valve to be operated, in combination with an extension on the extremity of said piston of reduced diameter and a flange projecting inwardly from said cylinder through which said extension passes.

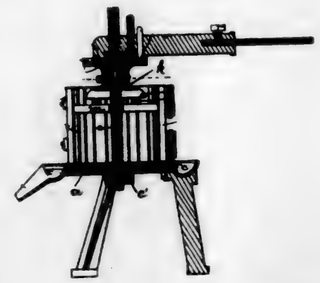
3. In a pneumatic tool, a cylinder, a piston therein, enlarged shoulders upon the extremities of said piston, an extension on the lower shoulder of the latter adapted to impact with the shank of the tool employed, an inwardly-projecting wall through which said extension passes, a valve movable on said piston between said shoulders and provided with ports extending therethrough, said valve having an annular passage between it and the bore of said cylinder, an inlet-passage *c* in said piston leading upwardly, an inlet-passage *d* therein leading in an opposite direction, an exhaust-passage in said piston extending through the extension thereof and having the ports *m* and *n* and an inlet-passage located for a portion of its length in said extension for enabling said valve to be operated.

4. In a pneumatic tool, a cylinder, a piston therein, shoulders upon the extremities of said piston, one of said shoulders being integral with said piston, and the other of said shoulders in threaded engagement therewith, a locking-screw H holding said shoulder in position, a valve movable on said piston between said shoulders and provided with ports in said cylinder, an inlet-passage *c* in said piston leading upwardly, an inlet-passage *d* therein leading downwardly, an exhaust-passage in said piston extending to the end thereof and having the ports *m* and *n*, and an inlet-passage *f* in said piston for enabling said valve to be operated, in combination with an extension on the extremity of said piston of reduced diameter and a flange projecting inwardly from said cylinder through which said extension passes.

5. In a pneumatic tool, a cylinder, a piston therein, shoulders upon the extremities of said piston, one of said shoulders being integral with said piston, and the other of said shoulders in threaded engagement therewith, a locking-screw H holding said shoulder in position, a valve movable on said piston between said shoulders and provided with ports in said cylinder, an inlet-passage *c* in said piston leading upwardly, an inlet-passage *d* therein leading downwardly, an exhaust-passage in said piston extending to the end thereof and having the ports *m* and *n*, and an inlet-passage *f* in said piston for enabling said valve to be operated, the lower portion of said cylinder having the exhaust-ports *b* therein.

6. In a pneumatic tool, a cylinder, a piston therein, shoulders upon the extremities of said piston, the latter being of reduced diameter between said shoulders, a valve mounted on said piston between said shoulders and having a plurality of ports therethrough, the outer intermediate portion of said valve being of reduced diameter and said valve having a plurality of recesses between its inner periphery and the outer periphery of said piston, an inlet-passage *c* in said piston leading to one end thereof and another inlet-passage in said piston leading to the opposite end thereof, an exhaust-passage in said piston extending toward the extremity thereof and having the ports *m* and *n*, and an inlet-passage *f* in said piston for enabling said valve to be operated.

705,487. WIRE-PRESS. LOUIS PEROTTI, Newark, N. J. Filed Oct. 8, 1901. Serial No. 77,943. (No model.)



Claim.—1. In a press, the combination with a threaded stud, a nut or head screwing on said stud and having an upper horizontal surface provided with concentric series of ratchet-teeth, the teeth of one series being oppositely directed from those of the other, a lever or handle centrally pivoted on the said nut or head, and pawl means upon said lever to engage said ratchet-teeth.

2. In a press, the combination with a threaded stud *a*, a nut or head screwing on said stud and having an upper horizontal surface in which are formed concentric series of recesses constituting ratchet-teeth, the teeth of one series being oppositely directed from those of the other, a lever or handle centrally pivoted upon the said nut or head and having upright perforations back from its end adapted to register one with each series of recesses or ratchet-teeth, and a pawl-pin interchangeable from one perforation to another to engage either series of teeth.

3. In a press, the combination with a threaded stud, of a nut or head screwing on said stud and having at its top a stem surrounded by a horizontal flange provided with concentric oppositely-directed series of ratchet-recesses, a radial lever or handle loosely receiving said stem as a pivot and having sockets registering one with each series of recesses, and a pawl-pin adapted to fit in each socket and engage the nut or head.

705,438. TELESCOPIC TRAVELING-BAG. EDWIN U. PHILLIPS and FRANCIS J. MCHENRY, Portland, Oreg., assignors to Modern Telescope Company, Portland, Oreg., a Corporation of Oregon. Filed Mar. 25, 1902. Serial No. 99,912. (No model.)

Claim.—1. In a telescopic bag of the character stated; an outer telescope-section, comprising a front and end portions rigidly joined, a body consisting of a back portion secured to the end portions, a top section having side and front extensions bent to lap over the end and front portions of the outer telescopic section, the end flanges being slitted vertically near their rear ends, and a reinforce member secured to the under side of the top at a point in front of the slits in the ends, and extended under the rear portion of the top, substantially as shown and for the purposes described.

2. In a telescopic trunk or bag of the character stated, an outer telescope-section, comprising a front and end portions, rigidly joined, a body consisting of back portions secured to the ends, a top section having pendent flanges at the ends and front to lap the ends and front portion of the said outer telescopic section, the end flanges being slit vertically near their rear ends, flexible reinforce members secured on the top adjacent said vertical slits, and a reinforced member secured to the under side of the top at a point in front of the slit ends and extended under the rear or stationary portion of the top, all being arranged substantially as shown and for the purposes described.

3. As a new article, a telescope of the character described, comprising in combination, a lower section, and an upper section, slidable over the lower section, said upper section consisting of front and end portions rivoted at their meeting ends, a body portion including a back having flanges for joining with the ends and a top section b^{14}, said top section having a front flange to lap over the front of the said section, and end portions to lap over the ends thereof, said end flanges being cut vertically whereby to produce a crossing-line for the top b^{14}, the rear portions of the end flanges being rigidly secured to the ends of the section, leather or hinge members, secured to the top b^{14}, to straddle the slit or crossing line of the top, a cleat secured to the under side of the loose part of the top, and having a portion to extend under the crossing or hinge line of the top, and binding-straps and a handle connected to the lift or loose part of the top, all being arranged substantially as shown and for the purposes described.

705,439. DEVICE FOR CARRYING PACKAGES. STANISLAS DE PLEIN POL, Laeken-Bruxelles, Belgium. Filed Feb. 20, 1902. Serial No. 95,541. (No model.)

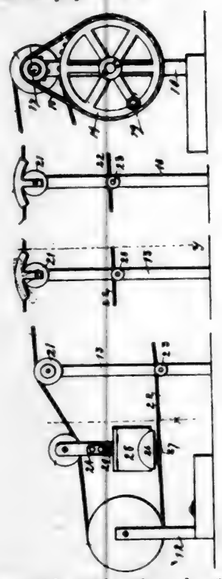
Claim.—1. A device for carrying packages comprising a plate provided at each extremity with opposite lateral extensions, one of each of said extensions at each end being slotted, and the transversely opposite extension being in the form of a hook, a handle secured to the plate, and ribbons provided with loop and hook end fixtures for engaging respectively the hooks and loops of the lateral extensions of the plate, substantially as described.

2. A device for carrying packages comprising a plate provided at each extremity with opposite lateral extensions, one of each of said extensions at each end being slotted, and the transversely opposite extension being in the form of a hook, a handle, chains connecting the handle and plate, and extensible ribbons provided with loop and hook end fixtures for engaging respectively the hooks and loops of the lateral extensions of the plate, substantially as described.

705,440. APPARATUS FOR CARRYING MAIL-MATTER. GEORGE S. POTTER, Dallas Center, Iowa. Filed Mar. 17, 1902. Serial No. 98,480. (No model.)

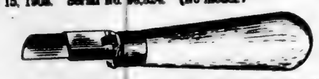
Claim.—1. In an apparatus for carrying mail-matter, a box holder and carrier consisting of a straight bar bent at right angles at its lower end to support a box placed thereon, a box-fastening device fixed to the bar to detachably fix the box in the angle of the bar and a pulley mounted at the top of the bar, and an endless cable or carrier, fixed to the bottom of the box-carrier, arranged and combined to operate in the manner set forth for the purposes stated.

2. In an apparatus for carrying mail-matter, a fixed post, a pulley mounted at the side of the top portion of the post, a trip device arched over the pulley and pivoted to the axle of the pulley and a roller mounted in the vertical plane of the pulley on a bearer fixed to a lower portion of the post to project horizontally for supporting an endless carrier in the manner set forth for the purposes stated.



3. An apparatus for carrying a box and mail-matter comprising a line of fixed posts, pulleys at their tops, rollers extending horizontally from their central portions, covers and trip devices pivoted over the pulleys, a fixed post at one end of the line, a roller mounted at its top, a fixed sprocket-wheel on the end of the axle of the roller, a larger sprocket-wheel mounted on a lower portion of the post, a chain on said sprocket-wheels, a fixed post at the other end of the line, a sheave mounted at the top of the post, a box-carrier having a pulley at its top and a box-support at its bottom, means for fastening a box to the box-carrier, a mail-box, a cable coiled around the roller and extended over the pulleys at the tops of the line of posts, under the pulley at the top of the box-carrier, over the rollers extending horizontally from the posts and fixed to the box-carrier, arranged and combined to operate in the manner set forth for the purposes stated.

705,441. KNIFE. NEWTON E. POTTER, Southbridge, Mass. Filed Mar. 15, 1902. Serial No. 98,324. (No model.)



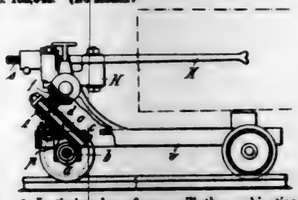
Claim.—1. A knife, comprising a handle, a blade fixed therein, a sheath for the blade, having an integral tubular extension mounted to slide in the said handle, a spring-catch for locking the sheath in position at the time the knife-blade is exposed, and a spring pressing the sheath, to move the same over the blade, for concealing the latter at the time the said spring-catch is unlocked, as set forth.

2. A knife, comprising a handle, a blade fixed therein, a sheath for the blade, having an integral tubular extension mounted to slide in the said handle, a spring-catch for locking the sheath in position at the time the knife-blade is exposed, a spring pressing the sheath, to move the same over the blade, for concealing the latter at the time the said spring-catch is unlocked, and a finger-piece on the sheath, located on the side opposite the one engaged by the said spring-catch, to allow the operator to press the finger-piece with one finger of the hand having hold of the handle, while the spring-catch is manipulated by another finger of the same hand, as set forth.

3. A knife, comprising a handle having a recess, a pin extending transversely through the recess, a tubular lining fitted in the said recess and held on the said pin, a sheath having a tubular extension mounted to slide in the said lining, a spring pressing the said sheath extension, and a spring-catch carried on the shank of the blade, adapted to engage the said sheath extension, to lock the latter in position against the tension of the spring, as set forth.

4. A knife, comprising a handle having a recess, a pin extending transversely through the recess, a tubular lining fitted in the said recess and held on the said pin, a sheath having a tubular extension mounted to slide in the said lining, a spring pressing the said sheath extension, a spring-catch carried on the shank of the blade, adapted to engage the said sheath extension, to lock the latter in position against the tension of the spring, the said spring-catch extending through an opening in the said sheath extension, and a finger-piece on the said sheath extension, located on the side opposite the one engaged by the said spring-catch, as set forth.

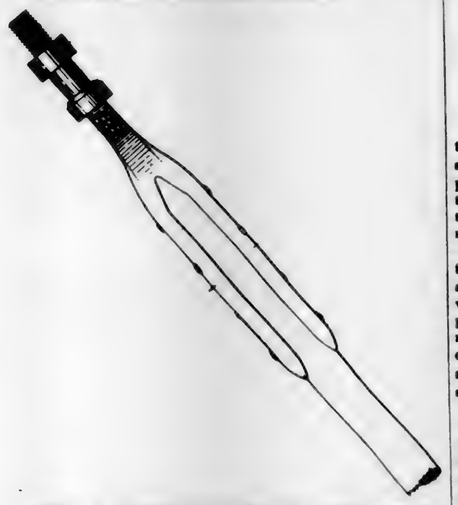
705,442. TIMBER-DRAG FOR SAWING CROOKED TIMBER. POSTEN M. GYARMERSTÄD, Stockholm, Sweden. Filed Apr. 12, 1902. Serial No. 103,643. (No model.)



Claim.—1. In timber-drags for sawmills the combination of a wheel-shaft *b* of the drag, provided with threads *a* gearing with a shaft *d*, a pinion *e* on said shaft *d*, and a toothed rack *f* engaging with said pinion and mounted on a sleeve H arranged to be shifted crosswise to the drag, said sleeve carrying the jaws K by means of which the root end of the timber is retained in place while sawing is going on.

2. In timber-drags for sawmills, the combination of a wheel-shaft *b* of the drag provided with threads *a* gearing with a shaft *d*, journaled in a holder *o*, movable on a horizontal pin *p* and acted upon by a spring *m* or similar device, a pinion *e* on said shaft *d*, and a toothed rack *f* engaging with said pinion and mounted on a sleeve H, arranged to be shifted crosswise to the drag, said sleeve carrying the jaws K, by means of which the root end of the timber is retained in place while the sawing is going on.

705,443. SUCKER-ROD STUB. ISAAC KALLSTON, New Bethlehem, Pa., assignor of one-half to Thomas Spillane, New Bethlehem, Pa. Filed Jan. 13, 1902. Serial No. 90,295. (No model.)

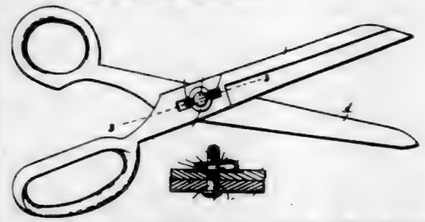


Claim.—1. A sucker-rod stub having a ring or collar portion with a cylindrical portion below it, and a squared wrench portion below the cylindrical portion; substantially as described.

2. A sucker-rod stub having two rings or collars with a substantially cylindrical portion between them and a squared wrench portion below the lower collar; substantially as described.

3. A sucker-rod stub having an upper screw-threaded portion with a collar at its lower end, a cylindrical portion, below the collar, another collar below the cylindrical portion, and a squared portion below the lower collar; substantially as described.

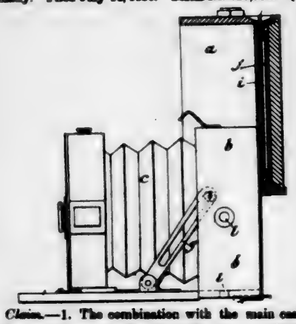
705,444. SHEARS. WILLIAM RICHARD, Bloomville, Ohio, assignor of one-half to Alvin S. Prouse, Bloomville, Ohio. Filed Apr. 1, 1902. Serial No. 100,986. (No model.)



Claim.—1. In a pair of shears, the combination with a pair of apertured blades, one of said blades having a groove thereon extending transversely the aperture therein, of a bolt passing through said aperture, said bolt having a slotted shank bearing a pawl, and a V-shaped spring bearing a rack and mounted to engage said pawl and said groove, substantially as described.

2. In a pair of shears, the combination with two apertured blades, of a bolt passing through said apertures, said bolt having a slotted shank bearing a pawl, and a V-shaped spring bearing a rack engaged by said pawl, substantially as described.

705,445. CAMERA. ALEXANDER H. RIETHMÜLL, Munich, Germany. Filed July 11, 1898. Serial No. 723,507. (No model.)



Claim.—1. The combination with the main casing having a rectangular central recess and end chambers to contain the film-rolls and a suitable frame and slide at the back of such recess in front of the back proper between which the film passes, of a supplemental casing carrying the focusing apparatus and means for holding such casing within the rectangular recess, so that the front face is flush with the front face of the main portion of the casing as and for the purpose specified.

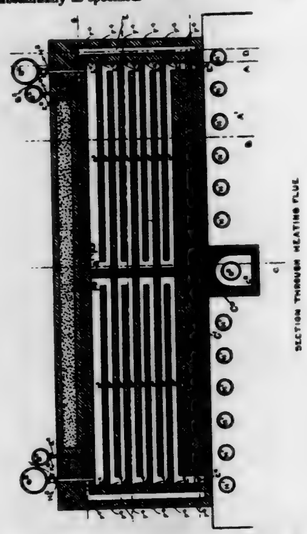
2. The combination with the main casing having a rectangular central recess and end chambers to contain the film-rolls and a suitable frame and slide at the back of such recess in front of the back proper, behind which the film passes, of a supplemental casing carrying the focusing apparatus, means for holding the casing to the back within the rectangular recess, and the bolt in the front casing or portion designed to fit into a corresponding socket or recess in the back of the main portion, so as to securely hold the parts from vertical displacement as and for the purpose specified.

3. The combination with the casing carrying the film-rolls, having a central recessed portion and grooves at the back of the recess, of a supplemental casing fitted to the recess, said supplemental portion carrying ribs adapted to interlock with said grooves, said ribs also providing guides adapted to receive a plate when the supplemental portion is used independently of the film-holding portion substantially as described.

705,446. COKE-OVEN. MATHEW B. ROTHERMEL, Lebanon, Pa. Filed Feb. 6, 1902. Serial No. 92,849. (No model.)

Claim.—1. In adjacent coking-ovens, a hollow longitudinal wall separating the oven-chambers, and longitudinal deflecting-partitions form-

ing heating or combustion flues in the cavity or chamber of said wall, and a vertical hot-air flue at the outer ends of said combustion-flues, the inner wall of which air-flue is pierced for passage of air to the combustion-flues, substantially as specified.



2. In adjacent coking-ovens, a hollow longitudinal wall, separating the oven-chambers, longitudinal deflecting-partitions forming heating or combustion flues in the cavity or chamber of said wall, said ovens having a chamber thereunder, and a series of transverse deflecting-partitions in said chamber forming reverting-flues leading to the draft-flue, and connecting with said longitudinal flues, substantially as specified.

3. In adjacent coking-ovens, a hollow longitudinal wall separating the oven-chambers, longitudinal deflecting-partitions forming heating or combustion flues in the cavity or chamber of said wall, a hot-air flue located above the oven, and communicating with a vertical flue at the end of the combustion-flues, said vertical flue having communication with the combustion-flues, and said hot-air flue connecting with a hot-air pipe located in the draft-flue, substantially as specified.

4. In adjacent coking-ovens, a hollow longitudinal wall separating the oven-chambers, longitudinal deflecting-partitions forming heating or combustion flues in the cavity or chamber of said wall, a hot-air flue located above the oven-chambers, and communicating with said combustion-flues, and with a hot-air pipe located in the draft-flue, substantially as specified.

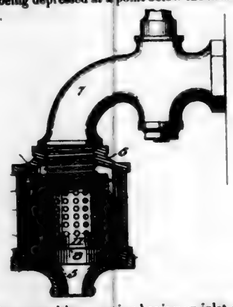
5. The adjacent coking-ovens, having the vertically-separated horizontal longitudinal flue-compartments between the oven-chambers, communicating with transverse flues underneath said chambers, the deflecting air-flue above the level of the oven-chambers, and vertical air-flues communicating with said deflecting air-flues and the horizontal flue-compartments, substantially as specified.

6. In a coking-oven, the combination with adjacent open-end coking-chambers, of a hollow intervening longitudinal wall, a vertical central transverse partition in said wall, horizontal longitudinal deflecting-flues in the compartments formed by said partition, transverse flues underneath the coking-chambers leading to the draft-flue, deflecting air-flues in the upper part of the structure, vertical air-flues in the front of the same, means of supplying fuel and air, and devices for regulating the supply of fuel and of air, and for regulating the draft, substantially as specified.

705,447. FILTER. WILLIAM H. SARGENT, Cambridge, Mass. Filed Oct. 2, 1901. Serial No. 77,206. (No model.)

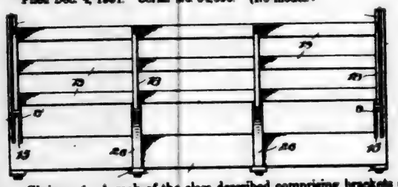
Claim.—1. A filter comprising an outer casing, a perforated filtering-chamber formed with annular grooves above and below its perforations, a fabric covering for said perforations, devices fitting said grooves for detachably securing the fabric in position, and an annular chemical-containing pocket formed by said fabric at one end thereof and arranged outside the filtering-chamber.

2. A filter comprising a casing having an inlet and an outlet, a perforated casing therein forming a filtering-chamber, a screen interposed between the outlets of the chamber and casing, filtering material supported upon said screen, a fabric covering for the perforated casing, a pocket formed thereby at one end and adapted to hold a chemical, said pocket being within the outer casing and outside the perforated casing, and means for detachably securing said fabric to the perforated casing, the upper end of said casing being depressed at a point below the inlet to the outer casing.



3. A filter comprising a casing having an inlet and an outlet, a perforated casing therein forming a filtering-chamber, a fabric covering for the perforated casing, a pocket formed thereby at one end and adapted to hold a chemical, said pocket being within the outer casing and outside the perforated casing, and means for detachably securing said fabric to the perforated casing, the upper end of said casing being depressed at a point below the inlet to the outer casing.

705,448. HAY AND STOCK RACK. CHARLES SCAFE, Burns, Wis. Filed Dec. 4, 1901. Serial No. 84,690. (No model.)



Claim.—1. A rack of the class described comprising brackets each including spaced members and a connecting attaching-leg, posts pivotally and slidably mounted between the members, for movement into and out of engagement with the sides, and connections between the posts.

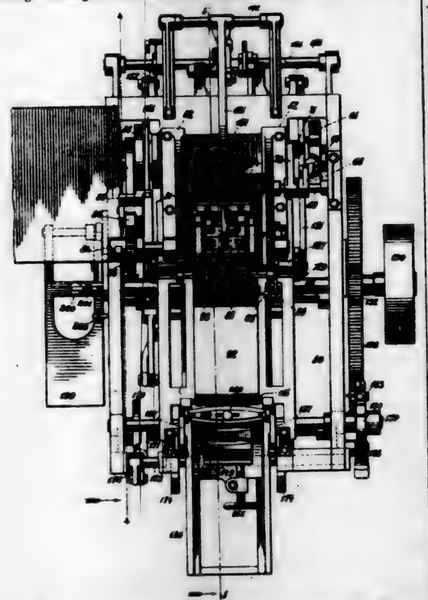
2. A rack of the class described comprising brackets and adjustable side members, each bracket comprising spaced members having a connecting attaching-leg and adapted to rest against the side of a wagon-body, and having stops connecting the members, each adjustable side member of the rack including posts pivotally mounted between the members of the brackets for movement into and out of engagement with the stops, and slidably mounted for movement into and out of engagement with the sides of the body.

3. A rack of the class described comprising brackets each including spaced arcuate members, an attaching-leg connecting the members and stops connecting the members, posts pivotally and slidably mounted between the members of the brackets, and connections between the posts at each side of the rack.

705,449. CIGAR-BUNCHING MACHINE. JULIUS H. SCHEIDT, Bayonne, N. J., assignor to William E. Sharpe, trustee, Philadelphia, Pa. Filed May 29, 1901. Serial No. 62,367. (No model.)

Claim.—1. In a cigar-machine, the bunch-rolling mechanism, the elevated hopper for filler-tobacco, and the charge-carrier below said hopper and having the pocket to receive a charge of filler-tobacco from said hopper for a bunch, said charge-carrier being adapted to be moved to carry said pocket from below said hopper and to a position to discharge the said charge of filler-tobacco, combined with means for actuating said charge-carrier, means for ejecting the charge of filler-tobacco therefrom when said pocket is moved from below said hoppor, the plunger for pressing the filler-tobacco into said pocket, and means operable from the driving-shaft for imparting to said plunger a plurality of movements against the filler-tobacco for pressing the charge of the same into said pocket; substantially as set forth.

2. In a cigar-machine, the bunch-rolling mechanism, the elevated hopper for filler-tobacco, and the charge-carrier below said hopper and having the pocket to receive a charge of filler-tobacco from said hopper for a bunch, said charge-carrier being adapted to be moved to carry said pocket from below said hopper and to a position to discharge the said charge of filler-tobacco, combined with means for actuating said charge-carrier, means for ejecting the charge of filler-tobacco therefrom when said pocket is moved from below said hopper, the plunger for pressing the filler-tobacco into said pocket, the springs for affording a yielding resistance to said plunger, agitators for acting upon the tobacco within said hopper, means operable from the driving-shaft for imparting motion to said agitators, and means operable from the driving-shaft for imparting to said plunger a plurality of movements against the filler-tobacco for pressing the charge of the same into said pocket; substantially as set forth.



3. In a cigar-machine, the bunch-rolling mechanism, the elevated hopper for filler-tobacco, and the charge-carrier below said hopper and having the pocket to receive a charge of filler-tobacco from said hopper for a bunch, said charge-carrier being adapted to be moved to carry said pocket from below said hopper and to a position to discharge the said charge of filler-tobacco, combined with means for actuating said charge-carrier, means for ejecting the charge of filler-tobacco therefrom when said pocket is moved from below said hopper, the plunger for pressing the filler-tobacco into said pocket, the slide 54 against the wall of said hopper and carrying the agitator-pins 55 for agitating the filler-tobacco within said hopper, and means operable from the driving-shaft for imparting vertical reciprocation to said slide, agitator-pins and plunger, whereby the filler-tobacco is prevented from packing and a proper charge therefor is pressed into said pocket by said plunger; substantially as set forth.

4. In a cigar-machine, the bunch-rolling mechanism, the elevated hopper for filler-tobacco, and the charge-carrier below said hopper and having the pocket to receive a charge of filler-tobacco from said hopper for a bunch, said charge-carrier being adapted to be moved to carry said pocket from below said hopper and to a position to discharge the said charge of filler-tobacco, combined with means for actuating said charge-carrier, means for ejecting the charge of filler-tobacco therefrom when said pocket is moved from below said hopper, the plunger for pressing the filler-tobacco into said pocket, and means operable from the driving-shaft for actuating said plunger to move against the filler-tobacco for pressing the charge of the same into said pocket, the mechanism being so timed that the said plunger will make a plurality of movements against the filler-tobacco and then remain in its lower position while said charge-carrier is moving to carry its said pocket from below said hopper to the point of discharging; substantially as set forth.

5. In a cigar-machine, the bunch-rolling mechanism, the elevated hopper for filler-tobacco, the oscillatory charge-carrier 53 below said hopper and having the pocket 57 to receive a charge of filler-tobacco for a bunch, the movable bottom 77 for said pocket 57, means for turning said charge-carrier to move said pocket from below said hopper to its discharging position, means for moving said bottom 77 to eject the charge of filler-tobacco when said carrier is turned to carry said pocket from below said hopper, and the wiper 73 for preventing an excess of tobacco from being moved outward by said charge-carrier, combined with the yielding plunger 56 within said hopper for pressing the filler-tobacco into said pocket, and means for operating said plunger; substantially as set forth.

6. In a cigar-machine, the bunch-rolling mechanism, the elevated hopper for filler-tobacco, the side brackets 52 sustaining said hopper above the bed-frame of the machine and having the cheek-pieces 74 below the lower end of said hopper, the oscillatory charge-carrier 53 mounted between said cheek-pieces and directly below the lower end of said hopper and having the pocket 57 to receive a charge of filler-tobacco for a bunch, the movable bottom 77 for said pocket, the plunger within the hopper for pressing the filler-tobacco into said pocket, and the wiper 73 for preventing an excess of tobacco from being carried from said hopper by said charge-carrier, combined with means for turning said charge-carrier to move said pocket 57 to its discharging position, and means for causing said bottom 77 to eject the charge of filler-tobacco from said pocket when the latter is in its discharging position; substantially as set forth.

7. In a cigar-machine, the bunch-rolling mechanism, the elevated hopper for filler-tobacco, the charge-carrier below said hopper and having the pocket to receive a charge of filler-tobacco from said hopper for a bunch, means for actuating said charge-carrier to move said pocket from below said hopper, and means for ejecting the charge of filler-tobacco from said pocket, combined with the receiver 83 for receiving the charge of filler-tobacco from said pocket and conveying the same to said bunch-rolling mechanism, means for moving said receiver 83 from its upper position where it receives the charge of filler-tobacco to its lower position where it delivers said charge to the rolling mechanism, and means for opening the lower end of said receiver for permitting the discharge of tobacco, said receiver having the converging front and rear walls, and the hinged door for permitting, when opened, the escape of filler-tobacco to the bunch-rolling mechanism; substantially as set forth.

8. In a cigar-machine, the bunch-rolling mechanism, the elevated hopper for filler-tobacco, the charge-carrier below said hopper and having the pocket to receive a charge of filler-tobacco from said hopper for a bunch, means for actuating said charge-carrier to move said pocket from below said hopper, and means for ejecting the charge of filler-tobacco from said pocket, combined with the receiver 83 for receiving the charge of filler-tobacco from said pocket and conveying the same to said bunch-rolling mechanism, means for moving said receiver 83 from its upper position where it receives the charge of filler-tobacco to its lower position where it delivers said charge to the rolling mechanism, and means for opening the lower end of said receiver for permitting the discharge of the tobacco therefrom, said receiver having the front and rear walls, the hinged door for permitting, when opened, the escape of the filler-tobacco to the bunch-rolling mechanism, and the spring for normally retaining said door in its closed position, the hinge for said door being about on a line with the upper edge of the rear wall of said receiver, and the front wall of said receiver extending above the horizontal plane of the rear wall thereof; substantially as set forth.

9. In a cigar-machine, the rolling-apron held at its opposite ends and normally slack, a bed supporting said apron and having a recess 90 below said apron, the roller 127 for coöperating with said apron in rolling the bunch, the elevated hopper for filler-tobacco, the charge-carrier below said hopper and having the pocket to receive a charge of the filler-tobacco from said hopper for a bunch, means for actuating said charge-carrier to move said pocket from below said hopper, and means for ejecting the charge of filler-tobacco from said pocket when the latter is in its discharging position, combined with the receiver 83 for receiving the charge of filler-tobacco from said pocket and conveying the same to said apron, means for moving said receiver from its upper position where it receives the charge of filler-tobacco to its lower position where it delivers said charge to said apron and then back to its upper position, the frame 100 carried by and projecting downward below the said receiver to precede the latter and form the pocket 93 by pushing the slack of the apron 92 into said recess 90, and means for opening the lower end of said receiver for permitting the escape of the tobacco into said pocket 93; substantially as set forth.

10. In a cigar-machine, the rolling-apron 92 held at its opposite ends and being normally slack so as to permit the formation therein of the pocket 93 to receive a charge of filler-tobacco, the bed-frame below said apron and having adjacent to one end of the latter the recess 90 through which the slack of the apron may be pressed to form said pocket, the roller 127 for coöperating with said apron in rolling the bunch, and means for reciprocating said roller, combined with the slide 137 in the rear of said recess 90, and means for moving said slide to close the pocket in the rolling-apron prior to the advance of said roller 127, and then withdrawing said slide to release said pocket when said roller 127 is in position with respect to said pocket to roll the bunch; substantially as set forth.

11. In a cigar-machine, the rolling-apron 92 held at its opposite ends and being normally slack so as to permit the formation therein of the pocket 93 to receive a charge of the filler-tobacco, the bed-frame below said apron and having adjacent to one end of the latter the recess 90 through which the slack of the apron may be pressed to form said pocket, the roller 127 for coöperating with said apron in rolling the bunch, and means for reciprocating said roller, combined with the slide-plate 137 mounted on said bed-frame in the rear of said recess 90 and having its upper surface about on the same horizontal plane with the upper surface of the bed supporting said apron, and means for moving said sliding plate 137 against the pocket in said apron to close said pocket against the rear edge of said bed in advance of the roller 127 and thereafter withdrawing said sliding plate 137 after said roller 127 has advanced sufficiently to effect the rolling of the bunch; substantially as set forth.

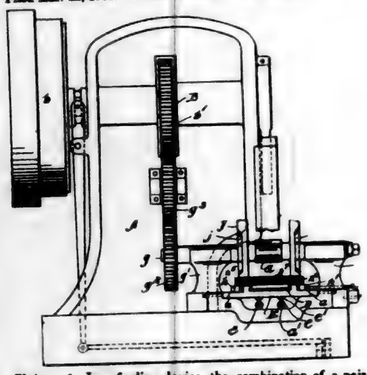
12. In a cigar-machine, the rolling-apron 92 held at its opposite ends and normally slack to permit of the formation of the pocket 93 therein to receive the charge of filler-tobacco for a bunch, the roller 127 for coöperating with said apron in rolling the bunch, and means for operating said roller, combined with the rolling-bed 125 below said apron and over which the bunch is rolled, said rolling-bed 125 being of thin sheet-steel yieldingly held at its opposite edges, whereby said bed 125 is enabled to yield to a limited extent under the pressure of the bunch being rolled; substantially as set forth.

13. In a cigar-machine, the bunch-rolling mechanism, the funnel 145 at the front end of the rolling-bed to receive the bunch from said rolling mechanism, the tramway-frame 150 below said rolling-bed and being pivotally secured at its rear end, the cams 174 engaging said frame 150 and supporting the same at its front end, means operable from the driving-shaft for actuating said cams 174 to elevate the front portion of said frame 150 at the proper time, the sliding frame 149 resting upon and guided by said frame 150, the mold-board 148 detachably secured upon said sliding frame 149, the rack 176 loosely connected with said frame 149, the pinion 178 in engagement with said rack, and means operable from the said driving-shaft for imparting through said pinion and rack an intermittent or step-by-step movement to said frame 149 and mold-board 148 upon said tramway-frame 150, combined with the plunger 146 for pressing the rolled bunch through said funnel 145 and into one of the molds of said mold-board 148, and means operable from the driving-shaft for moving said plunger 146 downward through said funnel and then back to its upward position, the timing of the mechanism being such that said tramway-frame 150 will elevate the mold-board 148 to the lower end of said funnel at the proper period to receive the bunch pressed through said funnel by means of said plunger; substantially as set forth.

14. In a cigar-machine, the bunch-rolling mechanism, the funnel 145 at the front end of the rolling-bed to receive the bunch from said rolling mechanism, the tramway-frame 150 below said rolling-bed and being pivotally secured at its rear end, the cams engaging and supporting said frame 150 at its front end, means operable from the driving-shaft for actuating said cams to elevate the front portion of said frame 150 at the proper time, the sliding frame 149 resting upon and guided by said frame 150, the mold-board 148 detachably secured upon said sliding frame 149, the rack 176 loosely connected with said frame 149, the pinion 178 in engagement with said rack, the strap 180 passing over the upper edge of said rack 176 and holding said rack in fixed relation to said pinion 178, and means operable from the driving-shaft for imparting through said pinion and rack an intermittent or step-by-step movement to said frame 149 and mold-board 148 upon said tramway 150, combined with the plunger 146 for pressing the rolled bunch through said funnel 145 and into one of the molds of said mold-board 148 and means operable from the driving-shaft for moving said plunger 146 downward through said funnel and then back to its upward position, the timing of the mechanism being such that said tramway-frame 150 will elevate the mold-board 148 to the lower end of said funnel at the proper period to receive the bunch pressed through said funnel by means of said plunger, substantially as set forth.

15. In a cigar-machine, the bunch-rolling mechanism, the funnel 145 at the front end of the rolling-bed to receive the bunch from said rolling mechanism, the tramway-frame 150 below said rolling-bed and pivotally secured at its rear end, the cams engaging and supporting said frame 150 at its front end, means operable from the driving-shaft for actuating said cams to elevate the front portion of said frame 150 at the proper time, the sliding frame 149 resting upon and guided by said frame 150 and having the raised rear end 167 and front clamping-screw 168, the mold-board 148 detachably secured upon said sliding frame 149 by means of the said screw 168, the rack 176 loosely connected with said sliding frame 149, the pinion 178 in engagement with said rack, and means operable from the driving-shaft for imparting through said pinion and rack an intermittent or step-by-step movement to said frame 149 and mold-board 148 upon said tramway-frame 150, combined with the plunger 146 for pressing the rolled bunch through said funnel 145 and into one of the molds of said board 148, and means operable from the driving-shaft for moving said plunger 146 downward through said funnel and then back to its upward position, the timing of the mechanism being such that said tramway-frame 150 will elevate the mold-board 148 to the lower end of said funnel at the proper period to receive the bunch pressed through said funnel by means of said plunger, substantially as set forth.

705,450. NAIL-MACHINE. EMERICH SCHWARZ, Chicago, Ill. Filed Mar. 22, 1902. Serial No. 99,547. (No model.)



Claim.—1. In a feeding device, the combination of a pair of pivoted levers, stock-gripping jaws at the ends of said levers, means for operating said levers to cause the jaws to engage the stock, a spring holding the jaws normally disengaged, a carriage upon which said levers are pivoted and means for reciprocating said carriage.

2. In a stock-feeding device, the combination of a reciprocating carriage, levers pivoted to said carriage provided with adjustable stock-gripping jaws at one end, rollers on said levers, a pair of cams mounted on a revoluble shaft and adapted to engage said rollers, and means for reciprocating said carriage.

3. In a stock-feeding device, the combination of a reciprocating carriage, a spring tending to hold said carriage in a normally retracted position, standards on said carriage carrying a roller, a cam mounted on a revoluble shaft held in relatively fixed bearings and adapted to engage said roller to move the carriage forward, and stock-gripping mechanism on said carriage.

4. In a feeding device the combination of a frame, a reciprocating carriage mounted in said frame, a spring holding said carriage in a normally retracted position, a pair of levers pivoted on said frame, adjustable stock-gripping jaws on said levers, rollers on said levers, a spring connecting the ends of said levers, standards on said carriage carrying a roller, a shaft mounted over said carriage in bearings on said frame, a pair of cams on said shaft engaging the rollers on said levers, a third cam on said shaft engaging said roller on the reciprocating frame, means for turning said shaft, and a spring-pressed clamp forward of said feeding apparatus adapted to engage the stock substantially as described.

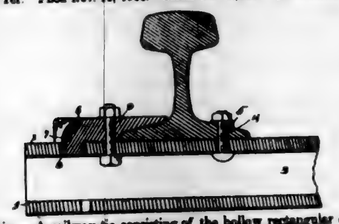
705,451. WRENCH-HANDLE. EDWARD H. SEARS, Collinsville, Conn., assignor to the Collins Co., Collinsville, Conn., a Corporation of Connecticut. Filed May 9, 1902. Serial No. 106,568. (No model.)

Claim.—1. In combination, the non-metallic handle interiorly larger than the shank, the shank inserted through the handle, the collars on the shank at the two ends of the handle, and the soft metal or other material making contact with the exterior of the shank and the interior of the handle.

2. In combination, the hollow wooden handle interiorly non-cylindrical, the non-cylindrical shank inserted through the handle, and the soft metal or other material making contact with the exterior of the shank and the interior of the handle.

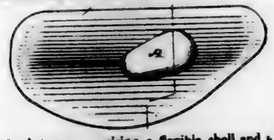
3. In combination, the shank having flattened sides, the ferrule-collar on the shank embracing the upper end of the handle, the nut-collar on the shank centering the lower end of the handle, the interiorly-grooved handle, and the soft metal or other material making contact with the exterior of the shank and the interior of the handle.

705,452. METALLIC RAILWAY-TIE. STEPHEN A. SHARUM, Bob, Ind. Ter. Filed Nov. 19, 1901. Serial No. 82,941. (No model.)



Claim.—A railway-tie consisting of the hollow rectangular casting having the bottom 1, and the parallel top 2 connected to the bottom by means of the integral vertical sides 3, 3, said casting being open at the ends; the clamp 6, having an integral tongue 7 which projects into an opening in the top 2; and a bolt inserted through said top and through the lower flange of the rail; a bolt inserted through said top and through said clamp, substantially as specified.

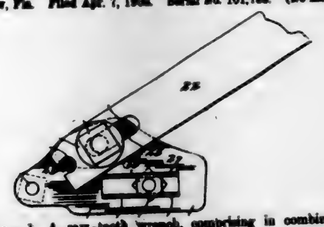
705,453. HERNIAL TRUSS. JOHN H. SHERMAN, Beaverdam, Wis. Filed Mar. 18, 1902. Serial No. 98,581. (No model.)



Claim.—1. A truss comprising a flexible shell and a knob within the shell, this shell being adhesive under atmospheric pressure when moistened upon its inner face and pressed against the body of a ruptured person to expel air from between the two.

2. A truss comprising a flexible shell and a knob therein of molded and vulcanized rubber material in one piece, the device as a whole being outwardly convex and having the shell portion thereof inwardly concave.

705,454. SAW-TOOTH WRENCH. GEORGE H. SHELLABERGER, Barlow, Fla. Filed Apr. 7, 1902. Serial No. 101,789. (No model.)



Claim.—1. A saw-tooth wrench, comprising in combination a wrench-head provided with a plurality of tooth-engaging devices thereon, and an operating-arm connected with said head and removably engaging one of said tooth-engaging devices on the opposite side of the tooth, substantially as described.

2. A saw-tooth wrench, comprising in combination a wrench-head provided with a pair of tooth-engaging devices at longitudinally-separated points thereon, and an operating-arm connected with said head and removably engaging one of said tooth-engaging devices on the opposite side of the tooth, substantially as described.

3. A saw-tooth wrench, comprising in combination a wrench-head provided with a pair of tooth-engaging devices at longitudinally-separated points thereon, and an operating-arm slidably secured to said head and removably engaging one of said tooth-engaging devices on the opposite side of the tooth, substantially as described.

4. A saw-tooth wrench, comprising in combination a wrench-head provided with a pair of tooth-engaging devices at longitudinally-separated points thereon, one of which is adjustable, and an operating-arm slidably secured to said head and removably engaging one of said tooth-engaging devices on the opposite side of the tooth, substantially as described.

5. A saw-tooth wrench, comprising in combination a wrench-head provided with a pair of laterally-extending tooth-engaging pins at longitudinally-separated points thereon, the foremost of which is fixed and the rearmost of which is adjustable, and an operating-arm slidably secured to said head and adapted to removably engage the foremost of said pins on the opposite side of the tooth, substantially as described.

6. A saw-tooth wrench, comprising in combination a wrench-head provided with a pair of laterally-extending tooth-engaging pins at longitudinally-separated points thereon, and an operating-arm slidably secured to said head and provided with a notch adapted to removably engage one of said tooth-engaging pins on the opposite side of the tooth, substantially as described.

7. A saw-tooth wrench, comprising in combination a wrench-head provided with a pair of laterally-extending tooth-engaging pins at longitudinally-separated points thereon, and an operating-arm slidably secured to said head and provided in its forward end with a notch adapted to removably engage the foremost of said tooth-engaging pins on the opposite side of the tooth, substantially as described.

8. A saw-tooth wrench, comprising in combination a wrench-head provided with a pair of laterally-extending tooth-engaging pins at longitudinally-separated points thereon, the foremost of which is fixed and the rearmost of which is adjustable, and further provided with a third laterally-extending pin located above and between said tooth-engaging pins, and a slotted operating-arm mounted on said last-named pin and provided in its forward end with a notch adapted to removably engage the foremost of said tooth-engaging pins on the opposite side of the tooth, substantially as described.

705,455. CLOSURE AND FEEDER FOR BAGS. CHARLES R. SIEGEL, St. Louis, Mo., assignor to the Peerless Pouch Company, a Corporation of Delaware. Filed Mar. 19, 1902. Serial No. 98,912. (No model.)

Claim.—1. A bag having a spring closure device and holding-pockets formed in the bag which serve to firmly hold the ends of said spring-closure in place without auxiliary securing means, substantially as described.

2. A bag having a closure device for the mouth thereof, a pocket formed in the bag at each end of the mouth, said bag having a contracted portion below said pockets, substantially as described.

3. A bag having a closure device for the mouth thereof, and having portions, projecting inwardly above and below the closure device and flaps extending along the mouth, the flaps of the bag and said projecting portions forming pockets to receive the ends of the closure device, substantially as described.

4. A bag having a closure-spring for the mouth thereof, and having a contracted neck below the mouth, said bag having means to surround and embrace the ends of said spring above said contracted neck, said means consisting of the turned-in joined edges of the bag and joined flaps extending along the mouth, between which edges and flaps each end of the spring is confined, whereby said spring is held by the formation of said bag independent of other means of fastening, substantially as described.

5. A bag having a closure-spring and having a contracted neck and pockets in which the ends of the spring are held, and means to protect the bag against chafing from the edge of the spring, substantially as described.

6. A bag having a closure-spring and ears forming pockets for the ends of the spring and protecting-flaps extending from said ears along the edge of said spring, substantially as described.

7. A bag having a closure-spring for the mouth thereof and having a contracted neck below the mouth, and means to hold the ends of said spring in said bag above said contracted neck, substantially as described.

705,456. IRIDESCENT COATING OF COPPER, BRONZE, OR LIKE SURFACES. DUNCAN SINCLAIR, Coalbrookdale, England. Filed Dec. 31, 1900. Serial No. 41,649. (No specimens.)

Claim.—1. As a new article of manufacture, an article having a metallic surface of copper, bronze or brass, coated with an iridescent layer of oxid of lead containing copper, substantially as described.

2. As a new article of manufacture, an article of metal having an

electrodeposited film of copper deposited thereon and an iridescent coating over this consisting of oxygen, lead and copper.

3. As a new article of manufacture, a metallic surface coated with an iridescent coating of oxid of lead and copper of different thicknesses in different parts arranged in a pattern, substantially as described.

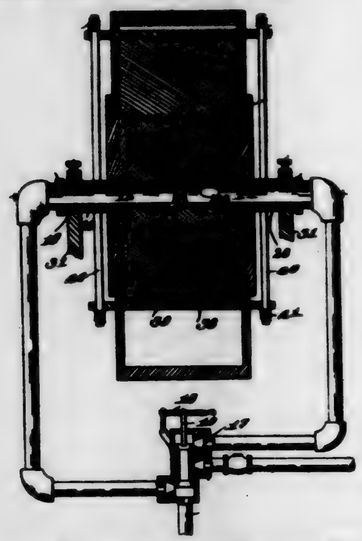
4. The process of coating articles having a surface of copper or of its alloys which consists in thoroughly cleaning the surface, immersing it in an electrolytic tank containing alkali, bleaching and water, and covering certain portions of the plate with a varnish resist during portions of the period of immersion, afterward removing the resist and polishing, whereby a variegated iridescent pattern is formed on the surface.

5. The process of coating articles having a surface of copper or its alloys which consists in thoroughly cleaning the surface, immersing it in an electrolytic tank containing alkali, oxid of lead, water and a little electropapering solution, and passing an electric current through, and then quickly drying and heating, substantially as described.

6. The process of coating articles having a surface of copper or its alloys, which consists in thoroughly cleaning the surface, immersing it in an electrolytic tank containing alkali, oxid of lead, water, and electropapering solution, passing an electric current through, and during part of the time preceding these parts of the surface with a resist of varnish, drying and rapidly heating, substantially as described.

7. In a process for coating articles with an iridescent coating by electrolysis, exposing the article at the anode in the solution to an electric current, and during portions of the time during which the article is so exposed, covering portions of the pattern with a varnish resist not acted upon by the solution whereby the depth of coating, and consequently the color is varied according to the time that the various parts have been exposed unprotected in the solution to the current.

705,457. ROTARY ENGINE. Gust. J. Stowell, Edgerville, Wis. Filed Mar. 20, 1902. Serial No. 98,311. (No model.)

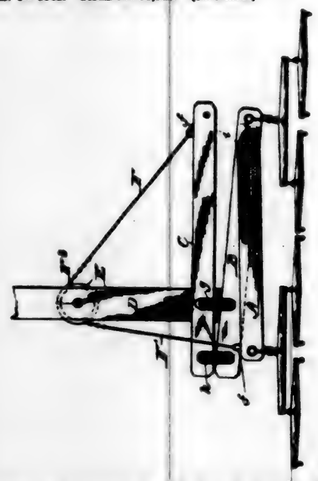


Claim.—1. A motor having a cylinder, a drum in said cylinder, and the periphery of the drum being in contact with the inner surface of the cylinder, and the drum having ports in communication with the interior of the cylinder, pistons adapted to project through slots in the cylinder, cross-bars connected with the pistons and having their outer ends perforated, rods passing through the perforations of said cross-bars, and springs carried by the rods and bearing against the cross-bars.

2. A motor of the class described having a cylinder, a drum in said cylinder and the periphery of the drum being in contact with the inner surface of the cylinder, a stationary shaft passing through said drum and having independent compartments, ports arranged in series and the respective series communicating with said compartments, bushings fitted in the ends of the cylinder and surrounding said shaft, pistons extending through slots in the periphery of the cylinder, a fly-wheel surrounding the piston and having guides for said pistons and means for holding the inner ends of the pistons in contact with the periphery of said drum.

3. A motor of the class described having a cylinder, a drum in said cylinder and the periphery of the drum being in contact with the inner surface of the cylinder, a fixed shaft passing through the drum and having independent compartments, ports arranged in series and the respective series being in communication with the said compartments, bushings fitted in the ends of the cylinder and surrounding said shaft, a two-part fly-wheel surrounding the cylinder and provided with ribs mating with each other and having guideways, pistons slidable in said guideways and adapted to project through slots in the cylinder and means rotative with the fly-wheel for holding the inner ends of the pistons in contact with the periphery of the drum.

705,458. DRAFT-EVENER. Milton W. Sleight, Denton, Tex., assignor of one-half to Joseph D. Moore, Matagorda county, Tex. Filed Mar. 15, 1902. Serial No. 98,315. (No model.)



Claim.—1. In combination with the subtongue D, pulley E, journaled to the lower face of said subtongue; lever C, bolted to said tongue, near its right-hand end; lever B, hinged to the right-hand end of said lever C, and also bolted to said subtongue D; lever A, having one end bolted near the left-hand end of lever B; clevises *f*, one secured to the left-hand end of lever C, and the other to the right-hand end of lever A; a chain F^2, passing around pulley E; a rod F, having one end secured to the clevis *f*, secured to the beam C, and the other to one end of the chain F^2; a rod F', having one end secured to the clevis *f*, secured to the right-hand end of lever A, and its other end to the chain F^2, substantially as shown and described and for the purposes set forth.

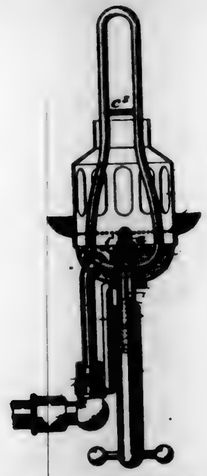
2. In combination with the subtongue D, pulley E, journaled to the lower face of said subtongue; lever C, bolted to said tongue, near its right-hand end; lever B, hinged to the right-hand end of said lever C, and also bolted to said subtongue D; lever A, having one end bolted near the left-hand end of lever B; clevises *f*, one secured to the left-hand end of lever C, and the other to the right-hand end of lever A; a chain F^2, passing around pulley E; a rod F, having one end secured to the clevis *f*, secured to the beam C, and the other to one end of the chain F^2; a rod F', having one end secured to the clevis *f*, secured to the right-hand end of lever A, and its other to the other end of the chain F^2; doubletrees, one secured to the right-hand end of lever A, and the other to the left-hand end of lever B, substantially as shown and described and for the purposes set forth.

705,459. VAPOR-BURNER. Walter J. Shaft, Orange, N. J. Filed Jan. 16, 1900. Serial No. 702,276. (No model.)

Claim.—1. The combination of a vaporizer, a valve for regulating the discharge therefrom, a shell or casing disposed exteriorly of the vaporizer and provided with openings for the admission of air, means for delivering a liquid hydrocarbon to the vaporizer, a gas-inlet tube communicating with the interior space of the shell or casing, and an independent support for attaching the parts to a gas-outlet.

2. The combination of a vaporizer, a shell or casing surrounding the same and having openings for the admission of air, a cup for absorbent material open to the interior of the shell, and a receptacle exterior to the shell and communicating with the cup.

3. The combination of a vaporizer, a shell or casing surrounding the same and having openings for the admission of air, a cup for absorbent material open to the interior of the shell, a receptacle exterior to the shell and communicating with the cup, and a support for attaching the parts in place.



4. A vaporizer flattened in form and provided with a succession of channels intermediate its inlet and outlet openings, each of said intermediate channels communicating at its ends with the adjacent channel on one side and at a point between its ends with the adjacent channel on the other side.

5. A vaporizer comprising an inlet and an outlet tube, in combination with a connecting part, flattened or disk-like in form, and provided with a succession of channels intermediate its inlet and outlet openings, each of said intermediate channels communicating at its ends with the adjacent channel on one side and at a point between its ends with the adjacent channel on the other side.

6. The combination of a vaporizer, a shell or casing within which the vaporizer is located and which is provided with openings for the admission of air and has its outlet-passage restricted, means for delivering a liquid hydrocarbon to the vaporizer, a gas-inlet tube communicating with the interior space of said apron or shell and an independent support for attaching the parts in place.

7. The combination with a vaporizer flattened in form and provided between the inlet and outlet openings with a succession of channels connected with each other alternately at their end and middle portions, of a shell or casing within which the vaporizer is located and which is provided with openings for the admission of air and means for delivering a liquid hydrocarbon to the vaporizer.

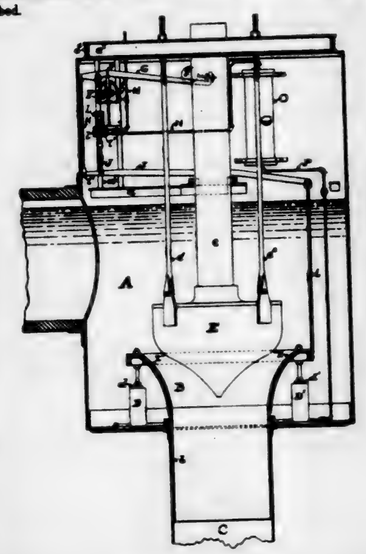
705,460. AUTOMATIC REGULATOR FOR HYDRAULIC AIR-COMPRESSORS. Charles M. W. Smith, Cambridge, Mass. Filed Mar. 20, 1901. Serial No. 52,099. (No model.)

Claim.—1. In a hydraulic air-compressor, a regulating device consisting of a constantly-loaded movable part, actuated by air-pressure from the main reservoir thereof, operatively connected by links and levers to a controlling-valve, alternately admitting and allowing the escape of pressure to and from plungers operatively connected to means for varying the area of the water-inlet passage thereby controlling the quantity of water admitted into the compressor, substantially as described.

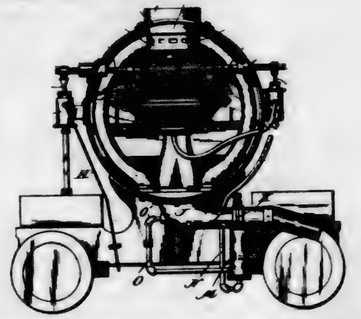
2. In a hydraulic air-compressor, a regulating device consisting of a constantly-loaded movable part actuated by air-pressure from the main reservoir thereof, operatively connected by links and levers to a controlling-valve, alternately admitting and allowing the escape of pressure to and from plungers operatively connected to an adjustable throat-piece for controlling the amount of water admitted into the compressor, by varying the area of the water-inlet passage thereof, substantially as described.

3. In a hydraulic air-compressor, a regulating device consisting of a constantly-loaded movable part under pressure from the main reservoir thereof, operatively connected to a controlling-valve, controlling the pressure in a secondary reservoir containing a non-compressible liquid, which in turn operates plungers operatively connected to means for varying the area of the water-inlet passage, substantially as described.

4. In a hydraulic air-compressor, a regulating device consisting of a constantly-loaded movable part under pressure from the main reservoir thereof operatively connected to a controlling-valve controlling the pressure in a secondary reservoir containing a non-compressible liquid, which in turn operates plungers operatively connected to means for varying the area of the water-inlet passage, also causing the controlling mechanism to come to a state of rest under a constant pressure, substantially as described.



705,461. SPARK ARRESTING AND DISCHARGING DEVICE. Edward J. Smith, High Springs, Fla. Filed May 1, 1902. Serial No. 105,503. (No model.)



Claim.—1. The combination substantially as herein described of the smoke-box, the stack-saddle and the cylindrical flange depending within the smoke-box, the spark-arresting screen or cage operating in the smoke-box and provided at its upper end with the cylindrical cap operating in the flange of the stack-saddle and provided with slots which may be adjusted into and below the cylindrical flange, and means for operating the screen or cage into the closed position and to permit it to drop to open position substantially as and for the purposes set forth.

2. A spark-arresting screen or cage for locomotives provided at its upper end with a cylindrical cap having numerous slots and a cylindrical flange in which said cap operates and means whereby the screen or cage may be raised and lowered, substantially as set forth.

3. The combination with the locomotive smoke-box of the spark-discharging tube connected therewith, a valve in said tube, a steam-pipe for discharging the sparks from said tube when the valve is opened, and steam-operated means for opening the valve and for permitting the passage of pressure to the spark-discharging steam-pipe, substantially as set forth.

4. The combination of the smoke-box, the spark-discharging tube leading therefrom, a valve in said tube, a cylinder having the piston-rod and devices whereby the movements of said rod operate the valve or gate, a pressure-pipe leading to said cylinder for operating its piston, and a pipe leading from said cylinder to the spark-discharging tube and arranged to be opened to the pressure after the valve has been opened by the travel of the piston in said cylinder substantially as and for the purposes set forth.

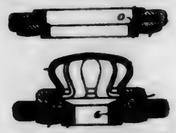
5. The combination of the smoke-box, the pipe I, the valve K, the lever connected with said valve, the cylinder M, the supply-pipe N leading to the lower end of said cylinder, the pipe O leading from said cylinder above its lower end, and the piston-rod extending from said cylinder and connected with the lever for operating the valve K, substantially as and for the purposes set forth.

705,462. FERTILIZER AND METHOD OF MAKING SAME. GEORGE H. SMITH, New York, N. Y. Filed Dec. 16, 1901. Serial No. 86,072. (No specimens.)

Claim.—1. The process of making fertilizer, consisting in mixing night-soil, phenol, calcium carbonate and alumina silicate in about the proportions specified, then slowly drying the mixture by air-exposure and then grinding the same to a fine powder, substantially as described.

2. A fertilizer consisting of dried and ground night-soil, phenol, calcium carbonate and alumina silicate in about the proportions specified.

705,468. PLACKET-FASTENER. JOSEPH R. SMITH, Waterbury Conn., assignor to the Waterbury Button Company, Waterbury, Conn. a Corporation. Filed Mar. 8, 1902. Serial No. 97,394. (No model.)



Claim.—1. In a placket-fastener, the combination with the stud or socket members thereof, of a non-metallic flange projecting beyond the edge thereof, substantially as described.

2. In a placket-fastener, the combination with the stud and socket members, of a fabric disk secured thereto, the edges of the disk inclosed within the parts of the respective members, substantially as described.

3. In a placket-fastener, the combination with the stud member comprising an eyelet member and a washer, a socket member also comprising an eyelet member and a washer, of fabric disks having their edges secured between the eyelet members and said washers and so as to project beyond said washers forming a non-metallic flange therefor, substantially as described.

705,464. WOVEN FABRIC. WILLIAM T. SMITH, Philadelphia, Pa. Filed Feb. 17, 1902. Serial No. 94,403. (No specimens.)

Claim.—1. A woven fabric in which are combined party-colored chenille face weft-threads, back weft-threads of mottled or variegated spun yarn, and binder warp-threads tying together the face and back weft-threads, portions of the party-colored chenille face weft-threads projecting between the back weft-threads so as to produce, upon the back of the fabric, a pattern composed in part of those projecting portions of the party-colored chenille face weft-threads and in part of the mottled or variegated yarn constituting the back weft-threads, substantially as specified.

2. A woven fabric in which are combined party-colored chenille face weft-threads, back weft-threads of mottled or variegated yarn, stuffer warp-threads separating the face and back weft-threads, and binder warp-threads tying together the face and back weft-threads, portions of the party-colored chenille face weft-threads projecting between the back weft-threads so as to produce upon the back of the fabric a pattern composed in part of those projecting portions of the party-colored chenille face-threads and in part of the mottled or variegated yarn constituting the back weft-threads, substantially as specified.

705,465. LOG-RELEASING DEVICE FOR BOOMS. ERNEST W. SPENCER, Portland, Oreg. Filed Feb. 24, 1902. Serial No. 96,204. (No model.)

Claim.—1. In a device for unloading logs, a suitable base, inclined trusses mounted on said base, chock-blocks movably held on and adjacent to the outer end of said trusses, cables or equivalent means secured at one end to the chock-blocks and detachably held at the other end to releasing mechanism, and means for operating said releasing mechanism.

2. In a device for unloading logs, a suitable base transverse double-inclined trusses mounted on said base, a longitudinal shaft mounted on said base, chock-blocks movably held on said trusses adjacent to ends thereof, and intermediate releasing mechanism between the shaft and the chock-blocks.

3. In a device for unloading logs, the combination with a base, of inclined log-supports, chock-blocks movably held adjacent to the ends of said log-support, a longitudinal shaft mounted on the said base, releasing mechanism secured to said shaft, cables or equivalent means connected to said chock-blocks and to said releasing mechanism, and means for longitudinally moving said shaft whereby the releasing mechanism is unlocked, to release the cable and allow the chock-blocks to move over and beyond the ends of the inclined log-supports.

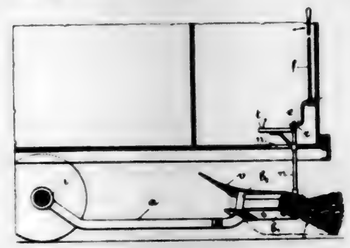
4. In a device for unloading logs, the combination with a base, of inclined log-supports or trusses, a longitudinal shaft suitably mounted on said base, and screw-threaded at its ends, keepers secured to the said shaft, pivoted bolts secured to the base, chock-blocks movably held on and adjacent to the ends of the inclined trusses, cables or equivalent means secured to the chock-blocks at one end and engaging the pivoted bolts at the other end, and an internally-threaded hand wheel or nut mounted on the threaded ends of the shaft and adapted to have a bearing against the base, whereby when the said hand wheel or nut is rotated the shaft is longitudinally moved carrying the keeper out of locking engagement with the said swinging bolts, releasing the cable and allowing the chock-blocks to be moved outwardly over the ends of the inclined log-supports or trusses by the weight of the logs bearing against the said chock-blocks.

5. In a device for unloading logs, the combination with a suitable base, of inclined trusses, a longitudinal shaft held in bearings on said base and in said base, and threaded at each end, main keepers having openings therein and secured to said shaft, auxiliary keepers loosely mounted on said shaft and provided with holes, pivoted bolts secured to the base between the said main keepers and auxiliary keepers, a projection or boss on the end of said bolt adjacent to the auxiliary keeper, and in alinement with main portion of the said bolts, the said projection or boss adapted to engage the opening in the auxiliary keepers, chock-blocks movably held on and adjacent to the ends of the inclined trusses, cables or equivalent means pivotally secured at one end to the chock-blocks, and at the other end engaging loosely with the pivoted bolt, hand wheels or nuts engaging the threaded ends of the shaft and adapted to have a face bearing against the end bearings supporting the shaft, whereby when the said hand-wheels are screwed up against the end shaft-bearings, the shaft is caused to be moved longitudinally and carry the main keepers out of engagement with the pivoted bolts permitting them to swing and release one end of the cable and allow the chock-blocks to be moved outwardly over the ends of the inclined trusses by the weight of the logs against them.

6. In a device for unloading logs, the combination of a base, double-inclined trusses mounted thereon, a longitudinal shaft, suitably mounted on said base, and threaded at each end, bearings secured at each end of said base and supporting said shaft, main keepers secured to the shaft at suitable intervals having side extensions provided with openings, longitudinal pins secured to said main keepers between the shaft and the openings in said main keepers, auxiliary keepers mounted to slide on said shaft and separated from the main keepers by the pins secured to said main keepers, and having side extensions provided with holes in alinement with the holes of the main keepers, bolts pivotally secured to the base opposite the holes in the main and auxiliary keepers, and consisting of a main portion and a projection or boss, chock-blocks movably mounted on and adjacent to the ends of the inclined trusses, cables or equivalent means pivotally secured at one end to the chock-blocks and provided with an eye at the other end adapted to engage the pivoted bolts, a stop interposed between the ends of the cable through which said cable is adapted to pass, and internally-threaded hand wheels or nuts engaging the threaded ends of the shaft, having a face bearing against the end shaft-bearings, whereby when the said hand-wheels are alternately screwed up against the said end bearings the shaft is caused to move longitudinally and cause the main keepers to release or lock all of the pivoted bolts simultaneously.

7. In a device for unloading logs, a suitable base, inclined trusses mounted on said base, chock-blocks movably held on and adjacent to the outer end of said trusses, cables, or equivalent means pivotally secured at one end to the chock-blocks, and detachably held at the other end to releasing mechanism, means for operating the releasing mechanism, and a ledge or shelf secured to the sides of the base below the lower end of the inclined trusses, whereby when the chock-blocks are released and turn over the ends of the trusses they rest upon the said ledges or shelves and form a continuation of the said inclined trusses.

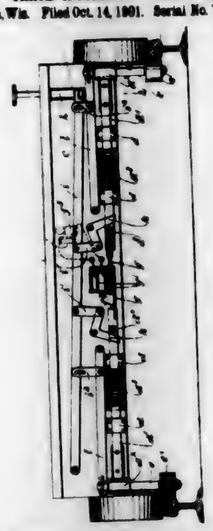
705,466. STREET-CAR FENDER. OTTO SPILLER-SPITZER, Brunnersdorf, near Kaaden, Austria-Hungary. Filed Apr. 5, 1902. Serial No. 101,555. (No model.)



Claim.—1. In a street-car fender, the combination of a frame, pivotally suspended with its rear end below the car-body, angular or curved clamping-jaws forming the front end of the said frame, bunches of twigs clamped between the said jaws, and means for temporarily suspending the front end of the said frame, substantially as and for the purpose set forth.

2. In a street-car fender, the combination of a frame pivoted at the rear end to the car, clamping-jaws forming the front part of the said frame, bunches of twigs clamped between the said jaws, a rod secured to the upper jaw and extending through an aperture in the car-bottom, a foot-rest pivoted to the upper slotted end of the said rod, a double-armed lever fulcrumed at the car-wall and adapted to temporarily engage the slotted end of the said rod, and a net back of the said brushes, the parts being constructed, arranged and working substantially as and for the purpose specified.

705,467. TRACK-INDICATOR. STEPHEN A. STARGE, Hutchins, near Mattoon, Wis. Filed Oct. 14, 1901. Serial No. 78,580. (No model.)



Claim.—1. The combination of members adapted to engage the track-trails, means pressing each of said members into active position, extensions connected with said members, the extensions being crossed and projected past each other, contact devices carried on the ends of the extensions and engaged together by a spreading movement of said yielding members, and an electrical indicating device controlled by the contact device.

2. The combination of a slidable member, an axle slidable therein and carried thereby, a wheel on the axle, means for simultaneously sliding the said slidable member and the axle, and an indicating device actuated from the said sliding member.

3. The combination of a slidable member, an axle slidable transversely therein and carried thereby, a wheel on the axle, means for sliding the said slidable member and the axle, and an indicating device actuated from the said sliding member.

4. The combination of a slidable member, an axle carried slidably thereby and transversely thereto, a wheel on the axle, an indicating device controlled from the said slidable member, levers connected respectively to the axle and slidable member, and means for throwing the levers, for the purpose specified.

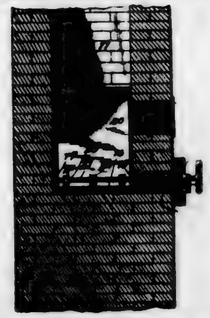
5. The combination of a slidable member, an axle carried slidably thereby and transversely thereto, a wheel on the axle, an indicating device controlled from the said slidable member, levers connected respectively to the axle and slidable member, a third lever, links connecting the third lever with the first two levers, and means for operating the third lever.

6. The combination of a slidable member, an axle carried slidably thereby and transversely thereto, a wheel on the axle, an indicating device controlled from the said slidable member, levers connected respectively to the axle and slidable member, a third lever, links connecting the third lever with the first two levers, and means for operating the third lever, said means comprising a push-rod connected with the third lever and a dog for holding the push-rod.

7. The combination of two yielding members adapted to be actuated by inequalities in track-rails, extensions on said members, said extensions being crossed and projected past each other, a blade hung between the extensions, and an electrical signaling device comprising contacts adapted to be connected by the blade when moved to engage them.

8. The combination of a slidable member, an axle slidably carried therein, a connection between the slidable member and the axle whereby they may be moved in unison in and out of operative position, means exerting a constant pressure on the said slidable member, and an indicating device actuated from the slidable member.

705,468. SOOT OR ASH PAN. THOMAS K. STANTON, Tolula, Ind. Ter. Filed Feb. 11, 1902. Serial No. 93,584. (No model.)



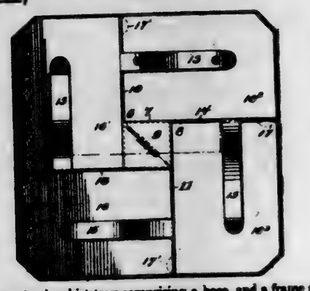
Claim.—1. The combination with a chimney having a flue and an opening in the chimney-wall communicating with the flue, of a soot-receptacle removably mounted in the flue, said receptacle having a bottom and a front wall that closes the opening, and an intermediate partition spaced from the front wall and above the bottom, said partition extending across the inner portion of the chimney-opening, whereby a dead-air space is formed in said opening.

2. A soot or ash receptacle comprising a drawer, said drawer having front, rear and side walls, and an intermediate transverse partition, a cover for that portion of the drawer between the partition and the rear wall, said cover being movably mounted upon the drawer, and operating means for the cover connected thereto and mounted upon the drawer.

3. A soot or ash receptacle comprising a drawer, a cover extending across the drawer, and a rock-shaft journaled to the drawer contiguous to one side thereof and projecting through the front wall of said drawer, said rock-shaft extending longitudinally along one end of the cover and being secured thereto.

4. A soot or ash receptacle, comprising a drawer constructed to be inserted in a chimney, said drawer having front, rear, and side walls, and an intermediate transverse partition, a rock-shaft journaled on the drawer contiguous to one side thereof and projecting through the front wall, said projecting end having a handle, and a cover for that portion of the drawer between the partition and the rear wall, said cover being attached to and movable with the rock-shaft.

705,469. DUPLICATE-WRIST TRAY. ROBERT B. STARKWEATHER, Hartford, Conn. Filed Jan. 3, 1902. Serial No. 88,041. (No model.)



Claim.—1. A whist-tray comprising a base, and a frame secured to the base, and composed of plates, which, when assembled, form a central portion; arms projecting from said central portion and dividing the base into compartments, and card-clamping devices carried by said arms.

2. A whist-tray comprising a base, and a frame composed of interlocking sheet-metal sections, said frame having a central portion and arms dividing the base into compartments projecting from the central portion, and springs projecting from the arms, said springs serving to clamp the cards upon the base.

3. A whist-tray consisting of a base; a frame composed of sheet-metal plates, which, when assembled, constitute a central portion; arms projecting from said central portion, and serving to divide the base into compartments; means for securing the arms to the base; and springs projecting from the arms.

4. The combination, with a base, of a frame composed of interlocking sheet-metal sections; arms projecting from said sections, each arm having a lug inserted in an opening of the base; and springs projecting from the arms.

5. In a whist-tray, the combination, with a base, of a plate having projecting arms; a plate covering the first-named plate and also having projecting arms, the arms of said plates dividing the base into compartments; and springs carried by the arms and serving to secure the cards upon the base.

6. In a whist-tray, the combination, with a base, of a plate having arms projecting from its diagonally opposite corners; means for securing said arms to the base; springs projecting from said arms; a cover-plate fitted over the first-named plate; arms projecting from two of the corners of said cover-plate; springs carried by said arms; and means for securing the arms of the cover-plate to the base.

7. In a whist-tray, the combination, with a base, of a plate having flanged sides and open ends; arms projecting from the plate; springs projecting from the arms; a cover-plate having flanges adapted to inclose the open ends of the other plate; arms projecting from the cover-plate; and springs carried by said arms.

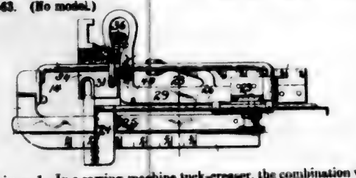
705,470. MEANS FOR DETECTING TAMPERING WITH SEALED ENVELOPS. HARRY G. STARRER, Newark, N. J., assignor of one-half to Herman R. L. Beyer, Newark, N. J. Filed June 4, 1901. Serial No. 63,076. (No model.)

Claim.—1. In a means of detection to indicate that a sealed envelop has been tampered with, the combination, with the body of the envelop and its gummed flap, of a piece of thin material arranged within a part of the said body and having a portion of said thin material extending beyond the mouth of said body, said material having a marginal edge 7 made to conform with the contour of the marginal and gummed edge of the said flap, but being slightly smaller than said gummed edge, all being adapted to be folded and arranged between said body and the gummed flap and sealed in place when the flap is sealed against said body of the envelop, said thin material being prepared with a solutive coloring-matter, substantially as and for the purposes set forth.

2. In a means of detection to indicate that a sealed envelop has been tampered with, the combination, with the body of the envelop and its gummed flap, of a piece of stiff material 5 arranged within the body of the envelop and a piece of tissue-paper attached to said piece of stiff material extending beyond the mouth of the envelop, said piece of tissue-paper having a marginal edge 7 made to conform with the contour of the marginal and gummed edge of the said flap, but being slightly smaller than said gummed edge, all being adapted to be folded and secured between the body of the envelop and the flap when the latter is sealed against the said body of the envelop, substantially as and for the purposes set forth.

3. In a means of detection to indicate that a sealed envelop has been tampered with, the combination, with the body of the envelop and its gummed flap, of a piece of stiff material 5 arranged within the body of the envelop and a piece of tissue-paper attached to said piece of stiff material extending beyond the mouth of the envelop, said piece of tissue-paper having a marginal edge 7 made to conform with the contour of the marginal and gummed edge of the said flap, but being slightly smaller than said gummed edge, all being adapted to be folded and secured between the body of the envelop and the flap when the latter is sealed against the said body of the envelop, the said piece of tissue-paper being prepared with a solutive coloring-matter, substantially as and for the purposes set forth.

705,471. TUCK-CREASER FOR SEWING-MACHINES. HIRAM P. STEWARD, Elizabeth, N. J., assignor to The Singer Manufacturing Company, a Corporation of New Jersey. Filed Dec. 3, 1901. Serial No. 84,563. (No model.)



Claim.—1. In a sewing-machine tuck-creaser, the combination with a creaser-frame consisting of a plate composed of two right-angular parts one of which forms an upturned flange and which parts afford a creaser-frame of L-shaped cross-section, of connected upper and lower creasing members and operating means supported by said frame.

2. In a sewing-machine tuck-creaser, the combination with a creaser-frame consisting of a plate composed of two right-angular parts one of which forms an upturned flange and which parts afford a creaser-frame of L-shaped cross-section, of a clamping saddle-piece adjustably mounted on said flange, upper and lower creasing devices both connected with said saddle-piece, and a yielding device through which the upper creasing member is to be operated.

3. In a sewing-machine tuck-creaser, the combination with a creaser-frame consisting of a plate composed of two right-angular parts one of which forms an upturned flange and which parts afford a creaser-frame of L-shaped cross-section, of a clamping saddle-piece adjustably mounted on said flange, upper and lower creasing devices both connected with said saddle-piece, a yielding device through which the upper creasing member is to be operated, and an adjustable edge-guide held in place by said saddle-piece when the latter is clamped to the said flange.

4. In a sewing-machine tuck-creaser, the combination with the creaser-frame, of creasing devices adjustably supported on said frame and comprising a vibratory creasing-lever, of a spring having a forked arm for lifting said lever and an arm overlying said lever having an upwardly-bent extension to be engaged by a projection or part on the needle-bar of a sewing-machine.

705,472. ATTACHMENT-HOLDER FOR SEWING-MACHINES. HIRAM P. STEWARD, Elizabeth, N. J., assignor to The Singer Manufacturing Company, a Corporation of New Jersey. Filed Dec. 3, 1901. Serial No. 84,562. (No model.)

Claim.—1. The combination with a sewing-machine presser-foot having a horizontal groove or recess extending lengthwise or from front to rear thereof, and the bottom wall of which groove or recess is above the bottom of said foot, and said foot having a vertical pin or stop fixed in and crossing said groove or recess, of a sewing-machine attachment having a forwardly-extending tongue closely fitting between a wall of said groove or recess and said pin or stop.

2. The combination with a sewing-machine presser-foot having a horizontal groove or recess extending lengthwise or from front to rear thereof, and having a vertical pin or stop in said groove or recess, of a sewing-machine attachment having a forwardly-extending tongue closely fitting between a wall of said groove or recess and said pin or stop.

3. The combination with a sewing-machine attachment provided with a tongue, of a presser-foot grooved or recessed for the reception of said tongue, and a spring-catch mounted on the attachment and having a shoulder or portion to engage a part of the said presser-foot to positively lock the attachment to the said presser-foot.

4. The combination with a sewing-machine attachment having a tongue, of a presser-foot having a horizontal groove, a fixed pin crossing said groove vertically and between which pin and the inner wall of said groove said tongue closely fits, and a spring-catch having a shoulder or portion to engage a part of said presser-foot to lock the attachment to the said presser-foot.

705,473. PARALLEL-RULER. JULIUS STERNFELD, New York, N. Y. Filed Sept. 30, 1901. Serial No. 77,081. (No model.)

Claim.—A parallel-ruler comprising a ruler proper, a shaft having rollers and journaled on the ruler, a ratchet-wheel having teeth of a pitch varying according to a predetermined law and rotating with the shaft and rollers, and a pawl carried by the ruler and engaging the said ratchet-wheel, as set forth.

705,474. CONVEYER. HENRY L. ST. JAMES, Marshall, Tex. Filed Feb. 11, 1902. Serial No. 93,894. (No model.)

Claim.—1. In a conveyer the combination with the body and chain-sprockets, of a conveyer-chain, conveyer-slats adapted to be carried thereon, threaded bolts passing through the horizontal links of said chain and passing through and secured to said slats, substantially as described.

2. In a conveyer the combination with a body of a conveyer-chain and conveyer-slats, T-bolts securing said slats to said chain, chain-sprockets having grooves therein for the vertical links of said chain, recesses for the horizontal links, recesses for the bolt-heads, and means for revolving said sprockets, substantially as described.

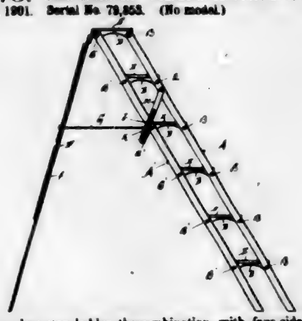
3. In a conveyer the combination with a body, of a conveyer-chain, and means for driving the same, conveyer-slats, bolts securing said slats to said chain, chain-sprockets having grooves therein for the reception of the vertical links of said chain, and recesses for the horizontal links, substantially as described.

4. In a conveyer the combination with the body, of a conveyer-chain and slats secured thereto, hooked supports transversely bolted to said slats, and arranged so that the center of gravity of the load is forward of the center of the slats, substantially as described.

5. In a conveyer the combination with the body, of a conveyer-chain and slats secured thereto, hooked supports secured to said slats, and arranged so that the center of gravity of the load is forward of the center of the slats, and vertical pins secured in said slats, substantially as described.

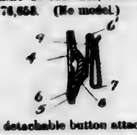
705,474. [illegible]

705,475. STEP-LADDER. VOLNEY B. ST. JOHN, Erie, Pa. Filed Oct. 24, 1901. Serial No. 79,853. (No model.)



Claim.—In a step-ladder, the combination, with four side bars A A A′ A′ arranged in pairs, of a series of steps E each step being pivotally connected with the four side bars, a rear leg or brace F pivotally connected with the top of the rear side bars A′ and provided with a projecting pin *f*, a pin *b* projecting from one of the rear side bars A′, and a locking-brace H pivoted to one of the front side bars A and provided with a longitudinal series of holes for engaging with the pins *f* and *b*, substantially as set forth.

705,476. SEPARABLE GARMENT-SUPPORTING BUTTON ATTACHMENT. HENRY F. STOWELL, Rochester, N. Y. Filed Sept. 26, 1901. Serial No. 76,658. (No model.)



Claim.—1. The detachable button attachment for supporting nether undergarments from an outer garment, said attachment having means for making connection directly with a button at the outer part of the latter and outside the connection of the button and said outer garment.

2. The detachable button attachment for supporting nether undergarments from an outer garment, said attachment having means for making connection directly with a button, and adapted for application to the button after the latter is fixed upon a garment.

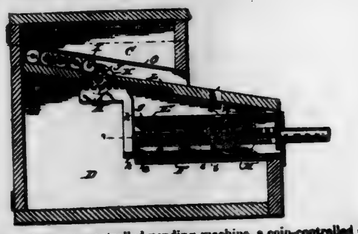
3. The detachable button attachment for supporting nether undergarments from an outer garment, said attachment having an opening to

receive the connection of the button and garment and having means distinct from said opening for making connection directly with a button, and a hook to receive a tape.

4. A detachable garment-supporting device provided with means for fixing it on the edge of a button, said device comprising an offset to be in contact with the button, and a hook to receive a tape.

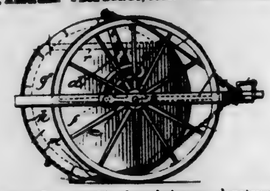
5. The sheet-metal blank 1 having an opening 2 to receive a button, and an extension 3 for fixing the same to the button.

705,477. COIN-CONTROLLED VENDING-MACHINE. DAVID K. BYERS and WILLIAM W. HEALY, Bloomingdale, Mich. Filed Mar. 21, 1902. Serial No. 99,256. (No model.)



Claim.—In a coin-controlled vending-machine, a coin-controlled operating mechanism comprising a supporting-frame provided with guide-grooves upon its sides and an opening through which the coin may pass, a slidable yoke engaging the grooves and having inwardly-extending arms, a slidable carrier-frame consisting of two horizontal and parallel plates joined at one end by a vertical end plate having a central opening, the inwardly-extending arms of the yoke loosely engaging the end plate to return the carrier-frame to its normal position, and a spring-actuated push-rod for operating the yoke, and suitable vending mechanism connecting with the coin-controlled operating mechanism, substantially as and for the purpose set forth.

705,478. COMBINED ROAD-CLEANER, ELEVATOR, AND DIRT-CART. MATTHEW STOBBS and JOHN S. THOMPSON, Sydney, New South Wales, Australia. Filed Dec. 26, 1900. Serial No. 741,501. (No model.)



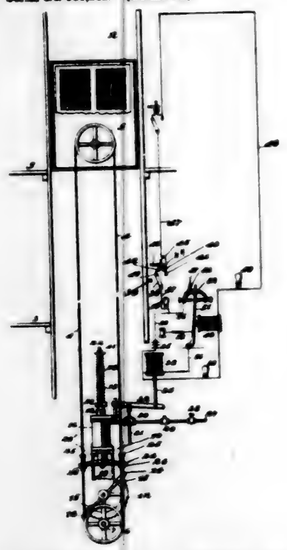
Claim.—1. In a combined road-cleaner, elevator and dirt-cart, an outer stationary casing supported in proximity to the ground and having an open lower portion, an inner stationary receiver arranged concentric therewith forming an annular space between, said receiver having an open upper side, radially-arranged blades located in said annular space, and means for causing said blades to travel through said space, substantially as described.

2. In combination, an outer stationary casing having an open lower side supported in proximity to the ground, an inner stationary receiver arranged concentric therewith with an annular space between, and spaces at the ends, said receiver having an open upper portion, heads or plates journaled in the spaces between the ends of said casing and receiver, and radially-arranged blades carried by said heads and fitting said annular space, substantially as described.

3. In combination, an outer stationary casing having an open lower side supported in proximity to the ground, an inner stationary receiver arranged concentric therewith with an annular space between, and spaces at the ends, said receiver having an open upper portion, heads or plates journaled in the spaces between the ends of said casing and receiver, and radially-arranged blades carried by said heads and fitting said annular space and means for raising said casings from the ground, substantially as described.

4. In combination, a frame, supporting-wheels journaled therein, angle-levers pivotally mounted in said frame, an axle carried by said angle-levers, a stationary cylindrical casing carried by said axle having an open lower side, a cylindrical receptacle within the casing also carried by said axle having an open upper side, heads or plates journaled on the axle between the ends of the casing and receptacle and projecting through the open side of the casing for contact with the ground, radial blades carried by said heads and fitting the annular space between the peripheral walls of the casing and receptacle, and means for rocking said angle-levers, substantially as described.

705,479. SAFETY DEVICE FOR ELEVATORS. SAMUEL D. STROHM, Philadelphia, Pa., assignor to Strohm Elevator Safety Device Company, Philadelphia, Pa., a Corporation of New Jersey. Filed Apr. 4, 1896. Serial No. 586,212. (No model.)



Claim.—1. The combination of an elevator-car and a door, with means for locking said car by fluid-pressure when said door is open.

2. The combination of an elevator-car and a door with means for controlling the power-operating mechanism of said car by fluid-pressure by the opening and closing of said door.

3. A safety device for elevators, comprising a cylinder and a piston therein connecting with the elevator-controlling mechanism, so as to be adapted to move the latter to an inactive position, a valve for said cylinder, and connections between said valve, and a door adjacent to the elevator-shaft, whereby when said door is put in an unsafe or insecure condition, the said valve will be operated, substantially as set forth.

4. A safety device for elevators, comprising a cylinder, a piston therein, a cross-head connected with said piston normally retracted from the elevator-controlling mechanism, but adapted to engage and force the same to an inactive position, a valve for said cylinder, and connections between said valve, and a door adjacent to the elevator-shaft, whereby when said door is put in an unsafe or insecure condition, the valve will be operated, substantially as set forth.

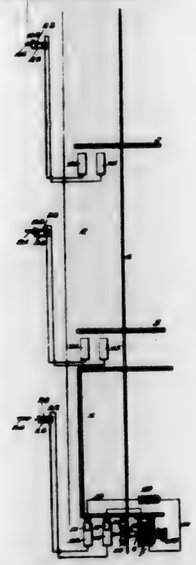
5. A safety device for elevators, comprising a pulley connected with and operating the elevator-valve, a controlling-rope connected to said pulley, two stop-plates connected with said pulley adapted to be brought to a horizontal position so as to turn said pulley to close the elevator-valve, a cylinder mounted above said stop-plates, a piston in said cylinder, a cross-head connected with said piston, normally disengaged from said stop-plates, but adapted to engage the same, a valve for said cylinder, and connections between said valve, and a door opening upon the elevator-shaft, substantially as set forth.

6. In a safety device for elevators, the combination of a pulley 6 connected to and operating the elevator-valve, a controlling-rope for said pulley, a pinion 13 on the pulley-shaft, a semicircular rack 12 engaging with said pinion, cam-plates 14, 14, secured to said rack, a cylinder 16, a piston 17 in said cylinder, a cross-head 24 connected to said piston, adjusting-screws 25, 25, on said cross-head, adapted to engage with said cam-plates 14, a valve 30 for said cylinder, and connections between said valve, and a door opening upon the elevator-shaft, substantially as set forth.

7. In a safety device for elevators, the combination of a pulley 6 connected to and operating the elevator-valve, a controlling-rope for said pulley, a pinion 13 on the pulley-shaft, a semicircular rack 12 engaging with said pinion, cam-plates 14, 14; carried by said semicircular rack, each cam-plate having a recess 15, a cylinder 16, a piston in said cylinder, a cross-head 24 connected to said piston, adjusting-screws 25, 25, on said cross-head, normally disengaged from said cam-plates, but adapted to engage the same, a valve 30 for said cylinder, and connections between said valve, and a door opening upon the elevator-shaft, substantially as set forth.

8. In a safety device for elevators, the combination of a pulley 6 connected to and operating the elevator-valve, a controlling-rope for said pulley, a pinion 13 on the pulley-shaft, a semicircular rack 12 engaging with said pinion, cam-plates 14 carried by said rack, a cylinder 16, a piston in said cylinder, a cross-head 24 carried by said piston, but adapted to engage said cam-plates 14, a spring 23 normally keeping said piston in one position of its travel, a valve 30 for said cylinder, and connections between said valve, and a door opening upon the elevator-shaft, substantially as set forth.

705,480. SAFETY DEVICE FOR ELEVATORS. SAMUEL D. STROHM, Philadelphia, Pa., assignor to Strohm Elevator Safety Device Company, Philadelphia, Pa., a Corporation of New Jersey. Filed Apr. 4, 1896. Serial No. 586,214. (No model.)

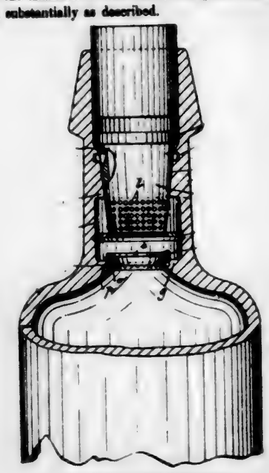


Claim.—1. In a safety device for elevators, the combination of an elevator-car, a controlling-rope for operating the controlling mechanism of said car, a clamping or locking device on the car normally out of engagement with said controlling-rope, a solenoid or magnet for operating said locking or clamping device, a partial or incomplete circuit carried on the car, a series of corrider-doors, a separate partial electric circuit for each of said doors, a closer in each of said circuits operated by the corresponding door, and means whereby the partial circuit on the car will connect with the partial door-circuits when adjacent to the latter, substantially as described.

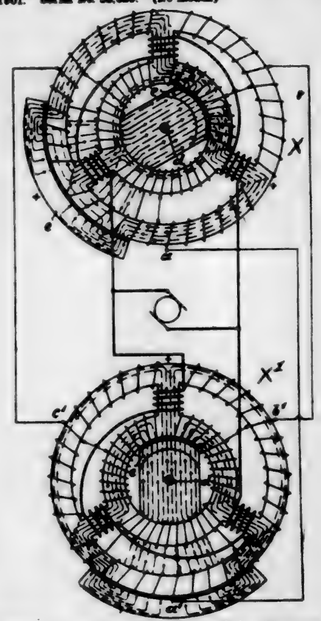
2. In a safety device for elevators, the combination of an elevator-car, a controlling-rope for operating the controlling mechanism of said car, a clamping or locking device on the car normally out of engagement with said controlling-rope, a solenoid or magnet for operating said locking or clamping device, a partial or incomplete circuit carried on the car, the contacts 16, 17, thereon, a series of corrider-doors, a separate partial electric circuit for each of said doors, a closer in each of said circuits operated by the corresponding doors, and the contacts 14, 15, whereby the partial circuits of the car will connect with the partial door-circuits, when adjacent to the latter, substantially as described.

705,481. NON-REFILLABLE BOTTLE. JOHN TARBOX, Paterson, N. J. Filed Aug. 22, 1901. Serial No. 73,876. (No model.)

Claim.—The combination of a bottle, an annular valve-seat fitted into the neck of said bottle, said valve-seat and the surrounding portion of the bottle having opposed grooves, a valve-seat-retaining ring fitted into said grooves, an outwardly-opening disk-like valve pivoted in said valve-seat, and a cup-shaped guard also arranged in said bottle-neck above the valve and having its lower end spaced from the same a distance slightly greater than the thickness of said valve, said guard having openings in its side wall, substantially as described.



705,482. SYSTEM OF AND APPARATUS FOR TRANSMITTING MOVEMENTS AND INDICATING THE POSITION OF INDICATORS OR THE LIKE. WILHELM A. THEBRATH, Hanover, Germany. Filed Nov. 12, 1901. Serial No. 82,089. (No model.)



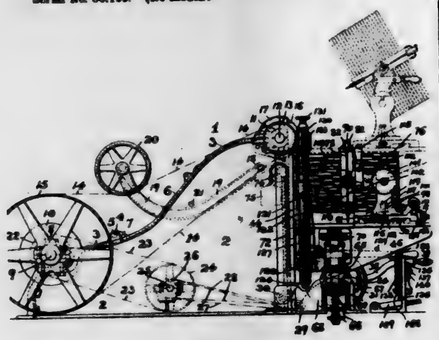
Claim.—1. In a system for the transmission of movements and positions of indicators by means of electric currents, the combination of apparatuses, each consisting of a bipolar rotor, having no coils, and of a stator, having primary and secondary coils, the primary coils of the stators being connected with one another and also to a source of electricity, while the secondary windings of all stators are connected at corresponding points, substantially as shown and described.

2. In a system for the transmission of movements and positions of indicators by means of electric currents, the combination of apparatuses, each consisting of a bipolar rotor, having no coils, and of a stator, having

primary and secondary coils, the primary coils of the stators being connected with one another and also to a source of electricity, while the secondary windings of all stators are connected at corresponding points each apparatus being provided with a bell, which sounds only when compensating currents occur and which stops ringing, when the rotor is adjusted substantially as shown and described.

705,488. MACHINE FOR GROOVING ASSEMBLED STOCK.

MARCUS B. TIDEY, Belleville, N. J.; Sarah B. Tidey and Lillie V. Tidey executrices of said Marcus B. Tidey, deceased. Filed Mar. 7, 1901 Serial No. 50,199. (No model.)



Claims.—1. In a woodworking-machine for the purpose of grooving the ends of assembled stock, the combination, with a gang of cutters, of a vertically-rotatable stock-holder in which the assembled stock is held, and means connected with the said stock-holder arranged and constructed for the alternate presentation of the ends of the stock to the cutters of the machine for the grooving of said ends, substantially as and for the purposes set forth.

2. In a woodworking-machine for the purpose of grooving the ends of assembled stock, the combination, with a gang of cutters, of a supporting-table, a lock-frame in which the assembled stock is held, and means for mounting said lock-frame so that either end of the assembled stock is presented to the cutters of the machine to be worked, substantially as and for the purposes set forth.

3. In a woodworking-machine for the purpose of grooving the ends of assembled stock, the combination, with a gang of cutters, of a supporting-table, a rotatably-arranged lock-frame in which the assembled stock is held, and means for the presentation of either end of the stock to the cutters of the machine to be worked, substantially as and for the purposes set forth.

4. In a woodworking-machine for the purpose of grooving the ends of assembled stock, the combination, with a gang of cutters, of a supporting-table, standards on said table, a lock-frame rotatably arranged in said standards, the assembled stock being held in said frame for presentation to the cutters of the machine and the stock worked at either end by revolving the charge in the lock-frame in said standards, substantially as and for the purposes set forth.

5. In a woodworking-machine for the purpose of grooving the ends of assembled stock, the combination, with a gang of cutters, of a supporting-table, standards on said table, jaw members pivotally connected with each standard, means for closing said jaw members and providing bearings, a lock-frame rotatably arranged in said bearings, the assembled stock being held in said frame for the presentation to the cutters and the stock being worked at either end by revolving the charge in the lock-frame in said bearings substantially as and for the purposes set forth.

6. In a woodworking-machine for the purpose of grooving the ends of assembled stock, the combination, with a gang of cutters, of a supporting-table, standards on said table, jaw members pivotally connected with each standard, means for closing said jaw members and providing bearings, a lock-frame consisting of stock-holding strips, means for retaining said strips about the assembled stock, and presser-cams connected with said stock-holder, trunnions for rotatively piecing said stock-holder and assembled stock in the bearings of said jaw members for presentation to the cutters and the stock to be worked at either end by revolving the charge in the lock-frame in said bearings, substantially as and for the purposes set forth.

7. In a woodworking-machine for the purpose of grooving the ends of assembled stock, the combination, with a gang of cutters, of a vertically-moving supporting-table, a lock-frame in which the assembled stock is held, means for mounting said lock-frame on said table, so that either end of the assembled stock is presented to the cutters of the machine, and mechanism for producing alternate upward and downward movements of the supporting-table for the cutting of the presented end of the assembled stock during either vertical movement of the supporting-table, substantially as and for the purposes set forth.

8. In a woodworking-machine for the purpose of grooving the ends of assembled stock, the combination, with a gang of cutters, of a supporting-table, comprising a vertically-moving frame, a longitudinally-moving lower platen on said frame, a laterally-moving upper platen, and means for adjustment of the said platens, a lock-frame in which the assembled stock is held arranged upon the upper platen, and mechanism for producing alternate upward and downward movements of said supporting-table, for the cutting of the stock during either vertical movement of the supporting-table, substantially as and for the purposes set forth.

9. In a woodworking-machine for the purpose of grooving the ends of assembled stock, the combination, with a gang of cutters, of a vertically-moving supporting-table, laterally-adjustable standards on said table, a lock-frame rotatably arranged in said standards, the assembled stock being held in said frame for presentation to the cutters of the machine, and mechanism for producing alternate upward and downward movements of the supporting-table for the cutting of the stock during either vertical movement of the supporting-table, substantially as and for the purposes set forth.

10. In a woodworking-machine for the purpose of grooving the ends of the assembled stock, the combination, with a gang of cutters, of a supporting-table comprising a vertically-moving frame, a longitudinally-moving lower platen on said frame, a laterally-moving upper platen, and means for adjustment of said platens, of a pair of laterally-adjustable standards on said upper platen, a lock-frame rotatably arranged in said standards, the assembled stock being held in said frame for presentation to the cutters of the machine, and mechanism for producing alternate upward and downward movements of the supporting-table for the cutting of the stock during either vertical movement of the supporting-table, substantially as and for the purposes set forth.

11. In a woodworking-machine for the purpose of grooving the assembled stock, the combination, with a gang of cutters, of a vertically-moving supporting-table, a pair of laterally-adjustable standards on said table, jaw members pivotally connected with each standard, means for closing said jaw members and providing bearings, a lock-frame rotatably arranged in said bearings, the assembled stock being held in said frame for presentation to the cutters of the machine, and mechanism for producing alternate upward and downward movements of the supporting-table for the cutting of the stock during either vertical movement of the supporting-table, substantially as and for the purposes set forth.

12. In a woodworking-machine for the purpose of grooving the ends of assembled stock, the combination, with a gang of cutters, of a supporting-table, comprising a vertically-moving frame, a longitudinally-moving lower platen on said frame, a laterally-moving upper platen, and means for adjustment of said platens, a pair of laterally-adjustable standards on said upper platen, jaw members pivotally connected with each standard, means for closing said jaw members and providing bearings, a lock-frame rotatably arranged in said bearings, the assembled stock being held in said frame for presentation to the cutters of the machine, and mechanism for producing alternate upward and downward movements of the supporting-table for the cutting of the stock during either vertical movement of the supporting-table, substantially as and for the purposes set forth.

13. In a woodworking-machine for the purpose of grooving the ends of assembled stock, a stock-supporting table, means for causing reciprocatory vertical movements of said table, comprising a shaft, a pair of friction devices on said shaft, means for causing the rotation of said devices in opposite directions, means for engaging and disengaging said friction devices, consisting, of a pivoted lever 38, a sleeve 36 with which said lever is connected, and friction-disks 42 and 43 on said sleeve, and means for actuating the said lever 38, consisting, of a standard 135, having depressions 136, 137 and 138, a V-shaped member 134 on said lever adapted to be arranged in said depressions, foot-treadles for forcing said member from the central depression 136 into either of said depressions 137 and 138, and means actuated from the moving table for forcing said member 134 from either depression 137 or 138 back to the central depression 136, substantially as and for the purposes set forth.

14. In a woodworking-machine for the purpose of grooving the ends of assembled stock, a stock-supporting table, means for causing reciprocatory vertical movements of said table, comprising a shaft, a pair of friction devices on said shaft, means for causing the rotation of said devices in opposite directions, means for engaging and disengaging said friction devices, consisting, of a pivoted lever 38, a sleeve 36 with which said lever is connected, and friction-disks 42 and 43 on said sleeve, and means for actuating the said lever 38, consisting, of a standard 135, having depressions 136, 137 and 139, a V-shaped member 134 on said lever adapted to be arranged in said depressions, foot-treadles for forcing said member from the central depression 136 into either of said depressions 137 and 139, spring 138 for drawing member 134 into depression 136, and means actuated from the moving table for lifting said member 134 from either depression 137 or 139 back to the central depression 136, consisting, essentially, of a sector 140 pivotally connected with said standard 135, a pair of horns on said sector adapted to engage said V-shaped member 134, an arm 158, a pair of spring-actuated disks connected with the vertically-moving table, a flexible connection reeled on one of said disks and attached to said arm 158, for forcing the member 134 from the depression 137 during the completed upward movement of the table, and a stud or projection on said table adapted to engage one of the horns of said sector 140, and force the member 134 from the depression 139 during the completed downward movement of the table, substantially as and for the purposes set forth.

15. In a woodworking-machine for the purpose of grooving the ends of assembled stock, a platen 50 provided with a lug 190, a second laterally-moving platen 61 on said platen 50, said platen 61 having a groove, a pair of dogs slidably arranged in said groove, means for securing said dogs in their adjusted positions and a connecting-latch between one of said dogs and said lug 190 substantially as and for the purposes set forth.

16. In a woodworking-machine for the purpose of grooving the ends of assembled stock, a platen 50 provided with a lug 190, a second laterally-moving platen 61 on said platen 50, said platen 61 having a groove, a pair of dogs 181 and 182 slidably arranged in said groove, a right and left threaded screw-bolt connected with said dogs, a set-screw connected with each dog for securing it in its adjusted position, an apron 187 on said dog 181, and a spring-actuated latch connected with said apron and adapted to be brought in holding engagement with the said lug 190, substantially as and for the purposes set forth.

17. In a woodworking-machine for the purpose of grooving the ends of assembled stock, the combination, with a gang of cutters, of a supporting-table, a supporting means on said table, a rotatable stock-holder supported by said means, and mechanism for moving said stock-holder and supporting means in a lateral direction, for shifting the charge in the periphery of the cutters and thereby work a greater width of stock than the maximum capacity of the cutters, substantially as set forth.

18. In a woodworking-machine for the purpose of grooving the ends of assembled stock, the combination, with the frame-pieces 46 and platen thereon, a screw 52 and nut 51 for moving said platen in a longitudinal direction, and means connected with said frame and said screw, arranged and constructed to cause a forwardly-sliding motion of said screw-platen, consisting, of a crank-shaft and crank member, a collar on said screw, a pair of connecting-links between said crank member and collar, and springs, all arranged, substantially as and for the purposes set forth.

19. In a woodworking-machine for the purpose of grooving the ends of assembled stock, the combination, with the frame-pieces 46 and platen thereon, a screw 52 and nut 51 for moving said platen in a longitudinal direction and means connected with said frame and said screw, arranged and constructed to cause a forwardly-sliding motion of said screw and platen, consisting of a crank-shaft and crank member, a collar on said screw, a pair of connecting-links between said crank member and collar, and springs, a lever 174, gears 175 and 176, sector 179, stopping-post 177 and slot 178, all arranged, substantially as and for the purposes set forth.

705,484. DARNING-LAST.

MARY G. TILNEY, Orange, N. J. Filed Apr. 24, 1902. Serial No. 104,607. (No model.)

Claim.—1. A cup-shaped darning-last, a frame for holding the material to be darned thereon and a removable cover for the last, substantially as specified.

2. A cup-shaped darning-last substantially ovate in contour, a clamping-frame for engaging therewith, and a holding-strap attached to the frame, substantially as specified.

3. A cup-shaped darning-last having a shoulder at its upper portion, a frame adapted to engage around the last over said shoulder, a flexible strap attached at one end to the frame, and a hook on the other end of the strap for engaging with the frame, substantially as specified.

4. A cup-shaped darning-last having a shoulder at its upper portion, a frame for engaging around the last over said shoulder, a holding-strap attached to said frame, and a cover for the last, substantially as specified.

5. A cup-shaped darning-last having a shoulder at its upper portion, a frame for engaging around the last over said shoulder, a tubular handle for said frame, a removable cap on the end of the handle, and a holding-strap attached to the frame, substantially as specified.

705,485. INK-WELL.

GEORGE H. TEUE, East Oakland, Cal. Filed Feb. 19, 1902. Serial No. 94,746. (No model.)

Claim.—1. The combination of a containing-well having a horizontal flange and a vertical cylindrical wall of less diameter extending above and having an opening therethrough a cap having a corresponding opening on one side fitting over the cylindrical extension and a clamp by which the cap is held in place and revolvable in a horizontal plane, said clamps normally extending across the top of the cap, and thence down the sides and said well having vertical channels to receive the extending portions of the clamp.

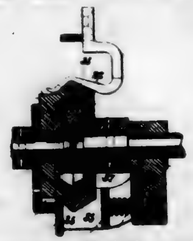
2. An open-topped ink-well having a flange surrounding it, said flange having notches made in opposite sides, a cap covering the open top extending downwardly and having a flange resting upon the flange of the well, said cap-flange having cut-away portions upon opposite sides, a clamp extending across the top of the cap having the vertical sides engaging the grooves of the well-flange and forming a stop against which the ends of the cut-away portion of the cap-flange contact to limit its revolution.

3. An ink-well consisting of a body having an open top, a peripheral flange around the upper part, a side opening above and extending into the top of the flange, a cap turnable about the upper part of the well having an opening adapted to register with that in the side of the well, said cap having an annular flange around the bottom resting upon the flange of the well and having cut-away portions upon opposite sides, a clamp having vertical sides extending through the cut-away portions of the cap-flange and engaging notches or grooves in the well-flange whereby it is held stationary, the upper part of said clamp engaging the top of the cap whereby the latter is held in place and allowed to revolve so as to close or open the passage into the well.

4. An ink-well and a holder or socket therefor, said well having an annular ledge or shoulder below the top and an opening through the side and shoulder, a cap having a corresponding opening and resting upon the ledge, a stationary clamp normally extending across the top of the cap with lugs upon each side and securing means, said lugs extending parallel with the outer wall of the well and lugs or stops to limit the turning movement of the cap.

705,486. BLIND-STITCH OVERSEAMING-MACHINE.

BENJAMIN W. TUCKER, Newark, N. J., assignor, by mesne assignments, to Charles C. Gill, New York, N. Y. Filed Mar. 22, 1900. Serial No. 9,054. (No model.)



Claim.—1. In a sewing-machine having a needle, looper and presser-foot, the hinged front plate, the spring pressing said plate toward the presser-foot, and the feed-shaft carried by said plate, combined with the feed-wheel on said shaft to coöperate with and press the fabric against said foot, said wheel comprising sections one of which is rigid on said shaft and yielding therewith and the other of which is adapted to yield independently thereby to compensate for inequalities in the thickness of the fabric supplied to the machine; substantially as set forth.

2. In a sewing-machine having a needle, looper and presser-foot, the hinged front plate, the spring pressing said plate toward the presser-foot, and the feed-shaft carried by said plate, combined with the feed-wheel on said shaft to coöperate with said foot and having the outwardly-projecting annular formation on its periphery to correspond with the form of the lower surface of said foot, said wheel comprising sections meeting at the center of said annular formation and one of which is adapted to yield independently of the other to compensate for inequalities in the thickness of the fabric supplied to the machine; substantially as set forth.

3. In a sewing-machine, the yielding feed-shaft, and the coöperating rotatable wheel-sections thereon and adapted to rotate therewith, one of

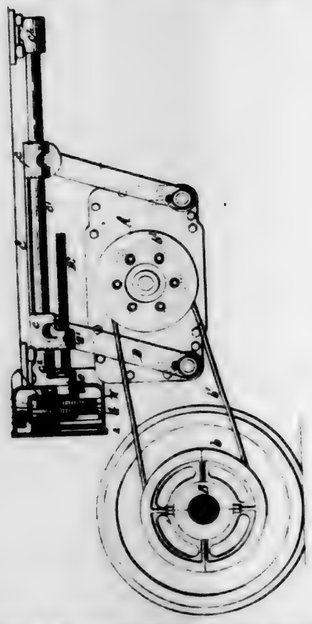
said sections being capable of independent yielding action while performing its rotation; substantially as set forth.

4. In a sewing-machine, the yielding feed-shaft, and the coöperating rotatable wheel-sections thereon and adapted to rotate therewith, combined with the hinged shoe engaging one of said sections, the spring acting against said shoe, and the slidable slotted block intermediate said sections and engaging parallel shoulders on said section acted upon by said shoe; substantially as set forth.

5. In a sewing-machine, the needle, looper and presser-foot, the latter being recessed upon its operative surface, combined with the yielding feed mechanism comprising sections or parts one of which is adapted to yield independently of the other section or part and which sections at their meeting edges conform to the said operative surface of said foot; substantially as set forth.

6. In a sewing-machine, the needle, looper and presser-foot, the latter being recessed upon its operative surface, combined with yieldingly-supported feed mechanism conforming to said foot and comprising rotatable sections or parts one of which is capable of independent yielding action; substantially as set forth.

705,487. AUTOMATIC DYNAMO-REGULATOR. WILLIAM A. TURBAYNE, Buffalo, N. Y., assignor to Charles M. Gould, New York, N. Y. Filed Jan. 13, 1902. Serial No. 89,413. (No model.)



Claim.—1. The combination of a driving element, a generator mounted to move relative to said driving element, drive connections between said driving element and the generator, means for moving said generator, and electrically-controlled mechanism for actuating said moving means and which operates upon a variation of the speed of said generator, substantially as set forth.

2. The combination of a driving element, a generator mounted to move relative to said driving element, drive connections between said driving element and the generator, a motor and connections for moving said generator, and electrically-controlled means for operatively connecting said motor with said generator for moving the same and which operates upon a variation of the speed of said generator, substantially as set forth.

3. The combination of a driving element, a generator mounted to move relative to said driving element, drive connections between said driving element and the generator, an electric motor for moving the generator, an electromagnetic device operatively connecting said motor with the generator for moving the same, said electromagnetic device being controlled by the speed of said generator, substantially as set forth.

4. The combination of a driving element, a generator mounted to move relative to said driving element, drive connections between said driving element and the generator, an electric motor for moving the generator, an electromagnetic device for operatively connecting said motor with the generator for moving the same, a governor operated by the generator, and electrical connections for said electromagnetic device controlled by said governor, substantially as set forth.

5. The combination of a driving element, a generator mounted to move relative to said driving element, drive connections between said driving element and the generator, an electric motor for moving the generator, an electromagnetic device for operatively connecting said motor with the generator for moving the same, a governor actuated by the generator, and electrical connections for said electromagnetic device and said motor controlled by said governor, substantially as set forth.

6. The combination of a driving element, a generator mounted to move relative to said driving element, drive connections between said driving element and the generator, a device for moving the generator toward and from said driving element, an electric motor, connections between the same and said device whereby the latter can be moved in one or the other direction, an electromagnetic device controlling said connections, whereby the direction of movement of said device is determined, a governor operated by the generator, and electrical connections for said electromagnetic device controlled by said governor, substantially as set forth.

7. The combination of a driving element, a generator, mounted to move toward and from said driving element, drive connections between said driving element and the generator, a screw for moving said generator toward and from said driving element, an electric motor, a ratchet-and-pawl mechanism between said motor and screw whereby the same can be rotated in either direction, an electromagnetic device controlling said ratchet-and-pawl mechanism, a governor actuated by the generator, and electrical connections for said electromagnetic device controlled by said governor, substantially as set forth.

8. The combination of a driving element, a generator mounted to move toward and from said driving element, drive connections between said driving element and the generator, a screw for moving said generator toward and from said driving element, an electric motor, ratchet-wheels connected to said screw, an oscillating lever operated by said motor, pawls carried by said lever and coöperating with said ratchet-wheels, an electromagnetic device for moving one or the other of said pawls into engagement with the teeth of its ratchet-wheel, a governor actuated by the generator, and electrical connections for said electromagnetic device controlled by said governor, substantially as set forth.

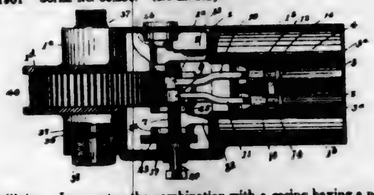
705,488. CONSTRUCTION OF METAL FURNITURE. JOSEPH F. L. UHL, Toledo, Ohio. Filed May 5, 1902. Serial No. 105,879. (No model.)

Claim.—1. The improvement in the construction of metal furniture, comprising a table-section, metal standards having a U-shaped cross-section for supporting the table-section, a brace formed from a single length of strap metal bent at suitable points to fit the interior of the U-shaped standards, the ends of the strap forming the brace meeting in one of the standards, and screws for securing the brace in position between the standards.

2. The herein-described improvement in the construction of metal furniture, comprising a table-section, castings secured upon the table-section, provided with downwardly-extending lugs adapted to fit within the standards, the sheet-metal standards having a U-shaped cross-section for supporting the table-section, a brace for the standards formed from a single piece of strap metal bent at suitable points to fit the interior of the standards, the ends of the strap meeting in one of the standards, and screws for securing the lugs and the brace in their respective positions, as set forth

3. A chair having a seat-section, castings provided upon the bottom thereof, sheet-metal standards having a U-shaped cross-section secured at their upper ends to the castings, a sheet-metal chair-back having a U-shaped cross-section, secured at its ends to two of the castings upon the chair-seat, a brace formed from a single piece of strap metal bent at suitable points to fit within the U-shaped standards, screws for securing the back and the standards to the castings and also the brace within the standards, and metal straps secured at their lower ends to the chair-seat and provided with a return-bend at their upper ends to fit within the U-shaped back, and screws for securing the straps to the back-section, as described.

705,489. MOTOR. JOHN ULRICH, Columbus, Ohio. Filed Oct. 28, 1901. Serial No. 80,250. (No model.)



Claim.—In a motor, the combination with a casing having a pair of power-cylinders and a pair of valve-cylinders, the former provided with a central fixed partition and ports on each side of said partition connecting the valve-cylinders with the corresponding power-cylinders and each of said valve-cylinders having an exhaust-port 36 and an inlet-air port connecting with both said valve-cylinders, of a journaled shaft 7, valves 12 and 13 working in said valve-cylinders and having peripheral recesses 14, arms 10 and 11 eccentrically connecting said valves with said shaft 7, a journaled crank-shaft having a gear connection with said shaft 7 and provided with two cranks, a piston within each of the cylinders 2, said piston carrying a head on opposite sides of the central partition and driving-arms connecting said pistons with said cranks, a rotatably-mounted tool carrying shaft 37 in the forward portion of said casing, a gear-wheel carried on said shaft and a pinion-wheel on said crank-shaft gearing therewith, substantially as specified.

705,490. MEANS FOR DISSIPATING STATIC ELECTRICITY. ROBERT O. VANDERCOOK, Evanston, Ill. Filed Mar. 13, 1901. Serial No. 50,936. (No model.)

Claim.—1. As a means for obtaining non-electrical atmospheric conditions in a press-room or apartment for like uses, cooling means at the top of the said room or apartment and means for introducing water-vapor into the room or apartment at a point distant from the cooling means, said cooling means being disposed uniformly throughout the area over the space to be maintained in non-electrical condition.

2. As a means for obtaining non-electrical atmospheric conditions in a press-room or apartment for like uses, means located at the bottom of the room or apartment for evaporating water to produce water-vapor, and cooling means at the top of said room or apartment, said cooling means being disposed uniformly throughout the area over the space to be maintained in a non-electrical condition.

3. As a means of obtaining non-electrical atmospheric conditions in a press-room or apartment for like uses, means for introducing water-vapor therein cooling means at the top of the room, and grounded electric conductors in said room.

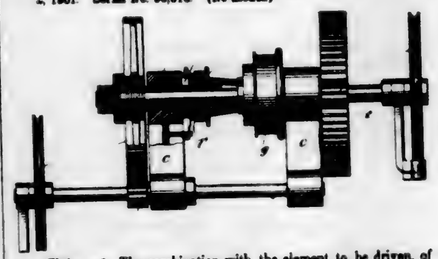
705,491. GLAZED ROOF OR STRUCTURE. EZEKIEL VAN HOOGENS, Boston, Mass. Filed Feb. 13, 1902. Serial No. 93,833. (No model.)

Claim.—1. In a glazed structure, the combination of the channel-bars, panes of glass having edges which rest thereon, integral ears upon the inner sides of the walls of the said channel-bars, clips bearing against the said ears, caps covering the joints between contiguous panes of glass, and bolts extending from the clips to the caps tying them together and the panes of glass to the channel-bars.

2. The combination of channel-bars having integral ears extending inward from their sides and provided with seats upon their under surfaces, downwardly-arched clips having ends held against said ear-seats, panes of glass supported by the channel-bars, caps covering the joints between them, and bolts extending from the clips through the caps and serving to hold the clips against the ears with their ends in the ear-seats, the caps against the outer surface of the glass panes and the panes upon the channel-bars.

3. The channel-bars having cross-recesses, cross-channel supports extending from said recesses and supported by the channel-bars, the said supports having outwardly-turned flanges from the edge of their upper and lower sides, the flanges from the edge of the lower side being adapted to laterally support the upper edge of the glass panes, while the flange from the upper edge is turned away to afford opportunity for the passing of drip upon the under surface of said panes to the channel, and independent clips bearing upon the bottom of the supports, having upon one side seats for panes of glass and extending between the panes and forming the outer down-holes for panes.

705,492. GEARING. WILLIAM L. VOSS, Harvey, Ill. Filed July 2, 1901. Serial No. 66,818. (No model.)



Claim.—1. The combination with the element to be driven, of a drive-shaft geared directly thereto, a second drive-shaft independent of the first, and gearing connecting the two drive-shafts, said gearing embodying a clutch automatically operative upon the movement of the second shaft, whereby to connect or disconnect the shafts.

2. The combination of a rotary shaft, a sleeve mounted loosely thereon, a rotary member threaded on the sleeve and capable of movement to bind itself and the sleeve between two parts on the shaft, and means for driving said rotary member.

3. The combination of a revolvible shaft, a sleeve mounted loosely thereon, collars fastened to the shaft and between which collars the sleeve is located, a rotary member threaded on the sleeve, and means for driving the rotary member.

4. The combination with an element to be driven, of a shaft fastened thereto, a second shaft geared with the first-named shaft, a sleeve mounted loosely on the second shaft, collars fastened to the second shaft and between which collars the sleeve is located, a gear threaded on the sleeve at one end thereof, and a rotary driving member transmitting movement to the gear.

5. The combination with the element to be driven of a drive-shaft geared directly thereto, a second drive-shaft independent of the first, and gearing for transmitting from the second to the first drive-shaft, said gearing embodying a threaded member operative by the turning of the second drive-shaft and forming a clutch for completing the connection between the two shafts.

705,493. MECHANICAL MOVEMENT. ADOLPH WAHLE, Davenport, Iowa. Filed July 10, 1901. Serial No. 67,746. (No model.)

Claim.—1. A drive-shaft having continuous rotary motion, a rotary reciprocal shaft at right angles thereto, a bevel-gear secured to said drive-shaft, bevel-pinions in mesh with said gear at opposite points of engage-

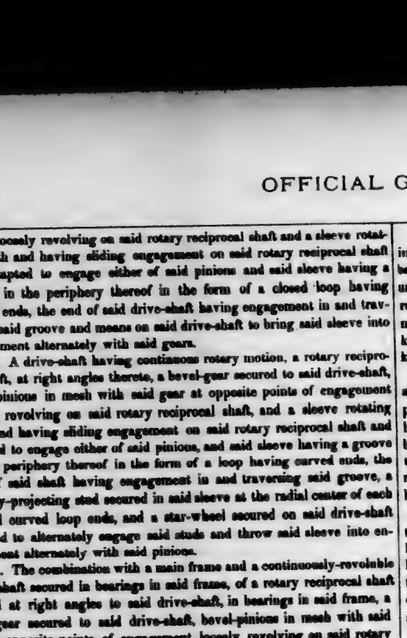
ment, loosely revolving on said rotary reciprocal shaft and a sleeve rotating with and having sliding engagement on said rotary reciprocal shaft and adapted to engage either of said pinions and said sleeve having a groove in the periphery thereof in the form of a closed loop having curved ends, the end of said drive-shaft having engagement in and traversing said groove and means on said drive-shaft to bring said sleeve into engagement alternately with said gears.

2. A drive-shaft having continuous rotary motion, a rotary reciprocal shaft, at right angles thereto, a bevel-gear secured to said drive-shaft, bevel-pinions in mesh with said gear at opposite points of engagement loosely revolving on said rotary reciprocal shaft, and a sleeve rotating with and having sliding engagement on said rotary reciprocal shaft and adapted to engage either of said pinions, and said sleeve having a groove on the periphery thereof in the form of a loop having curved ends, the end of said shaft having engagement in and traversing said groove, a radially-projecting stud secured in said sleeve at the radial center of each of said curved loop ends, and a star-wheel secured on said drive-shaft adapted to alternately engage said studs and throw said sleeve into engagement alternately with said pinions.

3. The combination with a main frame and a continuously-revolving drive-shaft secured in bearings in said frame, of a rotary reciprocal shaft secured at right angles to said drive-shaft, in bearings in said frame, a bevel-gear secured to said drive-shaft, bevel-pinions in mesh with said gear at opposite points of engagement loosely revolving on said rotary reciprocal shaft, a sleeve rotating with and having sliding engagement on said spindle between said pinions, adapted to engage either of said pinions and said sleeve having a groove on the periphery thereof in the form of a closed elliptical loop, radially-projecting studs secured to said sleeve at the radial center of each of said curved ends of the loop, the end of said drive-shaft being adapted to have engagement with and traverse said loop, a star-wheel on said drive-shaft alternately engaging said studs and a spherical casing extending from the bearings of said spindle and inclosing said pinions and gears.

4. A drive-shaft having continuous rotary motion, a rotary reciprocal shaft at right angles thereto, a beveled gear secured to said drive-shaft, bevel-pinions loose on said rotary reciprocal shaft in mesh with said gear at opposite points of engagement, and a sleeve rotating with and having sliding engagement on said rotary reciprocal shaft, and adapted to engage either of said pinions, and said sleeve having an endless loop-shaped groove, and means to bring said sleeve into engagement alternately with said pinions.

705,494. CHECKING-MACHINE. FRANK B. WAINWRIGHT, Jersey City, N. J. Filed Aug. 27, 1901. Serial No. 73,445. (No model.)



Claim.—1. A checking-machine having a roller-platen, a line-spacing mechanism, for moving the roller-platen bodily, a set of units type-bars, a set of tens type-bars, a set of hundreds type-bars, the said sets of units, tens and hundreds type-bars being arranged to print longitudinal rows of figures on the check held on the roller-platen, the said spacing mechanism remaining dormant while printing a row of figures, sets of keys for the corresponding sets of type-bars, and a connection between a key and its type-bar, as set forth.

2. A checking-machine having a roller-platen, a line-spacing mechanism for moving the roller-platen bodily, a set of units type-bars for printing units on the check held on the roller-platen and for actuating the line-spacing mechanism, a set of tens type-bars, a set of hundreds type-bars, the said sets of units, tens and hundreds type-bars being arranged to print longitudinal rows of figures on the check, sets of keys for the corresponding sets of type-bars and a connection between a key and its type-bar, as set forth.

3 A checking-machine, comprising a roller-platen mounted to slide transversely, a set of units type-bars, a set of tens type-bars and a set of hundreds type-bars, for printing longitudinal rows of figures on a check held over said platen, keys connected with said type-bars for operating the individual type-bars in said sets, and means for passing a duplicate continuous strip superimposed on a transfer-strip over said roller-platen, as set forth.

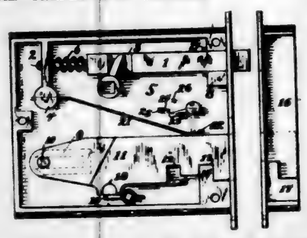
4. A checking-machine, comprising a roller-platen mounted to slide transversely, a set of units type-bars, a set of tens type-bars and a set of hundreds type-bars, for printing longitudinal rows of figures on a check held over said platen, keys connected with said type-bars for operating the individual type-bars in said sets, and means for imparting a traveling motion to a duplicate continuous strip superimposed on a transfer-strip and passing over said roller-platen, and impartine a rotary motion to the said roller-platen, as set forth.

5. A checking-machine, comprising a roller-platen mounted to slide transversely, a set of units type-bars, a set of tens type-bars and a set of hundreds type-bars, for printing longitudinal rows of figures on a check held over said platen, keys connected with said type-bars for operating the individual type-bars in said sets, and means for imparting a traveling motion to a duplicate continuous strip superimposed on a transfer-strip and passing over said roller-platen, and imparting a rotary motion to the said roller-platen, said means being actuated upon moving the roller-platen into a return position, as set forth.

6. A checking-machine, comprising a roller-platen mounted to slide transversely, a set of units type-bars, a set of tens type-bars and a set of hundreds type-bars, for printing longitudinal rows of figures on a check held over said platen, keys connected with said type-bars, for operating the individual type-bars in said sets, means for imparting a return sliding motion to the roller-platen, and means for automatically turning the roller-platen at the time it reaches a final return position, as set forth.

7. A checking-machine having a spacing mechanism for the carriage of a roller-platen, comprising a rack-bar on the carriage, a gear-wheel in mesh with the rack-bar, a ratchet-wheel on the shaft of said gear-wheel, a pawl engaging said ratchet-wheel, a spring-pressed trip for engaging said pawl, and a rock-shaft controlled by a key and pressed on by a spring, the rock-shaft having an arm on which said trip is fulcrumed, as set forth.

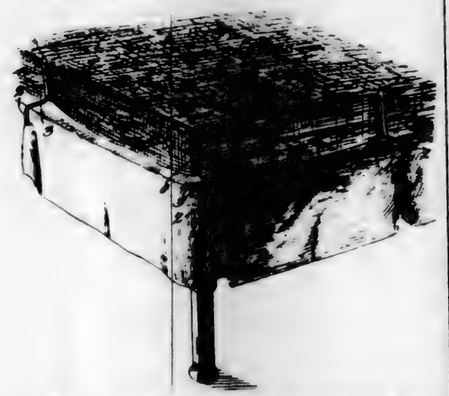
705,495. LOCK. ALLEN B. WALLACE, Newcastle, Pa. Filed Jan. 31, 1902. Serial No. 91,864. (No model.)



Claim.—1. The combination with the lock-casing having a projection therein through which operates the spring-pressed latch, of a lock-bolt secured in the casing and carrying a pin, a guide in which the pin operates, the under face of the front end of the lock-bolt having recesses formed therein, a lug secured in the casing and normally engaging in one of said recesses, the lower end of the said projection having a flat spring rigidly secured therein, the free end of the spring extending downwardly and engaging the upper face of the lock-bolt, with a lug carried by the said end, means pivotally secured in the casing for engagement with said spring, whereby the lock-bolt is held in an inoperative position, and means for operating the lock-bolt, substantially as described.

2. The combination with the lock-casing having the latch-bolt therein, of a lock-bolt mounted so as to have a pivotal and longitudinal movement, means for operating the lock-bolt, the free end of said lock-bolt having recesses therein, a lug secured in the casing and engaging in said recesses, a spring having its one end rigidly secured in the casing and its free end engaging the upper face of the lock-bolt, means in the casing for engaging said spring whereby movement of the lock-bolt is prevented, means for supporting said means, and means for limiting the movement of said first-named means, substantially as described.

705,496. COMBINED TABLE-SPREAD AND NAPKIN-HOLDER. CORNELIUS M. WALSH, Guntown, Miss. Filed May 16, 1902. Serial No. 107,662. (No model.)

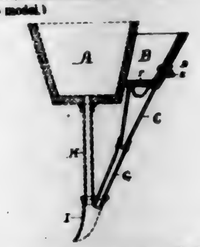


Claim.—1. In a device of the class described, a horizontally-disposed book combined with a vertical stem bent upon itself twice to form a pair of vertically-disposed oppositely-facing hooks, substantially as set forth.

2. In a device of the class described, a hook adapted to engage the edge of a table and to hold the cloth upon the same by frictional contact, combined with a pair of oppositely-facing auxiliary hooks or clamps to receive the edges of the table-cloth and of an auxiliary cover, substantially as set forth

3. The herein-described holder and clamping device comprising an approximately horizontal hook member and two approximately vertical clamping members or oppositely-facing hooks, all bent or formed from a single piece of wire, substantially as set forth.

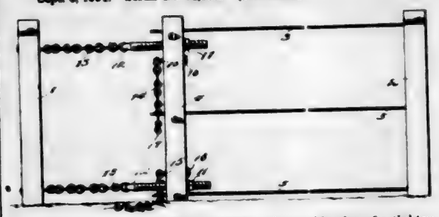
705,497. SEEDING ATTACHMENT FOR GRAIN-DRILLS. HERBERT O. WALTON, Bates county, Mo. Filed Mar. 31, 1902. Serial No. 100,736. (No model.)



Claim.—1. In a seeding attachment for grain-drills, the combination of a seedbox B secured to the grain-box of a grain-drill, a spout secured by a bolt E with the loop D in the rear of the seedbox, said spout being located underneath and opposite the holes in the bottom of the seedbox with a hose G leading downward from the lower extremity of the spout C, all substantially as shown and described.

2. In a seeding attachment for grain-drills, the combination of the following elements: the auxiliary seedbox B, secured to the grain-box A; holes F through the bottom of the seedbox; the spout C held against the under side of the bottom of B and secured to the side of B by a bolt passing through a loop extending upward from the top of the spout C; all substantially as shown and described.

705,498. WIRE-FENCE STRETCHER. ISAAC H. WARNER, Union City, Mich., assignor to Frank C. Boise, Union City, Mich. Filed Sept. 6, 1901. Serial No. 74,552. (No model.)

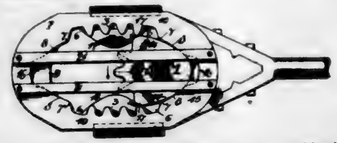


Claim.—1. In a wire-fence stretcher, the combination of a tightening connecting element attached to a fixed point, a stretcher-bar having means to secure runner-wires thereto, a tightening-screw attached to and movable axially with reference to the stretcher-bar, means to adjustably connect the tightening-screw to the tightening connecting element, a holding connecting element carried by the stretcher-bar and means to adjustably connect the holding connecting element to the tightening connecting element, prior to disconnecting the latter from the axially-movable tightening-screw, substantially as described.

2. In a wire-fence stretcher, the combination of a tightening connecting element attached to a fixed point, a stretcher-bar having means to secure runner-wires thereto, a tightening-screw, attached to and movable axially with reference to the stretcher-bar, an adjusting-nut bearing against the bar and engaging the screw, to adjust the latter axially, means to adjustably connect the tightening-screw to the tightening connecting element, a holding connecting element carried by the stretcher-bar, and means to adjustably connect the same to the tightening connecting element prior to disconnecting the latter from the axially-movable tightening-screw, substantially as described.

3. A wire-fence stretcher comprising a two-part stretcher-bar, nut-bearing screws carried thereby, tightening-chains associated with the screws, and stretcher-bar-holding chains carried by the said bar.

705,499. MECHANICAL MOVEMENT FOR CONVERTING MOTION. JOHN T. WATTS, Crookston, Minn. Filed Apr. 12, 1902. Serial No. 102,604. (No model.)



Claim.—1. In a device for converting motion, the combination of a reciprocating frame having an opening the opposite sides of which are provided with racks of cogs, a shaft, a cogged sector thereon the cogs on each side of the middle cog standing obliquely away from the middle cog at angles not radial with the center of the shaft, whereby to render certain the engagement of the sector with the racks of cogs and to prevent cramping and striking in such engagement.

2. In a device for converting motion, the combination of a reciprocating frame having an opening the sides of which are provided with cog-racks, cams projecting into said opening adjacent to each rack and cams at the ends of the opening, a shaft, and a cogged sector thereon adapted to engage the racks, and provided with a cam adapted to engage the frame-cams, for the purpose stated.

3. In a device for converting motion, the combination of a reciprocating frame having an opening the sides of which are provided with cog-racks, cams projecting into said opening adjacent to each rack on one side of the frame, a shaft and a cogged sector thereon adapted to engage the racks and having a cam adapted to engage the frame-cams, and guides or ways on the other side of said frame, whereby the frame is prevented from lateral cramping on the shaft.

4. In a converting-motion device, a reciprocating frame having an opening the sides of which are provided with cog-racks, and formed with elliptical side walls 8 8 which are contracted to form dead spaces at the ends of said opening, frame-cams projecting into said opening adjacent each rack, a cam at each end of said frame-opening overhanging the said dead spaces, a shaft, and a cogged sector thereon adapted to engage the racks and the elliptical side walls 8, and having a cam adapted to engage the aforesaid frame-cams, for the purpose stated.

5. In a device for converting motion, the combination of a reciprocating frame having an opening the longitudinal sides of which are pro-

vided with cog-racks, and with cams extending into the opening at one side of and beyond the cogs, a shaft, and a cogged sector thereon adapted to engage the racks and to lap with the side cams in passing them, and provided with a cam adapted to engage the inner edges of the said side cams, for the purpose stated.

705,500. WIRE-FENCE MACHINE. GEORGE P. A. WEISENBORN, Clarence, Mo. Filed Feb. 15, 1902. Serial No. 94,164. (No model.)

Claim.—1. A wire-fence machine including a frame, twisting-heads, means for operating the twisting-heads, a plurality of spreaders, one for each twisting-head, and a plurality of couplers for the spreaders, one for each spreader connected with the spreader and also with a twisting-head and rotative therewith.

2. In a wire-fence machine, the combination of a main frame member, a pair of combined gage and frame members, frame-arms extending from the main frame member to and beyond the combined gage and frame members, twisting-heads mounted at the extremities of the frame-arms, a drive-chain, and driving mechanism.

3. In a wire-fence machine, the combination of a main frame member, a driving-wheel, a plurality of frame-arms having the gage-holes therein, a pair of combined gage and frame members having the gage-holes therein, twisting-heads mounted in the frame-arms at the sides of the combined gage and frame members opposite to the main frame member, deflecting-rolls, a drive-chain, a slack-adjuster, and the bolts extending through the gage-holes in the frame-arms and the combined gage and frame members.

4. In a wire-fence machine, the combination of a main frame member, a pair of combined gage and frame members parallel to the main frame member, a series of frame-arms extending from the main frame member to and beyond the combined gage and frame members, twisting-heads mounted at the extremities of the frame-arms and supported in their positions axially by said combined gage and frame members, a drive-chain connecting the twisting-heads, an auxiliary frame, and twisting-heads in the auxiliary frame, substantially as set forth.

5. In a wire-fence machine, the combination of a frame comprising a main member, a series of frame-arms adjustably attached to the main member, a pair of parallel members situated parallel to the main member and adjustably secured to the arms, a drive-wheel, and a deflecting-roll at either side of the drive-wheel, in combination with a series of twisting-heads mounted at the extremities of the frame-arms and supported in their positions axially by said combined gage and frame members, a drive-chain connecting the twisting-heads, an auxiliary frame, and twisting-heads in the auxiliary frame, substantially as set forth.

6. In a wire-fence machine, the combination with a frame, a series of twisting-heads, a drive-chain, a drive-wheel, guide-rods, and a guide-head, of spreaders each comprising a frame-plate, a pair of opposing rollers, and a pair of opposing guide members at the end of the frame opposite to the rollers, substantially as set forth.

7. In a wire-fence machine, the combination of the spreader consisting of the frame-plate having the portion bent over and forming the companion plate, the rollers mounted between the main plate and the companion plate, and the loops bent over and forming guide members at the end of the main plate opposite to the rollers, substantially as set forth.

8. In a wire-fence machine, the combination of the frame, the twisting-heads having the apertures in the side walls thereof, the spreaders having the aperture in the frame thereof, a spreader-coupler engaging the apertures in said heads and also the aperture in said spreader, and the driving mechanism, substantially as set forth.

9. In a wire-fence machine, the combination with the main frame member and the series of twisting-heads, of the series of arms supporting the twisting-heads and having the holes therein whereby the slack-adjuster roll-shafts may be supported and also having the bolt-holes adjacent to the twisting-heads, the pair of parallel frame members situated adjacent to the twisting-heads and having the bolt-holes therein, the bolts securing said parallel members to said arms, the drive-chain, and the drive-wheel, substantially as set forth.

10. In a wire-fence machine, the combination with the main frame member having the perforations transversely therein, the twisting-heads having their axes at right angles to the perforations, and the guide-head, of the guide-rods having the short ends bent at right angles to the main portions thereof and extending through the perforations in said member, and the nuts on said short ends, the guide-rods being connected to the guide-head, as set forth.

11. In a wire-fence machine, the combination of the main frame member, the frame-arms, the parallel frame members having the bolt gage-holes therein and secured to the arms, the drive shaft and wheel situated between two of said arms, the slack-adjusters situated between said main frame member and said parallel frame members, the twisting-heads mounted in the heads of said arms opposite said parallel members from said main member, the auxiliary frame, the twisting-heads in said auxiliary frame, and the drive-chain, substantially as set forth.

12. In a wire-fence machine, the combination of the main frame member, the pair of parallel frame members having the gage-holes therein, the two-part frame-arms having the binding-bolts therein extending through said gage-holes, the slack-adjusting wheels mounted in said arms between said main frame member and said parallel frame members, the twisting-heads mounted in said arms at the sides of said parallel frame members opposite said main frame member, the drive-wheel, and the drive-chain, substantially as set forth.

13. In a wire-fence machine, the combination of the main frame member, the pair of parallel frame members extending parallel to the main frame member, the frame arms having the heads at the sides of the parallel frame members opposite to the main frame member, the twisting-heads in said heads, the auxiliary frame secured to said main frame member and having the bars in alinement with said parallel frame members and also having the heads adjacent to said bars, the twisting-heads in said last-described heads, the drive-chain, the driving-gears, the truss-rod attached to said main frame member, the guide-rods, the guide-head, and the spreaders, substantially as set forth.

705,501. NECKTIE-FASTENER. JOSEPH WEIL, New York, N. Y. Filed Mar. 28, 1902. Serial No. 100,380. (No model.)

Claim.—1. A neckwear-fastener made of a single and continuous piece of wire, bent to form an open spring-eye, a spring-tongue behind said eye and a laterally-extending arm at each side of the tongue and eye, said arm being formed by a continuation of the outermost part of the wire forming the eye and extending outward from the eye, at a point at about one-half the height of the eye, returning upon itself at its outer end, the two members of the arm thus formed being in the same plane throughout, substantially as set forth.

2. A neckwear-fastener made of a single and continuous piece of wire, bent to form a spring-eye, a spring-tongue behind said eye, an arm at each side of the tongue and eye, said arm extending in the direction from the top toward the bottom of the fastener, a U-shaped outwardly-projecting lateral arm formed at the lower end of each of said arms, that extend in the direction from top toward bottom of the shield, and said lateral arm located at about midway of the height of the fastener, the wire of said lateral arm being bent at its free end to form a clenching-arm, substantially as set forth.

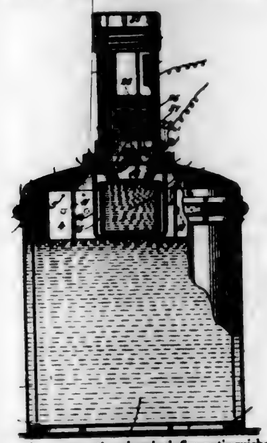
3. The combination with a neckwear-shield having two holes, of a neckwear-fastener located between the holes, and made of a single and continuous piece of wire, with a spring-tongue and open spring-eye in front of said tongue, a lateral arm at each side of said tongue and eye, formed by the outer end part of the wire forming the eye, said arms extending laterally from the fastener midway of the height of the same, the wire forming said arms being returned upon itself, and both shanks of the arm thus formed being in the same plane and resting snugly on the one surface of the shield, the end of the wire of each lateral arm being passed through one of the holes in the shield and folded down on that face of the shield opposite the one on which the fastener rests, substantially as set forth.

705,502. SPECTACLE OR EYEGLASS CASE. CHARLES M. WELLS, Southbridge, Mass. Filed Jan. 16, 1902. Serial No. 89,962. (No model.)

Claim.—1. As an improved article of manufacture, a spectacle or eyeglass case comprising a bottom piece and a top or front piece forming with the bottom piece a pocket, a flange projecting from the edge of the bottom piece opposite the mouth of said pocket to form in conjunction with said bottom piece a holding-receptacle for the eyeglasses, and a lid for the eyeglass-case hinged to the projecting edge of said flange, and a covering for said case and lid.

2. As an improved article of manufacture, a case for spectacles or eyeglasses comprising a body portion having a plain flat bottom, a straight back or flange projecting from said bottom, ends extending up from said bottom, and a bowed or curved front forming with the bottom and the flange a receptacle for eyeglasses, and a lid extending along and hinged to the top edge of the back of flange for its full length, an outside covering and an inside lining for the case and lid, substantially as described.

705,503. AUTOMATIC CHEMICAL FIRE-EXTINGUISHER. LOUIS WERLÉE, Elsmere, Del. Filed Jan. 20, 1902. Serial No. 90,413. (No model.)



Claim.—1. An automatic chemical fire-extinguisher, comprising separate receptacles for holding liquids to be used in generating a gas fatal to combustion, a substance tentatively held adjacent to one of said receptacles, heat-controlled mechanism for precipitating said substance into said receptacle adjacent thereto for the purpose of displacing the liquid into either receptacle, and means for distributing the gas thus formed.

2. An automatic chemical fire-extinguisher, comprising separate receptacles for holding liquids to be used in generating a gas fatal to combustion, a substance tentatively held adjacent to one of said receptacles, heat-controlled mechanism for simultaneously actuating an electric alarm and precipitating said substance into said receptacle adjacent thereto for the purpose of displacing liquid into either receptacle, and means for distributing the gas thus generated.

3. An automatic chemical fire-extinguisher, comprising separate receptacles for holding liquids to be used in generating a gas fatal to combustion, a receptacle for tentatively holding a material for displacing one of said liquids and provided with movable doors for supporting said substance, and a heat-controlled mechanism for automatically controlling said doors for the purpose of precipitating said substance.

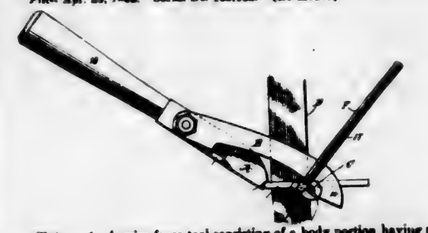
4. An automatic chemical fire-extinguisher, comprising separate receptacles for holding liquids to be used in generating a gas fatal to combustion, a receptacle for tentatively holding a material for displacing one of said liquids and provided with movable doors for supporting said substance, said doors being capable of conducting an electrical current, electrical contacts to be engaged by said doors for the purpose of actuating an electric alarm, and a heat-controlled mechanism for automatically controlling said doors.

5. An automatic chemical fire-extinguisher, comprising separate receptacles for holding liquids to be used in generating a gas fatal to combustion, a receptacle for holding a material for displacing one of said liquids and provided with swinging members for tentatively supporting said substance, rods provided with hooks for normally supporting said doors, and bodies of fusible material for normally supporting said rods.

6. An automatic chemical fire-extinguisher, comprising separate receptacles for holding liquids to be used in generating a gas fatal to combustion, a receptacle for holding a material for displacing one of said liquids and provided with swinging members for tentatively supporting said substance, said members having electrical conductors, electrical contacts to be engaged by said members for the purpose of actuating an electric alarm, rods provided with hooks for normally supporting said doors, and bodies of fusible material for normally supporting said rods.

7. An automatic chemical fire-extinguisher, comprising a flask provided with a circle of holes, an annular member encircling said flask adjacent to said holes and provided with perforations, said holes and perforations being for the purpose of distributing an agent used in extinguishing fires, and means for automatically forcing said agent through said holes and said perforations.

705,504. WIRE-FENCE TOOL. CHARLES WHIPPLE, Ashley, Ohio. Filed Apr. 29, 1902. Serial No. 105,188. (No model.)



Claim.—1. A wire-fence tool consisting of a body portion having a handle at its rear end, projections from the side portions of the said body, and clamping-arms pivotally attached to the sides of the body, which clamping-arms extend over the projections and beyond the forward end of the body, the forward ends of the clamping-arms being downwardly curved and terminating in heads, which heads when the arms rest upon the projections are beyond the plane of the under surface of the body, as set forth.

2. A wire-fence tool consisting of a body-section having a handle at its rear end and its forward end concaved, projections from the side portions of the body, clamping-arms pivoted to the sides of the body, being adapted in one position to rest on the said projections, which clamping-arms extend beyond the forward end of the body and are downwardly curved at their forward ends, terminating in heads having recesses in their inner edges, the recesses and the heads being below the plane of the under surface of the said body, as set forth.

3. In a wire-fence tool, a body-section having a handle at its rear end, its upper surface at its forward end being downwardly-inclined and its forward end being provided with horizontal slots at its side portions, projections from the sides of the body, clamping-arms pivoted to said side portions of the body, which arms in one position rest upon the said projections, the said arms extending beyond the forward end of the body, the projecting portions of the arms being downwardly and forwardly curved and provided with recesses in their inner edges near their forward terminals, as and for the purpose specified.

705,505. CIRCULAR SPRING-NEEDLE KNITTING-MACHINE. FRANK WILCOX, Norristown, Pa. Filed Aug. 7, 1900. Serial No. 26,157. (No model.)

Claim.—1. In a circular-rib-knitting machine, in combination the two rows of needles, means for making one row inoperative automatically, a series of web-holders and automatic means for making them operative and inoperative, substantially as described.

2. In a circular spring-needle, rib-knitting machine, with the two rows of needles, means for making one row inoperative automatically, web-holders arranged within the needle-row and having hooks pointing toward their stems and automatic means for making the web-holders inoperative.

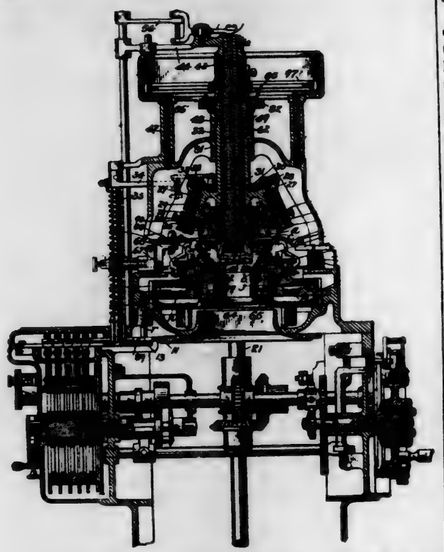
3. In combination in a circular-knitting machine, a series of needles having sets of long and short shanks, an advancing-cam for operating the needles for the formation of the loops with means for operating the same out of the path of both sets of needles to make the whole series inoperative, said cam having a step-by-step action, first out of line with the short-shanked needle and then out of line with all the needles.

4. In combination, in a circular-knitting machine, the long and short shanked needles, the cam for operating them for the formation of the loops and means for adjusting the cam laterally automatically step by step, substantially as described.

5. In combination in a circular-rib-knitting machine adapted to make a welt and comprising the two rows of needles, one row of needles being arranged in two sets with long and short laterally-projecting shanks, the laterally-movable cam with means for operating the same laterally step by step for throwing the circle of needles into and out of operation beginning and leaving off with one needle, the entire circle being out of operation when the throwing-out action is completed, substantially as described.

6. In combination, in a circular-knitting machine, the long and short shanked needles, the cam adjustable laterally in respect to the set of needles, the block carrying the cam, the cam-ring in which the block is guided

the ring having the stepped cam-slots and the connections for operating the ring.



7. In combination in a circular-rib-knitting machine with the two rows of needles, means for throwing one set of needles out of action automatically, the sinkers for feeding yarn to the operative set of needles, means for automatically adjusting the sinker-cam when one set of needles is thrown out of action to form the welt and means for adjusting the drawing-in cam of the operative needles, substantially as described.

8. In combination in a circular-rib-knitting machine, with the two rows of needles, sinkers or thread-measurers with operating means therefor for sinking the yarn across the stems of the needles, means for throwing one set of needles out of operation automatically and means for adjusting automatically the cam of the operative needles to take up the slack thread measured off by the sinkers or thread-measurers; substantially as described.

9. In combination, in a circular-knitting machine with the pivoted sinkers, the cam having its face extending at an acute angle to the stem of the sinker to have a contact movable longitudinally of the sinker.

10. In combination, in a circular-knitting machine, the sinkers with the adjustable cam and means for adjusting the sinker-cam automatically, comprising the screwed spindle, the nut thereon, a ring movable circumferentially for operating the nut and means for operating the ring, substantially as described.

11. In combination, in a circular-knitting machine, the sinkers, the cam therefor, the screwed spindle, the nut engaging the same, means for operating the nut automatically, means for turning the spindle by hand and a support for the sinker-cam carried by the screwed spindle, substantially as described.

12. In combination in a circular-rib-knitting machine, means for throwing out of action one set of needles, and means for adjusting the drawing-in cam of the other set, said means comprising the screwed spindle connected with the cam, the pinion on the screwed spindle, the geared ring meshing with the pinion and means for moving the geared ring circumferentially, substantially as described.

13. In combination, in a circular-rib-knitting machine, two rows of independently-operated needles, a single row of pivoted sinkers cooperating with the two rows of needles, a series of web-holders, the sinker-cam, means for throwing out of operation the second set of needles, means for adjusting in unison the sinker-cam and the drawing-in cam of the operating set of needles and means for automatically throwing the web-holders into operation, substantially as described.

14. In combination, in a circular-knitting machine, a rotary bed for the needles, a cap or cover for said bed, having a hollow stem through which the shaft of the bed passes, the ring surrounding the stem and supported by the cover, a nut operated by said ring, the drawing-in cam and the spindle connected therewith and with the nut, substantially as described.

15. In combination, with the drawing-in cam, the spindle connected therewith, a nut screwed on the spindle with means for operating the nut automatically and means whereby the spindle may be adjusted by hand, substantially as described.

16. In combination, in a rib-knitting machine, means for throwing one set of needles into and out of operation, web-holders arranged within the circle of the other set of needles, and means for throwing the said web-holders into and out of operation, said means extending down through the needle-bed of the operative set of needles, substantially as described.

17. In combination, the two rows of needles, of a rib-knitting machine, means for throwing one set of needles out of operation, a series of web-holders arranged within the circle of the operative needles, the needle-bed of said needles having a hollow shaft, the fixed sleeve extending down within the hollow shaft, the bed for the web-holders supported on the lower end of said sleeve, the cam for operating the web-holders and the rod extending down through the fixed sleeve and connected with the cam for operating the same, substantially as described.

18. In combination, the two rows of needles, the web-holders arranged within the needle-circle, the fixed bed for the web-holders within the needle-circle, the needle-bed, the hollow shaft, the rod extending down through the same, the cam for the web-holders and the bell-crank levers between the rod and the cam, substantially as described.

19. In combination, the needles, the web-holders arranged within the circle of the needles, the rod extending down through the needle-bed to operate the web-holders and the cam for pressing the rod down with connections for operating the cam, substantially as described.

20. In combination, the inclined adjustable cam, the cam-ring having an inclined surface for guiding the cam in its adjustment, means for adjusting the same and the loose connection between the adjusting means and the cam.

21. In combination, the inclined adjustable cam, the cam-ring having an inclined surface for guiding the cam in its adjustment, the vertically-movable part for adjusting the same and the loose connection between said part and the inclined cam.

22. In combination, the two rows of needles, the knock-off cam for one row of needles and a cam operating upon the needles of the other row for advancing them during the knock-off movement.

23. In combination, a plurality of presser-wheels adapted to be thrown out of action, and means for automatically moving them in succession out of operation, the one first thrown out being maintained inoperative when the other or others are rendered inoperative.

24. In combination, a plurality of presser-wheels and means for throwing them out of operation, said means being arranged to have either entire or partial or full movement to throw one or more presser-wheels out, substantially as described.

25. In combination, the plurality of presser-wheels, the supports therefor, connections for throwing the presser-wheels out of action, said connections including means for providing lost motion at one or more of the presser-wheels whereby the presser-wheels will be rendered inoperative in succession, substantially as described.

26. In combination, the presser-wheels, the supports therefor, the sleeves on the supports adapted to make contact and move the different presser-wheels at different times and means for operating the sleeves, substantially as described.

27. In combination, the thread-carrier finger pivotally supported to be moved in a vertical plane and an arm pivoted to swing horizontally and carrying the finger.

28. In combination, the two rows of needles, the knock-off cam for one row of needles, and a cam operating upon the needles of the other row for advancing them during the knock-off movement, said rows of needles being at an obtuse angle to each other, substantially as described.

29. In combination, the two rows of needles, the web-holders arranged within the needle-circle, the fixed bed for the web-holders within the needle-circle, the needle-bed, the hollow shaft, the rod extending down through the same, the cam for the web-holders and operating means between the rod and the cam, substantially as described.

30. In combination, the adjustable cam and means for adjusting the same having a loose connection therewith, said cam and means being arranged at different angles and moving in different planes, substantially as described.

31. In combination in a circular-rib-knitting machine, the two rows of needles and means for throwing the entire circle of needles into and out of operation beginning and leaving off with a single needle, the throwing-in of the needles taking place only from the retracted position of the needles and the needles being thrown out of action only after they have been returned to their retracted position, substantially as described.

32. In a circular-rib-knitting machine, in combination the two rows of needles, means for making one row inoperative automatically, a series of web-holders arranged within the needle-circle and means for making them operative and inoperative, substantially as described.

33. In a circular-rib-knitting machine, in combination, the two rows of needles, means for making one row inoperative, a series of web-holders within the needle-circle, means for making them operative and inoperative and a row of sinkers encircling the needles, substantially as described.

705,506. GARMENT-SUPPORTER. JESSIE WILKINSON, Cleveland, Ohio. Filed Mar. 11, 1901. Serial No. 50,533. (No model.)

Claim.—1. A garment-supporter comprising a flexible metallic waist-band having its end portions extended at an angle to its body portion, and means for securing said end portions together to make the waistband extend from the waist-line at the back down and around the abdomen in front, substantially as described.

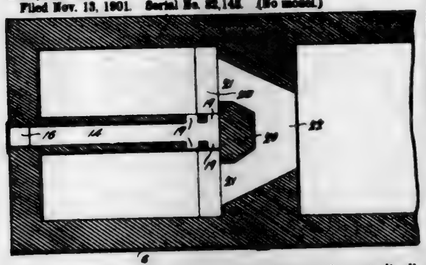
2. A metallic waist-belt comprising two sections provided with means for adjustment at the back, the front ends of said sections being extended downward and provided with fastening means, said belt when in use extending from the line of the waist at the back around the abdomen in front, substantially as described.

3. A metallic waist-belt provided with downwardly-extending front ends having fasteners thereon, means for adjusting the belt at the back, hooks at intervals around the belt, and points or prongs on the lower edge of the belt at the back, substantially as described.

705,507. STOVEPIPE. BERT A. WILLIAMSON, Maitland, Mo. Filed Jan. 24, 1902. Serial No. 91,126. (No model.)

Claim.—The combination with a stovepipe having upper and lower inclosures forming chambers, of a drum terminally secured to the said inclosures and having a clear flue-space extending vertically through the center thereof, the said drum being also formed with inwardly-projecting radially-arranged ducts of alternate long and shorter extent, the said ducts extending completely in a vertical direction from the lower to the upper end of the drum and opening out through the periphery of the latter, the alternate long and shorter arrangement of the ducts preventing clogging of the throats between the latter communicating with the central flue-space, the upper and lower terminals of the ducts being closed and the spaces between said ducts opening into the upper and lower chambers.

705,508. BOILER-FURNACE. THOMAS YORK, Portsmouth, Ohio. Filed Nov. 13, 1901. Serial No. 82,142. (No model.)

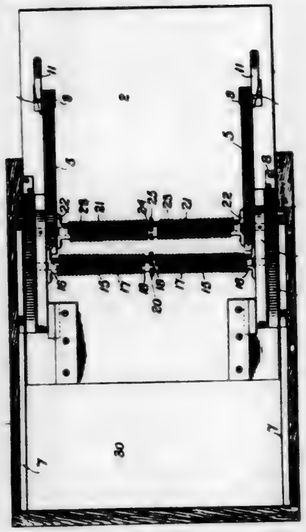


Claim.—1. The combination in a boiler-furnace, of a centrally-disposed longitudinal wall dividing the ash-pit and combustion-chamber into two sections, said wall being built solidly to a point above the level of the grates and being provided with an air duct or passage having communication at one end with an air-supply and having at its rear end side ducts or passages opening into the rear of the combustion-chamber, and a bridge-wall having an opening leading from each of the combustion-chambers, and a rear escape-opening connecting with the combustion-chamber openings to form a passage for the products of combustion.

2. The combination in a steam-boiler furnace, of a centrally-disposed longitudinal wall dividing the fire-pot and combustion-chamber into two sections, said wall having an air duct or passage extending longitudinally thereof, at a point above the grate-surface and having at its outer end a valved passage in communication with an air-supply, there being at the rear end of said wall side ducts or openings to permit of the passage of air to the rear of the combustion-chambers, a lateral bridge-wall having an opening leading from each of the combustion-chambers at a point above and to the rear of the rear ends of the grate-bars and in horizontal alinement with the air duct or passage of the longitudinal wall, substantially as specified.

3. The combination in a boiler-furnace, of the ash-pit and combustion-chamber, the centrally-disposed longitudinal wall 12 formed of ordinary fire-brick and built solidly up to a point above the level of the fuel-grate and being provided with a longitudinally-disposed air duct or passage 14 having communication with a vertically-disposed air duct or passage 16, a damper 18 disposed in said passage 16, said longitudinal duct 14 being provided at its rear end with side ducts or openings 19 opening into the two divisions of the combustion-chamber, and a bridge-wall having a centrally-disposed longitudinal passage 22 located above the rear ends of the grates and having tapering side walls, there being a flue or passage 21 leading from each of the combustion-chambers and merging into the passage 22, substantially as specified.

705,509. TYPE-WRITER CABINET. JOHN B. ANDERSON, Muskegon, Mich., assignor of one-half to Ulrich J. Beumee, Muskegon, Mich. Filed July 3, 1901. Serial No. 67,465. (No model.)



Claim.—1. In a type-writer desk, the combination with the table, of lifting apparatus consisting essentially of interpivoted levers, and a tension device arranged horizontally between said levers and consisting essentially of reversely-coiled springs that apply their power against the levers, and means for regulating the tension of said springs.

2. In a type-writer desk, the combination with the table, of lifting means therefor comprising levers, springs coiled between said levers, and tightening devices for regulating the tension of the springs, consisting of a rotary sleeve to which the springs are connected and a rod passing through the springs and the sleeve, and means whereby the sleeve and rod are engaged.

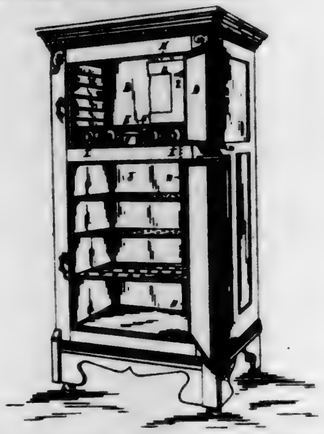
3. In a type-writer desk, the combination with the table, of lifting means comprising interpivoted levers, spring devices between the levers for lifting the latter, and means for regulating the tension of the springs, consisting essentially of a rotary sleeve to which the springs are connected, together with a rod passing through the springs and the sleeve.

and means for causing the sleeve to be engaged with the rod, together with the levers for supporting the shelf after it has been raised.

4. In a type-writer desk, the combination with the table, of interpivoted levers, one of which is hinged to the table and both of which have rollers, for engaging the desk-frame, tension-springs arranged horizontally between the levers, forward supporting-levers that engage and uphold the shelf after it has been lifted, and disengaging devices for said supporting-levers.

5. The combination with the table, and interpivoted levers arranged beneath it, of tension devices for said levers consisting of reversely-coiled springs, a central rotary sleeve to which said springs are connected, a rod running through the springs and the rotary sleeve and supported at its ends by attachment to the outer of the levers, and a pin passing through a perforation in the sleeve and engaging the inner rod, substantially as described.

705,510. REFRIGERATOR. FRANCIS B. BEAL, Northville, Mich. Filed Jan. 11, 1901. Serial No. 43,523. (No model.)



Claim.—1. In a refrigerator the combination with an ice-chamber, of an upright front door adjacent to the ice-chamber, a separate inner upright door in front of said ice-chamber and controlling access to the ice-chamber, said inner door spaced from the outer door, said inner door also spaced at its upper edge from adjacent portions of the refrigerator to permit an air circulation.

2. In a refrigerator, the combination of an ice-chamber a cooling-chamber therebelow, an ice-rack at the base of the ice-chamber, an outer upright door in front of said chambers, a separate inner upright door in front of the ice-chamber between the ice-chamber and said outer door and spaced from the outer door to protect the ice in the ice-chamber from the air when the outer door is open and controlling access to the ice-chamber.

3. In a refrigerator, the combination with an ice-chamber, of an upright outer door adjacent to said chamber, an ice-rack at the base of the ice-chamber, a cooling-compartment underneath the ice-rack communicating through the ice-rack with the ice-chamber, a separate upright inner door above the cooling-chamber to protect the ice-chamber and controlling access to the ice-chamber, and a drip-pan at the base of the cooling-compartment to receive the water from the ice, said drip-pan formed with an opening therethrough and with an upright flange about said opening for the purpose described.

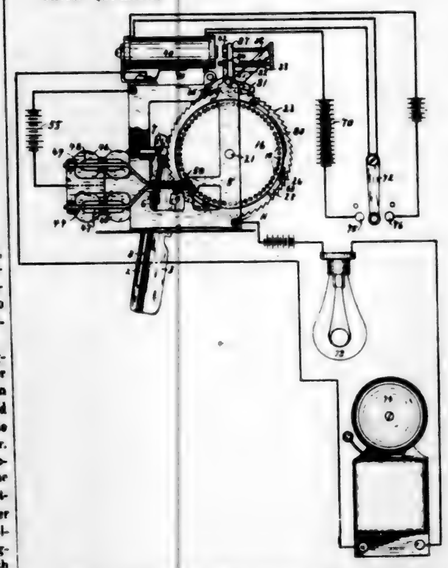
4. In a refrigerator, the combination with an ice-chamber, of an outer upright door adjacent to said chamber, a separate inner upright door to protect the ice-chamber and controlling access to the ice-chamber, a provision-chamber, and a cooling-compartment between the provision-chamber and the ice-chamber, said inner door spaced from said outer door and from the adjacent portions of the refrigerator at the upper edge of the inner door, the cooling-compartment communicating with the ice-chamber and with the provision-chamber, and whereby an air circulation is afforded through the ice-chamber, the cooling-compartment and the provision-chamber, and between the outer and inner doors.

5. In a refrigerator, the combination of an ice-chamber at the top of the refrigerator provided with an open ice-rack at the base thereof, a provision-chamber at the base of the refrigerator, a cooling-compartment between the provision-chamber and the ice-chamber communicating with both the ice-chamber above and with the provision-chamber beneath, and a drip-pan at the base of said cooling-chamber separating the provision-chamber from the cooling-compartment, said drip-pan provided with a waste-pipe, and with an opening through which the cooling-compartment communicates with the provision-chamber therebeneath, and means above the openiag in the drip-pan to prevent water from the ice-chamber passing through said opening.

6. In a refrigerator, an ice-chamber at the top of the refrigerator, a provision-chamber at the base of the refrigerator, a cooling-compartment located between the ice-chamber and the provision-chamber provided with a waste-pipe, an ice-rack provided with openings therethrough at the base of the ice-chamber through which the ice-chamber communicates with the cooling-chamber whereby the drip from the ice-chamber may be utilized for cooling articles in the cooling-compartment, a drip-pan at the base of the cooling-chamber provided with an opening in the base thereof through which the cooling-compartment communicates with the provision-chamber, said drip-pan having an upwardly-projecting flange about said opening to prevent water from the cooling-compartment overflowing through said opening into the provision-chamber, said ice-rack constructed to prevent any drip passing therethrough into said opening in the drip-pan.

7. In a refrigerator, the combination of an ice-chamber a cooling-chamber therebelow, an ice-rack at the base of the ice-chamber, an outer upright door in front of said chambers, a separate inner upright door in front of the ice-chamber, between the ice-chamber and said outer door and spaced from the outer door to protect the ice in the ice-chamber from the air when the outer door is open and controlling access to the ice-chamber.

705,511. MULTIPLEX TELEGRAPH. WILLIAM S. BURNETT and WILLIAM H. GOODALL, Milwaukee, Wis. Filed Apr. 6, 1900. Serial No. 11,791. (No model.)



Claim.—1. In a circuit-closing mechanism for electrical stations, the combination of a circuit-closer at each station having individual characteristics; a carrier located at each station and provided with a series of elements adapted to be adjusted in accordance with the individual characteristics of the circuit-closer at such station; an electromagnetic device controlling the movement of the carrier; and means for definitely limiting the length of the carrier movement for any one electrical impulse.

2. In a circuit-closing mechanism for electrical stations, a carrier at each station provided with differentiating elements; a plurality of devices for mechanically limiting the movement of the carrier; and electromagnetic means for independently operating said devices, whereby the movement of the carrier may be divided into fixed differential distances of either equal, or unequal length.

3. In a circuit-closing mechanism for electrical stations, a carrier at each station provided with differentiating elements; and electrically-controlled mechanism for holding said carrier and permitting its movement at fixed distances of equal, or unequal length, according to the will of the operator.

4. In a circuit-closing mechanism for electrical stations, a carrier at each station provided with differentiating elements; means for driving the carrier; stopping devices adapted to move with the carrier, but capable, respectively, of differently-limited independent movement; and electrically-controlled mechanism for alternately engaging the carrier, and any one or more of the stopping devices, at the selection of the operator.

5. In a circuit-closing mechanism for electrical stations, a carrier at each station provided with differentiating elements; means for driving the carrier; stopping devices adapted to move with the carrier, but capable respectively, of differently-limited independent movement; means for restoring the stopping devices to their original position after such independent movement; and electrically-controlled mechanism for alternately engaging the carrier and any one or more of the stopping devices, at the selection of the operator.

6. In a circuit-closing mechanism for electrical stations, a carrier at each station provided with differentiating elements; electrically-controlled mechanism for holding said carrier and permitting its movement at fixed distances of equal, or unequal length, according to the will of the operator; and similarly-controlled mechanism arranged to operate concurrently with the holding mechanism for adjusting the differentiating elements in position for contact with the circuit-closer.

7. In an electrical circuit connected with a plurality of stations, the combination of circuit-closing keys for the stations, having characteristics different from the keys of other stations; carriers provided with a series of key-actuating elements; electromagnets controlling the movement of said carriers; and electromagnetic means for adjusting said elements in any carrier to fit the individual characteristics of its respective key.

8. In an electrical circuit connected with a plurality of stations, the combination of a circuit-closing key for each station, having characteristics different from the keys of other stations; a carrier provided with a multiple series of key-actuating elements; electromagnets controlling the movement of said carrier; and electromagnetic means for adjusting said elements to fit the individual characteristics of any one of said keys; together with means for actuating the carrier and the key-actuating elements.

9. In an electrical circuit connected with a plurality of stations, the combination of keys for the stations, each having characteristics different from the keys of other stations; key-actuating devices at the stations, adapted to be adjusted to the individual characteristics of one of the keys; means for actuating said devices; and electromagnetic means for adjusting the key-actuating devices, said devices being ineffective to move a key into operative position except when adjusted to the individual characteristics of such key.

10. In an electrical circuit connected with a plurality of stations, the combination of keys for the stations having characteristics different from the keys of other stations; key-actuating devices at the stations, adapted to be adjusted to the individual characteristics of the keys; means for actuating said devices; electromagnets controlling the movement of the key-actuating devices; electromagnets for adjusting the key-actuating devices to the individual characteristics of its respective key; and means for energizing certain of said controlling and adjusting electromagnets concurrently; said key-actuating devices being ineffective to move a key into operative position, except when adjusted to the individual characteristics of such key.

11. In an electrical circuit connected with a plurality of stations, the combination of circuit-closing keys for the stations having characteristics different from the keys of the other stations; key-actuating devices at the stations, adapted to be adjusted to the individual characteristics of the keys at such stations; means for actuating said devices; electromagnets for adjusting the key-actuating devices to the individual characteristics of the keys at such stations; means for energizing certain of the adjusting and controlling magnets concurrently; and means for readjusting the key-actuating devices to an inoperative position, except when adjusted to the individual characteristics of such key.

12. In an electrical circuit connected with a plurality of stations, the combination of circuit-closing keys for the stations, each having characteristics different from the keys of other stations; key-actuating devices adapted to be adjusted to the individual characteristics of the keys; means for actuating said devices; electromagnets controlling the movements of said devices; electromagnets for adjusting said devices to the individual characteristics of the keys; said devices being ineffective to move a key into operative position, unless adjusted to the individual characteristics thereof; together with means for communicating motion from said devices to restore the keys to their initial position.

13. In an electrical circuit connected with a plurality of stations, the combination of circuit-closing keys for the stations, each having characteristics different from the keys of the other stations; a carrier at each station, provided with a series of key-actuating elements; means for actuating the carrier; electromagnetic means for controlling the movement thereof; electromagnetic means for adjusting the key-actuating elements of the carrier to register with the individual characteristics of their respective keys; and key-supporting devices adapted to release the respective keys and permit them to return to their initial position, when the adjusting actuating elements of the carrier fail to register with the individual characteristics of such keys.

14. In an electrical circuit connected with a plurality of stations; the combination of circuit-closing keys for the stations, each having characteristics different from the keys of the other stations; a carrier at each station, provided with a series of key-actuating elements; means for actuating said carrier; electromagnetic means for adjusting the key-actuating elements of the carriers to register with the individual characteristics of their respective keys.

15. In an electrical circuit connected with a plurality of stations; the combination of circuit-closing keys for the stations, each having characteristics different from the keys of the other stations; a carrier at each station, provided with a series of key-actuating elements; means for actuating said carrier; and electromagnetic means for controlling the movement of the carrier.

16. In an electrical circuit connected with a plurality of stations; the combination of circuit-closing keys for the stations, each having characteristics different from the keys of the other stations; a carrier at each station, provided with a series of key-actuating elements; means for actuating said carrier; electromagnetic means for controlling the movement of the carrier; and means for restoring the keys to their initial positions.

17. In an electrical circuit connected with a plurality of stations; the combination of circuit-closing keys for the stations, each having characteristics different from the keys of the other stations; a carrier at each station, provided with a series of key-actuating elements; means for actuating said carrier; electromagnetic means for adjusting the key-actuating elements of the carriers to register with the individual characteristics of their respective keys; and means for automatically restoring the key-actuating elements to an inoperative position, after said elements have actuated the key.

18. In an electrical circuit connected with a plurality of stations; the combination of circuit-closing keys for the stations, each having characteristics different from the keys of the other stations; a carrier at each station, provided with a series of key-actuating elements; means for actuating said carrier; electromagnetic means for adjusting the key-actuating elements of the carriers to register with the individual characteristics of their respective keys; and means for restoring the keys to their initial positions.

19. In an electrical circuit connected with a plurality of stations; the combination of circuit-closing keys for the stations, each having characteristics different from the keys of the other stations; a carrier at each station, provided with a series of key-actuating elements; means for actuating the carrier; a plurality of sliding connections mounted on said carrier; stops for limiting the movement of said connections, arranged to allow each such connection a different movement from the other; holding devices for said carrier; and sliding connections, and electromagnetic means for releasing said holding devices interchangeably, whereby the movement of the carrier is controlled.

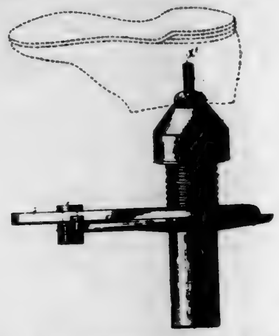
20. In an electrical circuit connected with a plurality of stations; the combination of circuit-closing keys for the stations, each having characteristics different from the keys of the other stations; a carrier at each station, provided with a series of key-actuating elements; means for actuating the carrier; a plurality of sliding connections mounted on said carrier; stops for limiting the movement of said connections, arranged to allow each such connection a different movement from the other; holding devices for said carrier; and sliding connections, and electromagnetic means for releasing said holding devices interchangeably, whereby the movement of the carrier is controlled; electromagnets arranged to be switched into and out of circuit with a source of electrical current by said sliding connections; and levers adapted to be actuated by such magnets to adjust the key-actuating elements with reference to the individual characteristics of the keys.

21. In an electrical circuit connected with a plurality of stations; the combination of circuit-closing keys for the stations, each having characteristics different from the keys of the other stations; a rotary disk-carrier at each station; means for driving said carrier; a series of key-actuating elements adjustably connected with said carrier; electromagnetic means for controlling the movement of said carrier; electromagnetic means for adjusting said key-actuating devices into registry with a key; and means for securing a concurrent action of the carrier-controlling and the adjusting magnets.

22. In a circuit-closing mechanism for electrical stations, a carrier at each station; differentiating elements adapted to be supported thereby; and means, controlled by electrical impulses of variable character for regulating the carrier movement in correspondence with the character of the impulse transmitted, whereby the movement of the carrier is controlled independently of the duration of the transmitted impulses.

23. In a circuit-closing mechanism for electrical stations, a series of differentiating elements mounted in a suitable support at each station; and means, controlled by electrical impulses of variable character, for adjusting the differentiating elements of any one series to the desired operative, or inoperative, position, whereby such adjustment may be effected, independently of the duration of the transmitted impulses.

705,512. JACK FOR SLUGGING AND NAILING MACHINES. LOUIS A. CASGRAIN, Winchester, Mass., assignor, by mesne assignments, to the United Shoe Machinery Company, a Corporation of New Jersey. Filed June 10, 1898. Serial No. 683,119. (No model.)



Claim.—1. A universally-tipable last-holding pin, combined with a yielding support for said pin and locking means to hold said pin in any position in which it may be put by the requirements of the work, said locking means retaining said pin in locked position only while a slug or nail is being driven.

2. A universally-tipable last-holding pin, a support for the same, and locking means for said pin operative only when a slug or nail is being driven to lock said pin in the position it should occupy according to the requirements of the work to be nailed.

3. A jack presenting a yielding curb, means to support and direct said curb in its yielding movement, a tipable last-pin mounted in said curb loosely and capable of adapting itself to the requirements of the last, and means acting during the yielding movement of said curb to lock the last-pin in the position occupied by it when the work was put into the position required for nailing.

4. A yielding spring-supported curb having a cup-shaped seat, a last-pin presenting a spherical enlargement resting and movable in said seat, and a slide-plate with which said pin is loosely connected, combined with a toothed plate, and a toothed locking-plate between which said slide is located, change in the position of the toothed plate and toothed locking-plate confining the slide and last-pin in fixed position.

5. A yielding spring-supported curb having a cup-shaped seat, a last-pin presenting a spherical enlargement resting and movable in said seat, and a slide-plate with which said pin is loosely connected, combined with a toothed plate, and a toothed locking-plate between which said slide is located, change in the position of the toothed plate and toothed locking-plate confining the slide and last-pin in fixed position, and a spring connected with said toothed plate and embracing the slide-plate.

6. A jack containing a last-holding pin provided with a ball or sphere like portion whereby said last-pin may have a substantially universal movement, a yielding seat for said ball or sphere, and means to lock and hold said pin during the driving of a slug or nail in the position in which the said pin may have been made to occupy by placing the last on said pin and putting the sole in its proper position preparatory to driving a slug or nail.

7. In a jack, a last-holding pin provided with a partial ball or sphere, a curb having a seat for said ball or sphere, and a movable nut to keep the ball or sphere seated in said seat, substantially as described.

8. In a jack, a last-holding pin provided with a partial ball or sphere, a curb having a seat for said ball or sphere, and a movable nut to aid in keeping the ball or sphere seated in said seat, a slide made movable with said pin, and a toothed plate coöperating with said slide, a relative change of position of said toothed plate and slide being effected preparatory to driving a slug or nail, to then lock said slide and pin in position temporarily, substantially as described.

9. In a jack, a hub, a plate having a shank guided by said hub and provided with an attached curb having a ball-seat, a spring to separate the plate carrying said curb and the said hub for a defined distance, a toothed locking-plate mounted loosely in said curb and sustained by suitable pins extended outwardly through the plate carrying the curb, a toothed plate fixed in said curb, and a toothed slide mounted between said toothed locking-plate and said toothed plate, combined with a last-holding pin provided with a ball or sphere entering said seat and actuating said slide, and means to keep said ball or sphere in operative position in said seat, substantially as described.

10. In a jack, the curb having the seat described, and a fixed toothed plate, a movable toothed slide, and a last-holding pin having a ball-like or spherical portion entering said seat, and a toothed slide adapted to be moved with said pin, combined with a toothed locking-plate which, by a change of position of said curb with relation to said toothed locking-plate, causes the latter to engage said slide, clamping it firmly between itself and the said toothed plate, thereby effectually locking the last-holding pin temporarily in a defined position according to the requirements of the work, substantially as described.

11. A plate adapted to be sustained by a horn-shank, a swing-plate movable freely thereon and provided with a hub, a plate having a shank inserted in said hub and provided with a curb having a concaved seat, a spring to normally keep said plate and curb in its elevated position, a last-pin having a ball-like or spherical portion mounted in said seat, means to retain said ball-like or spherical portion in said seat yet permit it to be moved freely therein, combined with locking means coöperating with the lower end of said pin to lock it whenever the relative positions of the said plate and its attached curb are changed with relation to the said hub, to thereby temporarily lock the last-holding pin in any desired position for the driving of a slug or nail, substantially as described.

12. The swing-plate, a support for it, a guided shank vertically movable with relation to said swing-plate, combined with a last-holding pin supported by and universally movable with relation to said shank, and means to lock said last-pin in any position in which it may be put, while a nail or slug is being driven, substantially as described.

13. A universally-tipable work-support and means to lock said work-support against tipping, said locking means being operative only when the work is under pressure.

14. A universally-tipable work-support and means to lock said work-support against tipping, said locking means being automatically operative when the work is under pressure.

705,513. BOX FOR CIGARETTES, MATCHES, OR THE LIKE. JOHN E. CLARK, New York, N. Y., assignor to Nelly M. Clark, New York, N. Y. Filed Aug. 20, 1901. Serial No. 72,719. (No model.)

Claim.—1. In a box, a flame-guard having an opening in a broad side and having one of its broad sides shortened, a receptacle slidably fitted in the flame-guard and having a loose end provided with a flap to extend over an end portion of the receptacle and come opposite the shortened side of the flame guard, and a case having the flame-guard and receptacle independently slidable therein and adapted to close the opening in the broad side of the flame-guard and to confine the aforesaid flap, substantially as described.

2. In a box, a flame-guard having an end portion cut away from its narrow sides, a receptacle slidable within the flame-guard, and a case to receive the flame-guard and receptacle and having a portion cut away at one end of its narrow sides to register with the cut-away portions of the flame-guard to admit of gripping the aforesaid receptacle, substantially as described.

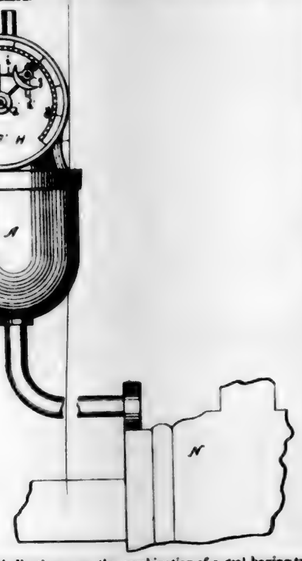
3. In combination with a flame-guard having a broad side extended and having an opening therein, a receptacle slidable within the flame-guard and adapted to close the side opening thereof and having a flap coextensive with the end cut-away portion of the broad side of the flame-guard, substantially as described.

4. A box comprising a receptacle having a loose end and a flap at the extremity of the said end, a flame-guard for the receptacle to slide into and having a side opening and an extension, and a case to receive the flame-guard and receptacle to hide the opening and the cut-away portions of the flame-guard and to confine the flap of the receptacle, and having an end of its narrow sides notched, substantially as and for the purpose described.

705,514. SPEED-GAGE. HENRY S. CRESLENBAUGH, New Carlisle Ohio. Filed July 15, 1901. Serial No. 68,422. (No model.)

Claim.—1. In a speed-indicating gage, the combination of a dial having two reading-scales, one of which to indicate the various speeds at

which a vehicle is driven, and the other of which to indicate the maximum speed at which such vehicle may be driven, a sleeve geared to the hand of the pointer which indicates the first-named speeds, a rotating shaft driven from a rotating part of a vehicle, centrifugal devices connecting said sleeve and shaft and whereby a rotary and vertically-reciprocating movement is imparted to said sleeve, alarm devices adapted to indicate the maximum speed as indicated on the dial, electrical connections between said alarm devices and said sleeve, a circuit-closer under the control of said sleeve and whereby the said circuit-closer is closed upon an elevation of said sleeve, and the alarm is sounded when the vehicle has attained its maximum or prescribed limit of speed, substantially as and for the purpose specified.

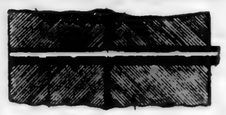


2. In a speed-indicating gage, the combination of a dial having two reading-scales, one of which indicates the various speeds at which a vehicle is driven, and the other of which indicates the maximum speed at which such vehicle may be driven, a sleeve geared to the hand of the pointer which indicates the first-named speeds, said sleeve having an enlargement or projection above the toothed portion, centrifugal devices through which said sleeve is given a rotary and a vertical movement, alarm mechanism, electrical connections between said alarm mechanism and said sleeve, and an adjustable contact with which the enlarged portion of said sleeve connects when the maximum speed of the vehicle is attained, and whereby the circuit is closed and the alarm is sounded simultaneously with the indication of maximum speed on the dial, substantially as and for the purpose specified.

3. In an indicating-gage for indicating the speed of a vehicle, the combination of a shaft adapted to rotary motion, means for driving said shaft from a rotating portion of a vehicle, a sleeve loosely connected to said shaft and subjected to a rotary motion therewith, and also to a vertically-reciprocating movement, centrifugal devices connecting said sleeve with the shaft, a series of annular projections on said sleeve, an enlargement on said sleeve above said annular projections, a dial bearing indications denoting the speeds at which the shaft and the sleeve are rotated, and likewise the speed at which the vehicle is driven, a pinion geared to said annular projections, a pointer movable by said pinion to positions to indicate such speeds on the dial, an alarm device adapted to sound an alarm when the speed of the vehicle reaches a prescribed limit, electrical connections between said alarm device and said sleeve, a circuit-closer actuated by the enlarged portion of said sleeve, and whereby the circuit is closed when said sleeve is lowered to a predetermined point and an alarm is sounded, substantially as and for the purpose specified.

705,515. JOINT FOR USE IN PNEUMATIC APPARATUS. CHAS. L. DAVIS, Chicago, Ill., assignor, by direct and mesne assignments, to Engelina Honer, William H. Honer, and A. Miller Baldwin, Chicago, Ill. Filed Apr. 30, 1900. Serial No. 14,976. (No model.)

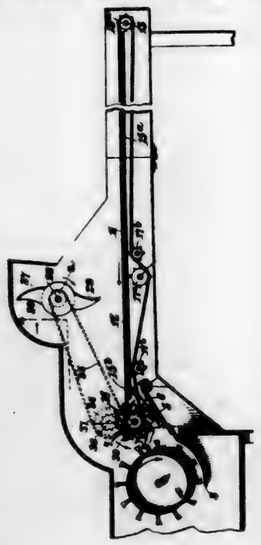
Claim.—1. In a pneumatic apparatus, the combination of a metallic pipe having its end provided with a laterally-projecting lip or flange, a support or holder for said pipe, the said support or holder being composed of wood, and the pipe or tube being fitted into the same, so that the lip or flange overlaps the surface of the wood, and a member having a port or passage adapted to form a continuation of the bore of the said pipe or tube, the said member being fitted against the wooden support or holder for the pipe or tube, so that the port or passage in the member registers with the bore of the pipe or tube and also so that the rim of said port or passage abuts against the lip or flange which overlaps the surface of the support or holder, and which thus lies and fits closely between the abutting surfaces of said support and said member, substantially as set forth.



2. In a pneumatic apparatus, the combination of a metallic pipe having its end provided with a laterally-projecting lip or flange whose outer edge is bent backwardly, a support or holder for said pipe, the said support or holder being composed of wood and the pipe or tube being fitted into the same, so that the lip or flange overlaps the surface of the wood, and a wooden member having a port or passage adapted to form a continuation of the bore of the said pipe or tube, the said wooden member being fitted against the wooden support or holder for the pipe or tube so that the port or passage in the member registers with the bore of the pipe or tube, and also so that the rim of said port or passage abuts against the lip or flange which overlaps the surface of the support or holder and which thus lies and fits closely between the abutting wooden surfaces of said support and said member, substantially as set forth.

3. In a pneumatic apparatus, the combination of a metallic pipe having its end provided with a laterally-projecting lip or flange, a support or holder for said pipe, the said support or holder being composed of wood and the pipe or tube being fitted into the same so that the lip or flange overlaps the surface of the wood, a wooden member having a port or passage adapted to form a continuation of the bore of the said pipe or tube, the said wooden member being fitted against the wooden support or holder for the pipe or tube, so that the port or passage in the member registers with the bore of the pipe or tube and also so that the rim of said port or passage abuts against the lip or flange which overlaps the surface of the support or holder and which thus lies and fits closely between the abutting wooden surfaces of said support and said member, and a layer of felt interposed between the abutting surfaces of the holder and member, so as to fit against the lip or flange on said pipe or tube, substantially as described.

705,516. BAND-CUTTER AND FEEDER. JOHN B. DENLINGER, Union City, Ind., assignor of one-half to Benjamin E. Denlinger, Union City, Ind. Filed Mar. 5, 1901. Serial No. 49,858. (No model.)



Claim.—1. The combination with an endless bundle-carrier, a rotary shaft, a series of distributing-fingers mounted thereon, and a grain-return board, of a series of clearers or guard-fingers supported in advance of the shaft and extending under and to the rear thereof, said clearers or guard-fingers forming at their rear edges abutments for doffing the straw from the distributing-fingers.

2. In a bund-cutter and feeder, the combination with the endless bundle carrier, a series of rotary distributers disposed at one end of the upper run thereof, a return-board located below the distributers, a table disposed below the upper run of the bundle-carrier, and a supporting-bar for said table, of a series of longitudinally-curved and tapering distributer clearers or guards secured at their front ends to said supporting-bar and extended between the distributers immediately above the return-board, said guards being arranged in pairs, each of which pairs is arranged for the reception of a distributer, the rear vertically-disposed end edges of the guards being disposed to form abutments against which the straw is caught and detached from the distributers.

3. In a bund-cutter and feeder, the combination with an endless bundle-carrier, a distributer-shaft located at one end thereof, distributers carried by said shaft, a carrier-shaft geared directly to the bundle-carrier at a point intermediate the ends of the latter, a power-transmitting shaft geared to the carrier-shaft, a shiftable pinion mounted upon the power-transmitting shaft, a friction-disk carried by the distributer-shaft and having its outer face entirely unobstructed, movable journal-boxes supporting the inner end of the power-transmitting shaft and located at opposite sides of the friction-disk, springs disposed to urge the journal-boxes to maintain the contact between the friction-pinion and the disk, and means for regulating the tension of said springs.

4. In a bund-cutter and feeder, the combination with a bundle-carrier, a distributer-shaft, and a threshing-cylinder disposed beyond the distributer-shaft, of a series of rotary distributers supported by the shaft and comprising longitudinally-curved fingers rotated in a direction to present their convex edges to the straw to distribute the same to the cylinder, and having their concaved edges sharpened, whereby straw tangled around the fingers will be drawn against the sharpened edges of the latter and severed as the straw is carried down by the threshing-cylinder.

5. In a bund-cutter and feeder, the combination with an endless bundle-carrier, a series of rotary distributers disposed at one end of the upper run thereof, of a series of longitudinally curved and tapered distributer clearers or guards secured at their front ends and extended between the distributers, said guards being arranged in pairs, each of which pairs is arranged for the reception of a distributer, and vertically-disposed shields secured to and extending between the rear end edges of opposed guards of adjacent pairs.

6. In a bund-cutter and feeder, the combination with an endless bundle-carrier, a distributer-shaft, a series of rotary distributers, and a return-board, of a series of distributer clearers or guards supported in front of the distributer and extended rearwardly under and beyond the distributer-shaft, said clearers or guards being of increasing width toward their rear ends which are vertically disposed to constitute abutments facilitating the removal of the straw from the clearers.

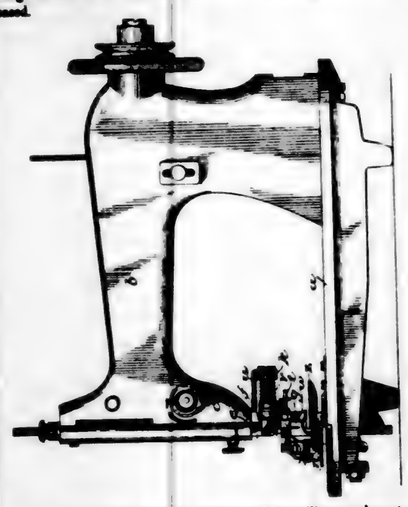
705,517. SEWING-MACHINE RUFFLER. PHILIP DEBUS, Elizabeth, N. J. Filed Oct. 26, 1901. Serial No. 80,169. (No model.)

Claim.—1. In combination, a seam-forming mechanism, a ruffler-blade, reciprocating mechanism for the same, said mechanisms being so combined that the engagement of one with the other forces said ruffler-blade in one direction, a spring adapted when compressed to force said blade in the opposite direction, and a manually-operated lever whereby said spring is compressed, substantially as described.

2. In combination, sewing mechanism, a tool operating upon the material being sewed, means for actuating the said tool, a manually-operated member, and a spring interposed between said tool and said member, which spring is so disposed as to be subjected to compressive against or in opposition to said member by the action of said actuating means when said tool is thrown into action, and which spring is also so disposed as to permit said tool to be thrown out of action by its actuating means when said member is released; whereby the intermittent operation of said tool upon the material being sewed may be controlled by the operator.

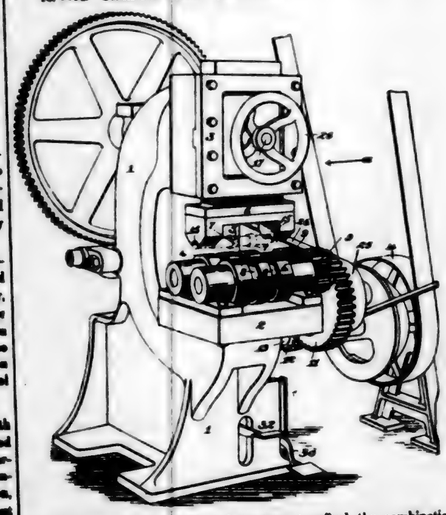
3. A sewing-machine ruffling or guthering attachment provided with a manual device or lever and a movable ruffling-blade carrier, combined with a spring connecting said manual device or lever and said blade-carrier and which spring is so arranged as to be compressed by said manual device or lever when the ruffling-blade is to be thrown into action, and said spring being also so disposed as to throw the ruffling-blade out of action when the manual pressure on said device or lever is released.

4. In a ruffling or gathering device adapted for operative attachment to a sewing-machine, the combination with a movable blade-carrier, of a normally stationary, manual device or lever, of the needle-bar of the machine, and by which the said blade-carrier may be instantaneously thrown into action without retarding or arresting the stitch-forming operation of the machine, and a spring connecting said manual device or lever with said blade-carrier, so that the latter is shifted to operative position by the compression of said spring, the tension of said spring being relaxed when the manual pressure on said device or lever is released.



5. The combination with a sewing-machine ruffling attachment, comprising a stationary frame and a movable ruffling-blade carrier, of a pin or bolt fixed to said frame, a manual lever for throwing said blade-carrier into action and which is pivotally mounted on said pin or bolt, and a torsional spring encircling said pin or bolt and connecting said manual lever with said blade-carrier.

705,518. MACHINE FOR FORMING WHEEL-HUBS FROM TUBULAR BLANKS. EGIL REPPLIER, Davenport, Iowa, assignor to Bettendorf Metal Wheel Company, a Corporation of Illinois. Filed Oct. 18, 1901. Serial No. 79,131. (No model.)



Claim.—1. In a machine of the type described, the combination with the supporting-rolls, of driving mechanism therefor, a vertically-moving pressure-head, a mandrel adapted to be carried by the head into active relation to the supporting-rolls, mechanism for moving the head vertically, and operative connections between the same and the driving mechanism of the supporting-rolls.

2. In a machine of the type described, the combination with the supporting-rolls, of driving mechanism therefor, a pulley 25 connected with said driving mechanism, a vertically-movable pressure-head, mechanism for operating the same, a worm-wheel connected therewith, a worm engaging the worm-wheel, a pulley on the worm, and a belt connecting said pulley with pulley 25.

3. In combination with the supporting-rolls, a pressure-head movable to and from the same and adapted to afford a bearing for a mandrel a crank-stud engaging the head, a rotary shaft connected with the stud and means for rotating the shaft, the relation of the crank-stud and head being such that when the head presents the mandrel in active relation to the rolls the crank-stud will be at its lowest point.

4. In combination with the supporting-rolls, a mandrel-carrying head movable to and from the same, a horizontal slot in the head, a crank-stud mounted in the slot, a shaft connected with the stud, and means for rotating the shaft.

5. In combination with the supporting-rolls, a mandrel-carrying pressure-head, operating mechanism therefor, means for connecting and disconnecting the mechanism with the head, and means for manually moving the head when the operating mechanism is disconnected.

6. In combination with the supporting rolls, a mandrel-carrying head movable to and from the same, an operating-shaft operatively connected with the head, power-driven means for rotating the shaft, and a hand-wheel connected with the shaft, and serving as a means for rotating the shaft independently of the power-driven mechanism; whereby the power-driven mechanism may be disconnected from the head and the latter operated by hand.

7. In combination with the supporting-rolls, a vertically-movable mandrel-carrying head, a horizontal shaft, a crank-stud on the shaft engaging the head, a hand-wheel on the stud, a worm-wheel on the shaft, a worm adapted to be engaged or disengaged with the wheel, and means for driving the worm.

8. In combination with the supporting-rolls, a vertically-movable mandrel-carrying head, operating mechanism therefor, a worm-wheel connected with said operating mechanism, a rocking frame, a worm mounted in the frame, means for rocking the frame to engage and disengage the worm with the worm-wheel, and means for driving the worm.

9. In a machine of the type described the combination with the vertically-movable pressure-head and the worm-wheel for operating the same, of a rocking frame, a worm mounted therein, means for driving said worm, an arm depending from the rocking frame, toggle-links connected with the arm and with the frame of the machine, a foot-lever, and connections between the same and the toggle-links.

10. In a machine of the type described, the combination with the pressure-head and the worm-wheel operatively connected therewith, of a rocking frame, a worm mounted therein below the worm-wheel and movable to and from the same, a foot-lever operatively connected with the rocking frame and adapted when depressed to rock the same and lower the worm out of engagement with the worm-wheel, and a second lever engaging the first and adapted when depressed to elevate the first lever and engage the worm with the worm-wheel.

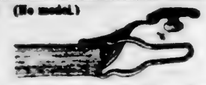
11. In a machine of the type described, the combination with the supporting-rolls adapted to support the blank under treatment, of a vertically-movable pressure-head formed with open bearings adapted when the head is moved toward the supporting-rolls to loosely engage the ends of a portable mandrel.

12. In a machine of the type described, the combination with the supporting-rolls adapted to support the blank under treatment, of a portable mandrel adapted to be inserted within the blank with its ends projecting beyond the ends of the blank, and a vertically-movable pressure-head adapted to engage the ends of the mandrel and apply pressure thereto and formed to afford a bearing therefor; whereby as pressure is applied to the mandrel by the head the former may be rotated freely.

13. In a machine of the type described, the combination with the supporting-rolls, of a vertically-moving head provided in its lower end with opposing open bearing-slots, and a portable mandrel having its ends in the form of journals adapted to extend in said slot.

14. In a machine for forming grooved hubs from tubular blanks, the combination with grooved supporting-rolls, of a ribbed expanding-mandrel adapted to extend within the blank, a vertically-movable pressure-head adapted to be engaged with the mandrel and to present the same with the blank in active relation to the supporting-rolls, and power-driven mechanism so connected with the pressure-head that the latter will approach the supporting-rolls with a gradually-decreasing speed; whereby the formation of the grooves is initiated by a comparatively rapid approach of the mandrel, and the speed of the latter decreased as the resistance offered by the deepening of the grooves becomes greater.

705,519. HOSE-SUPPORTER. MORRIS H. RIESMAN, Chicago, Ill., assignor of one-half to Louis Rosse, Jr. Filed Apr. 22, 1902. Serial No. 104,083. (No model.)



Claim.—1. A combined button and plate for a garment-supporter, comprising, in combination, a button having a soft-rubber head, and a plate having a button-receiving opening of smaller diameter than that of said head, and through which said button-head is inserted, substantially as and for the purpose set forth.

2. A combined button and plate for a garment-supporter, comprising, in combination, a button having its head and a shoulder both formed of soft rubber, and a plate having a button-receiving opening of smaller diameter than that of either said head or shoulder, and through which said button-head is inserted, substantially as and for the purpose set forth.

3. A combined button and plate for a garment-supporter, comprising, in combination, a button formed entirely of soft rubber and having a head, a shoulder and a base, and a plate having a button-receiving opening of smaller diameter than that of either said head or shoulder and through which said button-head is inserted, substantially as and for the purpose set forth.

4. In a garment-supporter, the combination of a plate having an eye at each end and an intermediate button-opening and a button having a soft-rubber head of greater diameter than said opening and inserted therethrough, and the loop-carrying strap passed through said eyes and folded on the plate to cover its entire back surface and the base of the button and clamp between portions of the strap its end and thereby secure it to the plate without stitching, substantially as described.

5. In a garment-supporter, the combination of a plate having an eye at each end and an intermediate button-opening, a button having its head and a shoulder both formed of soft rubber and each of greater diameter than said plate-opening, through which opening the button-head is inserted, and the loop-carrying strap passed through said eyes and folded on the plate to cover its entire back surface and the base of the button and clamp between portions of the strap its end and thereby secure it to the plate without stitching, substantially as described.

6. In a garment-supporter, the combination of a plate having an eye at each end and an intermediate button-opening, a soft-rubber button having a head and a shoulder each of greater diameter than said plate-opening through which the button-head is inserted and in which said shoulder is confined, and the loop-carrying strap passed from the face of said plate through one of its eyes thence over the back of the plate and the button-base through the other eye and folded over the adjacent plate edge backward over the back of the plate and over its opposite edge and passed at its end through the first eye between the adjacent strap-folds which clamp the strap end in place, as and for the purpose set forth.

705,520. DRAFT-RIGGING. WILLIAM H. EMERICK, Chicago, Ill. Filed Apr. 16, 1902. Serial No. 103,119. (No model.)

Claim.—1. A draft-rigging including draft-rods mounted for relative longitudinal movement, a draft-spring associated with each draft-rod, each draft-rod arranged to engage the draft-spring upon the other rod,

whereby said draft-springs operate in opposition to each other, as and for the purpose set forth.

2. A draft-rigging comprising draft-rods, a follower mounted on each draft-rod, draft-springs mounted on each draft-rod, each draft-spring being arranged between the follower of the draft-rod upon which said spring is mounted and the end of the other draft-rod, whereby in compression or expansion said springs operate in opposition to each other, as and for the purpose set forth.

3. A draft-rigging comprising draft-rods, a follower carried by each draft-rod, a compression-washer loosely mounted upon each rod, a spring interposed between each follower and its coöperating compression-washer, the adjacent ends of said compression-rods, respectively, engaging the compression-washer upon the other rod; all combined and arranged as and for the purpose set forth.

4. A draft-rigging comprising draft-rods arranged in alinement with each other, a follower mounted upon opposite ends of said rods, and springs interposed between each follower and the adjacent end of the other rod; all combined and arranged as and for the purpose set forth.

5. A draft-rigging comprising draft-rods having forked ends and arranged in alinement with each other, said forked ends straddling each other, followers mounted upon the other ends of said rods, and springs interposed between each follower and the adjacent end of the other rod, as and for the purpose set forth.

6. A draft-rigging comprising draft-rods, a follower mounted upon opposite ends of said rods, compression-washers loosely mounted upon each rod, a spring interposed between each follower and its coöperating compression-washer, the compression-washer upon one rod being engaged by and bearing against the proximate end of the other rod; all combined and arranged as and for the purpose set forth.

7. A draft-rigging comprising draft-rods, means for supporting the same, followers mounted upon opposite ends, respectively, of said draft-rods, a spring interposed between each follower and the proximate end of the other rod, a strap straddling said rods and operating over said followers, and a draw-bar connected to said strap and arranged to form a bearing against the follower upon one of said rods, as and for the purpose set forth.

8. A draft-rigging including draft-rods, followers mounted upon the opposite ends, respectively, of said rods, guides for said followers, a spring interposed between each follower and the proximate end of the other rod, and a limit-stop for said followers; all combined and arranged as and for the purpose set forth.

9. In a draft-rigging, draft-rods, a supporting-casting therefor provided with pockets or recesses, followers mounted on said rods and guided in said pockets or recesses, and springs interposed between the follower on one of said rods and the proximate end of the other of said rods, as and for the purpose set forth.

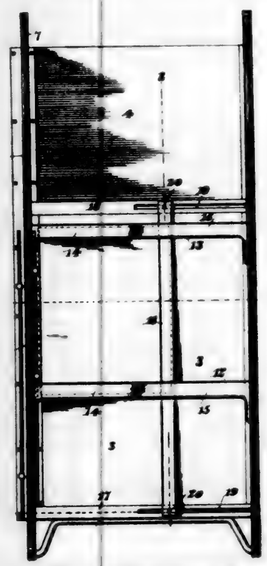
10. In a draft-rigging, draft-rods having forked ends, said rods arranged in longitudinal relation with respect to each other, the forked ends straddling each other, followers mounted upon the opposite ends, respectively, of each of said rods, a spring interposed between the follower of one rod and the adjacent end of the other rod, means for centering said rods in longitudinal relation, and a supporting-casting having guides for said followers; all combined and arranged as and for the purpose set forth.

11. In a draft-rigging, supporting-sills, castings arranged on the opposed faces of said sills and provided with pockets, draft-rods arranged between said castings and in longitudinal relation with respect to each other, followers mounted upon the opposite ends, respectively, of said rods, said followers being guided in said pockets, a spring interposed between the follower on each rod and the proximate end of the other rod, a bearing shoulder or abutment for each follower, a limit-stop for each follower, a strap for said rods and followers, and a coupling-arm connected to said strap; all combined and arranged as and for the purpose set forth.

12. A draft-rigging including draft-rods arranged in longitudinal relation with respect to each other, a follower carried by the opposite ends, respectively, of said rods, a compression-washer loosely mounted upon each rod, a spring interposed between each follower and its coöperating compression-washer, said compression-washers being counterbored, the adjacent ends of said rods being reduced to form a shoulder, the reduced or shouldered end of one rod arranged to be received in the counterbore of the compression-washer upon the other rod; all combined and arranged as and for the purpose set forth.

705,521. PLATEN FOR TYPE-WRITING MACHINES. ROBERT J. FISHER, Athens, Tenn., assignor to the Fisher Book Typewriter Company, Cleveland, Ohio, a Corporation of Delaware. Filed June 21, 1901. Serial No. 65,402. (No model.)

Claim.—1. In a type-writing machine, the combination with a flat platen to support the work-sheet, of work-holding means comprising transverse and longitudinal rigid plates disposed above the platen and movable in unison toward and from the same, said plates being individually adjustable longitudinally and transversely, respectively, of the platen.



2. In a type-writing machine, the combination with a flat platen to support the work-sheet, of a vertically-movable frame disposed over the platen, and a plurality of individually-adjustable work-holding members movable in unison with the frame and disposed transversely and longitudinally of the platen, said members having the form of rigid plates or webs.

3. In a type-writing machine, the combination with a flat platen to support the work-sheet, of a vertically-movable machine-supporting frame carried by and disposed over the platen, and an individually-adjustable work holding or guarding member disposed longitudinally of the platen and supported wholly by said frame between the opposite sides thereof for movement therewith away from the writing-surface.

4. In a type-writing machine, the combination with a flat platen to support the work-sheet, of a vertically-movable machine-supporting frame disposed thereover, and individually-adjustable transverse and longitudinal work holding or guarding members supported wholly by the frame for movement therewith away from the writing-surface.

5. In a type-writing machine, the combination with the flat platen to support the work-sheet, of the vertically-movable main tracks or guides, a pair of transverse supporting-bars carried by the vertically-movable tracks or guides, and disposed normally below the plane of the writing-surface, and a work holding and guarding member adjustably supported at its opposite ends by the supporting-bars and disposed longitudinally over the writing-surface.

6. In a type-writing machine, the combination with a flat platen to support the work-sheet, of the vertically-movable main tracks or guides for the traveling printing mechanism, a plurality of transverse work holding and guarding members slidably engaging said tracks or guides, a plurality of supporting-bars rigidly secured to said tracks or guides, and a longitudinal work holding and guarding member adjustably carried by said supporting-bars.

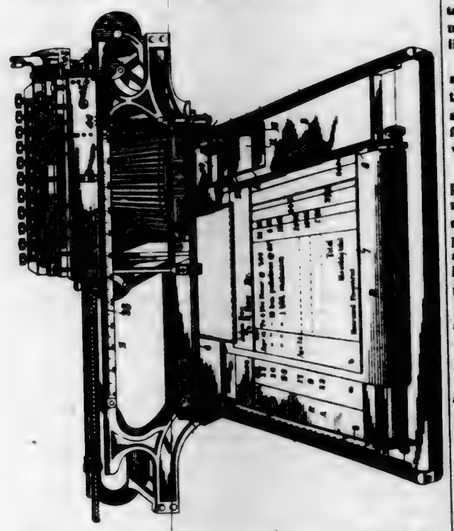
7. In a type-writing machine, the combination with a flat platen to support the work-sheet, of work holding and guarding means comprising members disposed substantially at right angles to each other, one of said members having a slightly-elevated portion to accommodate the subjacent member.

8. In a type-writing machine, the combination with a flat platen to support the work-sheet, of a work holding and guarding member disposed over the platen, said member being formed with portions thereof located in different planes, and a second holding and guarding member disposed under the elevated portion of the first-named member.

9. In a type-writing machine, the combination with a flat platen, and the main tracks or guides, of transverse work holding and guarding members slidably engaging said tracks or guides, supporting-bars connected to the tracks or guides, and a longitudinal work holding and guarding member adjustably supported by the bars, said transverse members having elevated portions to accommodate the movement of the subjacent longitudinal member.

10. In a type-writing machine, the combination with a flat platen to support the work-sheet, and the main tracks or guides, of slotted transverse supporting-bars carried by the tracks or guides, a work holding and guarding member supported by said bars, and adjusting devices connected to said member and movable in the slots of the supporting-bars.

705,522. TALLY-SHEET ATTACHMENT FOR BILLING-PLATENS. ROBERT J. FISHER, Athens, Tenn., assignor to the Fisher Book Typewriter Company, Cleveland, Ohio, a Corporation of Delaware. Filed May 18, 1901. Serial No. 60,908. (No model.)



Claim.—1. In a type-writing machine, the combination with the flat platen and traveling printing mechanism, of means for retaining a plurality of separated work elements or sheets in position to be operated upon directly by the printing mechanism, only one of said work-sheets being movable in the direction of line-spacing.

2. In a type-writing machine, the combination with the flat platen and traveling printing mechanism, of means for retaining a work-sheet at rest opposite the platen within the printing area thereof, and for retaining a supplemental work-sheet in position to be operated upon by the printing mechanism, said supplemental work-sheet being movable independently of the printing mechanism and the primary work-sheet.

3. In a type-writing machine, the combination with the platen and printing mechanism, of a primary work-holder disposed opposite the platen to retain a primary work-sheet, and a supplemental work-holder disposed to retain a supplemental work-sheet in position to be printed upon, said work-holders being carried by the platen.

4. In a type-writing machine, the combination with the flat platen and traveling printing mechanism, of a primary work-holder, and a relatively movable supplemental work-holder both carried by the platen, said work-holders being disposed to retain primary and supplemental work-sheets in position to be printed upon.

5. In a type-writing machine, the combination with the flat platen and the tracks or guides for the traveling machine, of a primary work-holder disposed to retain a primary work-sheet opposite the platen, and a supplemental work-holder movable independently of the primary work-holder and of the platen, one of said work-holders being mounted on the platen.

6. In a type-writing machine, the combination with a platen and printing mechanism, of a primary work-holder disposed to retain a primary work-sheet opposite the platen, a supplemental work-holder carried by the platen to support the supplemental work-sheet, and means for moving the supplemental work-sheet to effect the line-spacing thereof.

7. In a type-writing machine, the combination with the platen and printing mechanism, of a primary work-holder for the primary work-sheet, a supplemental holder carried by the platen to support the supplemental work-sheet, and means for imparting a step-by-step movement to the supplemental work-holder.

8. In a type-writing machine, the combination with the platen and printing mechanism, of a primary work-holder carried by the platen, a separate supplemental work-holder disposed to retain a supplemental work-sheet and movable independently of the platen in the direction of line-spacing, and means for imparting a step-by-step movement to the supplemental work-holder.

9. In a type-writing machine, the combination with the flat platen, printing mechanism, and a primary work-holder movable toward and away from the writing-surface, of a supplemental work-holder for retaining a work-sheet in the printing position, and means for moving said work-sheet in the direction of line-spacing independently of the primary work-holder.

10. In a type-writing machine, the combination with the flat platen and traveling printing mechanism, of a plurality of work-holders for retaining a plurality of separate work-sheets in the printing position, and means for automatically advancing one of said sheets in the direction of line-spacing independently of the other.

11. In a type-writing machine, the combination with the flat platen and traveling printing mechanism, of a primary work-holder mounted on the platen and disposed to retain a primary work-sheet opposite the platen, a supplemental work-holder for a supplemental work-sheet, and means for moving the supplemental work-sheet independently of the primary work-sheet in the direction of line-spacing.

12. In a type-writing machine, the combination with the platen and printing mechanism, of a primary work-holder disposed to retain a primary work-sheet opposite the platen, a supplemental work-holder designed for the retention of a supplemental work-sheet and movable independently of the platen in the direction of line-spacing, and means for automatically advancing the supplemental work-holder in the direction of line-spacing through the relative movement of the platen and printing mechanism.

13. In a type-writing machine, the combination with the flat platen and the traveling printing mechanism, of a plurality of relatively movable work-holders carried thereby for retaining a plurality of work-sheets in the printing position at different points on the platen.

14. In a type-writing machine, the combination with the flat platen and the main tracks or guides for the traveling machine, of a primary work-holder, and a tally-sheet holder, both carried by the platen and disposed within the printing area thereof.

15. In a type-writing machine, the combination with the platen, of a plurality of work-holders carried thereby, one of said work-holders being independently movable in the direction of line-spacing.

16. In a type-writing machine, the combination with the platen, of a plurality of separate work-holders carried thereby, one of said work-holders being independently movable in the direction of line-spacing, and means for advancing said movable work-holder to effect the line-spacing thereof.

17. In a type-writing machine, the combination with the platen, of a plurality of work-holders carried thereby, one of said work-holders being independently movable in the direction of line-spacing, and means for automatically advancing the said last-named work-holder to effect the line-spacing thereof.

18. In a type-writing machine, the combination with the platen, of a work-holder and a tally-sheet holder carried thereby, to retain a work-sheet and a tally-sheet at different points on the platen, said tally-sheet holder comprising delivering and receiving members for the tally-sheet.

19. In a type-writing machine, the combination with the platen, of a work-holder and a tally-sheet holder carried thereby to retain a work-sheet and a tally-sheet at different points, said tally-sheet holder comprising rotary delivering and receiving members for the tally-sheet.

20. In a type-writing machine, the combination with the platen, of a work-holder and a tally-sheet holder disposed at different points on the platen, said tally-sheet holder comprising movable delivering and receiving members for the tally-sheet, and means for operating said members to effect a transfer of the tally-sheet from one member to the other.

21. In a type-writing machine, the combination with the flat platen and traveling printing mechanism, of a primary work-holder and a tally-sheet holder, said tally-sheet holder comprising delivering and receiving members for the tally-sheet, and means for automatically operating said members independently of the primary work-holder to effect the line-spacing of the tally-sheet.

22. In a type-writing machine, the combination with the flat platen and traveling printing mechanism, of a work-holder and a tally-sheet holder, said tally-sheet holder comprising a delivering member and a rotary receiving member for the tally-sheet, and means for imparting a step-by-step rotation to said rotary receiving member through the movement of the printing mechanism to effect the line-spacing of the tally-sheet.

23. In a type-writing machine, the combination with the platen pre-

vided with a supplemental platen, of means for retaining separate work-sheets opposite said platens.

24. In a type-writing machine, the combination with the platen provided with a supplemental platen, of separate work-holders for retaining separate work-sheets opposite said platens.

25. In a type-writing machine, the combination with the platen provided with a supplemental platen, of separate work-holders for retaining primary and supplemental work-sheets opposite said platens, and means for imparting movement to the supplemental work-sheet in the direction of line-spacing.

26. In a type-writing machine, the combination with the stationary flat platen, and the tracks or guides for the traveling machine, of an independently-movable tally-sheet holder comprising delivering and receiving members, and an intermediate supplemental or tally-sheet platen.

27. In a type-writing machine, the combination with a stationary platen, of a tally-sheet holder comprising movable delivering and receiving members, and an intermediate movable tally-sheet platen, and means independent of the platens for imparting intermittent movement to one of said members to advance the tally-sheet in the direction of line-spacing.

28. In a type-writing machine, the combination with the flat platen and the tracks or guides for the traveling machine, of a tally-sheet holder comprising delivering and receiving rolls, an intermediate platen-roll and means independent of the platen for operating said holder.

29. In a type-writing machine, the combination with the flat platen and traveling printing mechanism, of a tally-sheet holder comprising delivering and receiving members for the tally-sheet, and a line-spacing lever operatively related to one of said members to operate the same in the direction of line-spacing.

30. In a type-writing machine, the combination with the flat platen and traveling printing mechanism, of a tally-sheet holder comprising delivering and receiving rolls for the tally-sheet, and a line-spacing lever operatively related to the receiving member to impart a step-by-step advance thereto in the direction of line-spacing.

31. In a type-writing machine, the combination with the flat platen and traveling printing mechanism, of a tally-sheet holder carried by the platen and disposed below the writing-surface thereof.

32. In a type-writing machine, the combination with the flat platen and traveling printing mechanism, of a tally-sheet holder carried by the platen and disposed below the writing-surface thereof for the reception of the tally-sheet, and line-spacing mechanism for said sheet.

33. In a type-writing machine, the combination with the platen, of a tally-sheet holder disposed below the writing-surface thereof for the reception of the tally-sheet, and tally-sheet line-spacing mechanism extended above the platen for actuation.

34. In a type-writing machine, the combination with the platen, of a tally-sheet holder disposed below the writing-surface thereof for the reception of the tally-sheet, and tally-sheet line-spacing mechanism comprising a line-spacing lever extended above the platen for actuation.

35. In a type-writing machine, the combination with the flat platen and traveling printing mechanism, of a work-holder carried by the platen to retain a work-sheet in the printing position, and line-spacing mechanism for said work-sheet, said line-spacing mechanism being extended beyond the writing-surface of the platen and into operative relation with the printing mechanism whereby the relative movement of the platen and printing mechanism will cause the actuation of the line-spacing mechanism to advance the work-sheet.

36. In a type-writing machine, the combination with the platen and printing mechanism, of a primary work-holder, and a supplemental work-holder located at different points thereof, one of said work-holders being movable in the direction of line-spacing, and line-spacing mechanism for the movable work-holder, said line-spacing mechanism being disposed above the platen for engagement with the printing mechanism.

37. In a type-writing machine, the combination with the platen and printing mechanism movable thereover, of a work-holder movably carried by the platen, and line-spacing mechanism operatively related to said work-holder and extended above the platen and into the path of the printing mechanism for actuation thereby.

38. In a type-writing machine, the combination with the stationary platen and the printing mechanism movable thereover, of a work-holder movable in the direction of line-spacing, and line-spacing mechanism for said holder comprising a line-spacing lever extended through the platen and into the path of the printing mechanism.

39. In a type-writing machine, the combination with the stationary platen and the printing mechanism movable thereover, of a work-holder carried by the platen and comprising movable delivering and receiving members, and line-spacing mechanism operatively related to one of said members and extended into the path of the printing mechanism for actuation thereby.

40. In a type-writing machine, the combination with the stationary platen, and the printing mechanism movable thereover, of a work-holder comprising delivering and receiving rolls, and a line-spacing lever operatively related to one of said rolls and extended into the path of the printing mechanism for actuation thereby.

41. In a type-writing machine, the combination with the flat platen and the main tracks or guides for the traveling printing mechanism, of a plurality of work-holders mounted on the platen and retaining a plurality of separate work-sheets.

42. In a type-writing machine, the combination with a flat platen, traveling printing mechanism and the main tracks or guides for the traveling printing mechanism, of a tally-sheet holder carried by the platen between said tracks or guides and movable in the direction of line-spacing by the longitudinal movement of the traveling printing mechanism over the platen.

43. In a type-writing machine, the combination with the flat platen and the main tracks or guides for the traveling printing mechanism, of a primary work-holder, and a supplemental tally-sheet holder, both carried by the platen between the main tracks or guides and arranged to retain a primary work-sheet and a supplemental work-sheet at separated points, the tally-sheet holder being movable with respect to the platen in the direction of line-spacing.

44. In a type-writing machine, the combination with the stationary flat platen provided with a tally-opening, and with the main tracks or guides for the traveling printing mechanism, of a tally-sheet holder disposed to hold a tally-sheet exposed at said opening.

45. In a type-writing machine, the combination with the flat platen and the main tracks or guides, of a machine-frame movable upon said tracks or guides, and a type-carriage movable upon the frame, said frame and carriage constituting members of the traveling printing mechanism, and a stop device for arresting the movement of one of said members, said stop device being effective only in a predetermined position of the other member.

46. In a type-writing machine, the combination with the flat platen having the main tracks or guides, of the machine-frame movable thereon, a type-carriage movable on the frame, and a stop device for limiting the movement of the frame, said stop device being disposed for control by the carriage.

47. In a type-writing machine, the combination with the flat platen having the main tracks or guides, of a machine-frame movable thereon, a type-carriage movable on the machine-frame, a stop device for the frame, said stop device being arranged to be set in its effective position by the carriage, and a second stop device disposed to arrest the carriage in position to set the first-named stop device.

48. In a type-writing machine, the combination with the flat platen having the main tracks or guides, of the machine-frame movable thereon, a type-carriage movable on the frame, a fixed stop member on the platen, and a movable stop member mounted on the machine-frame and arranged to be moved into and out of a path obstructed by the fixed stop member to arrest the frame at the fixed stop or to permit its movement therebeyond, as desired.

49. In a type-writing machine, the combination with the flat platen having the main tracks or guides, of the machine-frame movable thereon, a type-carriage movable on the frame, a fixed stop member and a movable stop member carried by the platen and frame respectively, and a trip device operated by the carriage to throw the movable stop member into position for engagement with the fixed stop member.

50. In a type-writing machine, the combination with the flat platen having the main tracks or guides, of the machine-frame movable thereon, a type-carriage movable on the frame, a fixed stop member on the platen, a pivoted stop member on the machine-frame, and a trip-head movable with the type-carriage and disposed to move the pivoted stop member into its effective position.

51. In a type-writing machine, the combination with the flat platen having the main tracks or guides, of the machine-frame movable thereon, a type-carriage movable on the frame, a fixed stop member, a movable stop member for arresting the machine-frame, and normally disposed in an ineffective position, and a trip device operated by the carriage to throw the movable stop member to its effective position and to permit said movable stop member to return to its ineffective position, whereby the carriage by its movement to a given position on the frame will position the stop members to arrest the frame and by further movement will release the frame for movement beyond the stop.

52. In a type-writing machine, the combination with the flat platen having the main tracks or guides, of the movable machine-frame, stop mechanism therefor, and a type-carriage on the frame, said type-carriage being operatively related to the stop mechanism to effect the arrest or release of the frame.

53. In a type-writing machine, the combination with the flat platen having the main tracks or guides, of the machine-frame movable thereon, a type-carriage movable on the frame, and means for automatically effecting the arrest or release of the machine-frame through the movement of the type-carriage.

54. In a type-writing machine, the combination with a flat platen having the main tracks or guides, of means for retaining primary and supplemental work-sheets at different points on the platen, printing mechanism mounted to travel laterally and longitudinally over the platen, and separate stop devices for limiting the lateral and longitudinal movements of the printing mechanism to insure the accurate location of the latter over the supplemental work-sheet, one of said stop devices being automatically released when an entry or item is printed on the supplemental work-sheet.

55. In a type-writing machine, the combination with a flat platen having the main tracks or guides, of means for retaining a primary work-sheet and a tally-sheet at different points on the platen, a machine-frame mounted to travel on said tracks or guides, a traveling type-carriage on the frame, a carriage stop device for arresting the movement of the carriage on the frame, a machine stop device for arresting the movement of the machine-frame over the platen to accurately position the type-carriage over the tally-sheet, and means for automatically releasing the machine stop device by the movement of the carriage incidental to the printing of an entry or item on the tally-sheet.

56. A type-writing machine provided with a plurality of platens disposed to retain primary and supplemental work-sheets in position to be printed upon alternately by the same printing mechanism, one of said platens being stationary and flat.

57. A type-writing machine having a plurality of platens for primary and supplemental work-sheets respectively, said platens being relatively movable and carried one by the other.

58. A type-writing machine having stationary and movable platens disposed to retain separate work-sheets in position to be printed upon.

59. The combination with a stationary primary platen, and a movable supplemental platen, of traveling printing mechanism movable over said platens.

60. In a type-writing machine, the combination with a platen and printing mechanism, of a primary work-holder carried by the platen, and a separate supplemental work-holder disposed to retain a supplemental work-sheet, and movable independently of the platen in the direction of line-spacing.

61. A type-writing-machine platen provided with a supplemental platen carried thereby and with main tracks or guides for the traveling machine.

62. In a type-writing machine, the combination with a platen, of the tally-sheet holder for the reception of the tally-sheet, and tally-sheet line-spacing mechanism extended above the platen from below the writing-surface thereof for actuation.

63. In a type-writing machine, the combination with a stationary flat platen provided with a tally-opening and the tracks or guides for the traveling machine, of a tally-sheet holder disposed to hold the tally-sheet exposed at said opening.

64. In a type-writing machine, the combination with a flat platen having the main tracks or guides, of means for retaining primary and supplemental work-sheets at different points on the platen, printing mechanism mounted to travel laterally and longitudinally over the platen, and separate stop devices for limiting the lateral and longitudinal movement of the printing mechanism to insure the accurate location of the latter over the supplemental work-sheet.

65. In a type-writing machine, the combination with a stationary flat platen and printing mechanism mounted to travel thereover, of means for retaining a plurality of separated work-sheets in position to be operated upon directly by said printing mechanism.

66. In a type-writing machine, the combination with a stationary flat platen, and the main tracks or guides for the traveling printing mechanism, of a work-holder including a roll, and means for effecting the automatic actuation of the roll to feed the work-sheet with respect to the platen.

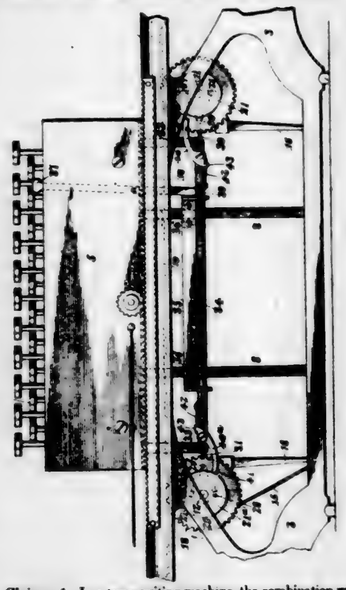
67. In a type-writing machine, the combination with a stationary flat platen, and the tracks or guides for the traveling machine, of a primary work-holder movable toward and away from the platen, and a supplemental work-holder independently movable in the direction of line-spacing only.

68. In a type-writing machine, the combination with the flat stationary platen, and the traveling printing mechanism, of a primary work-holder disposed opposite the platen to retain a primary work-sheet, and a tally-sheet holder disposed to retain a tally-sheet in position to be printed upon, said tally-sheet being movable longitudinally of the platen.

69. In a type-writing machine, the combination with the flat stationary platen, and the traveling printing mechanism, of a primary work-holder disposed to retain a primary work-sheet over the platen, and a tally-sheet holder disposed to retain a tally-sheet in position to be printed upon at one side of the primary work-sheet, said tally-sheet being movable longitudinally of the platen.

70. In a type-writing machine, the combination with the flat stationary platen, and printing mechanism mounted to travel thereover, of means for retaining a primary work-sheet and a tally-sheet at different points of the platen so as to be in position to be operated upon directly by said printing mechanism at different periods of the movement of the latter.

705,528. RIBBON-FEEDING MECHANISM FOR TYPE-WRITING MACHINES. ROBERT J. FISHER, Athens, Tenn., assignor to the Fisher Book Typewriter Company, Cleveland, Ohio, a Corporation of Delaware. Filed June 21, 1901. Serial No. 65,465. (No model.)



Claim.—1. In a type-writing machine, the combination with a traveling carriage, of a rack mounted independently thereof and arranged parallel with the line of writing, ribbon-spool shafts arranged at each side of the carriage and terminating adjacent to the rack, separate gearing for connecting each shaft independently to the rack, pinions constituting elements of said separate gearing, and means for throwing said pinions out of gear with the shafts.

2. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of spool-shafts movable with the carriage, ribbon-spools and spool-pinions mounted on said shafts, said pinions being constantly in direct engagement with the rack, and means for alternately effecting the operative connection of said pinions with their shafts, and their disconnection from said shafts.

3. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool and a spool-pinion mounted on each shaft, said pinions being constantly and directly geared to the rack, and shifting mechanism movable with the carriage and disposed to alternately connect the pinions with their shafts.

4. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool and a spool-pinion mounted on each shaft, said pinions being directly geared to the rack, releasing means for releasing the pinions from their shafts, and shifting mechanism for operating the releasing means to release the pinions.

5. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool and a spool-pinion mounted on each shaft, said pinions being directly geared to the rack, separate releasing devices for releasing the pinions from their shafts, and shifting mechanism mounted on the carriage and arranged to shift the positions of the releasing devices to release the pinions alternately from their shafts.

6. In a type-writing machine, the combination with a traveling car-

riage, and a rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool and a spool-pinion mounted on each shaft, said pinions being operatively related to the rack, pawl-and-ratchet mechanism disposed to connect each pinion with its shaft, and shifting mechanism disposed to move said pawls out of their engaging positions.

7. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool and a spool-pinion mounted on each shaft, a pawl and a ratchet-wheel constituting means for operatively connecting each pinion to its shaft, and shifting mechanism for moving the pawls to their disengaging positions, said shifting mechanism being effective in any position of the pawls.

8. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool and a spool-pinion mounted on each shaft, said pinions being operatively related to the rack, a ratchet-wheel fixed on each shaft, a pawl mounted on each pinion to engage the adjacent ratchet-wheel, disks shiftably mounted on the shafts and disposed to move the pawls out of engagement with their ratchet-wheels, and means for operating said disks.

9. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool and a spool-pinion mounted on each shaft, said pinions being operatively related to the rack, a ratchet-wheel fixed on each shaft, a pawl mounted on each pinion to engage the adjacent ratchet-wheel, beveled disks shiftably mounted on the shafts and disposed to move the pawls out of engagement with their ratchet-wheels, and means for operating said disks.

10. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool and a spool-pinion mounted on each shaft, said pinions being geared to the rack, a ratchet-wheel on each shaft, a pawl on each pinion to engage the adjacent ratchet-wheel, disks shiftably mounted on the shafts to move the pawls out of engagement with the ratchet-wheels, and means for shifting said disks simultaneously in opposite directions.

11. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool, a spool-pinion and a ratchet-wheel mounted on each shaft, a pawl on each pinion to engage the adjacent ratchet-wheel, beveled disks shiftably mounted on the shafts to move the pawls out of engagement with the ratchet-wheels, and means for shifting said beveled disks simultaneously in opposite directions.

12. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool and a spool-pinion mounted on each shaft, releasing mechanism for effecting the release of each pinion from its shaft, a reciprocatory shift-bar mounted on the carriage and connected to said releasing mechanism, and means for reciprocating said shift-bar.

13. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool and a spool-pinion mounted on each shaft, separate releasing devices for effecting the release of the pinions from their shafts, a shifting-lever connected to each releasing device, and a shift-bar connected to both of said levers to effect their simultaneous movement in opposite directions.

14. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool and a spool-pinion mounted on each shaft, pawl-and-ratchet mechanism for connecting each pinion to its shaft beveled disks arranged to shift the positions of the pawls and having grooved hubs, bell-crank shifting-levers engaging the grooved hubs of the disks, a shift-bar connected to both of said bell-crank levers, and a lever operatively connected to the shift-bar to actuate the same.

15. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of ribbon-spools movable with the carriage, spool-pinions operatively related to the rack and arranged to rotate the spools in a given direction, and means for positively locking the spools against rotation in a direction to slacken the ribbon.

16. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of ribbon-spools movable with the carriage, spool-pinions operatively related to the rack, mechanism for connecting each pinion to its spool to cause the rotation of the spool in one direction and to permit the pinion to rotate idly in the opposite direction, and locking means for preventing either spool from rotating during the idle movement of its pinion.

17. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool and a spool-pinion mounted on each shaft, said pinions being operatively related to the rack, a check-wheel and a ratchet-wheel fixed upon each spool-shaft, a pawl mounted on each pinion and disposed to engage the ratchet-wheel, and restraining-dogs disposed to alternately engage the check-wheels to prevent rotation of the spool-shaft whose pawl is moving idly over the ratchet-teeth of the adjacent ratchet-wheel.

18. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool and a spool-pinion mounted on each shaft, said pinions being operatively related to the rack, shifting mechanism for effecting the alternate engagement and disengagement of the pinions to and from their shafts, and restraining mechanism for said shafts, said restraining mechanism being controlled by the shifting mechanism.

19. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool, a spool-pinion, a ratchet-wheel and a check-wheel mounted upon each spool-shaft, a pawl mounted upon each pinion to engage the adjacent ratchet-wheel, a shift-bar mounted upon the carriage, restraining-dogs carried by said shift-bar and designed for presentation to the check-wheels, and means connected with said shift-bar for throwing the pawls out of engagement with their ratchet-wheels.

20. In a type-writing machine, the combination with a suitable support, of a spool-shaft, a ribbon-spool carried by said shaft, a spool-pinion loosely mounted on the shaft and provided with a pawl, a ratchet-wheel mounted to rotate with the shaft and disposed for engagement by the pinion, a beveled disk shiftably mounted in operative relation to the pawl to urge the same out of engagement with the ratchet-wheel, and means for shifting said beveled disk.

21. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool, and a spool-pinion mounted on each shaft, said pinions being operatively related to the rack, pawl-and-ratchet mechanism disposed to connect each pinion with its shaft, and shifting mechanism disposed to move said pawls out of their engaging positions.

22. In a type-writing machine, the combination with a traveling carriage, and a stationary rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool, and a spool-pinion mounted on each shaft, said pinions being operatively related to the rack, a ratchet-wheel on each shaft, a pawl on each pinion to engage the adjacent ratchet-wheel, disks shiftably mounted on the shafts to move the pawls out of engagement with the ratchet-wheels, and means for shifting said disks simultaneously.

23. In a type-writing machine, the combination with a traveling carriage, and a stationary rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool, a spool-pinion, and a ratchet-wheel mounted on each shaft, a pawl on each pinion to engage the adjacent ratchet-wheel, beveled disks shiftably mounted on the shafts to move the pawls out of engagement with the ratchet-wheels, and means for shifting said beveled disks simultaneously.

24. In a type-writing machine, the combination with a traveling carriage, and a rack mounted independently thereof, of spool-shafts movable with the carriage, a ribbon-spool and a spool-pinion mounted on each shaft, said pinions being operatively related to the rack, shifting mechanism for effecting the alternate feeding of the ribbon from one spool to the other, and restraining mechanism for said shafts, said restraining mechanism being controlled by the shifting mechanism.

25. In a type-writing machine, the combination with the traveling carriage, of a rack mounted independently thereof and arranged parallel with the lines of writing, ribbon-spool shafts arranged at each side of the carriage and terminating adjacent to the rack, and separate gearing for connecting each shaft independently to the rack, said gearing having means for releasing the connection at will.

26. In a type-writing machine, the combination with the traveling carriage, of a rack mounted independently thereof and arranged parallel with the line of writing, ribbon-spool shafts arranged at each side of the carriage and terminating adjacent to the rack, separate gearing for connecting each shaft independently to the rack, pinions constituting elements of each independent gearing, and means for simultaneously throwing one of the pinions into gear with its shaft and the other pinion out of gear with its shaft.

705,524. CARBON-ROLL BILLING-PLATEN FOR TYPE-WRITING MACHINES. ROBERT J. FISHER, Athens, Tenn., and RALPH D. STACKPOLE, Chicago, Ill., assignors to the Fisher Book Typewriter Company, Cleveland, Ohio, a Corporation of Delaware. Filed May 23, 1901. Serial No. 61,565. (No model.)

Claim.—1. In a type-writing machine, the combination with a flat platen, of the main tracks or guides, and a work-holder movable independently thereof toward and away from the writing-surface and having supporting means for the sheet to be printed on and also for the carbon element or web.

2. In a type-writing machine, the combination with the flat platen, of the main tracks or guides, a work-holder movable independently thereof toward and away from the writing-surface and having supporting and guiding means for a work-sheet and for a carbon-web, and shiftable supporting means for said carbon-web.

3. In a type-writing machine, the combination with the flat platen, of the main tracks or guides, a work-holder movable independently thereof and having means for supporting a folded sheet and a carbon-web disposed between the leaves of said sheet.

4. In a type-writing machine, the combination with the flat platen, of the main tracks or guides, and a support for the edge of the carbon element or web, said support being disposed above the platen to form an abutment for the folded edge or bight of the bill or sheet, and mounted for movement independently of the main tracks or guides.

5. In a type-writing machine, the combination with the flat platen and the tracks or guides, of a substantially counterbalanced work-holder mounted to sustain a work-sheet over the platen and movable away from the writing-surface independently of the tracks or guides.

6. In a type-writing machine, the combination with the flat platen, of a substantially counterbalanced work-holder disposed thereover and having supporting means for the sheet to be written upon and also for the carbon element or web.

7. In a type-writing machine, the combination with the flat platen, of the main tracks or guides, and a substantially counterbalanced work-holder mounted between said tracks or guides and movable independently thereof.

8. In a type-writing machine, the combination with the flat platen, of the main tracks or guides, and a substantially counterbalanced work-holder mounted between said tracks or guides and movable independently thereof, said work-holder having supporting means for the sheet to be printed on and also for the carbon element or web.

9. In a type-writing machine, the combination with the flat platen, of the main tracks or guides, and a vertically-swinging work-holder adapted to occupy a position beneath the printing mechanism and movable independently of said main tracks or guides, said work-holder being provided with means for supporting and guiding the work-sheet and the shiftable carbon-web.

10. In a type-writing machine, the combination with the flat platen, of the main tracks or guides, and a work-holder movable independently of said main tracks or guides and arranged over the platen to position both a work-sheet and a carbon-sheet thereon, said work-holder having means for aligning one of said sheets and means for guiding the other sheet.

11. In a type-writing machine, the combination with the flat platen, and the main tracks or guides for the traveling machine, of a swinging work-holder frame disposed over the platen between said tracks or guides and comprising a pair of work-holding members connected at or adjacent to their outer ends and movable vertically independently of the main tracks or guides.

12. In a type-writing machine, the combination with the flat platen, and the main tracks or guides, of a substantially counterbalanced swinging work-holder movable independently of said tracks or guides and comprising a pair of work-holding members, one of which is provided with means for guiding the edge of the carbon sheet or web.

13. In a type-writing machine, the combination with the flat platen, of the main tracks or guides, a work-holder movable independently of said tracks or guides and comprising a support, an alinement-guide, and means for supporting the edge of the carbon-web.

14. In a type-writing machine, the combination with the flat platen, of the main tracks or guides, and a work-holder movable independently of said tracks or guides and comprising a guide-strip having a laterally-disposed abutment for the edge of the sheet.

15. In a type-writing machine, the combination with the flat platen, and the main tracks or guides, of a spring-balanced work-holder located between the tracks and movable independently thereof.

16. In a type-writing machine, the combination with the flat platen, and the main tracks or guides, of a substantially counterbalanced work-holding frame located between said tracks or guides and movable independently thereof, and means for retaining the work-holding frame in its depressed position.

17. In a type-writing machine, the combination with the flat platen, and the main tracks or guides, of a work-holding frame comprising work-holding members connected for movement in unison transversely of the platen, and means for moving the members laterally to effect the lateral adjustment of the frame.

18. In a type-writing machine, the combination with the flat platen, of the main tracks or guides, a work-holder movable independently thereof, and arranged over the platen to position both a work-sheet and a carbon-sheet thereover, said work-holder having means for alining one sheet and means for guiding the other sheet, and means for effecting the lateral adjustment of said work-holder to correspond with various type-writing machines.

19. In a type-writing machine, the combination with the flat platen, of a work-holder disposed thereover and having a hinged mounting located below the writing-surface within the limits of the platen, and means for moving the work-holder laterally to effect its lateral adjustment to correspond with various type-writing machines.

20. In a type-writing machine, the combination with the flat platen, of a work-holder, a rock-shaft therefor, and means for moving said shaft to effect the endwise adjustment thereof.

21. In a type-writing machine, the combination with a flat platen, of a swinging work-holder disposed thereabove, a rock-shaft for said work-holder, and a rotary adjusting member having a threaded connection with the shaft to effect the endwise adjustment thereof and the lateral adjustment of the work-holder.

22. In a type-writing machine, the combination with the flat platen of a swinging work-holder comprising holding members disposed over the platen, and supporting-arms therefor extending under the platen, said members and arms being connected in a rigid organization.

23. In a type-writing machine, the combination with the flat platen, of a work-holding frame having a pivotal mounting below the plane of the writing-surface and comprising holding members above the platen, supporting-arms below the platen, and means for connecting the arms and holding members in a rigid organization or frame.

24. In a type-writing machine, the combination with the flat platen, of the main tracks or guides, and a work-holder provided with an upstanding flange disposed longitudinally of the platen for contact with the machine-frame mounted to travel over said flange.

25. In a type-writing machine, the combination with the main tracks or guides for the printing mechanism, of a work-holder vertically movable independently of the tracks or guides and disposed above the platen, and a carbon-carrier operatively related to said frame for movement therewith.

26. In a type-writing machine, the combination with the flat platen, of the tracks or guides for the printing mechanism, a work-holding frame vertically movable independently of the tracks or guides, and a carbon-carrier supported by the frame for movement therewith.

27. In a type-writing machine, the combination with the flat platen, and the main tracks or guides, of a vertically-movable work-holding frame independent of the tracks or guides, a carbon-carrier supported by said frame for movement therewith, and means for retaining the end of the carbon at a point removed from said carrier.

28. In a type-writing machine, the combination with the flat platen, of the main tracks or guides, a vertically-movable work-holding frame disposed to retain a work-sheet upon the platen, and a plurality of carbon-carriers carried by and movable with said frame.

29. In a type-writing machine, the combination with the flat platen, of the main tracks or guides, a vertically-movable work-holding frame disposed over the platen and having supporting and guiding means for the edge of the carbon sheet or web, and carbon-carriers movable with

said work-holding frame and constituting delivering and receiving members for the carbon.

30. In a type-writing machine, the combination with the flat platen, of the main tracks or guides, a work-holding frame disposed between and vertically movable independently of said main tracks or guides, and a plurality of carbon-carriers supported by and movable with the work-holding frame.

31. In a type-writing machine, the combination with the flat platen, of the main tracks or guides, a vertically-movable work-holding frame having means for supporting the edge of the carbon-sheet, and carbon-carriers supported by and movable with the frame, said carbon-carriers being located beyond the opposite ends of said carbon-supporting means.

32. In a type-writing machine, the combination with a flat platen, of a pivotally-mounted work-holder, and carbon-carriers supported by said work-holder at opposite sides of its pivot.

33. In a type-writing machine, the combination with the flat platen, and a movable work-holder disposed thereover, of carbon-carriers located beyond the opposite ends of the printing area of the platen, and means for moving said carriers in opposite directions to prevent slacking of the carbon when the work-holder is moved.

34. In a type-writing machine, the combination with the flat platen having pockets at the opposite ends of the printing area, of a carbon-carrier mounted in each pocket, said carriers being normally disposed in a plane below the writing-surface.

35. In a type-writing machine, the combination with the flat platen having pockets at the opposite ends of the printing area, of a work-holding frame disposed to retain a work-sheet upon the platen, and carbon-carriers supported by and movable with the work-holding frame and normally located in said pockets.

36. In a type-writing machine, the combination with the flat platen, and a swinging work-holding frame disposed to retain a work-sheet thereover, of a carbon-carrier supported at the front end of the frame, and a shield for said carrier.

37. In a type-writing machine, the combination with a flat platen, and a laterally-adjustable swinging work-holding frame, of a frame-guide carried by the platen adjacent to the free end of the frame, and means for adjusting said guide.

38. In a type-writing machine, the combination with the flat platen, of a vertically-movable work-holding frame comprising supporting members and work-holding members disposed respectively above and below the platen, and coöperating stop devices carried by the supporting members and platen respectively to relieve the holding members of the weight of the frame.

39. In a type-writing machine, the combination with the flat platen, of an envelop-retaining clip carried thereby, and a clamp-plate disposed to compress the clip upon the work and to also engage the work to assist in its retention.

40. In a type-writing machine, the combination with the flat platen, of an envelop-retaining clip, a gage device to facilitate the positioning of the envelop, and a clamp-plate coöperating with said clip and gage device and disposed to compress the clip upon the work and to also engage the work to assist in its retention.

41. In a type-writing machine, the combination with the flat platen formed with a pocket, of a cover-plate disposed over the pocket and having gage projections and work-retaining springs carried by the plate and designed to locate and retain an envelop in the printing position and a clamp-plate arranged to depress the springs upon the work.

42. In a type-writing machine, the combination with the flat platen, of a cover-plate having alined gage projections, and work-retaining springs adjacent to said projections, and a swinging clamp-plate disposed above the cover-plate and provided with openings for the reception of the gage projections.

43. In a type-writing machine, the combination with the flat platen having the work-retaining springs mounted thereon, of the swinging clamp-plate adapted to compress the springs upon the work and to also engage the work to assist in its retention.

44. In a type-writing machine, the combination with the flat platen, and a swinging work-holding frame arranged thereover and projecting at one end beyond the platen, of a carbon-carrier supported on the extended end of the frame, and a pocket in which the carbon-carrier fits when the parts are in their normal positions.

45. In a type-writing machine, the combination with the flat platen, and a swinging work-holding frame arranged thereover and provided with a plurality of carbon-carriers, and means for guiding and protecting the edge of the carbon-web.

46. In a type-writing machine, the combination with the platen, the swinging work-holder comprising an upper section made up of a pair of longitudinal side frames rigidly connected and held in spaced relation and constituting holding and guiding means for the work, and a lower section formed of longitudinal bars arranged below the platen and disposed in similar spaced relation to the frames, both the frames and the bars being connected so as to move in unison.

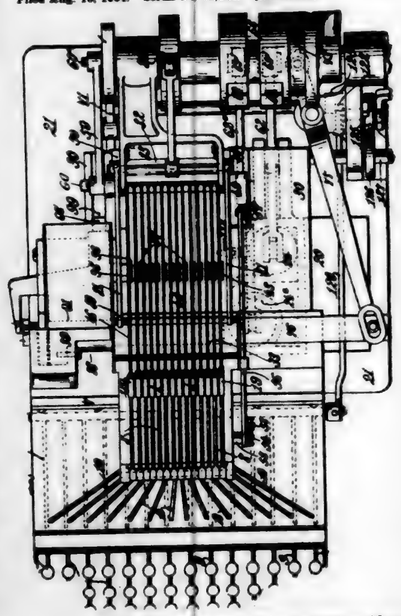
47. In a type-writing machine, the combination with the flat platen, of the main tracks or guides, and a work-holder movable independently thereof and having means for supporting the sheet to be printed on and also for protecting the edge of the carbon element or web.

48. In a type-writing machine, the combination with the flat platen, of the main tracks or guides, and a work-holder movable independently thereof and having means for supporting a folded sheet and for protecting the edge of a carbon-web disposed between the leaves of said sheet.

49. In a type-writing machine, the combination with the flat platen, and the main tracks or guides, of a work-holder movable independently thereof and comprising a strip designed to constitute protecting means for the edge of the carbon element or web, and means for supporting said carbon element or web in proximity to said strip.

705,525. TYPE CASTING AND SETTING MACHINE. JOSEPH C. FOWLER and JOSEPH C. FOWLER, Jr., Baltimore, Md., assignors to Typographic Development Company, Chicago, Ill., a Corporation of Illinois.

Filed Aug. 16, 1901. Serial No. 72,248. (No model.)



Claim.—1. In a type-casting machine, the combination with a series of matrices, keepers pivoted at one end, engaging the matrices at their free ends and resting loosely on the keeper-releasers, the keeper-releasers and finger-key mechanism for lifting the keeper-releasers, substantially as described.

2. In a type-casting machine, the combination with a series of matrices, of a series of pivoted keepers engaging the matrices at their free ends and resting loosely on the keeper-releasers, a series of bodily-movable keeper-releasers, and finger-key mechanism engaged with said keeper-releasers for actuating the same, substantially as described.

3. In a type-casting machine, the combination of a series of matrix-keepers, pivoted at one end, engaging the matrices at their free ends and resting loosely on the keeper-releasers, a series of keeper-releasers provided with lateral pins, and finger-key mechanism for actuating the keeper-releasers, substantially as described.

4. In a type-casting machine, the combination with a series of matrix-keepers pivoted at one end, free at their other ends, and finger-key mechanism, of a series of keeper-releasers interposed between the keepers and finger-key mechanism and upon which the keepers rest loosely, substantially as described.

5. The combination with a series of matrix-keepers and finger-key mechanism, of a series of keeper-releasers interposed between the keepers and the key mechanism and provided with a series of lateral pins resting upon the finger-keys, substantially as described.

6. In a type-casting machine, the combination with a series of matrix-keepers and a series of matrix-arresters, of finger-key mechanism, a series of keeper-releasers engaging the keepers and having lateral pins engaging the finger-keys, and a series of levers engaging the matrix-arresters and the finger-keys, substantially as described.

7. In a type-casting machine a melting-pot having a series of ducts, having their discharge in a common line and a series of duct-cut-off gates, substantially as described.

8. In a type-casting machine, a melting-pot having series of ducts, a series of duct-cut-off gates, and means for automatically operating said gates.

9. In a type-casting machine, a melting-pot provided with a type-metal compartment and a spacer-metal compartment, a series of ducts in communication with the type-metal compartment, and duct-cut-off gates arranged in said compartment, substantially as described.

10. In a type-casting machine, a melting-pot having a type-metal compartment and a spacer-metal compartment, plunger-chambers arranged in said compartments, a canal leading from the plunger-chamber of the type-metal compartment to a series of ducts, and a duct in communication with the plunger-chamber of the spacer-metal compartment, substantially as described.

11. In a type-casting machine, a mold comprising a bottom plate which rests upon the melting-pot, and is constructed with a series of grooves and mold-closing and type-extracting slides arranged to operate with said grooves, and means for introducing casting material into said grooves.

12. In a type-casting machine, a mold comprising a bottom plate provided with a type-race, means for introducing casting material into said mold, means for withdrawing type cast in said mold and means for pushing the type along the race.

13. In a type-casting machine, a mold comprising a bottom plate provided with slide-grooves and a type-race intersecting said grooves, in combination with mold-closing and type-extracting slides, means for introducing casting material into said grooves, and a type-pusher operating in the type-race.

14. In a type-casting machine, the combination with a melting-pot provided with a series of ducts, of a mold the bottom plate of which rests on said melting-pot and is provided with openings registering with the ducts of the melting-pot, substantially as described.

15. A mold the bottom plate of which rests upon the melting-pot and is provided with a waste-metal slot, substantially as described.

16. In a type-casting machine, the combination with a mold, of a slide provided with means to close an end of the mold and having a part to enter the mold, which part is provided with means to extract a type therefrom, substantially as described.

17. In a type-casting machine, a mold, and a slide constructed to enter the mold, close one end thereof and constitute the bottom of the casting-space thereof, substantially as described.

18. In a type-casting machine, a mold-closing and type-extracting slide provided with a reduced forward portion to enter the mold, a shoulder to close the end of the mold, and means for extracting the type, substantially as described.

19. In a type-casting machine, a mold-closing and type-extracting slide provided with a reduced forward portion to enter the mold, a shoulder to close the end of the mold, and means for extracting the type, and an abutment for engagement with a slide-retracting device.

20. In a type-casting machine, a mold-closing and type-extracting slide provided with a reduced forward portion to enter the mold, a shoulder to close the end of the mold, means for extracting the type, and a nozzle, substantially as described.

21. In a type-casting machine, a mold having a movable casting-space bottom provided with type-extracting means, substantially as described.

22. In a type-casting machine, the combination with a mold, of a mold-closing and type-extracting slide provided with a guide and a movable abutment arranged thereon, means for operating said abutment and means for operating said slide, substantially as described.

23. In a type-casting machine, the combination with a mold, of a mold-closing and type-extracting slide having a reduced forward portion to enter the mold, a shoulder to close the end of the mold, a nozzle leading to the casting-space of the mold, means for extracting the type, a guide, and a movable abutment arranged in said guide, means for operating said abutment, means for operating said slide, a type-metal pot, and means for introducing type-metal into the mold substantially as described.

24. In a type-casting machine, the combination with a mold, of a mold-closing and type-extracting slide provided with a portion to enter the mold, having a nozzle leading to the casting-space of the mold, type-extracting means, a guide, a movable abutment arranged thereon, and a depending ear, means for operating said abutment, means for operating said slide, a type-metal pot, and means connected to said ear and operated by the movement of the slide to permit metal to be introduced into the mold, substantially as described.

25. In a type-casting-machine, the combination with a mold, of a slide coöstructed to enter the mold and close the rear end thereof and provided with type-extracting means, substantially as described.

26. In a type-casting machine, the combination with a mold, of a mold-closing and type-extracting slide provided with a movable abutment and a depending ear, means for operating said abutment, means for operating said slide, and means connected with said ear and operated by the movement of the slide to permit type-metal to be introduced into the mold.

27. In a type-casting machine, the combination with a melting-pot and a mold, of a mold-closing and type-extracting slide provided with a nozzle for the passage of molten metal into the casting-space of the mold, substantially as described.

28. In a type-casting machine, the combination with a melting-pot having a series of ducts, of gates arranged in said ducts, a mold, mold-closing and type-extracting slides and mechanism connected with said slides for operating the gates, substantially as described.

29. In a type-casting machine, the combination with a mold, of a melting-pot having a series of ducts and gates for opening and closing said ducts, and slides constructed to enter and close the mold and provided with means for actuating said gates, substantially as described.

30. In a type-casting machine, the combination with a mold, of slides arranged to move in said mold, and a slide-retracting hand provided with a series of fingers, substantially as described.

31. In a type-casting machine, the combination of a mold, a matrix-aligning blade arranged in cooperative relation thereto, slides arranged to move in said mold, a slide-operating hand provided with a series of fingers and means for attachment of the matrix-aligning-blade-operating arm, and means for introducing type-metal into said mold.

32. In a type-casting machine, the combination with a mold and mold-closing and type-extracting slides, of a slide-operating hand having a series of fingers which overlie the slides, substantially as described.

33. In a type-casting machine, the combination with a mold, of a mold-closing and type-extracting slide having a movable abutment, and an arm arranged to rest at its free end on a matrix and connected to said abutment, substantially as described.

34. In a type-casting machine, the combination with a melting-pot provided with a series of ducts, of gates for opening and closing said ducts, a mold having a series of channels, mold-closing and type-extracting slides provided with movable abutments, connections between said slides and said gates, arms adapted to rest at their free ends on matrices and connected to said movable abutments, and a fingered hand for operating said slide, substantially as described.

35. In a type-casting machine, the combination with a mold and mold-closing and type-extracting slides provided with nozzles, of a nozzle-clearing comb, substantially as described.

36. In a type-casting machine, the combination with a mold and mold-closing and type-extracting slides provided with nozzles, of a nozzle-clearing device consisting of a plate provided with a series of teeth adapted to enter and clear the nozzles, substantially as described.

37. In a type-casting machine, the combination with a mold and mold-closing and type-extracting slides, of a nozzle-clearing device provided with a series of pins, and means for projecting said pins into said nozzles when the slides are in retracted position, substantially as described.

38. In a type-casting machine, the combination with a melting-pot, a plunger arranged in the melting-pot, a pedestal, a spring-pressed cap loosely mounted thereon, and a lever connected to said plunger and cap.

39. In a type-casting machine, the combination with a mold, of a type-race, a composing-box at its end, means for bringing type and compressible spaces from the mold to the race, a pusher reciprocating in said type-race, and means for operating said pusher to convey the type to the composing-box and justify the line of type therein, substantially as described.

40. In a type-casting machine, the combination with casting mechanism, a composing-box, and means for assembling the cast type and spaces into a line, of a line-ejector slide provided with a movable abutment and a blade to enter the composing-box and eject the line of type therefrom, means for operating the slide, and means brought into action by finger-key mechanism to cause the abutment to engage the slide-operating means, substantially as described.

41. In a type-casting machine, the combination of casting mechanism, a composing-box, means for conveying cast type and spaces to said box, a line-transferrer and a line-ejector having a blade to enter the composing-box and an arm for operating the line-transferrer, substantially as described.

42. In a type-casting machine, the combination of casting mechanism, a composing-box, and means for conveying cast type and spaces to said box, a slide and a line-ejecting blade carried thereby, a movable abutment connected to said a fixed abutment on said slide and a slide-operating hand arranged to engage said abutment, substantially as described.

43. In a type casting and composing machine, the combination with casting mechanism, a composing-box, and means for conveying cast type to said composing-box, of a swinging line-transferrer provided with a fork, a line-ejecting blade having a part to engage said fork and means for operating said line-ejecting blade.

44. In a type-casting machine, the combination of a pivoted line-transferrer arranged in coöperative relation to the composing-box, a fork connected to said line-transferrer, a line-ejecting blade, and means carried thereby for engaging the fork to operate the line-transferrer.

45. In a type-casting machine, a line-transferrer having a removable floor-section, substantially as described.

46. In a type-casting machine, the combination with a composing-box, of a filling-block and means for securing the latter in said box, substantially as described.

47. In a type-casting machine, the combination with a composing-box, a line-transferrer open at one end, and a yielding line-abutment closing the open end of the line-transferrer, substantially as described.

48. In a type-casting machine, a matrix-alining blade, a rocking trigger provided with a cam to operate said blade, and means for actuating said trigger to cause the cam to project the alining-blade into engagement with a matrix, substantially as described.

49. In a type-casting machine, the combination with a matrix-alining blade, a trigger provided with a cam arranged in operative relation to said blade, the fingered hand, an arm connected with said hand and having a pin engaging said trigger, substantially as described.

50. In a type-casting machine, the combination with a mold having a channel for casting spacers, of a slide constructed to enter and close said channel and constitute the bottom of the casting-space thereof, and provided with a plurality of projections and a nozzle, substantially as described.

51. In a type-casting machine, the combination with a melting-pot having a spacer-metal compartment, a duct leading therefrom, a gate for opening and closing said duct, a plunger therein, a mold having a spacer-casting channel, a slide coöperating with said channel, means connecting said slide with said gate comprising a link having a fork, a plunger-lever, and an abutment engaging said fork and adapted to be engaged with said lever to prevent the action of the plunger, substantially as described.

52. In a type-casting machine, the combination with a matrix; a mold, and means operated by finger-keys for releasing and positioning said matrix in front of the mold, of a mold-closing and type-extracting slide, means for projecting said slide into and withdrawing the same from the mold, and means for injecting metal into the mold, substantially as described.

53. In a type-casting machine, the combination with a matrix, a mold, and means operated by finger-keys for releasing and positioning said matrix in front of the mold, of a mold-closing and type-extracting slide, means for projecting said slide into and withdrawing the same from the mold, means for injecting metal into the mold, and means for releasing the cast type from the slide, substantially as described.

54. In a type-casting machine, the combination with matrices, a mold having a series of channels, means operated by finger-keys for selectively releasing and presenting the matrices to the mold, a melting-pot having a series of ducts, gates for said ducts, mold-closing and type-extracting slides connected to said gates, means for operating said slides, and means for injecting metal into the mold, substantially as described.

55. In a type-casting machine the combination with finger-key-released matrices, of a mold having a series of channels, a series of mold-closing and type-extracting slides adapted to said mold-channels, means for operating said slides and means brought into action by the fall of a matrix whereby the coöperating slide is made active, substantially as described.

56. In a type-casting machine the combination with finger-key-released matrices, of a mold having a series of channels, a series of independent mold-closing and type-extracting slides, movable abutments connected to said slides normally held out of action by the matrices and brought into action by the fall of the coöperating matrix, and means for engaging said abutment to project the slide into a mold-channel, substantially as described.

57. In a type-casting machine, the combination with a mold, matrices and means for presenting them to the mold, of a melting-pot, a mold-closing and type-extracting slide, having a nozzle adapted to communicate at the proper time with the melting-pot, means for projecting metal through said nozzle, means for releasing the cast type from the slide, and means for cleaning the nozzle, substantially as described.

58. In a machine for casting and composing individual type, the combination of a series of movable matrices bearing a plurality of characters, a mold having a series of channels, finger-key-actuated mechanism for selectively presenting the matrices to the corresponding channel of the mold, casting mechanism, means for extracting the cast type, means for composing and justifying the type, and means for transferring the composed and justified line to a galley, substantially as described.

59. In a machine for casting and composing individual type, the combination of a series of independent matrices bearing a plurality of characters, finger-key-actuated matrix keepers, releasers and arresters, a mold, having a series of channels, a melting-pot having a series of ducts, a series of mold-closing and type-extracting slides, means actuated thereby for opening and closing the mold-ducts, means for projecting metal into the mold, and means for composing and justifying the type in a line, substantially as described.

60. In a machine for casting and composing individual type, the combination of a series of independent matrices bearing a plurality of characters, a mold having a series of channels, finger-key-actuated mechanism for selectively presenting the matrices to the mold, casting mechanism, means for conveying and composing the individual type into a line, a line-transferrer, and a line-ejector for depositing the composed line thereon, substantially as described.

61. In a machine for casting and composing individual type, the combination of a series of independent movable matrices bearing a plurality of characters, a mold having a series of channels, finger-key-actuated mechanism for selectively presenting the matrices to the mold, casting mechanism and means for composing the individual type into a line, substantially as described.

62. In a machine for casting individual type, the combination of a series of independent movable matrices bearing a plurality of characters, a mold having a series of channels, finger-key-actuated mechanism for selectively presenting the matrices to the mold, casting mechanism comprising a pot having a series of normally-closed ducts leading to the several mold-channels, a metal projector and means for opening one of the ducts while the others remain closed, substantially as described.

63. In a machine for casting individual type, the combination of a series of independent movable matrices bearing a plurality of characters, a mold having a series of channels, finger-key-actuated mechanism for selectively presenting the matrices to the mold, casting mechanism comprising a pot with a series of normally-closed ducts, and means brought into action by the movement of the selected matrix for opening the proper duct, substantially as described.

64. In a machine for casting individual type the combination of a series of independent movable matrices bearing a plurality of characters, a mold having a series of channels, finger-key-actuated mechanism for selectively presenting the matrices to the mold, a melting-pot having a series of normally gate-closed ducts, a metal-projector plunger, mold-closing and type-extracting slides, connected to the duct-gates, and means for operating said gates, substantially as described.

65. In a type-casting machine, the combination of a series of matrices, a mold having a series of channels, means for selectively presenting the matrices to the mold, mold-closing and type-extracting slides, a molten-metal pot having a series of ducts, gates for said ducts connected to and operated by said slides, a fingered slide-operating hand, and movable abutments connected to the slides, pivoted arms connected to said abutments and resting on the matrices, a plunger in the molten-metal pot, and means for operating the slide-operating hand and the plunger, substantially as described.

66. In a type casting and composing machine, the combination of a series of matrices, a mold having a series of channels, means for selectively presenting the matrices to the mold, mold-closing and type-extracting slides, a molten-metal pot having a series of ducts, a metal-projecting plunger in said pot, gates for said ducts connected to and operated by said slides, a composing-box, means for conveying the cast type thereto, a line-ejector, a fingered hand for operating the slides and line-ejector, movable abutments connected to the slides and line-ejector, pivoted arms connected to said abutments and resting on the matrices, and means for operating said slides, plunger and line-ejector, substantially as described.

67. In a machine for casting and composing individual type, a line-ejector, a dummy matrix coöperating therewith, means for projecting the line-ejector, finger-key-actuated device for releasing the dummy matrix, and means made active by the movement of the dummy matrix for subjecting the line-ejector to the action of the projecting means, substantially as described.

68. In a casting-machine, a series of movable matrices bearing a plurality of characters, a mold having a series of channels, in alinement with said matrices, finger-key mechanism for selectively presenting the matrices to the mold, and casting mechanism, substantially as described.

69. In a machine for casting and composing individual type, the combination of a series of independent movable matrices bearing a plurality of characters, a mold having a series of channels, finger-key-actuated mechanism for selectively presenting the matrices to the mold, casting mechanism and means for extracting the cast type from the mold, substantially as described.

70. In a type-casting machine, the combination of a series of matrices, a mold, finger-key mechanism for selectively presenting the matrices to the mold, casting mechanism, a matrix-returning shoe, and mechanism set in operation by the actuation of the finger-key mechanism in selecting a matrix for actuating said shoe at the conclusion of each cycle of operation.

71. In a type-casting machine, the combination of a series of movable matrices each bearing a plurality of characters, a mold having a series of channels in alinement with said matrices, finger-key mechanism for selectively presenting the matrices to said mold, casting mechanism, means for extracting the cast type from the mold, a matrix-returning shoe, and mechanism set in operation by the actuation of the finger-key mechanism in selecting a matrix for actuating said shoe at the conclusion of each cycle of operation.

72. In a type-casting machine, the combination of a series of movable matrices each bearing a plurality of characters, a mold having a series of channels in alinement with said matrices, finger-key mechanism for selectively presenting the matrices to the mold, casting mechanism, means for extracting the cast type from the mold, and means for returning the matrices to normal position.

73. In a type-casting machine, the combination of a series of movable matrices each bearing a plurality of characters, a mold having a series of channels in alinement with said matrices, finger-key mechanism for selectively presenting the matrices to the mold, casting mechanism, means for extracting the cast type from the mold, and a matrix-returning shoe

74. A matrix for type-casting machines provided with a plurality of series of characters of different font.

75. In a type-casting machine, a series of matrices bearing a plurality of series of characters of different font, a mold having a series of channels, finger-key-actuated mechanism for selectively presenting the matrices to the mold, and a casting mechanism, substantially as describbed.

76. In a type-casting machine, a series of matrices bearing a plurality of series of characters of different font, a shiftable carrier therefor, a mold having a series of channels, finger-key-actuated mechanism for selectively presenting the matrices to the mold, and a casting mechanism.

77. In a type-casting machine a series of matrices bearing a plurality of series of characters of different font, a mold having a series of channels, means for shifting the matrices to bring either font of characters into operative relation to the mold, finger-key-actuated mechanism for selectively presenting the matrices to the mold, and a casting mechanism, substantially as described.

78. In a type-casting machine a series of matrices, bearing a plurality of characters, a mold having a series of channels in alinement with said matrices, finger-keys for selectively releasing the matrices, and individual matrix-arresters connected to and operated by its respective key, substantially as described.

79. In a type-casting machine, the combination with a driving-shaft, a normally loose pulley thereon, of an automatically-actuated pulley-engaging clutch, a clutch-arm engaging the clutch to hold it normally out of engagement with the pulley, a release-arm, finger-key mechanism, means arranged to be operated by any key of the mechanism to actuate the release-arm, and means operating to withdraw the clutch-arm from engagement with the clutch when the release-arm is actuated, substantially as described.

80. In a type-casting machine, a driving-shaft, a normally loose pulley thereon, of a clutch, and mechanism to permit the clutch to act comprising a clutch-arm engaging and normally holding the clutch inactive, a rock-shaft, a release-arm carried thereby, means for withdrawing the clutch-arm when the release-arm is actuated, trip-arms carried by the rock-shaft, finger-key mechanism and connections between the trip-arms and the finger-keys whereby the release-arm is actuated, substantially as described.

81. In a type-casting machine, the combination with releasably-stored matrices and means for casting type therefrom, of a driving-shaft, a normally loose pulley thereon, an automatic clutch, releasable means for normally holding the clutch from engagement with the pulley, finger-key mechanism, and matrix-release and clutch-holder-release connections operated by the finger-keys, substantially as described.

82. In a type-casting machine, a machine-starting mechanism comprising a clutch-arm, a weighted disk, a mutilated friction-disk operatively connected to said weighted disk, a cam also operably connected to and partaking of the movement of said weighted disk and adapted to engage and operate the clutch-arm, means for imparting motion to the mutilated friction-disk, means for holding the weighted disk from operation and connections actuated by depression of finger-key mechanism for releasing the weighted disk from the holding means, substantially as described.

83. In a type-casting machine, a machine-starting mechanism comprising a weighted disk provided with a beak-rib, a release-arm normally holding said disk inactive, means actuated by a finger-key for withdrawing said arm from engagement with the disk, a clutch-arm, and means actuated by said weighted disk for withdrawing such clutch-arm, substantially as described.

84. In a type-casting machine, a machine-starting mechanism comprising a clutch-arm, a friction-transmitting disk, a mutilated disk, a weighted disk for bringing said mutilated disk into frictional engagement with the transmitting-disk, a cam operatively connected to and partaking of the movement of said weighted disk to engage and withdraw the clutch-arm, a release-arm for holding said weighted disk inactive, and finger-key mechanism for withdrawing the release-arm and permitting operation of the weighted disk, substantially as described.

85. In a type-casting machine, the combination with independent, releasably-stored matrices, mechanism for casting therefrom, driving mechanism, finger-key mechanism for releasing the matrices and presenting the same in casting position and connections between said finger-key mechanism and the driving mechanism whereby the latter is made active on the actuation of any key of the mechanism, substantially as described.

705,526. SAFETY HOISTING-HOOK FOR ORE-BUCKETS, &c. HIRAM B. GRAY, Conneaut, Ohio, assignor of one-half to V. J. Craytor, Conneaut, Ohio. Filed Feb. 23, 1902. Serial No. 96,170. (No model.)

Claims.—1. A hook for hoisting buckets and other articles, provided with a safety-guard, adapted to move to and from the point of the hook, and a pawl and ratchet, arranged to lock the said safety-guard in contact with the said hook substantially as set forth.

2. A hook for hoisting buckets and other articles, provided with a safety-guard, having a V-shaped notch in its end and adapted to move to and from the point of the hook, and a pawl and ratchet, arranged to lock the said safety-guard in contact with the said hook, the said notch receiving the point of the latter substantially as set forth.

3. In a hook for hoisting buckets and other articles, the shank having a middle opening, and having two corresponding curved slots in its sides and the hook proper integral with it, in combination with a safety-guard adapted to fit on the said point and provided with a ratchet and gudgeons, and a pawl pivoted within the said opening and arranged to engage the said ratchet when the shank of the hook tilts forward, for the purpose of holding the safety-guard on the hook-point substantially as set forth.

4. In combination with a hook, a pivoted safety-guard ratchet and handle in one piece and a pawl adapted to automatically engage the said ratchet thereby locking the safety-guard on the hook-point and the handle against the back of the hook substantially as set forth.

5. In combination with a hook and a handle movable with respect thereto, but curved to fit close against the back of the hook in its closed position, means for automatically locking the said handle in such position, when the top of the shank tilts forward substantially as set forth.

6. In combination with a slotted hook, a movable piece provided with gudgeons adapted to slide in said slots and a pawl arranged to engage a ratchet on said piece for locking it in closed position, the said piece comprising a safety-guard adapted to fit on the point of the hook and a handle carved to fit against the back of the hook substantially as set forth.

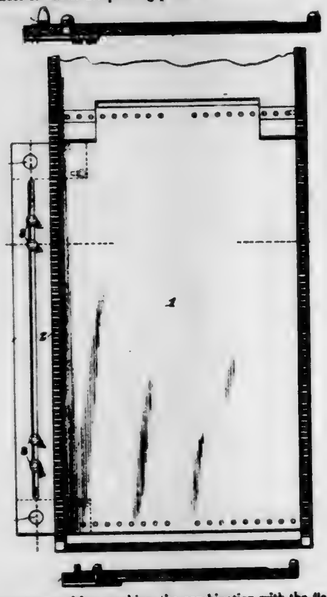
7. A hook having a pair of pawls pivoted in its shank, in combination with a safety-guard having successive teeth engaged respectively by said pawls, to lock the said guard on the point of the hook substantially as set forth.

705,527. WORK-GAGE ATTACHMENT FOR TYPE-WRITING MACHINES. HIRAM J. HALLE, Cleveland, Ohio, assignor to the Phelps Book Typewriter Company, Cleveland, Ohio, a Corporation of Delaware. Filed Dec. 13, 1900. Serial No. 39,730. (No model.)

Claims.—1. In a type-writing machine, the combination with a flat platen and the main tracks or guides for the traveling printing mechanism, of an adjustable work-gage disconnected from but coöperating with a track or guide to aline and hold the work.

2. In a type-writing machine, the combination with a flat platen and the main tracks or guides for the traveling printing mechanism, of a work-gage adjustable longitudinally of the platen and disposed to coöperate with a track or guide to aline and hold the work.

3. In a type-writing machine, the combination with a flat platen and the main tracks or guides for the traveling machine, of a work-gage comprising a plurality of independently-adjustable-gage members designed to be adjusted to register with the file-holes in a work-sheet or bill to retain said sheet or bill in the printing position.



4. In a type-writing machine, the combination with the flat platen, and the machine rails or guides, of a work-gage arranged to lie outside of the vertical plane of a track or guide and adjustable to different positions to accommodate different work-sheets.

5. In a type-writing machine, the combination with the flat platen, and the movable main tracks or guides for the traveling printing mechanism, of a work-gage arranged to lie in a plane at one side of a track or guide, said track or guides and said work-gage being disposed to cooperate to hold and aline the work.

6. In a type-writing machine, the combination with the platen and the movable tracks or guides for the traveling printing mechanism, of a work-gage arranged to lie outside of a track or guide and to aline a work-sheet held by said track or guide.

7. In a type-writing machine, the combination with the platen, and the rails or guides for the traveling printing mechanism, of a work-gage having a support distinct from the platen and arranged to lie outside of the vertical plane of a rail or guide.

8. In a type-writing machine, the combination with the platen, and the rails or guides disposed thereon for the traveling printing mechanism, of a work-registering gage attachment having a gage proper or gage-abutment located outside of the vertical plane of a rail or guide and independent of the latter.

9. In a type-writing machine, the combination with the flat platen, and the tracks or guides for the traveling printing mechanism, of a work-registering gage attachment having a gage proper arranged longitudinally of the platen, at one edge thereof and outside of the vertical plane of a track or guide, the gage proper and a track or guide being disposed in cooperative relation to aline and hold a work-sheet.

10. In a type-writing machine, the combination with the flat platen, and the rails or guides disposed thereon for the traveling printing mechanism, of a gage attachment arranged longitudinally of the platen at one edge thereof, and having a gage proper or gage-abutment located outside of the vertical plane of a rail or guide for interlocking engagement with a work-sheet.

11. In a type-writing machine, the combination with the platen, and the machine rails or guides arranged thereover, of a work-gage detachably supported by the platen outside of the vertical plane of a machine rail or guide, and arranged to prevent the shifting of the work-sheet in any horizontal direction.

12. In a type-writing machine, the combination with the platen and the machine rails or guides arranged thereover, of a work-gage detachably and adjustably supported by the platen outside of the vertical plane of a machine rail or guide, and cooperating therewith.

13. In a type-writing machine, the combination with the platen, of a work-gage detachably attached to the platen and arranged longitudinally at one side edge thereof, outside of a machine rail or guide, and disposed to cooperate therewith to aline and hold the work.

14. In a type-writing machine, the combination with the flat platen and the rails or guides, of a work-gage attachment detachably and adjustably fitted to the platen at one side thereof, and provided with a gage proper or gage-abutment located outside of a rail or guide and arranged to have interlocking engagement with the work.

15. The combination with a type-writing-machine platen, and the rails or guides, of a supporting member distinct from the platen and having a gage or gage-abutment lying in a plane outside of the vertical plane of a rail or guide and arranged for interlocking engagement with the work to prevent the shifting of the latter in any horizontal direction.

16. A work-gage for type-writing machines comprising an adjustable element or elements arranged outside of the vertical plane of a machine rail or guide to have interlocking engagement with a work-sheet.

17. A work-gage attachment for type-writing machines arranged to lie outside of the vertical plane of a machine rail or guide and adjacent to one longitudinal edge of the platen, said gage attachment comprising a supporting member distinct from the platen, and an adjustable gage proper or gage-abutment carried by said member and arranged to engage the work-sheet to prevent the shifting thereof in any horizontal direction.

18. A work-gage for type-writing machines arranged to lie without the plane of a machine rail or guide, said gage comprising a plurality of adjustable projections.

19. A work-gage attachment for type-writing machines arranged to lie outside of the vertical plane of a machine rail or guide, said gage attachment comprising a supporting member, and a plurality of alined pins detachably carried by said member.

20. A work-gage attachment for type-writing machines arranged to lie outside of the vertical plane of a machine rail or guide, said attachment comprising a supporting member, and a plurality of alined pins detachably and adjustably carried by said member.

21. A work-gage attachment for type-writing machines arranged to lie outside of the vertical plane of a machine rail or guide, said attachment comprising a supporting member having a longitudinal guide or slot, a plurality of detachable and adjustable pins, and fastening means extending from said guide or slot and engaging with the pin.

22. In a type-writing machine, the combination with the platen and the rails or guides, of a supporting member detachably fitted to the platen at one side edge, and a plurality of alined pins adjustable longitudinally of said supporting member and detachably fitted thereto.

23. In a type-writing machine, the combination with the flat platen, and the rails or guides, of a separate and complete work-gage attachment for the platen, arranged to lie outside of the vertical plane of a track or guide and comprising a work-gage cooperating with a track or guide to aline and hold the work.

24. A work-gage attachment for type-writing machines arranged to lie outside of the vertical plane of a machine rail or guide and comprising a supporting member, and a plurality of alined pins adjustable longitudinally of said supporting member in parallelism with the said rail or guide.

25. In a type-writing machine, the combination with the flat platen, and the machine rails or guides, of a work-gage arranged to lie outside of the vertical plane of a track or guide, and comprising a holding-pin to engage the work.

26. In a type-writing machine, the combination with the flat platen, and the machine rails or guides, of a work-gage arranged to lie outside of the vertical plane of a track or guide, and comprising an adjustable holding-pin to engage the work.

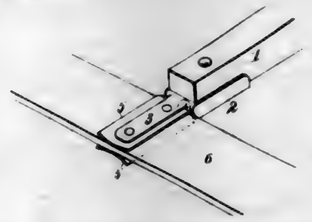
27. In a type-writing machine, the combination with the flat platen, and the machine rails or guides, of a work-gage arranged to lie outside of the vertical plane of a track or guide, and comprising an adjustable holding-pin to engage the work, said pin being adjustable in the direction of the length of the track or guide.

28. In a type-writing machine, the combination with the flat platen and the main tracks or guides, of a work-gage disposed outside of the vertical plane of a track or guide and adjustable both laterally and longitudinally of the platen.

29. In a type-writing machine, the combination with the flat platen and the tracks or guides for the traveling machine, of a work-gage attachment comprising a supporting member adjustable laterally, and gage-pins adjustable longitudinally along said member.

30. In a type-writing machine, the combination with a platen, and the main tracks or guides, of a work-gage attachment comprising a support and a plurality of gage-pins, the latter being located outside of the vertical plane of a track or guide to engage the work.

705,528. RADDLE FOR STRAW-CARRIERS. MARTIN HEBNER, Springfield, Ill., assignor to Sattley Manufacturing Company, Springfield, Ill., a Corporation of Illinois. Filed Apr. 14, 1902. Serial No. 103,915. (No model.)



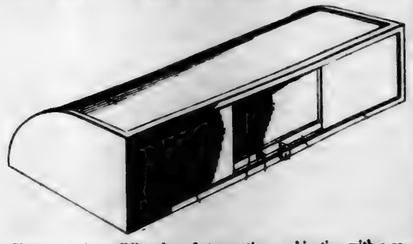
Claim.—1. In a raddle-clip the combination of a raddle-slat, a belt, a metal clip secured to the slat, an extension of the clip secured to the belt crosswise thereof, a separate metal plate secured to the belt crosswise thereof and on the opposite side from the clip, and a strip of flexible material secured between the belt and the clip extension and secured between the belt and the separate metal plate, substantially as described.

2. In a raddle, the combination of a raddle-slat, a belt, a metal clip secured to the raddle-slat, an extension of the clip secured to the belt crosswise thereof, and a strip of flexible material, secured between the belt and the clip extension, substantially as described.

3. In a raddle, the combination of a raddle-slat, a belt, a metal clip secured to the raddle-slat, an extension of the clip secured to the belt crosswise thereof, and a strip of flexible material, wider than the clip extension, secured between the belt and the clip extension, substantially as described.

4. In a raddle, the combination of a raddle-slat, a belt, a metal clip secured to the raddle-slat, an extension of the clip secured to the belt crosswise thereof, and a strip of flexible and yielding material, wider than the clip extension, secured between the belt and the clip extension with its edges projecting beyond the edges of the clip extension, substantially as described.

705,529. SLIDING-DOOR FASTENER. JOHN T. HICKS, Boston, Mass. Filed Nov. 13, 1901. Serial No. 82,082. (No model.)



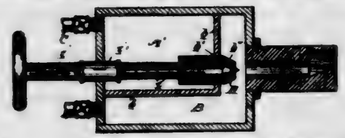
Claim.—1. In a sliding-door fastener, the combination with a series of doors, of a removable fastening-pin for the middle one of the series, said pin having means for securing it to said door, a bar for engaging said pin and adapted to have its ends engage the opposing edges of the other doors, together with means for securing the bar upon the pin.

2. In a sliding-door fastener, the combination with a series of doors, the middle one of which is provided with a transverse passage, of a sleeve or bushing therein, a pin adapted to be inserted into the said passage, said pin having means for securing it to the door, a locking-bar having a slot or opening designed to engage an angular portion of the said pin and means for fastening the pin and bar together.

3. In a sliding-door fastener, the combination with a series of doors, the middle one of which is provided with a transverse passage, of a sleeve or bushing in said passage, a pin having lugs thereon designed to engage the opposite faces of the door when the pin is in the said passage, said pin having also an angular portion and a slotted end, a locking-bar having an opening adapted to engage the angular portion of the pin, and a padlock for engaging the slotted end of the pin after the bar has been located on the pin.

4. In a sliding-door fastener, the combination with a series of doors, of a removable fastening-pin for the middle one of the series, said pin being adapted to be inserted into a transverse passage in the door and having lugs thereon designed to engage the opposite faces of the door when the pin is in the passage, a locking-bar for engaging said pin, together with means for securing the bar upon the pin.

705,530. HYDROCARBON-BURNER. JAMES F. HIGGINS, Corsicana, Tex. Filed July 30, 1901. Serial No. 70,308. (No model.)



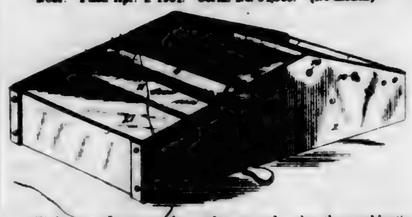
Claim.—1. In a burner of the character described, the combination with a casing, of a nozzle at one end of the casing, an angular partition in said casing constituting with the walls thereof an oil-chamber, an inlet through the end wall of the casing to said oil-chamber, a valved outlet from the oil-chamber at the lower end portion of the partition and in substantial alinement with the nozzle, a steam-chamber between the bottom of the casing and the oil-chamber and extending around the end of said oil-chamber, and an inlet through the end wall of the casing to said steam-chamber.

2. An atomizing-nozzle of substantially the character described, formed at its inner end with a passage constituting a mixing-chamber and at its discharge end with an inclined portion projecting into the path of the discharge from said passage.

3. An atomizing-nozzle of substantially the character described, formed at its inner end with a straight longitudinally-disposed passage constituting a mixing-chamber and at its discharge end with an upwardly-inclined portion projecting into the path of the discharge from said passage.

4. An atomizing-nozzle of substantially the character described, provided at its inner end with a longitudinally-disposed passage E and at its discharge end with an upwardly-inclined portion projecting into the path of the discharge from said passage, and a hood G arranged above said inclined portion and out of the path of said discharge from said passage, said hood being adapted to atomize the oil deflected thereagainst from said inclined portion.

705,531. ENVELOP MOISTENER AND SEALER. FRANK A. JOHNS, Omaha, Nebr., assignor of one-half to Edward M. Wilcox, Omaha, Nebr. Filed Apr. 4, 1901. Serial No. 54,305. (No model.)



Claim.—1. In an envelop moistener and sealer, the combination of means for moistening envelop-flaps while they are open, means for feeding envelops to and from the moistening means with the flaps open and in advance, and means for applying pressure to the flaps to seal the same after they have passed beyond the moistening means but before the bodies of the envelops have cleared said means.

2. In an envelop moistener and sealer, the combination of an endless feed-belt, a moistening device cooperating transversely with the belt and at least equal in length to the length of an envelop-flap, and a pressure device cooperating transversely with the belt to seal envelop-flaps, and at least equal in length to the length of an envelop-flap, the moistening device and the pressure device being spaced at a distance less than the width of an envelop and more than the width of an envelop-flap.

3. In an envelop moistener and sealer, the combination with an endless belt, of a moistening-roller disposed transversely in frictional engagement with the belt and extending for substantially the width thereof, and a pressure-roller disposed transversely in frictional engagement with the belt and extending substantially for the width thereof, the distance between the two rollers being less than the width of an envelop and more than the width of the sealing-flap thereof, whereby the forward edge of an envelop is engaged between the pressure-roller and the belt before the rear edge thereof has become disengaged from between the moistening-roller and the belt.

4. In an envelop moistener and sealer, the combination with a back, of an endless conveyor-belt traveling across the back, a moistening-roller in frictional engagement with the front end portion of the belt and extended transversely for substantially the width thereof, and a pressure-roller extending transversely in frictional engagement with the belt and for substantially the entire width thereof, the pressure-roller being located

in rear of the moistening-roller at a distance less than the width of an envelop and more than the width of the sealing-flap thereof, whereby the forward edge of an envelop is engaged between the pressure roller and the belt before the rear edge thereof has become disengaged from between the moistening-roller and the belt.

5. An envelop moistener and sealer comprising a frame or casing carrying a bed-plate, a moistening-roller, the journals of which are mounted in slots arranged at an upward inclined angle to the bed-plate, a sealing-roller the journals of which are mounted in vertical slots, said rollers being separated by a space which is less than the width of an envelop, two-armed springs secured to the sides of the casing and bearing upon the journals of the two rollers, two drive-rollers journaled contiguous to the ends of the bed-plate, an endless belt passing over the bed-plate and around the drive-rollers, and means for imparting motion to one of the drive-rollers.

6. An envelop moistener and sealer comprising a frame or casing carrying a bed-plate, a moistening-roller having its journals mounted in slots arranged at an upward angle to the bed-plate, the journals of the roller, when in operation, occupying the lowest portion of the slots, and when out of operation, the highest portion of the slots, thereby to lift the moistening-roller above the plane of the bed-plate, a sealing-roller the journals of which are mounted in vertical slots in the frame or casing, said rollers being separated by a space which is less than the width of an envelop, springs for exerting downward pressure on the journals of the two rollers, driving-rollers journaled contiguous to the ends of the bed-plate, an endless belt passing over the bed-plate and around the rollers, and means for imparting motion to one of the rollers.

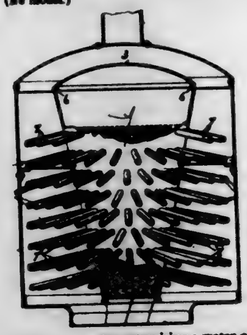
705,532. **MOUNT FOR ARTIFICIAL TEETH.** HENRY D. JUNE, Philadelphia, Pa. Filed Jan. 16, 1902. Serial No. 89,999. (No model.)

Claim.—1. In a mount for artificial teeth, a base having a surface of penetrable material, and an angular arm of pliable material, the vertical limb of which is anchored in said base and the horizontal limb thereof is elevated over said material and having its outer end free.

2. In a mount for artificial teeth, a base having a surface of penetrable material, and an angular-shaped arm of pliable material, the vertical limb of which is flattened and anchored in said base and the horizontal limb extends above said surface and has its outer end free.

3. A mount for artificial teeth, consisting of a base having a surface of penetrable material, an angular-shaped arm having a vertical limb anchored in said base, and a horizontal limb elevated above said base and having its outer end free, said base being adapted to have the teeth which are strung upon said horizontal limb engaged with said penetrable material.

705,533. **STEAM-GENERATOR.** CHARLES A. KITTS, Oswego, N. Y.; Harriet W. Kitts, administratrix of Charles A. Kitts, deceased, assignor to Steam Carriage Motor Company, Oswego, N. Y., a Corporation of New York. Filed Mar. 8, 1901. Renewed Apr. 3, 1902. Serial No. 101,233. (No model.)



Claim.—1. A steam-generator comprising a water-containing shell having inclined side walls, and a series of water-tubes projecting from said side walls at substantially right angles thereto and having their outer ends extended substantially equal distances from the center of the shell and closed.

2. A steam-generator consisting of a tapering water-containing shell having a series of water-tubes arranged in rows one above the other and inclining outwardly and downwardly therefrom, the tubes of each row being gradually reduced in length from the bottom row upwardly.

3. The combination with a burner and a heater-jacket, of an inverted truncated conical shell having a series of radial water-tubes extended outwardly from and at right angles to the side walls of the shell and closed at their outer ends, said outer ends being substantially equal distances from the center of the shell and disposed in a cylindrical plane parallel with the jacket.

705,534. **BRUSH.** CHARLES KLAUBERG, Hartford, Conn., assignor to Meinecke & Company, New York, N. Y., a Corporation of New Jersey. Filed Aug. 31, 1901. Serial No. 73,753. (No model.)

Claim.—1. In a brush, the combination of a wire bristle-retaining member; and a wire handle bent upon itself and extending along said member to reinforce the same.

2. In a brush, the combination of a bristle-retaining member; bristles retained thereby; and a handle having a part extending along said member to reinforce the same and having a bight for the securement of bristles retained by the bristle-retaining member.

3. A brush comprising a bristle-retaining member constructed of wires twisted together, and a spring-handle formed with bights a suitable distance apart, said handle having a portion extending alongside said member to reinforce the same, and said member being secured in place by having the ends thereof bent or turned into the bights.

4. A brush comprising a pair of twisted wires; bristles held therebetween; a wire handle having extensions; and two bights; said extension serving to shape and reinforce said twisted wires, and said bights to retain same.

5. A brush comprising a pair of twisted wires; bristles held therebetween; a wire handle reinforcing said wires; and bights in the end of said handle securing said wires and effective to embrace some of the bristles and form an end tuft.

6. In a brush, the combination of a wire bent to form a handle, and having rigid extensions, said extensions being constructed with bights a suitable distance apart, bristle-carrying members alongside the extensions having their ends bent or passed into said bights, bristles secured to said members throughout their length, and also to the bent portions thereof passing into the bights, said bights thereby embracing the end bristles and maintaining them in tufts.

7. In a brush, the combination of a wire handle having a spring at one end, and oppositely-disposed brushes on the other end; and reinforcing extensions on said handle effective to maintain and reinforce said brush portions, said extensions commencing in bights, each of which is effective to contact with the opposite side of the handle.

8. In a brush, the combination of a wire handle having a spring at one end, and oppositely-disposed brushes secured to the other end; reinforcing extensions on said handle effective to maintain and reinforce said brush portions, said extensions commencing in bights, each of which is effective to contact with the opposite side of the handle, and bights at the free ends effective to overlap.

9. In a brush, the combination of a wire handle having a spring at one end, and brushes secured to the other end; and reinforcing extensions on said handle effective to maintain and reinforce said brush portions, said extensions having bights at the free ends thereof effective to overlap under the influence of the spring.

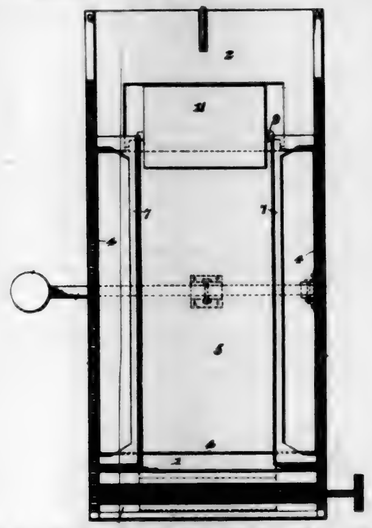
705,535. **TYPE-WRITING MACHINE.** CHARLES F. LAGANKE, Cleveland, Ohio, assignor to the Fisher Book Typewriter Company, Cleveland, Ohio, a Corporation of Delaware. Filed Dec. 31, 1900. Serial No. 41,708. (No model.)

Claim.—1. In a type-writing machine, the combination with the machine-support, and a work-holder adapted to occupy a position thereon beneath the printing mechanism, of a movable platen, and means for automatically moving the platen from the writing plane.

2. In a type-writing machine, the combination with the machine-support, and a work-holder adapted to occupy a position thereon beneath the printing mechanism, of a movable platen, and means for automatically moving the said platen to and from the writing plane.

3. In a type-writing machine, the combination with the machine-support, and a work-holder adapted to occupy a position thereon beneath the printing mechanism, of a movable flat platen, means for holding the platen in the printing plane, and means, controlled by the movement of the machine, for causing the platen to move from the writing plane.

4. In a type-writing machine, the combination with the machine-support, and a work-holder adapted to occupy a position thereon beneath the printing mechanism, of a movable platen, yielding means for normally elevating the platen, and means, operated by the movement of the machine, for automatically depressing the platen.



5. In a type-writing machine, the combination with the machine-support, and a work-holder adapted to occupy a position thereon beneath the printing mechanism, of a movable flat platen, means for holding the flat platen in an operative position, and means for automatically depressing the platen when the machine or printing mechanism is moved beyond the plane thereof.

6. In a type-writing machine, the combination with the machine-support, and a relatively fixed work-holder adapted to occupy a position beneath the printing mechanism, of a movable platen located below the work-holder, yielding means for normally elevating the platen, and independent means for depressing the platen.

7. In a type-writing machine, the combination with the main tracks or guides for the traveling printing mechanism and disposed in the same horizontal plane, of a fixedly-positioned work-holder disposed in a plane between said tracks or guides, and a platen located below the work-holder and movable toward and from the writing plane.

8. In a type-writing machine, the combination with the main tracks or guides for the traveling printing mechanism, of a fixedly-positioned work-holder disposed in a plane intermediate of said tracks or guides and arranged to support the work, and a platen located below the work-holder and movable to and from the writing plane.

9. In a type-writing machine, the combination with the main tracks or guides for the traveling printing mechanism and located in the same horizontal plane, of a fixedly-positioned work-holder disposed between and substantially in the horizontal plane of said tracks or guides, and a platen normally located immediately under the work-holder and depressible to a plane below said tracks or guides.

10. In a type-writing machine, the combination with fixedly-positioned main tracks or guides for the traveling printing mechanism, of a fixedly-positioned work-holder extending inwardly from said tracks or guides, and a depressible platen disposed immediately under the work-holder for presentation to the sheet held thereby.

11. In a type-writing machine, the combination with the main tracks or guides for the traveling printing mechanism and located in the same horizontal plane, of a fixedly-positioned work-holder disposed in a plane intermediate of said tracks or guides, and a depressible platen located below the work-holder and movable to the writing plane to engage a work-sheet held by the work-holder.

12. In a type-writing machine, the combination with the main tracks or guides disposed in the same horizontal plane for the support of the traveling machine, of a work-holder located between the vertical planes of the tracks or guides, and a spring-supported platen disposed below the work-holder and depressible from the writing plane.

13. In a type-writing machine, the combination with the main tracks or guides for the traveling printing mechanism, of a flat stationary work-holder disposed between said tracks or guides to support the work-sheet, and a platen located below said work-holder, said platen being movable toward the holder to engage the sheet and depressible from the writing plane.

14. In a type-writing machine, the combination with the main tracks or guides for the traveling printing mechanism, of a stationary work-holder extending horizontally from a track or guide, and a platen located below the work-holder, said platen being movable toward and depressible from the writing plane.

15. In a type-writing machine, the combination with the main tracks or guides for the traveling printing mechanism, of a horizontal stationary work-holder comprising members extended inwardly from the tracks or guides, and a platen located below the work-holder, said platen being movable toward and depressible from the writing plane.

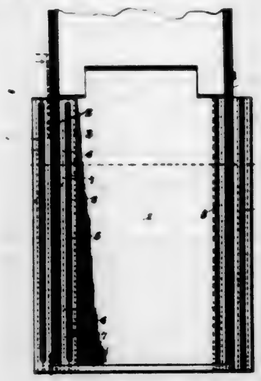
16. In a type-writing machine, the combination with the main tracks or guides for the traveling printing mechanism, of a flat work-holder located in a plane wholly below the upper edges of the tracks or guides to permit the machine to travel freely thereover, and a platen disposed immediately below the work-holder, said platen being movable to and depressible from the writing plane.

17. In a type-writing machine, the combination with the flat platen, the traveling machine, and the main tracks or guides, of a work-holder interposed in a plane between the machine and the writing-surface of the platen and having holding and aligning means for the work, said platen being depressible from the writing-surface.

18. In a type-writing machine, the combination with the tracks or guides for the traveling machine, of a platen depressible from the writing plane, and a work-holder located above the platen and arranged to sustain a work-sheet in the printing position.

19. In a type-writing machine, the combination with the main tracks or guides disposed in the same horizontal plane for the support of the traveling printing mechanism, of a work-holder disposed between said tracks or guides, and a platen located below the work-holder and movable toward and depressible from the writing plane, said work-holder being sustained independently of the platen.

705,536. **WORK GAGE AND CLAMP FOR TYPE-WRITING MACHINES.** CHARLES F. LAGANKE, Cleveland, Ohio, assignor to the Fisher Book Typewriter Company, Cleveland, Ohio, a Corporation of Delaware. Filed Mar. 21, 1901. Serial No. 52,231. (No model.)



Claim.—1. In a type-writing machine, the combination with the flat platen, the tracks or guides, and a work-gage, of a clamp member distinct from the rails and disposed to coöperate with the work-gage.

2. In a type-writing machine, the combination with the flat platen, tracks or guides, and a work-gage, of a clamp-plate disposed at one side of a track or guide and in coöperative relation with the work-gage.

3. In a type-writing machine, the combination with the flat platen, the tracks or guides, and a work-gage, of a clamp-plate distinct from the rails or guides and movable toward and away from the platen, said clamp-plate being disposed in coöperative relation with the work-gage.

4. In a type-writing machine, the combination with the flat platen, a work-gage, and the machine-rails, of a clamp-plate coöperating with the rails and gage to aline and hold the work.

5. In a type-writing machine, the combination with the platen, the machine-rails and work-gage, of a clamp-plate carried by one of the rails and coöperating with the work-gage to hold the work.

6. In a type-writing machine, the combination with a flat platen, a track or guide, and a clamp-plate connected to one of said elements for

movement toward and away from the platen, of a work-gage disposed in coöperative relation with said platen.

7. In a type-writing machine, the combination with the flat platen, a track or guide, and a clamp-plate having hinged connection with one of said elements, of a work-gage disposed in coöperative relation with the clamp-plate.

8. In a type-writing machine, the combination with the flat platen, the track or guides, and the work-gage, of a clamp-plate distinct from the tracks or guides and disposed directly over the work-gage to clamp and protect the edge of the sheet alined by said gage.

9. In a type-writing machine, the combination with the flat platen, the track or guides, and a work-gage carried by the platen, of a clamp member arranged without the plane of a track or guide and designed to have interlocking engagement with the work-gage.

10. In a type-writing machine, the combination with the flat platen, and the tracks or guides, of a work-clamp distinct from but associated with one of said tracks.

11. In a type-writing machine, the combination with the flat platen, and the tracks or guides, of a clamp-plate disposed intermediate of the platen and one of said tracks.

12. In a type-writing machine, the combination with the flat platen, and the swinging tracks or guides, of a work-clamp directly carried by one of said tracks and extended outside the vertical plane thereof.

13. In a type-writing machine, the combination with the tracks or guides, a work-gage, and a platen provided with means for retaining the work-gage upon the platen at either side of said track, of a clamp arranged to coöperate with the work-gage in either position of the latter.

14. In a type-writing machine, the combination with the flat platen, a track or guide, and a work-gage designed to be located upon the platen at either side of said track, of a clamp extended beyond both sides of the track for coöperation with the work-gage in either position of said gage.

15. In a type-writing machine, the combination with the tracks or guides, a work-gage, and a platen provided with means for locating the work-gage upon said platen adjacent to either side edge of the latter, of a clamp designed to be located in coöperative relation with the work-gage in either position of the latter.

16. In a type-writing machine, the combination with a flat platen, and an adjustable work-gage disposed longitudinally of the platen, of a clamp arranged to coöperate directly with the work-gage in any position of the latter.

17. In a type-writing machine, the combination with a flat platen, and a work-gage member, of a clamp provided with a slot for the reception of the gage member.

18. In a type-writing machine, the combination with a flat platen, and a work-gage adjustable thereon, of a clamp movable toward and away from the platen and provided with a slot designed to receive the gage and to accommodate the adjustment thereof.

19. In a type-writing machine, the combination with a flat platen, and a work-gage composed of a series of alined pins, of a clamp provided with a slot to receive said pins.

20. In a type-writing machine, the combination with the flat platen, and a work-gage composed of a series of alined individually-adjustable pins, of a clamp provided with a slot to receive said pins.

21. In a type-writing machine, the combination with the flat platen, and a work-gage composed of an alined series of pins individually adjustable upon the platen, of tracks or guides for the machine-frame, and a clamp carried by one of said tracks and provided with a slot to receive said pins.

22. In a type-writing machine, the combination with a platen, of an adjustable work-gage consisting of an alined series of pins, and supporting and guiding means for said pins, said supporting and guiding means being formed as a permanent part of the platen.

23. In a type-writing machine, the combination with a flat platen and the tracks or guides for the traveling machine, of a work-gage comprising gage-pins adjustable longitudinally of the platen, and supporting and guiding means for said pins, said supporting and guiding means being formed as a permanent part of the platen.

24. In a type-writing machine, the combination with a platen, and a track or guide, of a work-gage carried directly by the platen outside of the vertical plane of said track or guide and adapted to be arranged on either side thereof.

25. In a type-writing machine, the combination with a platen, of a work-gage comprising a plurality of alined gage members mounted directly upon the platen and individually adjustable to conform to the positions of the file-holes in the margins of the work-sheet, and adapted to be arranged on either side of the platen.

26. In a type-writing machine, the combination with the platen formed with a guide-groove and the main tracks or guides for the support of the traveling machine, of a gage-pin supported and guided within said groove.

27. In a type-writing machine, the combination with a platen formed with a guide-groove and the main tracks or guides disposed longitudinally of the platen for the support of the traveling machine, of a work-gage comprising an alined series of individually-adjustable pins supported and guided within said groove.

28. In a type-writing machine, the combination with a platen formed with a guide-groove and the main tracks or guides for the traveling machine, of a work-gage comprising a plurality of separate gage-blocks slidable within the groove, and gage-pins carried by said blocks and extended above the writing-surface of the platen.

29. In a type-writing machine, the combination with a platen provided with a groove and the main tracks or guides for the traveling machine, of a work-gage comprising a gage-block slidably mounted within the groove, and a gage-pin carried by and having an adjustable connection with the gage-block, whereby the pin and block may be caused to bind against oppositely-disposed faces of the platen to retain the gage in its adjusted positions.

30. In a type-writing machine, the combination with a platen formed with a plurality of parallel guide-grooves, of a track or guide disposed above the platen intermediate of said grooves, and a work-gage designed to be supported and guided within either of the grooves in the platen.

705,537. WORK-GAGE FOR TYPE-WRITING MACHINES. CHARLES F. LAGARDE, Cleveland, Ohio, assignor to the Fisher Type-writer Company, of Tennessee. Filed Aug. 29, 1900. Serial No. 28,441. (No model.)

Claim.—1. In a type-writing machine, the combination with the flat platen, and the main tracks or guides, of a work-gage arranged to lie in a plane beneath a track or guide and longitudinally thereof.

2. In a type-writing machine, the combination with the platen, and the tracks or guides, of a gage-abutment disposed longitudinally of the platen and arranged to lie beneath a track or guide.

3. In a type-writing machine, the combination with the platen, and the tracks or guides, of a gage-abutment, and means for covering the gage-abutment upon the lowering of the tracks or guides upon the platen.

4. In a type-writing machine, the combination with the flat platen, and the tracks or guides, of a work-gage abutment arranged beneath a track or guide, and means for covering the abutment upon the lowering of the track or guide onto the platen.

5. In a type-writing machine, the combination with the platen, and the tracks or guides for the printing mechanism, of a work-gage arranged parallel with a track or guide and consisting of an alined series of projections coöperating with a track or guide.

6. In a type-writing machine, the combination with the platen, and the tracks or guides, of a work-gage abutment consisting of a series of pins or projections arranged beneath a track or guide, and coöperating therewith.

7. In a type-writing machine, the combination with the platen, and the tracks or guides, of a work-gage abutment consisting of an alined series of pins or projections arranged beneath a track or guide, and means for covering the pins or projections upon the lowering of the tracks or guides onto the platen.

8. In a type-writing machine, the combination with the platen, and the tracks or guides for the printing mechanism, of a yielding gage-abutment for the work and coöperating with a track or guide.

9. In a type-writing machine, the combination with the platen, and the tracks or guides, of a disappearing gage-abutment coöperating with a track or guide.

10. In a type-writing machine, the combination with the platen, and the tracks or guides, of a yieldingly-projected gage-abutment, and means for causing the gage-abutment to recede upon the lowering of the tracks or guides onto the platen.

11. In a type-writing machine, the combination with the platen and the tracks or guides, of a work-gage consisting of a series of longitudinally-alined pins or projections arranged upon the platen in the vertical plane of a track or guide, and adapted to be entirely covered by the latter upon the lowering thereof.

12. In a type-writing machine, the combination with the platen, and the tracks or guides, of a work-gage consisting of a series of alined and spaced pins loosely mounted in the platen in the vertical plane of a track or guide, and spring-supports for yieldingly projecting the said pins through the top surface of the platen.

13. In a type-writing machine, the combination with the flat platen, and the movable tracks or guides for the printing mechanism, of a work-gage disposed in a plane between a track or guide and the platen and coöperating therewith.

14. In a type-writing machine, the combination with the flat platen, and the tracks or guides for the traveling printing mechanism, of a work-gage disposed longitudinally of the platen coöperating with a track or guide to aline and hold the work.

15. In a type-writing machine, the combination with the flat platen, and the movable tracks or guides for the printing mechanism, of a work-gage coöperating with a track or guide to aline and hold the work, said gage consisting of a series of pins or projections.

16. In a type-writing machine, the combination with the flat platen, and the movable tracks or guides for the printing mechanism, of a work-gage coöperating with a track or guide to aline and hold the work, said gage consisting of a series of yielding pins or projections.

17. In a type-writing machine, the combination with the flat platen, and the movable tracks or guides for the traveling printing mechanism, of a work-gage located within the limits of the platen and coöperating with a track or guide to aline and hold the sheet.

18. In a type-writing machine, the combination with the flat platen, and the movable tracks or guides for the traveling printing mechanism, of a work-gage supported on the platen and arranged in parallelism with a track or guide and coöperating therewith to aline and hold the work.

19. A platen having gage-pins mounted thereon and projecting above the writing-surface thereof, in combination with a clamping member arranged to hold the work on the pins.

20. In a type-writing machine, the combination with a flat platen, of a work-gage, and a clamping member disposed directly over the gage and arranged to coöperate therewith to hold and aline the work.

21. In a type-writing machine, the combination with a flat platen and a clamping member, of a work-gage arranged to lie wholly beneath said member.

22. In a type-writing machine, the combination with a flat platen, of a hinged clamping member, and a work-gage arranged in coöperative relation therewith and disposed longitudinally of the platen.

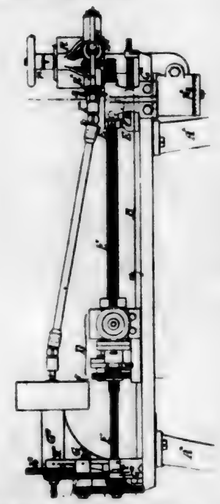
23. In a type-writing machine, the combination with a flat platen and a clamping member having hinged connection therewith, of a work-gage arranged to lie in a plane entirely beneath said hinged clamping member.

24. In a type-writing machine, the combination with a flat platen and the movable tracks or guides, of a gage device arranged for release by the movement of a rail or guide.

25. The combination with a flat platen and a movable rail or guide disposed for relative movement, of a gage device arranged for release from one of said elements by their relative movement.

705,588. SCREW-CUTTING MACHINE. DAVID LAKE and EDWIN W. CRELLIN, Philadelphia, Pa., assignors of one-half to Alvan Markle and John W. Griffin, Manayunk, Pa. Filed Aug. 6, 1901. Serial No. 70,973. (No model.)

Claim.—1. The combination in a screw-cutting machine, of a bed, a slideway thereon, a carriage mounted on said slideway, a chuck-spindle on the carriage in which the work is secured, a longitudinally-arranged lead-screw on the bed, a clutch on the carriage engaging said lead-screw, a sleeve on the screw and carried by the carriage, said sleeve having a key entering a spline in the lead-screw and geared to the chuck-spindle, and a cutter mounted to cut a thread on the rod as it is fed forward by the lead-screw, substantially as described.



2. The combination in a screw-cutting machine, of a bed, a longitudinal keyway thereon, a longitudinal lead-screw parallel thereto, gearing for driving said lead-screw, a carriage and a chuck-spindle both driven by said lead-screw, a carrier pivoted to the bed, a cutter-shaft mounted on the carrier, a cutter mounted on said shaft in the pivotal line of the carrier, a stud upon which the carrier is mounted, and means for driving the cutter-shaft, substantially as described.

3. The combination of a bed, a carrier pivoted to one end of the bed, a cutter-shaft having its bearings in said carrier, a cutter thereon, a hollow driving-shaft at the opposite end of the bed, a splined driving-rod mounted in the hollow shaft and keyed thereto, a universal coupling connecting the said driving-rod to the cutter-shaft, a carriage, a lead-screw, gearing by which the lead-screw is driven from the driving-shaft, and gearing by which the chuck-spindle on the carriage is driven from the lead-screw, substantially as described.

4. The combination in a screw-cutting machine of means for feeding a rod, a pivoted carrier, a cutter-shaft mounted in bearings in said carrier, a cutter on said shaft, means connected to the shaft for driving said cutter, said carrier being capable of adjustment on its pivot so that the cutter-shaft will be at right angles to the line of the work, and auxiliary mechanism for coupling said cutter-shaft to the driving mechanism when said shaft is in its adjusted position, substantially as described.

5. The combination of a bed, a pivoted carrier mounted on one end of the bed, a head, means for vertically adjusting said head, a cutter-shaft on said head, a cutter, driving mechanism at the opposite end of the machine, the driving mechanism consisting of three rods coupled together by universal joints, one of said rods being connected to the cutter-shaft, and means for feeding the work to the cutter, substantially as described.

6. The combination of a bed, a frame at one end of the bed, a driving-shaft mounted in said frame, a carrier pivoted to the opposite end of said bed, a cutter-shaft mounted on the carrier, a cutter thereon, a longitudinal guideway, a longitudinal lead-screw, said screw being mounted in a bearing on one end of the machine and in the frame at the opposite end of the machine, a train of change-gears by which the lead-screw is driven from the driving-shaft, a carriage on the guideway, a chuck on the carriage engaging the lead-screw and by which the carriage is moved toward or from the work, a hollow spindle on the carriage to which the work is chucked, and change-gearing by which a rotary motion is imparted to the spindle from the lead-screw, substantially as described.

7. The combination in a screw-cutting machine, of a bed, a longitudinal lead-screw, means for turning said lead-screw, a carriage operated by the lead-screw, a chuck on the carriage to hold the work, a stud projecting from the under side of the bed, a carrier pivoted to said stud, means for clamping the carrier thereto, a head, and a cutter carried by

said head, said cutter being mounted in line with the pivot of the carrier, substantially as described.

705,539. LACE-MAKING MACHINE. ADOLF MATTHEUS, Vienna, Austria-Hungary. Filed Oct. 31, 1901. Serial No. 80,668. (No model.)

Claim.—1. In a lace-loom, the combination of sets of pushers and needles, slides connected thereto, pawls connected to some of the sets of slides, sets of lifting-bars each of which is provided with a series of projections adapted to come into contact with and lift the slides and pawls corresponding thereto, and a jacquard to which each lifting-bar is connected to be moved laterally thereby, and means for raising and lowering the said lifting-bars.

2. In a lace-loom, the combination of three groups of needles one of them jacquard-controlled vertically, of which two groups adjust the threads for the correct insertion of the jacquard-controlled group of needles, which raises the twists and threads to the various heights required by the pattern.

3. In a lace-loom, a set of needles simultaneously movable at one side of the lace, a set of needles simultaneously rotatable between threads on the other side of the lace and needles jacquard-controlled vertically above the latter to lift the lace, substantially as described.

4. In a lace-loom, a set of lace-lifting needles having two arms at an angle to one another, a jacquard-controlled slide to reciprocate one of said arms, a reciprocable slide connected to the other arm, a jacquard-controlled stopped pawl pivoted to said slide and a bar connecting therewith, whereby the extent of movement of said bar and the vertical movement of the needle are selectively determined, substantially as described.

5. In a lace-loom, three combs arranged in the same arc of a circle, two of said combs laterally movable, thread-carriages, jacquard-controlled means for moving the carriages from one comb into another and for holding the carriages in the comb, a set of needles simultaneously movable, a set of needles to separate and position the carriage-threads and a serrated reciprocable bar to hold the carriage-threads in alinement, and a set of jacquard-controlled independently-movable needles to lift and hold the lace, substantially as described.

6. In a lace-loom, a central stationary, and a front and a back comb laterally movable and on the same arc of a circle, thread-carriages, jacquard-controlled means to move in the carriages from one comb to another, a set of needles movable into the lace from the front, a set of rotatable needles arranged to take between the carriage-threads to aline them and laterally movable with the back comb, a serrated reciprocable bar on the last set of needles to hold the carriage-threads in alinement, a set of needles each needle independently operated and jacquard-controlled means for lifting the needles, and jacquard-controlled means to selectively move them into and out of the lace, substantially as described.

7. In a lace-making machine, a stationary comb, laterally-movable front and back combs in the same arc of a circle, carriages therein and jacquard-controlled shifting means in each comb-slot of each comb to move the carriages, the shifting means in the slots of the stationary comb timed to move twice to one movement of the means in either of the other comb-slots, needles, jacquard-controlled means longitudinally reciprocable to raise and lower the needles and jacquard-controlled means longitudinally movable to withdraw the needles from and insert them into the lace, substantially as described.

8. In a lace-making machine, needles for supporting the lace comprising two arms at an angle to each other, a jacquard-controlled longitudinal slide connected to one arm of each needle to raise and lower it, a jacquard-controlled slide connected to each needle to withdraw it from and insert it into the lace, substantially as described.

9. In a lace-making machine, needles for supporting the lace comprising two arms at an angle to each other, a jacquard-controlled longitudinal slide to raise and lower each needle, a jacquard-controlled longitudinal slide connected to each needle to withdraw it from and insert it into the lace and means connecting the slides of each needle, whereby the former can be reciprocated simultaneously with the latter, substantially as described.

10. In a lace-making machine, needles for supporting the lace, each comprising a bell-crank lever, one arm of each needle rotatably secured to a longitudinally-reciprocable jacquard-controlled slide, means for locking the slide in several positions, a slide to which each needle is rotatably secured near the bell-crank angle, said slide jacquard-controlled to withdraw the needle from and insert into the lace, means connecting the two slides of each needle, whereby the first slide will be moved simultaneously with the second and at the same time unlocked preparatory to being lifted, substantially as described.

11. In a lace-making machine, needles for supporting the lace, each comprising a bell-crank lever, an upper slide having a serrated edge, one arm of each needle rotatably connected to one of said slides, a jacquard-controlled pawl having a stepped tail connected to each slide, a longitudinal reciprocable bar common to all the pawls to move them back to raise the needles, a stationary bar to engage the serrated edges of the slides to lock them, a lower jacquard-controlled slide secured to each needle near the angle of the bell-crank lever, a rod to connect the lower and upper slides of each needle, whereby when the lower slide is operated the upper slide is unlocked and both moved simultaneously, and means common to all the pawls to cause them to be positively moved down preparatory to withdrawing the needles, substantially as described.

12. In a lace-making machine, needles for supporting the lace, each comprising a bell-crank lever, an upper slide having a serrated edge, one arm of each needle connected to one of said slides, pawls having stepped tails connected to the slides, bars transverse to said pawls and a dropper-bar jacquard to selectively position the bars to move the pawls, a rail common to all the pawls to move them, a locking-rail common to all the upper slides to engage the serrated edges, a lower slide having a projection and connected to each bell-crank near its angle, a group of transverse slides, each slide having a projection, a bottom-bar jacquard to selectively position the transverse slides to cause their projections to aline with them on the lower slides, lifting-bars to move the transverse slides toward the lower slides, and a vertical rod to transmit the lift of the lower to the upper slide, substantially as described.

13. In a lace-loom, the combination with a stationary comb, a laterally-movable front and back comb, and carriages movable from one comb to another, with a rod and pushers for the stationary comb detachably mounted thereon, a front rod laterally movable with the front comb, pushers for the front comb detachably mounted thereon, a back rod and pushers for the back comb detachably mounted thereon, jacquard-controlled means for lifting the slides of the pushers of the front and back combs, and two pawls connected to each slide of the pushers of the middle comb, bars to longitudinally move the slides and pawls, and jacquard-controlled devices to move each pawl and slide into the path of its actuating-bar, substantially as described.

14. In a lace-loom, a laterally-movable comb adapted to receive thread-carriages, a second comb below it movable therewith and having perforated slotted teeth, a rod having a flat side adapted to pass through the slots in said teeth into the perforations and when partially rotated to be held therein, pushers one for each comb-slot cooperating with the first comb, detachably mounted on said rod and in the slots of the second comb, a slide having an upper and lower projection and detachably connected to each pusher, a bar common to all the slides movable below them, jacquard-controlled mechanism to selectively lift the slides, said slides being held lifted by said bar moving under their lower projections, two reciprocable bars connected together one on each side of the upper projections of the slides and arranged to engage them when lifted, substantially as described.

15. In a lace-loom, a comb adapted to receive thread-carriages, a second comb below it having perforated slotted teeth, a rod having a flat side adapted to pass through the slots into the perforations and be held thereon when partially rotated, pushers cooperating with the first comb, a pusher in each comb-slot, said pushers detachably connected to said rod in a corresponding comb-slot of the second comb, a slide detachably connected to each pusher, two pawls each having two upper and a lower projection connected to each slide, jacquard-controlled mechanism to lift the pawls, a bar movable under each of the lower projections of said pawls when lifted, two connected reciprocable bars to engage the upper projections of the lifted pawls to selectively reciprocate the slide, substantially as described.

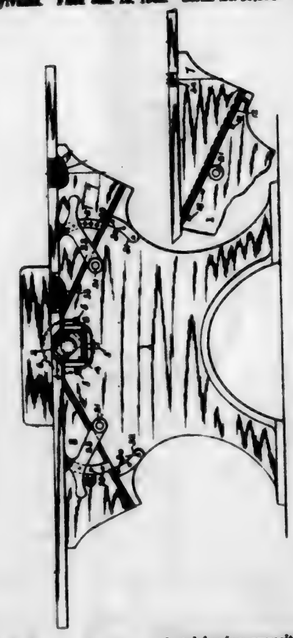
16. In a machine for the manufacture of pillow-lace, the combination of three combs which are arranged on the same arc of a circle and of which the two outer ones (the front and back combs) are movable laterally, pushers and a toothed driving-rod for moving carriages in slots of the said combs, a set of needles for lifting the twists, a back set and a front set of needles for separating threads to facilitate the insertion of the first-mentioned set of needles, slides connected to the said pushers and to the needles for lifting the twists (there being one set of slides for raising and lowering the twist-lifting needles and another set of slides for inserting and withdrawing the same), pawls (of which there are two for each slide) pivotally mounted on the slides for pushers of the middle comb, bottom-bar jacquards, thin longitudinal or lifting bars connected with the slides of the bottom-bar jacquards and adapted to operate the first-mentioned slides—through the said pawls in the ears of the slides of the pushers of the middle comb—means for moving the first-mentioned slides longitudinally when operated by the said longitudinal or lifting bars, and a toothed bar for separating threads and adapted to prevent a lateral movement of the threads of the carriages in the back comb after the insertion of the separating-needles, substantially as described.

17. In a machine for the manufacture of pillow-lace, the combination of three combs which are arranged on the same arc of a circle and of which the two outer ones (the front and back combs) are movable laterally, pushers and a toothed driving-rod for moving carriages in slots of the said combs, a set of needles for lifting the twists, a back set and a front set of needles for separating threads to facilitate the insertion of the first-mentioned set of needles, slides connected to the said pushers and to the needles for lifting the twists (there being one set of slides for raising and lowering the twist-lifting needles, and another set of slides for inserting and withdrawing the same), pawls (of which there are two for each slide) pivotally mounted on the slides for pushers of the middle comb, thin longitudinal or lifting bars connected with the slides of bottom-bar jacquards and adapted to operate the first-mentioned slides—through the said pawls in the ears of the slides of the pushers of the middle comb—means for moving the first-mentioned slides longitudinally when operated by the said longitudinal or lifting bars, and a toothed bar for separating threads and adapted to prevent a lateral movement of the threads of the carriages in the back comb after the insertion of the separating-needles, the blades of each comb being embedded at each of their ends in cast metal so as to render them immovable in relation to one another, substantially as described.

18. In a machine for the manufacture of pillow-lace, the combination of three combs, which are arranged on the same arc of a circle and of which the two outer ones (the front and back combs) are movable laterally, pushers and a toothed driving-rod for moving carriages in slots of the said combs, a set of needles for lifting the twists, a back set and a front set of needles for separating threads to facilitate the insertion of the first-mentioned set of needles, slides connected to the said pushers and to the needles for lifting the twists (there being one set of slides for raising and lowering the twist-lifting needles and another set of slides for inserting and withdrawing the same), pawls (of which there are two for each slide) pivotally mounted on the slides for pushers of the middle comb, thin longitudinal or lifting bars connected with the slides of the bottom-bar jacquards and adapted to operate the first-mentioned slides through the said pawls in the ears of the slides of the pushers of the middle comb—means for moving the first-mentioned slides longitudinally when operated by the said longitudinal or lifting bars—and a toothed bar for separating threads and adapted to prevent a lateral movement of the threads of the carriages in the back comb after the insertion of the separating-needles, the pushers and the twist-lifting needles being connected with their slides by means of rounded end portions located in slots formed by the slides for the purpose of enabling the pushers and the twist-lifting needles to be easily removed singly, substantially as described.

19. In a machine for the manufacture of pillow-lace, the combination of three combs, which are arranged on the same arc of a circle and of which the two outer ones (the front and back combs) are movable laterally, pushers and a toothed driving-rod for moving carriages in slots of the said combs, a set of needles for lifting the twists, a back set and a front set of needles for separating threads to facilitate the insertion of the first-mentioned needles, slides connected to the said pushers and to the needles for lifting the twists (there being one set of slides for raising and lowering the twist-lifting needles and another set of slides for inserting and withdrawing the same), pawls (of which there are two for each slide) pivotally mounted on the slides for pushers of the middle comb, bottom-bar jacquards, thin longitudinal or lifting bars connected with the slides of bottom-bar jacquards and adapted to operate the first-mentioned slides—through the said pawls in the ears of the slides of the pushers of the middle comb—means for moving the first-mentioned slides longitudinally when operated by the said longitudinal or lifting bars, and a toothed bar for separating threads and adapted to prevent a lateral movement of the threads of the carriages in the back comb after the insertion of the separating-needles, pawls which are mounted on the said slides for raising the twist-lifting needles and are provided with stepped projections, and means for moving the slides last mentioned longitudinally by acting upon the steps of the said projections, for the purpose of enabling each of the twist-lifting needles to be raised by a single operation of a jacquard to any one of several different positions and held therein by means of a single jacquard-slide.

705,540. ADJUSTABLE PLANER-BED. GILBERT S. MYRICK, Philadelphia, Pa., assignor to Cresswell & Waters Co., a Corporation of Pennsylvania. Filed Jan. 13, 1902. Serial No. 89,590. (No model.)



Claim.—1. In a jointer, a pedestal having oppositely-sloping inclines at its top, a cutter-head and cutters, a pulley upon the cutter-head, wedge-supports upon the inclines, level tables upon the supports, shafts, pinions and racks for moving the wedge-supports upon the inclines, levers upon the shafts, eccentrically-curved seats upon the wedge-supports, and means upon the levers whereby the eccentrically-curved seats are engaged by said means to secure the wedge-supports in different positions upon the inclines.

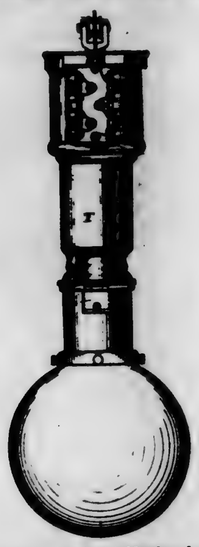
2. In a jointer, a pedestal, a cutter-head adjustably mounted thereon, and means for its rotation, oppositely-sloping downward inclines upon the pedestal-top, supports upon the inclines, tables upon the supports, racks upon the supports, shafts journaled upon the pedestal and having gears thereon which engage the racks aforesaid, adjusting-levers upon the shafts, eccentrically-curved seats upon the supports, concentrically-curved seats upon the pedestal, holes in the seats, spring-actuated pins in the adjusting-levers and adapted to enter the holes, and means also upon the levers whereby the pins are disengaged from the holes aforesaid.

3. In a jointer, a pedestal having a reversely-inclined top, wedge-supports upon the inclines and having their tops level, a table upon each support, transversely-operating means for one of the tables whereby its support, transversely-operating means for one of the tables whereby its outer end may be adjusted so that the table-top will be at an angle to the other table-top, and means to secure the adjustment, exterior to the table-top, for the purpose and in the manner substantially as set forth.

4. In a jointer, a pedestal having reverse inclines at its top, a wedge-

support upon each incline, a table upon each wedge-support, one of the tables being provided upon its under side with transversely-inclined seats a bar inserted between the table and its support and having inclined seats adapted to engage the inclined seats of the support, and when moved thereon place the table out of parallel alinement with the other table, means to adjust the bar for the purpose described, and means to lock the bar when adjusted.

705,541. ELECTRIC-ARC LAMP. JOHN S. HOWDEY, Madisonville, Ohio, assignor to General Electric Company, a Corporation of New York. Filed Nov. 20, 1897. Serial No. 659,698. (No model.)



Claim.—1. In an arc-lamp, the combination of a clutch for holding and feeding the upper carbon, a cylinder, a piston therefor, elastic material forming the peripheral portion of the piston and adapted to yield laterally, means for adjusting the diameter of said piston, a connection between the clutch and the piston, and a holder for the upper carbon.

2. In an arc-lamp, the combination of a clutch for holding and feeding the upper carbon and keeping its lower end in alinement with the lower carbon, a cylinder located above the clutch, a piston therein, elastic asbestos forming the peripheral portion thereof adapted to yield laterally, a connection between the clutch and piston, a guide for said connection, a nut for slightly adjusting the diameter of the piston, and a holder for the upper carbon.

3. In an electric-arc lamp, the combination of a tube, a second tube surrounding the first and forming the body portion of a piston, a piston-body for the second tube, and a flexible connection between the tubes which permits of a limited amount of independent movement.

4. In a feeding device for an arc-lamp, the combination of a dash-pot, a tube forming a support for the piston, a piston having an outer surface adapted to slide within the dash-pot, a head for the piston, an asbestos disk, and means for uniting the head and disk.

5. In a feeding device for an arc-lamp carbon, the combination of a device for grappling the carbon at suitable times, a dash-pot having a piston provided with an outer cylindrical portion made of asbestos and graphite, a tube or cylinder, a head for the tube, an asbestos disk for the head, and a clamping device for uniting the parts.

6. In an arc-lamp, the combination of a fixed solenoid-magnet, a reciprocating inhaler device for guiding the carbon and containing it, and a downward extension from the core extending below the magnet and provided with a device within easy reach for setting the position of the core relative to the magnet-coil without disconnecting the lamp.

7. The combination of the carbon, a slidable carbon-holder, a tubular device in which the carbon-holder slides, a magnetic solenoid-coil, an iron sheath or magnet-core located within the coil and accompanying the tube, and adjustable vertically relatively to the tube, the adjustment to be accomplished by an operator outside of the lamp and without dismounting the latter.

8. In an electric lamp, the combination of a dash-pot having a piston carrying a cylindrical frame, annular rings comprising asbestos and graphite, which rings are wedge-shaped and laid upon one another, a nut for varying the compression of the rings, a magnet-core, a tube, a head for the tube, an asbestos disk, and a screw for connecting the parts.

9. The combination of a carbon, a slidable carbon-holder, a tubular device in which the carbon-holder slides, a solenoid-coil, an iron sheath or core located within the coil and accompanying the tube, the core being adjustable vertically relatively to the tube, and an extension for the core having a set-screw or setting device for holding it in a fixed and desired position relative to the magnet-coil.

10. The combination of the carbon, a slidable carbon-holder, a tubular device in which the carbon-holder slides, a solenoid-coil, an iron sheath or core located within the coil and accompanying the tube, the core being adjustable vertically relatively to the tube, a piece attached to the core and provided with a set-screw or setting device for holding it in a fixed and desired position relative to the magnet-coil, a cover for inclosing the same, which is provided with an opening to permit the adjustment of the parts, and a door for said opening.

11. In an electric-arc lamp, the combination of a cylindrical magnetic shield, a winding therefor, a cap having a cylindrical wall formed thereon which extends into the shield, a shoulder formed between the shield and wall which acts as a support, and a frame-tube which is connected to the wall and passes through the winding.

12. In an arc-lamp, the combination of a frame-tube, a dash-pot, a carbon-containing tube, a core mounted thereon and located within the frame-tube, a magnet-coil embracing the frame-tube, a cylindrical magnetic shield for the coil having an apertured annular lower end, a shoulder formed on the shield, and a wall engaging with the shoulder for supporting the shield.

13. In an electric lamp; the combination of a piston, a carbon-holder, a magnet-coil, a cylindrical core for the magnet, a shield for the magnet which embraces the coil and is provided with an extension that projects upwardly, the said projection having a bore of such diameter that the core can pass through it, and a tube which forms the cylinder of the dash-pot and also passes through the extension and the coil.

14. In an electric-arc lamp, the combination of a magnet, an iron sheath or core, a non-magnetic extension secured thereto, and a setting device carried by the extension for shifting the position of the magnetic core in the field of force for the purpose of varying the resistance of the arc.

15. In an electric-arc lamp, the combination of a solenoid or hollow magnet surrounded by an iron magnetic yoke with an extension or annular iron ring formed integral therewith at its top, a magnetic core located within the coil and attached to a tube, a clutch-chamber secured to the tube and containing two or more balls which surround and clutch the upper carbon, the said carbon passing up through the tube and being surrounded by said solenoid magnetic coil, the magnet-core being also located within the coil and surrounding the tube containing the carbon and adjustable vertically on said tube for the purpose of shifting its position into a field of more or less density and also to vary the resistance of the arc according to the relative position of the magnet-core in a magnetic field by reason of the greater or less movement of the carbon under the action of the clutch.

16. In an electric-arc lamp, the combination of a solenoid-magnet, a yoke for said magnet, a dash-pot cylinder, a movable tube mounted within the magnet, an armature adjustably mounted on the tube so that the extent of movement from an extreme position to one of magnetic equilibrium can be changed, and means for connecting the magnet-winding in such manner that the resistance in one case is approximately one-half what it is in another case, thereby adapting the lamp to work on circuits of a given voltage or on those of approximately double the voltage.

17. In an electric-arc lamp, a rheostat constructed in the form of a drum, its outer surface being insulated and having attached to it a continuous spiral composed of resistance-wire and arranged in the form of loops surrounding the drum and held in position by means of slips insulated from said resistance-wire, and connections arranged so as to throw the loops of resistance-wire into series or parallel with the arc, for the purpose of increasing or decreasing the length of the resistance-wire and diminishing or increasing its cross-section as the case may be, the purpose being to operate the lamp on a given voltage or on double that voltage.

18. In combination with an electric-arc lamp, a compound magnet-coil made up of separate coils surrounding each other with terminal endings so arranged that the coils can be connected in series with one another and work in harmony, means for changing the connections whereby the coils can be connected in parallel with one another, the coils in both cases uniting so as to form one compound coil for the purpose of maintaining an electric arc in the lamp when connected on lines of a higher or lower potential, and mechanism for enabling the lamp, when the coils are connected in parallel with one another to operate on the lower-tension circuits, and when the coils are connected in series with one another to operate on higher-tension circuits.

19. In an electric-arc lamp, the combination of a magnet-coil having two windings acting to produce corresponding poles, and means for connecting the coils in series or in parallel to enable the lamp to be operated on high or low potential circuits.

20. In an electric-arc lamp, the combination of a magnet comprising two distinct windings acting to produce corresponding poles at the ends, means for connecting the windings in series to operate on circuits of high potential, means for connecting the coils in parallel to operate on circuits of low potential, and a feeding mechanism correspondingly acted upon by the windings to feed the carbon.

21. In an electric-arc lamp, the combination of a resistance, means for causing the current to pass through the coils in series or parallel, magnet-windings, means for connecting the magnet-windings in series or parallel relation with each other and in series with the resistance, and carbon-feeding mechanism which is under control of the magnets.

22. In an arc-lamp, the combination of a rheostat comprising a body of conducting material of high resistance and arranged to work in the same circuit with the arc, the rheostat having two paths for the current, connections so arranged that all of the current can be directed through one path by including all of the resistance-wire in series, and connections so arranged that the two paths through the resistance material can be thrown into parallel relation, thereby affording double the length of conductor with half the cross-section in one case, or double the cross-section with half the length of conductor, in the other case.

23. In an electric-arc lamp, the combination of a resistance-support, a coil of resistance material mounted thereon, means for retaining the coil in place, a connection leading from an intermediate portion of the coil, and other connections for uniting the portions of resistance material in series or parallel relation.

24. In an electric-arc lamp, the combination of a cylinder, a piston mounted therein which is composed of a sleeve having an elastic covering, and a carbon-containing tube secured to the sleeve by means of a flexible connection.

25. In an electric-arc lamp, the combination of a dash-pot cylinder, a piston therefor comprising a sleeve with a covering of asbestos rings, a carbon-containing tube mounted within the sleeve and slightly separated therefrom on the sides, a mechanical connection between the upper end of the sleeve and the tube, and flexible disks which form a part of said connection, thereby permitting the tube to have a slight movement independent of the sleeve.

705,542. PLASTER COMPOSITION. HERMAN T. J. OTTO, Allentown, Pa. Filed Sept. 26, 1901. Serial No. 76,288. (No specimens.)

Claim.—1. A plaster, comprising hydraulic cement two parts, powder silicate of aluminium one part and powdered carbonate of lime one part, all of the said substances being admixed together.

2. A plaster, comprising powdered hydraulic cement two parts, powdered silicate of aluminium one part, and powdered carbonate of lime one part, said silicate of aluminium and carbonate of lime being in a raw state saturated with water, and all of said powdered substances being admixed together.

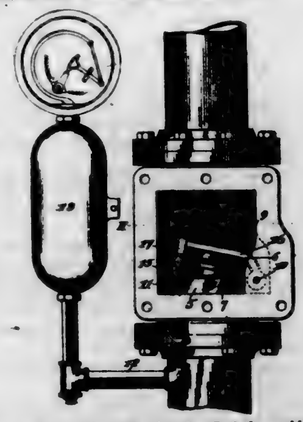
705,543. BUTTER-CUTTER. HERMAN H. PHILLIPS, East Congress, N. Y., assignor of one-half to John Henry Phillips, East Congress, N. Y. Filed May 24, 1901. Serial No. 61,982. (No model.)

Claim.—1. A machine for cutting masses of butter into smaller blocks or forms, provided with two sets of cutters, the planes of the two sets being arranged transversely to each other, and the cutters of one set crossing each other, and the plane of said set being substantially parallel with the cutters of the other set, a support for the butter, means for moving said support transversely to the cutters of one set, and means for causing transverse movement relatively to each other of said support and the other set of cutters, whereby the mass can be forced through the sets of cutters, or the cutters forced through the mass, thereby dividing the entire mass by transverse cuts.

2. A machine for cutting masses of butter into smaller blocks or forms, provided with two sets of cutters, the planes of the two sets being arranged transversely to each other, and the cutters of one set crossing each other, and the plane of said set being substantially parallel with the cutters of the other set, a support for the butter, means for moving said support transversely to the cutters of one set, and means for moving the other set of cutters in a direction transverse to the movement of the support, whereby the mass can be forced through the sets of cutters, or the cutters forced through the mass, thereby dividing the entire mass by transverse cuts.

3. A machine for cutting masses of butter into smaller blocks or forms, provided with two sets of cutters, those of one set being substantially parallel, the planes of the two sets being arranged transversely to each other, and the cutters of one set crossing each other, and the plane said set being substantially parallel with the cutters of the other set, a support for the butter, and means for causing transverse movement relatively to each other of said support, and each set of cutters, whereby the mass can be forced through the sets of cutters, or the cutters forced through the mass, thereby dividing the entire mass by transverse cuts.

705,544. AUTOMATIC ALARM-VALVE FOR FIRE-EXTINGUISHING APPARATUS. CAMPBELL B. SHAW, Kirkwood, Mo., assignor to Shaw Manufacturing Company, St. Louis, Mo., a Corporation. Filed May 24, 1901. Serial No. 61,995. (No model.)



Claim.—1. In a device of the class described, the combination of a housing having inlet, outlet and auxiliary openings, a valve-seat for the inlet-opening, a valve-seat for the auxiliary opening approximately in a plane with the inlet-valve seat, a rock-shaft mounted within the housing, and valves connected to said rock-shaft for simultaneously controlling the passage of fluid through both openings.

2. In a valve of the class described, the combination of a housing, a removable plate for the housing, a main nipple communicating with an inlet-opening, an auxiliary nipple communicating with alarm mechanism, valve-seats for the nipples, approximately in the same plane, a rock-shaft mounted within the housing, and valves connected to said rock-shaft for simultaneously controlling the passage of fluid through both nipples.

705,545. CINEOL ARSENATE AND PROCESS OF MAKING SAME. WATSON SMITH, London, England, assignor to Louis Merck, R. A. Merck, Willy Merck, and C. R. Merck, copartners as the firm of E. Merck, Darmstadt, Germany. Filed Sept. 27 1901. Serial No. 76,743. (Specimens.)

Claim.—1. The process of obtaining a compound of arsenic acid and cineol (eucalyptol), which consists in treating cineol with arsenic acid.

2. The process of obtaining a compound of arsenic acid and cineol, which consists in treating cineol, contained in a liquid, with arsenic acid.

3. The process of obtaining a compound of arsenic acid and cineol, which consists in treating cineol, contained in a liquid, with a solution of arsenic acid.

4. The process of obtaining a compound of arsenic acid and cineol, which consists in mixing eucalyptus oil containing cineol with an aqueous solution of arsenic acid.

5. The process of separating cineol from a compound, which consists in bringing an arsenic-acid-cineol compound in contact with water.

6. The process of obtaining cineol from a liquid in which it is contained, which consists in preparing from said liquid a chemical compound of arsenic acid with cineol, and splitting up said compound by bringing it in contact with water.

7. A chemical compound, consisting of arsenic acid and cineol, and characterized (when freshly prepared) as a solid, of white color and crystalline form; melting, when slowly heated, at about 95° centigrade; soluble in alcohol and in ether; and which, on contact with water, is decomposed into its components, arsenic acid and cineol.

8. The process of obtaining a natural ingredient of an essential oil which consists in treating the oil with arsenic acid, thereby forming a compound of said natural ingredient with said acid, separating said compound from the residual liquid mass, and splitting up the compound, thereby setting free the desired natural ingredient of the oil treated.

9. The process of obtaining cineol which consists in treating eucalyptus oil containing cineol with arsenic acid, thereby forming an arsenic-acid-cineol compound, isolating said compound, and splitting up said compound by bringing said compound in contact with water.

705,546. ARTIFICIAL TOOTH. THOMAS STEELE, Redbank, N. J. Filed Nov. 14, 1901. Serial No. 82,316. (No model.)

Claim.—1. An artificial tooth, comprising a front having a recess extending from the cervix toward the cutting edge, a backing having an integral inlay for engaging the said recess, and means for expanding the inlay in the recess, as set forth.

2. An artificial tooth, comprising a front having a recess extending from the cervix toward the cutting edge, a backing having an integral inlay engaging the said recess, the inlay having a tubular portion, and means for expanding the tubular portion in the recess, as set forth.

3. An artificial tooth, comprising a front having a recess, a backing fitting the said front, a hollow inlay for engaging the recess and expanded therein, and a tapering pin in the expanded inlay to hold the latter expanded, as set forth.

4. An artificial tooth, comprising a front having a recess, a backing, a tubular inlay on the backing, having longitudinal and transverse cuts and fitting the said recess, and a cement in the recess to engage the said cuts, as set forth.

5. An artificial tooth, comprising a front having a recess, a backing, an inlay on the backing, having longitudinal and transverse cuts and fitting the said recess, a cement in the recess to engage the said cuts, and a pin inserted in the said inlay to keep it expanded in the recess, as set forth.

6. An artificial tooth, having a tubular inlay formed with cuts to allow expansion of the inlay, as set forth.

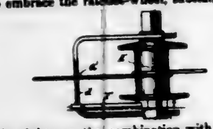
7. An artificial tooth, having a tubular inlay formed with longitudinal and transverse cuts, as set forth.

8. An artificial tooth, having a backing, and an inlay consisting of a shank integral with the backing, and a tubular portion on the shank, as set forth.

9. An artificial tooth, having a backing, and an inlay consisting of a shank integral with the backing, and a tubular portion on the shank, the said tubular portion having longitudinal and transverse cuts, as set forth.

705,547. WIRE-STRETCHER. JOHN STEVENSON, Detroit, Mich. Filed July 23, 1901. Serial No. 69,209. (No model.)

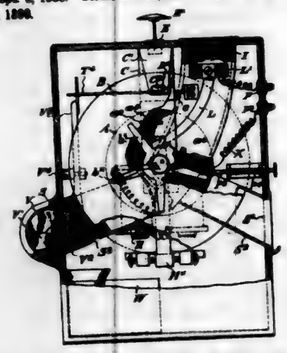
Claim.—1. In a wire-tightener, the combination with a frame comprising parallel arms and a cross member connecting the arms, of a winding-spool flanged at each end and journaled between the arm ends for rotary movement, a ratchet-wheel upon one end of the spool intermediate the flange and the adjacent arm of the frame, and a double pivotal pawl for the ratchet-wheel comprising a flat oblong plate arranged to swing freely between one of the spool-flanges and the adjoining frame-arm with its longitudinal axis and opposite sides extending in a plane parallel with the arm, said plate terminating at its inner end in a shank engaging loosely within an aperture formed within the cross member, and having its outer end concaved to embrace the ratchet-wheel, substantially as shown and described.



2. In a wire-tightener, the combination with a frame comprising parallel arms and a cross member connecting the arms, of a winding-spool flanged at one end and journaled between the arms for rotary movement, a ratchet-wheel fixed to the spool between the flange and the adjacent frame-arm, and a double pivotal pawl for the ratchet, comprising an elongated plate carrying a shank at one end engaging loosely within an aperture formed within the cross member and having its opposite end concaved and embracing the ratchet-wheel, said plate extending parallel with the frame-arm adjoining the ratchet and adapted to swing freely about its fulcrum between said frame-arm and the spool-flange.

REISSUES.

12,015. TOLL-COLLECTING AND CALL-RECORDING DEVICE FOR TELEPHONE SYSTEMS. JAMES R. GILL, San Francisco, Cal. Filed Sept. 6, 1900. Serial No. 29,151. Original No. 636,378, dated Oct. 24, 1899.



Claim.—1. A recording mechanism including a rotatable record-card, a marking device, means projecting said marking device against the face of the card, means for moving the card to space the markings, means for setting and locking the marking device for action, and means for releasing the marking device at will to impinge against the card.

2. A recording mechanism including a rotatable record-card, a marking device movable in a plane perpendicular to the face of said card, means for projecting the marking device against the card, means for setting and locking the marking device for such movement, means for releasing the marking device, and means for simultaneously rotating the card with the marking thereof.

3. A recording mechanism including a rotatable record-card, a marking device movable in a plane perpendicular to the face of the card, means for projecting the marking device against the card, means for drawing back and setting the marking device for such movement, means rotating said card and simultaneously imparting rectilinear movement thereto in a plane coincident with the plane of its rotation to space the markings, and a releasing device to set free the marking device.

4. The combination of a rotatable record-card, means for imparting a combined rotative movement and rectilinear movement in a plane coincident with the plane of rotation, a marking device operating in a plane perpendicular to the face of the record-card, means for drawing back and projecting said marking device against the face of the card, and means for locking and tripping the said marking device.

5. The rotatable disk having its center of rotation adapted to move in a right line coincident with the plane of rotation and having a spiral groove in one face, a fixed pin engaging said spiral, and means for imparting rotative movement to the disk; in combination with a marking device operating in a plane perpendicular to the face of the disk and adapted to impinge against the face thereof, whereby the movements of the marking device are recorded in a continuous spiral line on the disk, means for drawing back and setting the marking device for such movement, and a releasing device to set free the marking device.

6. A recording mechanism including a rotatable record-card, a marking device movable in a plane perpendicular to the face of the record-card, means for projecting the marking device against the record-card, means whereby the marking device will rotate the card to space the markings, means for setting and locking the marking device for said movement against the card, a releasing device, and means for operating the releasing device consisting of a relay in an open circuit in which is included a circuit-closing device and an armature adapted by its vibrations when the relay is energized to operate the releasing device.

7. In a recording mechanism a rotatable disk, a clamping device adapted to hold a record-card on the disk, a puncturing device, means for projecting the puncturing device against the card and means for moving the puncturing device laterally during its penetration of the card, to rotate the latter, means for drawing back and setting the marking device for such movement, and a releasing device.

8. In a recording mechanism, a rotatable record-card, means for moving said card in a plane coincident with the plane of rotation and simultaneous with such rotation, a puncturing device movable at right angles to the card, means for projecting the puncturing device against the face of the card, means for imparting lateral movement to the puncturing device during its penetration of the card, means for drawing back and setting the marking device for such movement, and a releasing device.

9. A recording mechanism including a record-card mounted for rotation on an axis, a puncturing device having a movement perpendicular to the face of the card to engage the card, and a lateral movement to rotate the card, means for setting and locking the marking device for such movement, and means for releasing the marking device.

10. The combination of a rotatable record-card, a puncturing device operating in a plane perpendicular to the face of the record-card, means for drawing back and locking the marking device, means for releasing and projecting said marking device against the face of the card, and means for moving the puncturing device laterally during its penetration of the card to rotate the latter.

11. A coin-controlled recording mechanism for telephone systems, including a record-card, a marking device, means projecting the marking device against the face of the card, means for moving the card to space the markings thereon, means for setting and locking the marking device for action, and coin-controlled means whereby the marking device is released by a current from the central station at the will of the operator.

12. A coin-controlled recording mechanism for telephone systems, including a record-card, a marking device, means projecting said marking device against the face of the card, means for moving the card to space the markings thereon, means for setting and locking said marking device for action, means whereby the marking device is released by a current from the line-circuit, and coin-controlled means whereby the circuit normally open at the recording mechanism is restored by the inserted coin.

13. A coin-controlled recording mechanism, including a rotatable record-card, a marking device movable in a plane perpendicular to the face of the card, means projecting the marking device against the card, means for moving back and locking the marking device in position for action, means for rotating the card, and coin-controlled means whereby the marking device is released by a current from the central station.

14. A recording mechanism, including a rotatable record-card, a marking device movable in a plane perpendicular to the card, means for projecting the marking device against the record-card, means for setting the marking device for said movement, an electrically-controlled releasing device in an open circuit in which is included a circuit-closing device, and coin-controlled means for closing said circuit to operate the releasing device.

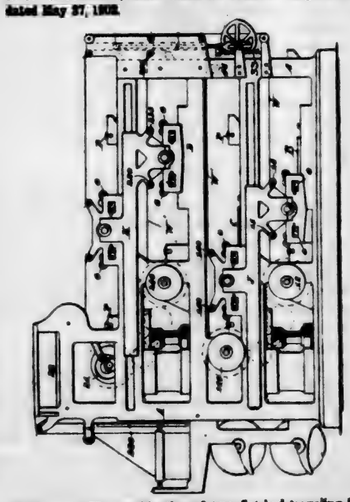
15. A recording mechanism including a rotatable record-card, a marking device movable in a plane perpendicular to the card, means for projecting said marking device against the face of the card, means for imparting lateral movement to the marking device in its forward throw at the time of its contact with the card to turn the card on its center of rotation, means for drawing back and setting the marking device, a releasing device and means for operating said releasing device adapted to be set in operative condition by the insertion of a coin therein.

16. In a coin-controlled recording mechanism the combination, with a rotatable record-card, reciprocating marking device, means for projecting the same against the face of the card, a push-button and means connecting the same with the marking device to draw back and set the latter for operation, a coin-controlled releasing device adapted to release the operative means that projects the marking device against the record-card, and means for imparting limited rotative movement to the record-card at each operation of the marking device.

17. The combination of the rotatable disk, means for attaching a record-card thereto, a marking device operating in a plane perpendicular to the record-card to impinge against the face thereof, means for drawing back and setting the marking device for operation, means for projecting the latter against the card, a releasing means consisting of a locking-lever, an electromagnet in an open circuit in which are included circuit-closing contacts, an armature adapted by the attraction of the magnet to trip the locking-lever and release the marking device, means for closing said magnet-circuit comprising a coin-chute, a device interposed in the path of the coin by engagement therewith to close the electrical contacts in the magnet-circuit, and means for energizing the magnet at will after the circuit thereof is closed by the coin.

18. In a coin-controlled mechanism the combination with the coin-chute I, of the push-rod T, push-button E', means connecting the latter with the rod, and the lever N having one arm engaging a pin on the push-rod and another arm adapted to work through a slot in the bank of the coin-chute and to engage the edge of the deposited coin from above.

12,016. DOUBLE MULTIPRESS. HENRY A. W. WOOD, New York, N. Y. Filed June 6, 1902. Serial No. 110,484. Original No. 701,130, dated May 27, 1902.



Claim.—1. The combination of two flat-bed traveling impression-cylinder web-perfecting printing-presses arranged one over the other, web-guides arranged so that two webs can be led through the mechanism, and devices for associating the two webs after they are perfected.

2. The combination of two side frames, four form-beds mounted therein in different horizontal planes, two sets of carriers fitted to said frames, each set carrying two impression-cylinders and web-guides, mechanism for reciprocating the two sets of carriers, web-guides for leading two webs through the machine, and manipulating devices for shifting said webs around the cylinders during the non-impression periods.

3. The combination in a web-perfecting printing-press of four form-beds arranged in different horizontal planes, a traveling impression-cylinder coöperating with each form-bed, web-guides arranged so that a web may be led around the lower and upper cylinders, and another web around the second and third cylinders, and a suitable web-manipulating device for each web.

4. The combination in a web-perfecting printing-press of four form-beds arranged in different horizontal planes, a traveling impression-cylinder coöperating with each form-bed, web-guides arranged so that a web may be led around the lower and upper cylinders, and another web around the second and third cylinders, whereby the last-named web is substantially within the loop of the first-named web, a suitable web-manipulating device for each web, and devices for associating the two webs.

5. The combination of two flat-bed traveling impression-cylinder web-perfecting printing-presses arranged one over the other, web-guides arranged so that one or two webs can be led through the mechanism, and means whereby one or both presses may be operated.

6. The combination in a web-perfecting printing-press of four form-beds arranged in different horizontal planes, a traveling impression-cylinder coöperating with each form-bed, web-guides arranged so that one

or two webs may be led through the mechanism, two driving mechanisms, one arranged to reciprocate the two lower and the other the two upper cylinders, and connections whereby one driving mechanism can be thrown out of operation.

7. The combination in a web-perfecting printing-press, of four form-beds arranged in different horizontal planes, two sets of carriers, each set carrying two impression-cylinders, a driving mechanism for each set of carriers, web-guides arranged so that one or two webs may be led through the mechanism, web-manipulating mechanisms, and connections whereby only one set of carriers can be operated.

8. The combination in a web-perfecting printing-press of four form-beds arranged in different horizontal planes, a traveling impression-cylinder coacting with each form-bed, web-guides arranged so that a web may be led around the lower and upper cylinders, and another web around the second and third cylinders, a feeding-in and feeding-out device for each of these webs, and means whereby the feeding-in device for the second web may be used at the feeding-out device when only one web is run through the machine, whereby the two lower impression-cylinders may be used for handling a single web.

9. The combination of four form-beds, two sets of carriers, two impression-cylinders journaled in each set of carriers, and a driving mechanism for each set of carriers, said driving mechanisms being set substantially quartering relatively to each other.

10. The combination of four form-beds, four impression-cylinders, web-guides and web-manipulating mechanisms arranged so that two webs can be printed, and two driving mechanisms, each driving mechanism being connected to reciprocate two cylinders, said two driving mechanisms being set substantially quartering relatively to each other, whereby two cylinders will be in impression or printing while the other two cylinders are reversing and vice versa.

11. The combination of four form-beds arranged in different horizontal planes, an impression-cylinder coöperating with each form-bed, a driving mechanism for the two lower impression-cylinders, a driving mechanism for the two upper impression-cylinders, said two driving mechanisms being set quartering relatively to each other, web-guides for leading a web around the lower and upper impression-cylinders, web-guides for leading another web around the second and third impression-cylinders, a feeding-in and feeding-out device for each web, and a compensating looping mechanism for the webs arranged so that the feed of each web will take place only around one cylinder at a time.

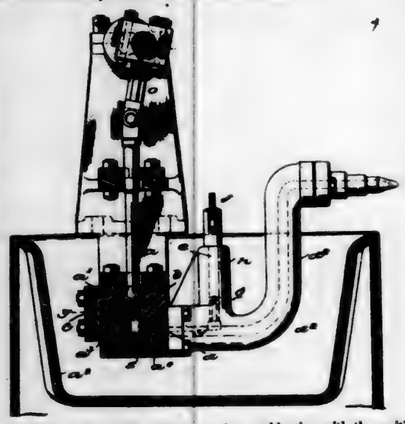
12. The combination of four form-beds arranged in different horizontal planes, an impression-cylinder coöperating with each bed, a driving mechanism for the two lower impression-cylinders, a driving mechanism for the two upper impression-cylinders, said driving mechanisms being set quartering relatively to each other, web-guides for leading a web around the lower and upper impression-cylinders, web-guides for leading another web around the second and third impression-cylinders, a feeding-in and a feeding-out device for each web, and a compensating looping mechanism for the webs, consisting of cam-actuated frames carrying a looping-roller for each web arranged so that the feed of each web will take place only around one cylinder at a time.

12,017. METAL-PUMP FOR TYPE-CASTING. FREDERICK WISER, Esher, England. Filed June 11, 1902. Serial No. 111,203. Original No. 669,695, dated Mar. 5, 1901.

Claim.—1. In a type-casting apparatus, the combination with a melting-pot, of a pump-cylinder provided with a reciprocating piston, having inlet and outlet ports, each provided with valves adapted to close the ports alternately, the inlet-port being located a substantial distance from the end of the cylinder, whereby the piston, after having made a stroke, on its return will create a positive vacuum below it before the inlet-port is passed and opened.

2. In a type-casting apparatus, the combination with the melting-pot, of a pump-cylinder located therein and having a passage leading from the pot into the cylinder, a peripherally-notched disk valve controlling said passage, a plunger operating in the cylinder and provided with a cavity in its operating end for the purpose specified, a nozzle for discharging the fluid metal, communicating with the interior of the cylinder, a peripherally-notched disk valve controlling the said passage, and a relief-valve communicating by a port or passage with said last-named passage, substantially as described.

3. In a type-casting apparatus, the combination with the melting-pot, of a pump-cylinder located therein and having a port or passage communicating with the pot, a disk valve controlling the flow of metal through said port or passage, an eccentrically-arranged projecting rib on said valve for the purpose specified, a plunger operating in the cylinder and provided with a cavity in its operating end, a nozzle for conducting the molten metal to the type-mold, a port or passage leading from the cylinder and communicating with said nozzle, a disk valve controlling said port or passage, an eccentrically-arranged rib on the face of said valve and a relief-valve communicating with the port or passage leading to the nozzle, substantially as and for the purpose specified.



4. In a type-casting apparatus, the combination with the melting-pot, of a pump-cylinder located therein and having a passage communicating with the melting-pot, a disk valve controlling said passage, a plunger operating in said cylinder and having a cavity in its operating end, a nozzle communicating by a port or passage with the interior of the cylinder, a disk valve controlling said port or passage, and a relief-valve arranged in the said port or passage communicating with the nozzle, substantially as described.

5. In a type-casting apparatus, the combination with the melting pot, of a pump-cylinder located therein and having a valve-controlled inlet-passage, a plunger operating in said cylinder, and having a cavity in its operating end, a nozzle communicating by a valve-controlled port or passage with the interior of the cylinder, and a relief-valve communicating with said last-named port or passage, said relief-valve comprising a cylinder having a lateral port and a weighted plunger operating in said cylinder, said plunger being provided with a central bore and a side port which communicate with the lateral port in the cylinder when the plunger is raised, substantially as described.

6. In a type-casting apparatus, the combination with the melting-pot, of a plurality of cylinders located therein and each having a passage leading into the pot, a disk valve controlling each passage, a plurality of plungers operating in said cylinders and each having a cavity in its lower end for the purpose specified outlet-passages for the cylinders, a nozzle for discharging the fluid metal, communicating with said outlet-passages, a disk valve controlling each outlet-passage, and a relief-valve communicating with the discharge-nozzle, substantially as described.

7. In a type-casting apparatus, the combination with the melting-pot, of a plurality of cylinders located therein and each having a passage leading into the pot, a disk valve controlling each passage, a plurality of plungers operating in said cylinder and each having a cavity in its operating end for the purpose specified, outlet-passages for the cylinders, a nozzle for discharging the fluid metal, communicating with said outlet-passages, and a disk valve controlling each outlet-passage, substantially as described.

8. In a type-casting apparatus, the combination with the melting-pot of a pump-cylinder located therein and having a passage leading from the pot into the cylinder, a valve controlling said passage, a plunger operating in the cylinder, a nozzle for discharging the fluid metal communicating with the interior of the cylinder, a valve controlling the said passage and a relief-valve communicating by a port or passage with said last-named passage, substantially as described.

9. In a type-casting apparatus, the combination with the melting pot of a pump-cylinder located therein and having a passage leading from the pot into the cylinder, a valve controlling said passage having spiral peripheral notches, a plunger operating in the cylinder, a nozzle for discharging the fluid metal communicating with the interior of the cylinder, a valve having spiral peripheral notches controlling said passage and a relief-valve communicating by a port or passage with said last-named passage.

10. In a type-casting apparatus, the combination with the melting-pot, of a pump-cylinder located therein and having a port or passage communicating with the pot, a disk valve controlling the flow of metal through said port or passage, an eccentrically-arranged projecting rib on said valve for the purpose specified, a plunger operating in the cylinder and a nozzle for conducting the molten metal to the type-mold, a port or passage leading from the cylinder and communicating with said nozzle, a disk valve controlling said port or passage, an eccentrically-arranged rib on the face of said valve and a relief-valve communicating with the port or passage leading to the nozzle, substantially as and for the purpose specified.

11. In a type-casting apparatus, the combination with the melting-pot, of a pump-cylinder located therein and having a passage communicating with the melting-pot, a disk valve controlling said passage, a plunger operating in said cylinder, a nozzle communicating by a port or passage with the interior of the cylinder, a disk valve controlling said port or passage, and a relief-valve arranged in said port or passage communicating with the nozzle, substantially as described.

12. In a type-casting apparatus, the combination with the melting-pot, of a pump-cylinder located therein and having a valve-controlled inlet-passage, a plunger operating in said cylinder, and a nozzle communicating by a valve-controlled port or passage with the interior of the cylinder, and a relief-valve communicating with said last-named port or passage, said relief-valve comprising a cylinder having a lateral port and a weighted plunger operating in said cylinder, said plunger being provided with a central bore and a side port which communicate with the lateral port in the cylinder when the plunger is raised, substantially as described.

13. In a type-casting apparatus, the combination with the melting-pot, of a plurality of cylinders located therein and each having a passage leading into the pot, a disk valve controlling each passage, a plurality of plungers operating in said cylinders and outlet-passages for the cylinders, a nozzle for discharging the fluid metal, communicating with said outlet-passages, a disk valve controlling each outlet-passage, and a relief-valve communicating with the discharge-nozzle, substantially as described.

14. In a type-casting apparatus, the combination with the melting-pot of a plurality of cylinders located therein and each having a passage leading into the pot, a disk valve controlling each passage, a plurality of plungers operating in said cylinders and outlet-passages for the cylinders, a nozzle for discharging the fluid metal, communicating with said outlet-passages, and a disk valve controlling each outlet-passage, substantially as described.

15. In a type-casting apparatus, the combination with a melting-pot, of a pump-cylinder located therein and having a passage leading from the pot into the cylinder, a valve controlling said passage, a plunger operating in the cylinder, a nozzle for discharging the fluid metal communicating with the interior of the cylinder, a valve controlling the said passage, and a relief-valve communicating by a port or passage with said last-named passage, said valve being so constructed as to allow a portion of the metal to pass it, substantially as described.

16. In a type-casting apparatus, the combination with a melting-pot, of a pump-cylinder located therein and having a passage leading from the pot into the cylinder, a valve controlling said passage, a plunger operating in the cylinder, a nozzle for discharging the fluid metal communicating with the interior of the cylinder, a valve controlling the said passage, and a hollow relief-valve communicating by a port or passage with said last-named passage, substantially as described.

DESIGNS.

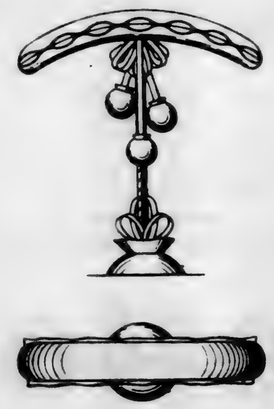
85,979. BADGE OR SIMILAR ARTICLE. JAMES L. EWIN, Washington, D. C., assignor to Luther B. Wilson, trustee, Washington, D. C. Filed Apr. 19, 1902. Serial No. 103,203. Term of patent 7 years.

Claim.—The ornamental design for a badge, or similar article, substantially as herein shown and described.

85,980. METAL BADGE. EDWARD R. SARGENT, New Haven, Conn., assignor to Sargent and Company, New Haven, Conn., a Corporation of Connecticut. Filed May 23, 1902. Serial No. 108,760. Term of patent 14 years.

Claim.—The ornamental design for a badge, as herein shown and described.

85,981. PEDESTAL-PINCUSHION. LILLIAN A. BARTHOLOMEW, New York, N. Y. Filed Mar. 18, 1902. Serial No. 98,844. Term of patent 3½ years.



Claim.—The ornamental design for a pedestal-pincushion, as herein shown and described.

TRADE-MARKS

REGISTERED JULY 22, 1902.

38,639. RECORDS FOR DISK TALKING-MACHINES. WILBERT V. F. BRADLEY, Toledo, Ohio. Filed May 5, 1902.

The word "MONOGRAM" and the letters "O T M Co" in monogram form. Used since January 2, 1902.

38,640. MOUTH-HARMONICAS. A. VOEHER & Co., New York, N. Y. Filed May 22, 1902.

MELOPHONE

The word "MELOPHONE." Used since January 1, 1902.

38,641. COTTON PIECE GOODS. J. & J. M. WORRALL, LIMITED, Salford, England. Filed Feb. 17, 1902.

The facsimile-signature of the firm "JAS. & JNO. M. WORRALL." Used since April, 1884.

38,642. SKIRTS. MISSOURI CLOTHING Co., Louis, Mich. Filed Feb. 10, 1902.

SOROSIS

The word "SOROSIS." Used since June 1, 1901.

38,643. CORSETS. FELIX E. MESTROT, Galveston, Tex. Filed Apr. 19, 1902.

The words "QUEEN REGENT" and the bust representation of a female figure wearing a crown and corsets, the neck and arms being exposed, the latter being raised in the act of tightening the corset-laces held in the hands. Used since October, 1899.

38,644. HATS. SANGER BROS., Dallas and Waco, Tex. Filed Mar. 6, 1902.

The words "THE BLACK DIAMOND," together with a representation of a black diamond-shaped figure. Used since July 16, 1894.

38,645. TOOTH-POWDER AND TOOTH-PASTE. JOHN H. COYLE, Thomasville, Ga. Filed June 20, 1902.

MAGIC

The word "MAGIC." Used since April 1, 1902.

38,646. OINTMENT FOR THE SKIN. THE LAXAKOLA COMPANY, New York, N. Y. Filed Nov. 27, 1901.

The word "DERMAKOLA" printed in script type on a red band that extends diagonally across a circular field, the upper and lower zones of said field being also red, leaving tapering sections that are located on opposite sides of the band. Used since June 15, 1901.

38,647. REMEDIES FOR HEADACHE, NERVOUS COMPLAINTS, AND GENERAL DEBILITY. THE JACK DRUG Co., New York, N. Y. Filed June 16, 1902.

BRACE-ME-UP

The hyphenated phrase "BRACE-ME-UP." Used since June 9, 1902.

38,648. MEDICINE FOR THE BLOOD, KIDNEYS, AND LIVER. CHARLES W. JOHNSON, Minneapolis, Minn. Filed May 19, 1902.

A representation of Cardinal Richelieu in a standing position with the right arm raised and the first two fingers of the right hand upraised and extended. Used since December 25, 1901.

38,649. PILLS FOR BLOOD TONIC. ADELARD JOSEPH PLAMONDON, Lowell, Mass. Filed Feb. 13, 1902.

The representation of a woman seated in a chair and a cupid or other winged figure descending into the room partially enveloped in a cloud and bearing in one hand a representation of a bee. This representation is surrounded by a circular border upon which are arranged two representations of a full-blown rose, and in the center of each rose is a representation of a human face. Used since January, 1901.

38,650. TONIC. ADOLPHE H. HOPKINS, Brooklyn, N. Y. Filed June 21, 1902.

Itsa-winna

The hyphenated word "ITSA-WINNA." Used since June 15, 1901.

38,651. BEER. ASHLAND BREWING Co., Ashland, Wis. Filed June 5, 1902.

WHITE RIBBON

The words "WHITE RIBBON." Used since July 1, 1901.

38,652. LAGER-BEER. THE CONSUMERS PARK BREWING COMPANY, Brooklyn, N. Y. Filed Apr. 4, 1902.

The representation of an imperial crown having streamers depending therefrom and a rosette located below said crown. Used since January 1, 1902.

38,653. SODA-WATER AND COMPOUNDS AND EXTRACTS FOR FLAVORING SAME. HANCE BROS. & WHITE, Philadelphia, Pa. Filed June 21, 1902.

AUTO

The word "AUTO." Used since June 1, 1902.

38,654. SODA-WATER AND COMPOUNDS AND EXTRACTS FOR FLAVORING SAME. HANCE BROS. & WHITE, Philadelphia, Pa. Filed June 21, 1902.

RIPE

The word "RIPE." Used since January 1, 1893.

38,655. GREEN COFFEE. BRYAN B. TOMLIN, Cordova, Mexico. Filed May 2, 1902.

ORO

The word "ORO." Used since March, 1897.

38,656. GRAIN. Gay Hermon Bean, Aguadilla, Porto Rico. Filed Apr. 11, 1902.

The words "LA FAVORITA" and the pictorial representation of a woman dressed in Turkish costume reclining upon the floor, with a cornet at her feet and a Turkish pipe and utensils at her side. In the background appears the representation of the sea with sailing vessels thereon, and behind the figure of the woman is a curtain, from which rises a column supporting a vase. The figure of a nude child is shown in the act of lifting the curtain. In the foreground appear flowers and medals. Used since January 9, 1899.

38,657. PEANUTS. THE GWALTNEY-DUDLEY PEANUT CO., Smithfield, Va. Filed June 26, 1902.

BON TON BURT UN

The compound word "BON-TON." Used since August, 1896.

38,658. FOOD PRODUCTS MADE FROM VEGETABLES AND CEREALS. DANIEL T. WILSON, Battlecreek, Mich. Filed June 16, 1902.

MALT-A-BAKE

The hyphenated word "MALT-A-BAKE." Used since January 1, 1902.

38,659. SALT. Gustave H. Stamm, Detroit, Mich. Filed June 6, 1902.

38,659.

An elliptical band inclosing the representation of two pairs of outstretched hands and the words "IN UNION THERE IS STRENGTH," and at opposite ends of the band are represented two female figures with the arms stretched outward toward each other. Used since May 30, 1901.

38,660. BOILER FLUIDS FOR PREVENTION OF SCALE. VALVOLINE OIL CO., New York, N. Y., and Liverpool, England. Filed June 19, 1902.

UCALYPSUM

The word "UCALYPSUM." Used since October 1, 1898.

38,661. ANTIFRICTION-METAL. MAGNUS METAL COMPANY, Buffalo, N. Y. Filed Jan. 17, 1902.

GALENA

The word "GALENA," inclosed within a diamond-shaped border, this word being formed of letters of different heights, so that the space covered by said letters shall be of a general diamond-shaped outline. Used since December 30, 1901.

38,662. PORTLAND CEMENT. DEXTER PORTLAND CEMENT CO., Nazareth, Pa. Filed June 13, 1902.

DEXTER

The word "DEXTER." Used since January, 1900.

38,663. CHEMICAL FIRE-EXTINGUISHERS. THE LITTLE GIANT FIRE EXTINGUISHER CO., New York, N. Y. Filed June 6, 1902.

THE LITTLE GIANT

The words "THE LITTLE GIANT." Used since December 1 1895.

THE NORRIS PETERS CO., PHOTO-LITHO., WASHINGTON, D. C.

LABELS

REGISTERED JULY 22, 1902.

9,313.—*Title:* "RANDOLF MAKER." (For Hats.) CHARLES E. SACKETT, Danbury, Conn. Filed May 26, 1902.

9,314.—*Title:* "BROMINT." (For Headache Cure.) KOEHLER & HINRICHS, St. Paul, Minn. Filed June 19, 1902.

9,315.—*Title:* "DR. FRANZ HELDENBERG PURIFIER." (For Medicines.) WM. H. GRABE, St. Louis, Mo. Filed May 14, 1902.

9,316.—*Title:* "PISO'S TABLETS FOR THE CURE OF DISEASES OF WOMEN." (For Medicines.) THE PISO COMPANY, Warren, Pa. Filed June 26, 1902.

9,317.—*Title:* "THE EAGLE PLASTER." (For Plasters.) ALLCOCK MANUFACTURING CO., Boston, Mass. Filed February 7, 1902.

9,318.—*Title:* "BOB WHITE." (For Whisky.) WILLIAM J. VONDERHEIDE, Washington, D. C. Filed June 25, 1902.

9,319.—*Title:* "LIQUID GLASS." (For Cement.) J. E. ULRICH & CO., Winneconne, Wis. Filed June 27, 1902.

9,320.—*Title:* "PROVIDER BROOMS BRUSHES." (For Brooms and Brushes.) ALFRED B. LEHMAN, Johnstown, N. Y. Filed June 28, 1902.

PRINTS

REGISTERED JULY 22, 1902.

536.—*Title:* "DR. PIERCE'S FAVORITE PRESCRIPTION." (For Medicine and Soda.) WORLD'S DISPENSARY MEDICAL ASSOCIATION, Buffalo, N. Y. Filed June 26, 1902.

DECISIONS

OF THE

COMMISSIONER OF PATENTS

AND OF

UNITED STATES COURTS IN PATENT CASES.

COMMISSIONER'S DECISIONS.

PUPIN *v.* HUTIN AND LEBLANC *v.* STONE.

Decided July 11, 1901.

1. INTERFERENCE—DISCLOSURE OF INVENTION.

A disclosure of the invention to a party skilled in the art to which the invention belongs is sufficient to be regarded as a disclosure in the sense of the patent law.

2. SAME—SAME.

When the testimony of the principal is worthy of belief and his testimony is corroborated by one credible witness, *Held* sufficient to establish a conception and a reduction to practice of the invention.

3. SAME—SAME.

Where the contents of a written report made by an inventor stands without sufficient corroboration as to time, this report cannot be considered as sufficient to establish a date of conception of the invention, even though it did in fact describe the invention.

4. SAME—DISCLOSURE IN FOREIGN PUBLICATION—WHAT NECESSARY.

A description of an invention in a foreign publication in order to defeat a patent in this country must be so clear as to enable persons "skilled in the art" to make the invention.

5. SAME—SAME—SAME.

The words "skilled in the art" include *careful workmen* who are skilful in the particular line of business in which they are engaged. The law does not warrant a construction of these words which includes only persons of high scientific attainments.

APPEAL from Examiners-in-Chief.

MULTIPLE TELEGRAPHY.

Application of Michael I. Pupin filed February 23, 1894, No. 501,092. Application of Maurice Hutin and Maurice Leblanc filed May 9, 1894, No. 510,658. Application of John S. Stone filed April 4, 1894, No. 506,316.

Mr. Thos. Ewing and *Mr. Vernon M. Dorsey* for Pupin.

Messrs. Lyons & Bissing for Hutin and Leblanc.

Messrs. Pollok & Mauro for Stone. (*Mr. W. W. Swan* of counsel.)

MOORE, *Acting Commissioner:*

This is an appeal by Hutin and Leblanc and Stone from the decision of the Examiners-in-Chief awarding priority of invention to Pupin on the following issue:

1. The method of distributing the electrical energy of periodic currents which consists in developing a number of effective currents of different frequencies independently upon a single line and conveying the several energies of these currents each selectively to a separate electrical translating device.

2. A system of distribution of electrical energy comprising a main line, means for independently developing effective electromotive forces of different frequencies thereon, branch lines connected with the main line each having its self-induction and capacity so related as to be permeable to alternating currents of a given frequency, and an electrical receiving device in each branch line.

Pupin was the first of the parties to file his application. Though made the junior party when this interference was declared, he is in fact under the present practice the senior party.

The right of Pupin to make the claims of the issue has been questioned. It is contended that Pupin's original specification is ambiguous in that it contains passages which conflict in statement. Some of these passages, it is admitted, tend to show that the invention of the issues was sought to be patented, while other passages, together with the statements of the original claims, tend to negative that fact.

It is urged, with much apparent reason, that the original claims are in fact drawn to cover a system of electrical signaling in which the *entire* circuits are "tuned from end to end," which system is said to be inoperative, and not that in which the "tuning" is confined to each separate receiving-circuit, in order that each "tuned" circuit will separately receive from the main line its own current of a certain predetermined periodicity, which is independently developed at the transmitting end of the main line, to the exclusion of all currents of different periodicities which may also be developed upon the main line, and this whether they are developed simultaneously or not.

Each of these receiving-circuits is provided with a coil of fixed self-induction and a condenser of fixed capacity capable of adjustment relatively to each other. Each branch or receiving circuit is "tuned" or "adjusted in resonance" by relatively adjusting its capacity and induction so that each receiving-circuit will be affected by a current of a certain periodicity which may be developed at the transmitting end of the main line. Transmitters are then adjusted so that they will each respectively develop upon the main line currents of different predetermined periodicities. These currents will then be separately selected each by its own receiving-circuit to the exclusion of all the other currents of different periodicities.

The Examiners-in-Chief have quoted quite fully from Pupin's original specification, and it is therefore unnecessary to again quote all of this matter at this time. They find Pupin's contentions to be well founded that there is a sufficient description

in his original specification which would enable any one skilled in the art by following this description to make and use the invention. With this view I agree. Pupin originally described the arrangement of the apparatus as follows:

I proceed to explain the operation of any branch at the receiving end by any branch at the transmitting end. Say it is required to send a message from transmitter 4 to branch *a*. It is to be understood that what follows is also true of any other branch, as *b* or *c*. The coil L has a fixed self-induction, and the condenser O has a fixed capacity. This branch is supposed to work with frequency C. Hence the operator at 4 will use a fork of frequency C, and then adjust auxiliary coil Z until the electrical periodicity of circuit Z, *z*, 1, 10, L, O, *a* G^2 is C. The operator at 4 can tell when this frequency is reached by the sound in the telephone T^2. This telephone is acted upon inductively by coil Z or any other convenient part of the circuit at the transmitting end. The sound of the telephone R calls the attention of the operator in the branch circuit *a*. This telephone is operated similarly to T^2. He answers the call by means of breaking the circuit several times in quick succession with the key 19^2. He then closes the battery-circuit which works the receiving-transmitter *r*, and the receiving instrument *u* is then ready to receive the electrical impulses from the line.

In this description the statement "Hence the operator at 4 will use a fork of frequency C, and then adjust auxiliary coil Z until the electrical periodicity of circuit Z, *z*, 1, 10, L, O, *a* G^2 is C," is pointed out and commented upon by opposing counsel. It is urged that in this is the description of tuning the *entire* circuit from end to end. I do not think that this contention is founded upon good and sufficient reason. As I read this statement it means simply that the transmitter and the receiving-circuit must be in perfect adjustment with each other. That they must be so is evident. The word "tuned" has been used in this statement and in the original claim as though it had reference to the main line; but from the description as a whole I think that it was not used in this quotation in its technical sense, nor was it used advisedly. It is urged by opposing counsel that a meaning should be placed upon this short paragraph referred to which cannot be gathered from the remaining description or showing in the drawing. The drawing does not show "tuning" means in the main line; nor is such a thing described or hinted at except in a vague way in this short passage referred to. As I have said above, I am convinced that the true meaning of this passage when taken together with the other passages of the specification and the showing of the drawing is that the transmitters and the branch receiving-circuits which respectively belong to them must be perfectly related one to the other.

In view of the fact that the larger part of the specification clearly describes the invention of the issue, it follows and I so hold that the description and showing in Pupin's case as originally filed are sufficient to support the claim of the issue and that Pupin is entitled to his date of filing—namely, February 23, 1894—as his date of constructive reduction to practice.

Pupin in his preliminary statement alleges conception of both issues in July or August, but prior to August 15, 1890, making drawings of the system at the same time, explaining the invention to others about October, 1890. Late in October or early in November, 1890, he embodied his invention in a system in which the instruments were full-sized machines, completed the same at that time, and operated it successfully in his laboratory at Columbia College, New York city, N. Y. This system determined the feasibility of the method of the interference, but did not carry out the exact method. In January, 1891, he completed a system which carried out the exact method of the interference and demonstrated that fact in that same month by successfully operating and practicing his invention in his said laboratory.

Stone in his preliminary statement alleges conception November 15, 1891; disclosure to others between November 15 and November 25, 1891, and again on November 25, 1891, and from time to time thereafter; made drawings illustrating the invention on November 25, 1891; reduced the invention to practice by setting up and operating apparatus sufficiently to show the practicability of the invention about December, 1892, and subsequently—to wit, January 14, 1893, and February 7, 1893—by another person under his direction.

Hutin and Leblanc are citizens of the Republic of France. They allege in their preliminary statements that they disclosed the invention at issue in an article published in a scientific periodical known as *La Lumière Electrique* in May 9, 1891, and in a book entitled *Etude sur les Courants Alternatifs et Leurs Applications Industrielles* in February, 1891. They also allege disclosures of the invention in patents obtained as follows: France, No. 215,901, September 3, 1891; Great Britain, No. 23,892, December 27, 1892; France, No. 234,783, December 13, 1893, and that a knowledge of said invention was introduced into the United States on January 24, 1893, by an application made by them for a United States patent on an application filed January 31, 1893, Serial No. 460,318; that knowledge of said invention was also introduced into the United States when the application involved in this interference was received by the attorney, Mr. Joseph Lyons, of Washington, D. C., some time during the second week of January, 1894.

Pupin testifies that he studied the investigations of the late Prof. Heinrich Hertz when in Yonkers, N. Y., in July or August, 1890, previous to a trip made by him during that summer and fall to Saratoga through northern New York to Montreal, and from that study he was led to conceive the invention. At that time he did not disclose it to any one. He had no opportunity to give an experimental test to these ideas until his return in October, 1890, to Columbia College, at which institution he is the professor of mechanics.

Upon his return he set about constructing and providing pieces of apparatus with which to set up a system. These acts were performed in October and November, 1890. He found that the theory underlying his conception was correct, but the result was not altogether satisfactory. In operating this system he used as transmitting means one "alternating-current machine" and one "rotating current-interrupter." The latter proved unsatisfactory, but was used at that time because he did not have two "alternating-current machines." The "rotating current-interrupter" proved so unsatisfactory in its results that another "alternating-current machine, was ordered by him and was received in January, 1891. The experiments were then continued, which were much more satisfactory.

Pupin states that he was assisted in setting up this system and providing the various apparatus to be used by one Michael J. O'Connor. He further states that he was always reluctant to speak about the invention to anybody until he had become convinced of its commercial value. He therefore did not say anything to O'Connor other than to give him directions as to setting up the apparatus. Pupin also says that though he did not tell O'Connor what his invention was or what he "was driving at" the secret could not be kept from O'Connor, as the latter in a very short time learned for himself what the invention was designed to accomplish. Pupin makes a sketch from memory (Pupin's Exhibit No. 1) and offers it in evidence. It is stated by him, to show a diagram of the system which was conceived by him in August, 1890. This sketch is a disclosure of the invention in issue. The original sketches were destroyed, as is his custom. O'Connor makes a sketch from memory, showing how the apparatus was set up by him under the direction of Pupin in October, 1890, and January, 1891. This is in evidence. Pupin's Exhibit No. 4; O'Connor diagram, March 23, 1896.) This sketch shows the invention of the issue and is quite similar to that shown in Pupin's Exhibit No. 1.

Pieces of the apparatus which were used in the original system as constructed by Pupin with the help of his assistants, O'Connor and Farrington, are in evidence and have been properly identified.

It has been stated by counsel for Hutin and Leblanc that these pieces of apparatus do not prove anything, as they are what may be found in any electrical laboratory. True, but they are the very pieces of electrical apparatus needful to construct a system as covered in count 2 of the issue by means of which the method of count 1 may be carried out.

An apparatus was set up in the room in which the testimony was taken (as per Pupin's Exhibit No. 12, O'Connor sketch No. 2) and was stated by Pupin and by O'Connor to be in all essential details like that used by them in October, 1890, to January, 1891. It differs in that an additional coil (marked S) was inserted by O'Connor of his own accord. O'Connor states of this apparatus in answer to cross-question 145 that "it works." The original apparatus set up in Professor Pupin's laboratory also was operative. The two apparatus were common, then, in the respect that they operated to the extent that each showed that the issue of the interference was covered by them.

As to the insertion of the coil S, O'Connor testifies:

Cross-question 106. Was such a coil always used when the apparatus was working?

Answer. I cannot remember whether we had an extra coil in there, or had a larger coil in place of one of the others.

In view of the fact that this coil seems necessary in order that the apparatus should "work" and that the original apparatus "worked," the reason above given by O'Connor for this apparent change seems to be a reasonable one.

Attention is called to the fact that in the apparatus used by Pupin the receiving-telephones differ very materially in size and in other respects. It is therefore contended that they were specially constructed to respond to one note stronger than to another note, and this would be the effect whether the receiving-circuits were resonant or not. This reasoning is well enough as far as it goes, but it does not go far enough. Pupin's record shows, if it shows anything, that the receiving-circuits were capable of being "tuned" or "adjusted to resonance" and that they were so "tuned" or "adjusted to resonance" as to be responsive to a current of a certain periodicity. This is the invention, and the method and system defined by the issues which cover the invention are shown to be operative if these conditions be present, the size of the telephone-receivers to the contrary notwithstanding. I am therefore of the opinion that the fact that the telephone-receivers differ in size does not show that the system operated by Pupin is devoid of the invention.

The Examiners-in-Chief have quoted quite largely from O'Connor's deposition on pages 9, 10, and 11 of their decision. It is unnecessary to repeat the same here. Suffice it to say that it is clear to me that O'Connor sufficiently corroborates the statements made by Pupin in all essential details to establish Pupin's dates of conception, disclosure, and actual reduction to practice. Pupin's evidence uncorroborated is of course insufficient, and therefore the credibility of O'Connor in this case should be carefully inquired into. If O'Connor is shown to have been incapable of observing or understanding the invention, his testimony is of no value to Pupin, whereas if he is capable it is of vital importance to Pupin in order to establish his alleged dates of conception, disclosure, and reduction to practice as early as the fall and winter of 1890–1891.

O'Connor testifies:

Cross-question 54. What was your occupation immediately before you became the assistant of Doctor Pupin?

Answer. Electrician of the college.

Cross-question 55. How long had you been the electrician for the college?

Answer. About three years electrician.

Cross-question 56. What were your duties as electrician for the college?

Answer. To see that all the lamp-circuits were in repair all through the building, battery-circuits, bell-circuits, clock-circuits for observatory and lecture-rooms.

Cross-question 57. Wherefrom did the college during that period receive its current for lighting?

Answer. Their own dynamos, and at nights from the street.

Cross-question 58. Were you in charge of the dynamos?

Answer. No.

Cross-question 59. What was your occupation immediately before you became electrician for the college?

Answer. Janitor for the college.

Cross-question 60. As assistant of Professor Pupin, were you an employee of the college, or were you paid by Professor Pupin?

Answer. An employee of the college up to July, 1891, and I was paid by Doctor Pupin after that.

O'Connor then goes on to state the manner in which he performed his duties. He shows himself to have been skilful in their performance. He was also present to assist Professor Pupin at all lectures. (Cross-question 160.)

He further testifies:

Cross-question 69. When and where did you acquire the knowledge requisite for repairing circuits in the manner you have described?

Answer. With different firms in New York city, in 1882 and 1883—parts of 1882 and 1883—and 1885.

Cross-question 70. What was the business of those firms, and in what capacity were you employed by them?

Answer. In 1882 and 1883, bell-wiring; 1885, electric-light wiring.

Cross-question 71. Are you still an employee of Columbia College?

Answer. No.

Cross-question 72. When did you leave Columbia College?

Answer. I left the employ of the college in July, 1891.

Cross-question 73. And did you since that time remain in the employ of Doctor Pupin?

Answer. No.

Cross-question 74. When did you leave the employ of Doctor Pupin?

Answer. November, 1892. I'll make that the first week in December. I worked off and on with him since that time.

He goes on to say that he knew nothing about periodicities or their effect in 1890. He further testifies:

Cross-question 111. How early did you learn about periodicities and their effects?

Answer. In 1891 I took the one-year course in Columbia College in electrical engineering. I commenced it in the fall of 1891.

Cross-question 112. And finished it?

Answer. In June, 1892.

Question 52. Did you learn for what purpose Professor Pupin thought to use the apparatus about which you have testified?

Answer. I thought it was for mutiplex telegraphy, but he did not tell me so at the time. I found that out myself.

Question 53. How early did you find it out?

Answer. In two or three weeks after the apparatus had been working, which was in 1890.

Cross-question 146. Did Professor Pupin at any time tell you that the apparatus which you had set up for him in 1890, and afterward changed in 1891, was meant to illustrate a multiplex telegraph.

Answer. Professor Pupin did not tell me during 1890 or 1891—or up to the latter part of 1891—that the apparatus was intended to illustrate multiplex telegraphy. I found that out myself; but later on—I believe it was 1892 or 1893—he told me then that the apparatus was meant for multiplex telegraphy.

Cross-question 147. How did you find out yourself, before Professor Pupin told you, that the apparatus was intended to illustrate a multiplex telegraph?

Answer. During my year's course at Columbia College we had lectures from Professor Crocker on telegraphy, and then it occurred to me why this apparatus that Professor Pupin had set up would not answer for that purpose. I spoke to one or two of my classmates about the matter, and told them that I thought it would be a good idea to use it for that purpose; but when I explained to them how it worked, they told me I was behind the times; that Professor Pupin evidently had that in mind when he had that apparatus made. So I never said anything to the professor about it until later—I cannot remember the date.

Cross-question 148. About what time during your course in electrical engineering, which, as I understand it, began in October, 1891, and terminated in June, 1892, did you, as you say, speak with your classmates about this matter?

Answer. I think it was during February or March, 1892, that I spoke to my classmates about the matter.

He explains apparent contradiction in answer to cross-question 149 that—

I stated in question 52 that I found out for myself that the apparatus was for multiplex telegraphy. I meant that as far as I was considered myself. I thought it would do for that purpose, but not knowing much about the subject, and not placing any reliance in what I thought about it personally, I did not mention it to anybody, and it was only after I heard the lectures from Professor Crocker, that I felt confident that my first thoughts about the apparatus was confirmed, and I felt safe in mentioning the subject to others, without being laughed at for my pains.

I am convinced by the above testimony that O'Connor has clearly shown that his evidence in this case is entirely credible. He was not a novice in matters pertaining to practical electricity. If he was, it is inconceivable that he could have given satisfaction to the college authorities or to Professor Pupin. He assisted Pupin in rigging apparatus in his laboratory work and also in his lectures, of which he delivered many. At a lecture an assistant must be quick-witted and have a considerable degree of skill in operating the apparatus used.

It is not fair to brand O'Connor by the simple title "janitor." He did not hold that position in the fall and winter of 1890–1891. He had proven himself capable of performing a higher class of work. Besides all this I am of the opinion, and very strongly so, that the fact that O'Connor took the course in electrical engineering in Columbia College during the year of 1891–1892 malces his testimony as to what he learned and observed as to the apparatus upon which he was employed by Professor Pupin in 1890–1891 credible to a high degree. It is very reasonable, and I have no doubt that it is often the case, that a person may at a certain time observe phenomena of which he is largely ignorant at the time of its observance and which he does not well understand and after a period of study into those matters his mind will be enlightened so that it then becomes evident to him that such and such phenomena which he had previously observed and about which he knew little was in fact the very thing about which he subsequently had learned. The fact that O'Connor became a different man mentally after the completion of his course in electricity at Columbia College did not change one iota the invention made by Pupin in 1890–1891 and which he (O'Connor) had then seen and "worked." O'Connor because of his better education was then able to more thoroughly appreciate and to understand an invention which he did not at first fully comprehend.

O'Connor is far above the class of witnesses upon whom it was necessary to rely for disclosure and whose testimony for that purpose was rejected by the court of appeals in *Eastman* v. *Houston*, (95 O. G., 2064.)

The testimony of Pupin is worthy of belief. It is corroborated by the testimony of O'Connor, which is entirely credible.

I read Pupin's record as proving for him a date of conception not later than November, 1890, and a reduction to practice not later than January, 1891. Witnesses Wetzler, Farrington, and Chapman also corroborate the testimony of Pupin as to his further experiments pertaining to matters relating to the invention at issue and to its further practical operation. Wetzler, the editor of the *Electrical Engineer*, witnessed the operation of the systems at Columbia College in company with others on June 4, 1894, and described the same and published it in an article in the *Electrical Engineer* on June 13, 1894. A copy of said article is in evidence.

Stone states, as does Pupin, that his attention was first attracted to the subject of electrical resonance through the researches of Doctor Hartz. He testifies that he was led to conceive the invention on learning the contents of a letter written on November 15, 1891, by Mr. Gardiner S. Hubbard, of Washington, D. C., to his sister, Miss Stone. This letter, with the postmarked envelop used, is in evidence and is properly identified. Stone states that it was not much more than a day after its receipt that he conceived the invention—namely, on or about November 16, 1891.

Stone then states that on November 25, 1901, he wrote a letter to Mr. Hubbard and inclosed a report, each disclosing the invention. A letter from Mr. Hubbard, properly identified, acknowledging the receipt of this letter and report is in evidence.

The letter and report to Hubbard could not be found; but the "original draft" of the report has been placed in evidence, as is also a report made by Stone to Mr. H. V. Hayes, the electrical engineer of the American Bell Telephone Company. This report to Hayes is properly identified.

I am of the opinion that the report of Stone to Hayes, dated January 2, 1893, discloses the invention of the issue.

It is contended that it does not describe the invention, for the reason, as stated by Doctor Kennelly, that the feature of "simultaneous generation" and "simultaneous transmission of multiperiodic currents on the line" is not to be found therein.

As I read the deposition of Doctor Kennelly he admits that the purpose of the invention disclosed in the report is for the selective transmission of call-signals one at a time, but insists that it is not for the selective transmission of call-signals simultaneously.

I am of the opinion that the issues are not limited to "simultaneous generation" or "simultaneous transmission." This opinion is strengthened by the depositions of Pupin and Doctor Cross. Stone certainly describes a system in which are several receiving-circuits, and therefore inasmuch as he distinctly describes and shows how a receiving-circuit may be "tuned" in order that it will separate from the main line and receive a current of a certain periodicity it follows that more than one tuned receiving-circuit was contemplated by Stone in these reports.

The report to Hayes of January 2, 1893, being fully identified, is sufficient to show a conception and disclosure to others on the part of Stone not later than January 2, 1893. After very carefully considering the history of the "original draft" of Stone's report to Hubbard, November 25, 1891, I am constrained to hold that it cannot be admitted for the purpose of evidence in this interference. The disclosure of this "original draft" in 1891 depends, in my opinion, wholly upon the unsupported testimony of the writer, Stone. This being the case, it cannot be considered. The "original draft" and its contents have not been satisfactorily identified by any witness. Its authenticity rests wholly upon the unsupported testimony of Stone.

I have carefully considered the deposition of Mr. Hubbard, who is the only corroborating witness for Stone, as to the nature of the contents of the report sent by Stone to Hubbard in 1891. As I read his testimony I am constrained to hold that it is not sufficient to properly support Stone's testimony as to what said report of 1891 disclosed. It is true that in the report to Hayes the letter and report to Hubbard of November, 1891, are referred to, and it is argued by counsel for Stone that it is inconceivable that Stone would make false quotations. It is argued that the report to Hayes was made more than a year after his communications to Hubbard, with necessarily no knowledge of this interference, as additional reasons why false quotations could not have been made.

That it is inconceivable that Stone would make false quotations in his report to Hayes is admitted; but nevertheless, though unfortunately for Stone his testimony as to the contents of the report of November 28, 1891, stands without sufficient corroboration. The contents of this report are known to the world only upon Stone's, the writer's, unsupported testimony. To consider this report as an evidence of disclosure, if it did in fact disclose the invention, would be contrary to the rules of evidence, and it must therefore be disregarded.

Stone made another report to Mr. Hayes on May 17, 1893, marked "Stone's Exhibit Report to Hayes, May 17, 1893." This is in evidence. This report discloses the invention. Following this report came his suggestions for the specification, dated June 26 and July 8, 1893. These were sent by Stone to Hayes and by Hayes to one Lockwood, who used them in drawing up the specification to file with the application for a patent. The application was filed April 4, 1894.

From Stone's record of work and from the nature of the invention I do not think that he can be successfully charged with lack of diligence in filing his application. As I view it, however, this question is unimportant. My conclusions from Stone's proofs are that his proved date of conception and disclosure is not later that January 2, 1893, that he never actually reduced the invention to practice, and that he was diligent in making a constructive reduction to practice by filing his application on April 4, 1894.

The earliest date of disclosure alleged by Hutin and Leblanc is February, 1891; but I find nothing in the record to support the same. The next alleged date is May 9, 1891. In support of this contention there is placed in evidence an "Exhibit Translation of a portion of Hutin & Leblanc's Article of May 9, 1891," which was published by them in the periodical entitled *La Lumière Electrique*. This article points out the analogy between the science of acoustics and of electricity as to resonance. It contains certain formulæ. It then describes a main circuit A, arranged in the neighborhood of which are several branch circuits B_1 B_2 to B_n. Each of these branch circuits is described as having a coefficient of self-induction L_1 L_2 to L_n, and in each of which are placed condensers of certain capacities c_1 c_2 to c_n. It is then stated that a current of a certain intensity is caused to pass through the circuit A. The article then concludes with the following statement:

We may undertake to so arrange matters that the waves of the period T be transmitted to the circuit B_1, the waves of the period T/k to the circuit B_2. * * *

For this purpose we have only to arrange the capacities c_1 c_2, &c., in such manner that we have

$$c_1 = \frac{T^2}{4\pi^2 L_1},\quad c_2 = \frac{T^2}{4\pi^2 k^2 L_2},\quad c_3 = \frac{T^2}{4\pi^2 k^4 L_3}\quad * * *$$

This is a property of which we shall study the applications to the simultaneous transmission of selective signals over the same line.

The fact that the means that can be used for developing currents of different periodicities and the receiving devices (telephone-receivers) are not shown or mentioned in this article I do not think is important, for the reason that each of these devices was well known long before 1891 in the art and could be easily supplied by one skilled in the art. The fact that it is said that currents of certain periodicity are developed is enough. This statement, to my mind, is sufficient, and the objection that no *means* are shown is not well taken.

This article is insufficient to be relied upon for a disclosure and completion of this invention, for the reason that it lacks the necessary information for one skilled in the art to have in order that he might make and use a system such as defined in the issues. It is not stated how Hutin and Leblanc were to "arrange matters." How the matters were to be arranged is the key to this invention.

This article has been explained by Doctor Kennelly. A drawing is in evidence which is made by Doctor Kennelly from his understanding of the article. It is clear, however, leaving out of consideration altogether that Doctor Kennelly knew of the invention when he made the sketch, that he has read into the article certain vital features which he says necessarily must be implied, but which he constructively admits are not explicitly and distinctly described in the article.

The article may very easily be deemed sufficient for a man like Doctor Kennelly after studying the same to make the invention. Pupin only needed a study of Doctor Hertz's researches. Stone needed only the same study and the letter from Mr. Hubbard. So, too, Doctor Kennelly only needed this little article to enable him to conceive and complete the invention.

The law on the sufficiency of disclosure of patents and printed publications is well settled.

As stated by Commissioner Mitchell in *Deprez and Carpentier* v. *Bernstein* v. *Hunter* v. *Gaulard and Gibbs*, (54 O. G., 1711:)

If a patent or printed publication, foreign or domestic, were evidence of conception only, the law would extend to it that tolerance and generosity which are extended to private drawings and descriptions representing the inceptive stages of an invention. It is because a patent or a printed publication is evidence, when it is evidence at all, of a perfected invention, that it is required to speak in unequivocal language, and fully, clearly, and exactly describe the invention against which it is urged, whether as a bar to a patent granted or as a basis for a patent asked.

In *Woven Wire Mattress Company* v. *Whittlesey* (8 Biss., 23,) it is said:

There is one further objection that is urged to the foreign testimony which I ought to notice, and that is, that the law requires that the description in foreign publications in order to defeat a patent in this country should be sufficiently definite so that a person of ordinary skill could construct the machine from the descriptions in the foreign publications.

The words "skilled in the art" in my opinion include *careful workmen* who are skilful in the particular line of business in which they are engaged. I do not think the law warrants a construction of those words which includes only persons of high scientific attainments.

In *Plimpton* v. *Malcolmson*, 1876, (L. R. 3 Ch., 531,) and *Jessel*, (M. R., 568,) cited in *Robinson on Patents*, (Vol. II, p. 78,) it is said:

Now what is the meaning of it being a sufficient specification? Upon that there has been a very great deal of authority. Judges have stated it in different ways, no doubt, but I do not think there is much difference in substance. In the first place, it is plain that the specification of a patent is not addressed to people who are ignorant of the subject-matter. It is addressed to people who know something about it. But then there are various kinds of people who know something about it. If it is a mechanical invention, as this is, you have, first of all, scientific mechanicians of the first class—eminent engineers; then you have scientific mechanicians of the second class—managers of great manufactories, great employers of labor, persons who have studied mechanics—not to the same extent as the first class, the scientific engineers, but still to a great extent—for the purpose of conducting manufactories of complicated and unusual machines, and who therefore must have made the subject a matter of very considerable study; and in this class I should include foremen, being men of superior intelligence, who like their masters would be capable of invention, and like the scientific engineers would be able to find out what was meant even from slight hints, and still more from imperfect descriptions, and would be able to supplement, so as to succeed even from a defective description, and even more than that, would be able to correct an erroneous description. That is what I would say of the two first classes, which I will call the scientific classes. The other class consists of the ordinary workman, using that amount of skill and intelligence which is fairly to be expected from him—not a careless man, but a careful man, though not possessing that great scientific knowledge or power of invention which would enable him, unaided, to supplement a defective description or correct an erroneous description. Now, as I understand, to be a good specification it must be intelligible to the third class I have mentioned, and that is the result of the law. It will be a bad specification if the first two classes only understand it, and if the third class do not. I do not think, when the cases come to be examined, there is really any difference between the judges on this point. Their language differs, but I do not think the cases differ.

I do not think the disclosure in the *La Lumière Electrique* article measures up to the standard required by the law. Hutin and Leblanc explicitly state in their last paragraph that "this is a property of which we *shall study* the application, etc."

For the same reasons above stated I am of the opinion that the French patent of 1891 to Hutin and Leblanc is defective in order to give a disclosure of the invention of the issue. This patent was cited by the Examiner during his *ex parte* consideration of the application of Stone and Pupin against the claims of the issue in their application and was formally withdrawn by him as a reference, "for the reason that it does not *show* a condenser in the receiving branches."

This action of the Examiner was deliberately made after a consideration for a period of some twenty-four days of the French patent as to whether or not it disclosed the invention of the issue claimed by Stone and Pupin. Counsel for Hutin and Leblanc say with respect to this action of the Examiner:

That it does not *show* condensers in the receiving branches is quite evident; a glance at the drawing will prove this; but that for that reason there are no condensers in the receiving branches does not logically follow. The Examiner evidently looked at *the drawing* of the French patent *and did not look* at the description; for he withdrew the French patent as a reference and said that it had no selective action because it did "*show*" a condenser in the receiving branches.

Because the Examiner in his letters to Stone and to Pupin used only the word "show" is no reason to my mind for charging the Examiner, the expert of this Office, with neglect of duty. It is inconceivable that the Examiner could have done nothing but *look* at the drawing for a period of twenty-four days to discover that a condenser was not in the receiving-circuit when from a mere glance this fact is apparent. The Examiner took time (twenty-four days) to make up his mind. He undoubtedly studied the description carefully. It would have been neglect of his plain duty if he had not done so. I see no force in this contention. Doctor Kennelly admits that if there was nothing in the French patent but the drawing he would say that the system therein cannot work selectively. Doctor Kennelly contends that this patent has a system which demands condensers for the receiving-circuits, and therefore they must be there.

Here, as with the article of May 9, 1891, Doctor Kennelly gathers enough to be able to invent the subject-matter of the issue; but I am of the opinion that neither disclosure is sufficient under the law. A person of ordinary skill in the art could not from the description in *La Lumière Electrique* or in the French patent of 1891 construct a system such as is covered in count 3 to carry out the method of count 1.

In answer to interrogatory 5 Maurice Leblanc makes answer as follows:

The opinion of Doctor Cross is erroneous. Our invention was not at all to have different specifications than the French patent. I only gave in the English patent new details of construction, and Mr. Hutin and I knew after the English patent was given that there was a difference, but it was too late to change it. Neither I or Mr. Hutin understood English. It was a patent agent who took the English patent, and the difference was only noticed when it was too late—when it was already perfected. I state that the whole technique of the invention is given in the French paper *La Lumière Electrique*. I do not remember the date exactly, but I believe it was in May, 1891. Our idea and plan of the invention is in that paper much more than the French patent, and certainly more than the English patent.

It is stated with reference to this answer by the counsel for Hutin and Leblanc:

From this it appears that Hutin and Leblanc did not consider the English patent to be a correct representation of what they intended it should represent. * * * They recognized that the English patent did not represent their invention.

It will be noticed that in the last sentence of the first paragraph Leblanc puts the *French patent* under the same ban as the *English patent*, though possibly to a lesser degree.

It is the opinion of the lower tribunals that the French patent to Hutin and Leblanc of March 5, 1894, is a full and complete disclosure of the invention at issue, and with this opinion I concur.

To recapitulate, I find that Pupin has proved conception and disclosure not later than November, 1890, actual reduction to practice not later than January, 1891. Pupin was the first to file, February 23, 1894. Stone has proved conception and disclosure not later than January 2, 1893. He never made an actual reduction to practice, and he was the second to file on April 4, 1894, and was diligent in so doing.

Hutin and Leblanc have proved completion of invention and disclosure no earlier than March 5, 1894. They were the last to file.

I agree with the finding of the Examiners-in-Chief that Pupin was the "first to conceive the invention, the first to constructively reduce it to practice, and the only one to actually reduce it to practice." Priority of invention is therefore awarded to Pupin.

The decision of the Examiners-in-Chief is affirmed.

Attorneys.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 21, 1902.

This Office has been advised by the Secretary of the Interior of the disbarment of the following attorneys from practice before the Department or any Bureau thereof:

Americus V. Spalding, Burlington, Vt., June 18, 1902; Jacob R. Deckard, Sandusky, Ohio, July 15, 1902; George W. Grim, Cleveland, Ohio, July 17, 1902.

C. M. IRELAN,
Chief Clerk.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 21, 1902.

This Office has been advised by the Secretary of the Interior that the following Department orders were rescinded July 19, 1902:

November 9, 1901, disbarring Benjamin C. Girdler, of Grand Rapids, Mich.; December 17, 1901, disbarring William M. Duffy, of Point Pleasant, W. Va.; January 28, 1902, disbarring Frederick T. R. Gruett, of Newark, N. J.; May 10, 1902, disbarring John Wainwright, of Wilmington, Del.

C. M. IRELAN,
Chief Clerk.

Money by Mail.

Money sent by mail to the Patent Office will be at the risk of the sender. Letters containing money should be registered.

APPLICATIONS UNDER EXAMINATION.

Condition at Close of Business July 22, 1902.

Room No.	Divisions and subjects of invention.	Oldest new application and oldest action by applicant awaiting office action. New.	Amended.	No. of applications awaiting action.

DEPARTMENT OF THE INTERIOR,
UNITED STATES PATENT OFFICE,
Washington, D. C., July 1, 1902.

The Patent Office is now prepared to furnish black line on white ground copies of any unbound drawing, foreign or domestic, which may be in its possession, instead of the blue-prints heretofore furnished. Only the 7x11 (patent) size and the full or 10x15 size prints will hereafter be furnished, at 15 and 25 cents per sheet, respectively.

Copies of drawings of pending, abandoned, forfeited, or informal cases and of caveats may be had in either of the above-named sizes except when they are to be certified, in which case they must be the 10x15 size.

Copies of United States or foreign patent drawings will be made only in the 10x15 size.

When ordering copies of foreign patent drawings, either the serial number of the applications in which they were cited as references or the class and subclass where they may be found must be given. The title of the invention or the number of the division will not be sufficient. Bound volumes cannot be used for making prints. Failure to give the fullest data whereby the mounted drawing may be found will result in delay and unnecessary correspondence.

The work will be much facilitated if a separate order be made for each drawing. The Office will furnish, gratuitously, blanks for this purpose on request.

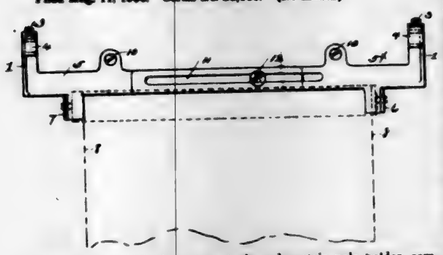
As a result of abolishing the small (5x8) size the requirement that duplicate prints must be ordered in certain cases will no longer be enforced. The requirement that less than all the sheets of a case will not be printed unless there is already a full set in the file will not be insisted upon; but applicants or attorneys are strongly urged to file a set of prints or order them to be made by the Office at the time of filing an application. Such procedure will save delay later if correction of the drawing is desired or required.

F. I. ALLEN,
Commissioner.

PATENTS

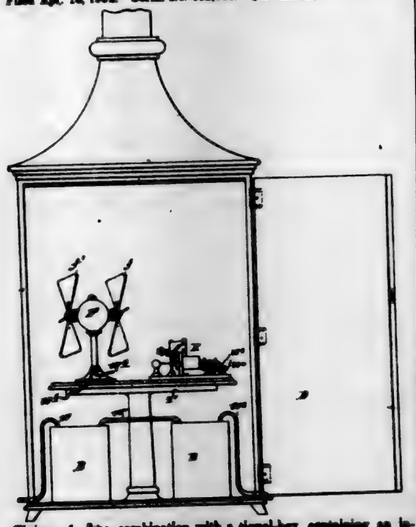
GRANTED JULY 29, 1902.

705,548. ADJUSTABLE WINDOW-SHADE AND CURTAIN-POLE HOLDER. GEORGE T. ASHTON and JESSE P. BAINTER, Pittsburg, Pa. Filed Aug. 11, 1900. Serial No. 26,608. (No model.)



Claim.—A combined window-shade and curtain-pole holder, comprising the supporting-brackets 1 with adjustable strips held thereon, and integral extension 5ˣ on one of said brackets and an extension 5 on the other, which is adjustably held against the face of an offset portion of said extension 5ˣ, which offset portion 5' terminates in a shoulder 14, the outer face of the extension 5 being flush with the outer face of the portion of the extension between said shoulder and the bracket 1, and integral shade-holding brackets 6 on the extensions, as set forth.

705,549. SIGNAL DEVICE. HERBERT S. BALLEY, Bethlehem, Pa. Filed Apr. 10, 1902. Serial No. 102,161. (No model.)



Claim.—1. The combination with a signal-box, containing an instrument of a signaling system, of means for producing a current of air, located and arranged, substantially as described, whereby said current of air will be caused to circulate over and about said instrument.

2. The combination with a signal-box, containing an instrument of a signaling system, of means for producing a current of air, located within the signal-box, and arranged substantially as described, whereby said current of air will be caused to circulate over and about said instrument.

3. The combination with a signal-box, containing an instrument of a signaling system, of a fan and means for operating it located and arranged substantially as described, whereby said current of air will be caused to circulate over and about said instrument.

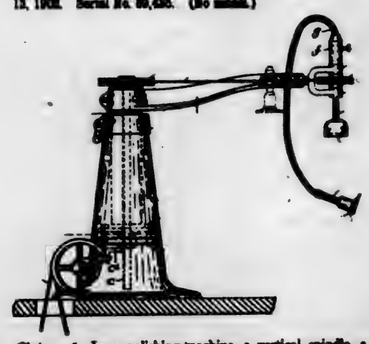
4. The combination with a signal-box, containing an instrument of a signaling system, of a fan and means for operating it, located within the signal-box, and arranged substantially as described, whereby said current of air will be caused to circulate over and about said instrument.

5. The combination with a signal-box, containing an instrument of a signaling system, of an electric motor-fan located and arranged as described, together with means for operating it located and arranged substantially as described, whereby said current of air will be caused to circulate over and about said instrument.

6. The combination with a signal-box, containing an instrument of a signaling system, of an electric motor-fan located in the signal-box with said instrument, and arranged as described, together with means for operating it located and arranged substantially as described, whereby said current of air will be caused to circulate over and about said instrument.

7. A semaphore signaling device composed of a post and signal-box provided with signaling devices, in combination with an electric fan-motor, located within said signal-box and arranged as described, together with suitable connections and energizing apparatus, all arranged and combined substantially as and for the purpose set forth.

705,550. POLISHING-MACHINE. MILTON H. BALLARD, Lynn, Mass., assignor to George W. Emerson & Co., Lynn, Mass. Filed Jan. 13, 1902. Serial No. 89,435. (No model.)



Claim.—1. In a polishing-machine, a vertical spindle, a support therefor, and means for revolving it, combined with a flexible shaft, clutch mechanism interposed between said spindle and shaft, and a polishing tool or pad connected to the extremity of said flexible shaft, substantially as described.

2. In a polishing-machine, a vertical spindle, a support therefor, and means for revolving it, combined with a flexible shaft, a slip-clutch mechanism interposed between said spindle and shaft composed of two crown ratchet-toothed members, one of which is connected to the spindle and the other to the shaft, a spring for holding said members in engagement and means for disengaging them, and a polishing tool or pad connected to the extremity of said flexible shaft, substantially as described.

3. In a polishing-machine, a vertical spindle, a support therefor and means for revolving it, combined with a flexible shaft, a clutch mechanism interposed between said spindle and shaft comprising two crown ratchet-toothed members, one of which has an annular flange, an eccentric-pin

engaging said flange and means for turning it, and a polishing tool or pad connected to the extremity of said flexible shaft, substantially as described.

4. In a polishing-machine, a vertical spindle, a support therefor, and means for revolving it, combined with a flexible shaft, a flexible tube inclosing it, a tubular case attached to the end of said flexible inclosing tube, a spindle contained in said tubular case, which is connected to said flexible shaft, said spindle projecting from said case, and a polishing tool or pad mounted on the projecting end of said spindle, substantially as described.

5. In a polishing-machine, a vertical spindle bearing a belt-pulley, an arm bearing said spindle, a vertically adjustable and rotatable bar to which said arm is secured, a stand or support for said bar, a shaft passing centrally through said bar having a spineway, a belt-pulley to which said shaft is spined, a belt-pulley secured to the upper end of said shaft which occupies a position in a horizontal plane with the belt-pulley on said vertical spindle, a flexible shaft connected to said vertical spindle, and a polishing tool or pad connected to the extremity of said flexible shaft, substantially as described.

6. A polishing tool or pad consisting of a circular base, a tubular spindle to which it is attached, a sixteen headed screw for holding the polishing-disk in position on said base, having a socket formed with an offset portion, to receive a pin having a corresponding offset portion by which said screw is turned, substantially as described.

705,551. ICE-CREAM CAN. RICHARD BAUER, Johnstown, Pa. Filed Feb. 5, 1902. Serial No. 92,672. (No model.)

Claim.—In a device of the character described, the combination with an outer receptacle, of an inner receptacle comprising a series of vertically-arranged standards, the two rear standards being right angular in cross-section, a bottom, a series of shelves and a top, said bottom, shelves and top being of the same form and having turned edges to which are secured the said standards, a series of drawers slidably mounted on said shelves and having its rearward movement limited by the rear standards, said drawers being of less height than the spaces between said shelves to form an air-passage therebetween, substantially as described.

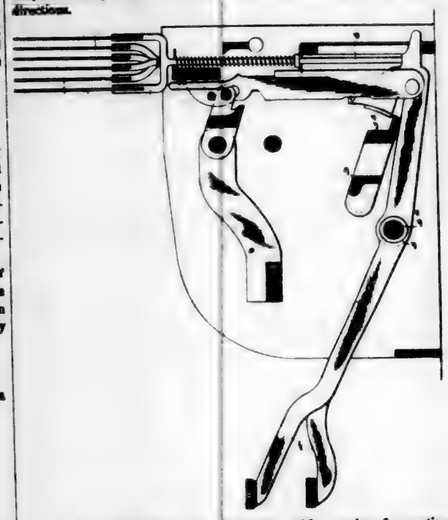
705,552. CASH-REGISTER. WALTER H. BELL, Dayton, Ohio, assignor, by mesne assignments, to National Cash Register Company Jersey City, N. J., a Corporation of New Jersey. Filed July 30, 1898. Serial No. 687,261. (No model.)

Claim.—1. In a cash-register, the combination with a series of keys, of a series of indicators, a key-coupler, two movable yokes and connections coöperating with the key-coupler so as to be simultaneously moved thereby and guard-plates connecting the arms of said yokes so as to extend upon both sides of the indicators to conceal the same until the operation of the keys is completed.

2. In a cash-register, the combination with a series of keys, of a series of indicators, a frame arranged to be operated by any one of said keys, levers pivoted independently of said frame but arranged to be engaged and positively operated by the same in both directions, and an indicator-guard mounted independently of said levers but arranged to be operated by the same.

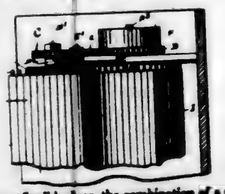
3. In a cash-register, the combination with a series of operating-keys, of a key-coupler coöperating therewith, indicators, pivoted levers mounted independently of the coupler but connected thereto so as to move positively therewith and a flash arranged to be operated by said levers to hide the said indicators while the keys are being operated.

4. In a cash-register, the combination with a series of operating-keys, of a key-coupler arranged to engage and hold said keys to simultaneous movement, a series of indicators, an indicator-flash arranged to hide both sides of said indicators during the operation of the keys, and pivoted levers for operating said flash mounted independently of the coupler but coupled thereto so as to be moved positively therewith in both directions.



5. In a cash-register the combination with a series of operating-keys, of a series of indicators for said keys, a movable frame arranged to be coupled to said keys, two movable yokes coöperating with said frame and guard-plates connecting the arms of said yokes so as to extend both in front and back of the indicators and hide the same during the operation of the keys.

705,553. FLEXIBLE DOOR. JOSEPH S. BLAKE, Worcester, Mass., assignor to Flexible Door and Shutter Company, Worcester, Mass., a Corporation of Maine. Filed May 6, 1901. Serial No. 59,051. (No model.)



Claim.—1. In a flexible door, the combination of a shaft or spindle, a series of leaves hinged together and forming the body of the door having one edge of said door-body connected with said shaft, whereby said leaves are wound into a coil by the rotation of said shaft, of a toothed wheel, means carried by said hinged leaves for engaging said toothed wheel and rotating the same as the door is opened or closed, and an intermediate connecting mechanism between said toothed wheel and said shaft comprising a yielding member, whereby the rotation of said shaft in winding said door-body may be varied relatively to the rotation of said toothed wheel, substantially as described.

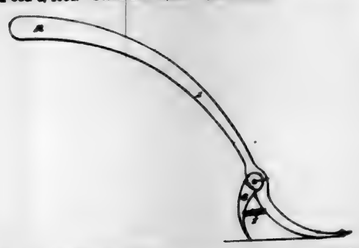
2. The combination with a shaft and a flexible door attached to said shaft, of a coiled spring having one end connected with said shaft and having its opposite end operatively connected with said door, whereby the operation of unwinding the door from said shaft will cause said spring to be wound with a uniform movement, substantially as described.

3. The combination with a shaft and a flexible door attached to said shaft, of a coiled spring carried by a wheel or drum and having one end attached thereto and having its opposite end attached to said shaft, means operated by the door in the operation of opening and closing the same for rotating said wheel or drum, substantially as described.

4. The combination of a shaft, a flexible door attached to said shaft, a coiled spring attached at one end to said shaft, a wheel or drum rotating concentrically with said shaft and attached to the opposite end of said coiled spring, and means for rotating said wheel or drum operated by the movement of the door in opening or closing the same, substantially as described.

5. The combination of a door-body composed of a series of leaves hinged together, a shaft upon which said door-body is wound, pins projecting from said leaves, a toothed wheel engaged by said pins, a pinion attached to said toothed wheel, a gear-wheel driven by said pinion and concentric with the shaft upon which the door is wound, and a yielding connection between said gear and shaft, substantially as described.

705,554. TACK-PULLER. THOMAS G. BLAKE, Vandergrift, Pa. Filed Oct. 8, 1901. Serial No. 78,013. (No model.)



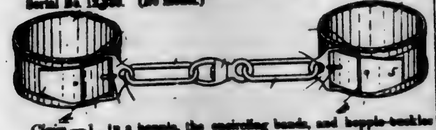
Claim.—A tack-puller which comprises a lever having an arc-shaped handle at one end thereof, and an arc-shaped portion carrying claws at its opposite end, the radius of the last-named arc being less than that of the first-named one, an arc-shaped dog formed of flat sheet metal carrying a pair of spaced lugs engaging said lever at the inner termination of the smaller arc and having a pin passed therethrough and permanently secured to said lugs, said arc-shaped dog being of such radius as will cause its free end to engage the body in which the tack is secured and have its engaging point located to the rear of the point of pivot when the claws are in engagement with the tack, and a spring secured to the said dog and the smaller arc-shaped portion of the lever, the lever moving about the said point and simultaneously therewith having a rearward movement whereby a direct vertical pull is exerted upon the tack, substantially as described.

705,555. WIRE-STRETCHER. ROBERT F. BOATRIGHT, Ex, Va. Filed July 10, 1900. Serial No. 23,147. (No model.)

Claim.—1. A wire-stretcher comprising an open hook including a stem and bill having a connecting-web, the inner faces of the stem and bill being recessed and the connecting-web being arched transversely on its inner face, and a facing including spaced members and an arched connecting-web, said facing being disposed with its spaced members in the recesses of the stem and bill and with its arched web fitted upon the arched face of the web of the hook, whereby the face is held immovably.

2. A wire-stretcher comprising a lever having a laterally-turned end adapted to engage a post and a wire-grip mounted upon the lever and comprising an open hook projecting at the same side with the laterally-turned end said hook including a stem and a bill having a connecting-web the inner face of which latter is arched from one side to the other, and a facing set into and fitting the inner faces of the stem, bill and web of the hook.

705,556. HOPPLE OR PASTURE-HALTER. HENRY A. BERTHEL, Spokane, Wash., assignor of one-half to George Lawrence Company, Portland, Oreg., a Corporation of Oregon. Filed Apr. 10, 1902. Serial No. 12,920. (No model.)



Claim.—1. In a hopple, the encircling bands, and hopple-buckles secured thereto comprising a frame-section and a tongue which passes through the free end of the encircling band, said frame-sections having formed upon their outer edges the D's in which the ends of the links are made to catch, combined with the links which unite the bands, and the swivel placed midway between the bands, and which serves to unite the inner ends of the links, substantially as shown and described.

2. In a hopple, the combination of the encircling band open at one side with the ends abutting, a buckle secured thereabout and comprising a frame with integral extension having an aperture, an anchoring device 4, secured to one end of said band, a strap secured to the other end of said band and entirely surrounding said band and engaging the tongue of the buckle, a link secured in the aperture of the extension, and a swivel connected to the said link, all substantially as herein shown and described.

705,557. ROTARY WHEEL-HARROW. ERNST BRÜCKER, Rochester, N. Y. Filed Sept. 26, 1901. Serial No. 76,663. (No model.)

Claim.—1. In a wheeled harrow, an axle, a roller-carrying frame loosely supported on the axle, a toothed roller having journals in the rear end of the frame, and means for raising the frame to lift the said roller above the ground, said means comprising a rotatable roller-shaft having bearings in arms pendent from said frame and situated in front of the toothed roller.

2. In a wheeled harrow, an axle, a roller-carrying frame loosely supported on the axle, a toothed roller having journals in the rear end of the frame, means for raising the frame to lift the said roller above the ground, said means comprising a rotatable roller-shaft having bearings in arms pendent from said frame and situated in front of the toothed roller, and the links, lever and holding-pawl situated immediately over the said roller-shaft.

3. In a wheeled harrow, an axle, a toothed roller, a roller-carrying frame loosely supported on the axle, and means for raising the frame to lift the said roller above the ground, said means comprising a rotatable roller-shaft having bearings in arms pendent from said frame, and the links, lever and holding-pawl, one of said links passing through the frame and limited as to its forward movement thereby.

4. In a wheeled harrow, the axle, the toothed roller, the roller-frame having side members loosely sleeved on the axle, the shield pivotally supported on said members, and the stops 30 to limit the fall of the shield.

5. In a wheeled harrow, the axle, the toothed roller, the roller-frame loosely supported on the axle and having side members, a bar joining said members, a gear on the axle, a gear on the roller, an intermediate gear, a case for the gears, and a stud in the case to rotatably support said intermediate gear.

6. In a wheeled harrow, the axle, the roller-frame having the side members, the rear-frame, the axle-wheels, and the gears on the axles, said frames having sleeves which together with the wheel-hubs cover the axle between its gears.

705,558. ELECTRIC CLOCK. JOSEPH BOTHNER, New York, N. Y., assignor to Simeon H. Putnam, Jersey City, N. J. Filed Oct. 16, 1901. Serial No. 78,726. (No model.)

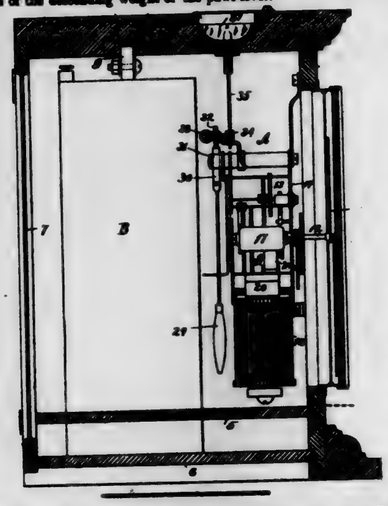
Claim.—1. In an electric clock of the character described, the combination with the movable armature and the weighted pawl-lever, of a flexible connecter which couples them together, and a contact device actuated to close the operating-circuit by the straightening of the connecter when the said weighted arm descends.

2. In an electric clock of the character described, the combination with the movable armature and the weighted pawl-lever, of a flexible connecter which couples them together, and means for completing the operating-circuit through said magnet when the weighted lever shall have descended and straightened the connecter, whereby the retraction of the armature throws up said weighted lever.

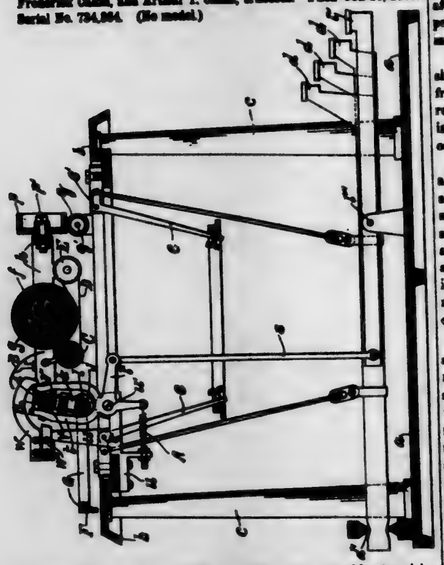
3. In an electric clock, of the character described, the combination of the movable armature, the weighted pawl-lever, and the flexible connecter which couples the armature with that arm of said lever opposite to the weight, of the fixed contact in the operating-circuit, the movable contact in said circuit, said movable contact having a pin which is in the path of the straightened connecter, and the said circuit including a generator and electromagnet.

4. In an electric clock, the combination with the hour-arbor, the driving-arbor, the connecting-train, the ratchet-wheel on the driving-arbor, the pawl-lever and its weight, the pawl on said lever and engaging the teeth of the ratchet-wheel, the electromagnet, its movable armature, the operating-circuit including a generator and the coils of said magnet, and

the fixed and movable contacts forming terminals at a break in said circuit, of the ribbon 24, coupling together the said armature and the arm of the pawl-lever opposite to its weight, said movable contact having a part projecting into the path of said ribbon as it straightens under the influence of the descending weight of the pawl-lever.



705,559. TYPE-WRITING MACHINE. THADDEUS CAHILL, New York, N. Y., assignor to James B. Lumble, B. Hilton Jackson, George Frederick Cahill, and Arthur T. Cahill, trustees. Filed Oct. 26, 1899. Serial No. 734,894. (No model.)



Claim.—1. In a type-writing machine and in combination, (*a*) a hinge and guide rod; (*b*) a yoke, pivoted on said hinge and guide rod, and mounted to travel longitudinally thereon; (*c*) a platen; and (*d*) a platen-carrier, pivotally connected with the yoke aforesaid, and traveling longitudinally therewith.

2. In a type-writing machine and in combination, (*a*) a hinge and guide rod; (*b*) a yoke, pivoted on said hinge and guide rod, and mounted to travel longitudinally thereon; (*c*) a platen; and (*d*) a platen-carrier, pivotally connected with the yoke aforesaid, and traveling longitudinally therewith; the whole being constructed and arranged in such a manner that the yoke aforesaid supports the platen-carrier and affords facility to the platen-carrier to shift transversely to the line of printing, and also maintains the platen constantly in the same position of substantial parallelism with the hinge and guide rod aforesaid, upon which the yoke aforesaid and the platen-carrier connected therewith, travel.

3. In a type-writing machine and in combination, (*a*) a hinge and guide rod; (*b*) a yoke, pivoted on said hinge and guide rod, and mounted to travel longitudinally thereon; (*c*) a platen; (*d*) a platen-carrier, pivotally connected with the yoke aforesaid, and traveling longitudinally therewith; (*e*) a key at the keyboard; and (*f*) means operated by said key for shifting the platen aforesaid from one printing position to another.

4. In a type-writing machine and in combination, (*a*) a platen; (*b*) a shifting, longitudinally-traveling platen-carrier, wherein said platen is mounted to rotate; (*c*) a rod mounted in the framework of the machine to lie parallel with the line of printing; (*d*) a member pivoted upon the rod aforesaid, and mounted to travel longitudinally thereon, said member being also pivotally connected with the platen-carrier, aforesaid, and serving both to permit the shifting of said platen and platen-carrier, and to maintain said platen in a position of substantial parallelism with the rod aforesaid.

5. In a type-writing machine and in combination, (*a*) a platen; (*b*) a shifting, longitudinally-traveling platen-carrier, wherein said platen is mounted to rotate; (*c*) a rod mounted in the framework of the machine to lie parallel with the line of printing; (*d*) a member pivoted upon the rod aforesaid, and mounted to travel longitudinally thereon; said member being also pivotally connected with the platen-carrier, aforesaid, and serving both to permit the shifting of said platen and platen-carrier, and to maintain said platen in a position of substantial parallelism with the rod aforesaid; and (*e*) a shifter operating to shift the platen aforesaid from one printing position to another.

6. In a type-writing machine and in combination, (*a*) a platen; (*b*) a shifting, longitudinally-traveling platen-carrier, wherein said platen is mounted to rotate; (*c*) a rod mounted in the framework of the machine to lie parallel with the line of printing; (*d*) a member pivoted upon the rod aforesaid, and mounted to travel longitudinally thereon, said member being also pivotally connected with the platen-carrier, aforesaid, and serving both to permit the shifting of said platen and platen-carrier, and to maintain said platen in a position of substantial parallelism with the rod aforesaid; (*e*) a shifter operating to shift the platen aforesaid from one printing position to another; and (*f*) a key at the keyboard controlling said shifter.

7. In a type-writing machine, the combination with a platen and a shifting, platen-carrying frame of a wheel, pivoted to the platen-carrying frame toward the front; and a longitudinal roller, whereon said wheel runs; said roller lying parallel, or nearly parallel, with the line of printing, and being mounted to turn upon its axis as the platen is shifted from one printing position to another.

8. In a type-writing machine, and in combination, (*a*) a platen; (*b*) a hinge and guide rod; (*c*) a yoke, pivoted upon the hinge and guide rod aforesaid, and traveling longitudinally thereon; (*d*) a shifting, longitudinally-traveling, carriage-frame, pivotally connected with the yoke aforesaid, and furnished with a supporting-wheel on the side opposite the yoke aforesaid; and (*e*) a roller, mounted in the framework of the machine, and having its length parallel, or nearly parallel, with the line of printing; the wheel before mentioned running upon said roller as the carriage moves longitudinally; and the roller aforesaid turning on its axis as the carriage and platen shift from one printing position to another.

9. In a type-writing machine, and in combination, (*a*) a platen, (*b*) a shifting, longitudinally-traveling, carriage-frame wherein said platen is mounted; (*c*) an oscillating member, connected to support one side of said carriage-frame, and to travel longitudinally therewith; (*d*) a rod whereby said oscillating member is pivoted, and whereon said oscillating member travels with the carriage, when the carriage moves longitudinally; (*e*) a wheel connected to the opposite side of the carriage-frame aforesaid to support the same; (*f*) a roller pivoted in the framework of the machine; said wheel running upon said roller when the carriage moves longitudinally; said roller being arranged to turn upon its axis as the carriage shifts from one printing position to another; (*g*) a key at the keyboard; and (*h*) means controlled thereby for shifting the carriage aforesaid from one printing position to another.

10. In a type-writing machine, the combination with a hinge and guide rod and a platen-carrying frame, of a yoke *k* pivoted upon said hinge and guide rod and traveling thereon; the platen-carrying frame being pivoted to said yoke.

11. In a type-writing machine, the combination, with a hinge and guide rod, of a platen-carrying frame and a yoke pivoted upon said hinge and guide rod; said yoke being pivoted to the platen-carrying frame aforesaid, and being furnished with wheels to ride upon the hinge and guide rod aforesaid.

12. In a type-writing machine, the combination, with a hinge and guide rod, of a platen-carrying frame and a yoke pivoted upon said hinge and guide rod; said yoke being pivoted to the platen-carrying frame aforesaid, and being furnished with wheels to ride upon the hinge and guide rod aforesaid; said platen-carrying frame having a wheel connected with it to support its weight in front.

13. In a type-writing machine, the combination, with a hinge and guide rod, of a platen-carrying frame and a yoke pivoted upon said hinge and guide rod; said yoke being pivoted to the platen-carrying frame aforesaid, and being furnished with wheels to ride upon the hinge and guide rod aforesaid; said platen-carrying frame having a wheel connected with it to support its weight in front; and a roller whereon the wheel last mentioned runs; said roller being pivoted in the framework of the machine with its length parallel, or nearly parallel, with the line of printing.

14. In a type-writing machine, the combination with a hinge and guide rod and a platen-carrying frame, of a yoke *k* pivoted upon said hinge and guide rod and traveling thereon; the platen-carrying frame being pivoted to said yoke; and a shifter engaging the rear of the platen-carrying frame aforesaid, to shift the platen from one printing position to another.

15. In a type-writing machine, the combination with a hinge and guide rod and a platen-carrying frame, of a yoke *k* pivoted upon said hinge and guide rod and traveling thereon; the platen-carrying frame being pivoted to said yoke; a shift-lever engaging the platen-carrying frame aforesaid to shift the platen from one printing position to another; and a key at the keyboard for controlling said shift-lever.

16. In a type-writing machine, the combination, with a hinge and guide rod, of a platen-carrying frame and a yoke pivoted upon said hinge and guide rod; said yoke being pivoted to the platen-carrying frame aforesaid, and being furnished with wheels to ride upon the hinge and guide rod aforesaid; a shift-lever lying transverse to the platen, and acting on the platen-carrying frame aforesaid, to shift the platen from one printing position aforesaid to another; and a key at the keyboard controlling said lever.

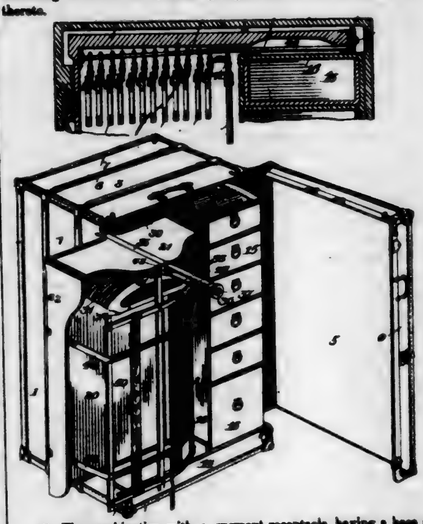
17. In a type-writing machine and in combination, (*a*) a platen; (*b*) type-bars disposed about an arc or a circle below the platen, and striking upward toward the platen to print; some, or all, of said type-bars carrying a plurality of types; (*c*) a shifting, longitudinally-traveling platen-carrier, wherein the platen aforesaid is mounted to rotate; (*d*) a rod, mounted in the framework of the machine to lie parallel with the line of printing; (*e*) a member pivoted upon the rod aforesaid, and mounted to travel longitudinally thereon, said member being also pivotally connected with the platen-carrier, aforesaid, and serving both to permit the shifting of said platen and platen-carrier, and to maintain said platen in a position of substantial parallelism with the rod aforesaid.

18. In a type-writing machine and in combination, (*a*) a platen; (*b*) type-bars disposed about an arc or a circle below the platen, and striking upward toward the platen to print, some, or all, of said type-bars carrying a plurality of types; (*c*) a shifting, longitudinally-traveling platen-carrier, wherein said platen is mounted to rotate; (*d*) a rod mounted in the framework of the machine to lie parallel with the line of printing; (*e*) a member pivoted upon the rod aforesaid, and mounted to travel longitudinally thereon; said member being also pivotally connected with the platen-carrier, aforesaid, and serving both to permit the shifting of said platen and platen-carrier, and to maintain said platen in a position of substantial parallelism with the rod aforesaid; and (*f*) a shifter operating to shift the platen aforesaid from one printing position to another.

19. In a type-writing machine and in combination, (*a*) a platen; (*b*) type-bars disposed about an arc or a circle below the platen, and striking upward toward the platen to print; some, or all, of said type-bars carrying a plurality of types; (*c*) a shifting, longitudinally-traveling platen-carrier, wherein the platen aforesaid is mounted to rotate; (*d*) a rod mounted in the framework of the machine to lie parallel with the line of printing; (*e*) a member pivoted upon the rod aforesaid, and mounted to travel longitudinally thereon, said member being also pivotally connected with the platen-carrier, aforesaid, and serving both to permit the shifting of said platen and platen-carrier, and to maintain said platen in a position of substantial parallelism with the rod aforesaid; (*f*) a shifter operating to shift the platen aforesaid from one printing position to another; and (*g*) a key at the keyboard controlling said shifter.

705,560. WARDROBE-TRUNK. JOHN J. CARMAN, Rochester, N. Y., assignor to Henry Lilly & Company, Rochester, N. Y., a Corporation of New York. Filed Feb. 8, 1901. Serial No. 46,499. (No model.)

Claim.—1. In a trunk, the combination with a casing having a bank and a top portion, a bar extending beyond the forward edge of the top, side portions extending outwardly at their lower ends and a front panel arranged at the outer edge of the base and extending between the projecting edges of the side portions, of a lid or door consisting of a panel having a top and side portions equal in width to the extensions on the sides and base of the casing and adapted when in the closed position to form a flat surface in the plane of the front panel of the casing and hinges between the door and one side of the casing arranged with their pintles extending in rear of the projecting edge of the base and perpendicular thereto.



2. The combination with a garment-receptacle having a base and the side portions and open at the front and guides on one of the sides of the receptacle, of a carriage movable on the guides, a casing pivoted to the carriage and capable of swinging outwardly through the front of the receptacle when the carriage is moved forwardly on the guides and a door on the receptacle engaging the casing when the latter is in closed position.

3. The combination with a garment-receptacle having the open front, guides on one of the sides of the receptacle and a movable carriage supported on the guides, an inner casing arranged in the receptacle and pivotally mounted on the carriage and means for limiting the swinging movement of the casing.

4. The combination with a garment-receptacle having the open front, guides on one of the sides of the receptacle and a movable carriage supported on the guides, of a casing arranged upon the interior of the receptacle, pivotal connections between the casing and carriage, and means engaging the guides to prevent the swinging of the casing excepting when the latter is moved out of the receptacle.

5. The combination with a garment-receptacle having the open front, guides on one of the sides of the receptacle, a carriage movably mounted on the guides, and ways coöperating with the guides and hinged to the carriage, of an inner casing supported on the ways, and a stop arranged to limit the outward movement of the casing after the ways have left the guides.

6. In a trunk the combination with an exterior casing, and an interior shell or casing, of guides arranged upon one of the parts, a carriage mounted in the guides having the hinged extensions operating in said guides and connected with the opposite part, whereby the casing may be revolved when the carriage is drawn forward on the guides.

7. In a trunk the combination with an exterior casing or body, an interior shell or casing provided with ways, and guides arranged upon the body, of a carriage movable in the guides, a stop for limiting the outward movement of the carriage, and a hinged connection between the ways and the carriage, said ways being adapted to coöperate with the guides when the carriage is moved inwardly, and means for limiting the swinging movement of the casing on its hinge.

8. In a garment-receptacle the combination with an exterior casing or body, of an interior shell or casing having a bank, movable connections between the latter and one side of the outer casing, of a bar connected to the inner casing and a series of garment-supports arranged beneath the bar.

9. In a garment-receptacle the combination with an exterior casing or body, a shell or casing having the bank, and movable connections between the latter and one side of the body, of a bar extending from the bank, a support for the end of the bar arranged upon the opposite side of the body, a series of garment-supports suspended from the bar and movable longitudinally thereof, a movable frame, and means for adjusting it toward the bank to compress the garments against the latter.

10. In a garment-receptacle the combination with a casing or body, an inner shell having a bank and guides between the latter and one of the sides of the body, a bar extending from the upper end of the bank

and a support for the outer end of the bar arranged upon the opposite side of the casing, of a separate supporting-rod arranged below the bar, a series of garment-supports mounted on the rod, a movable frame carried on the rod and means for adjusting the latter to compress the garments against the back of the shell.

11. In a garment-receptacle the combination with a casing or body, an inner frame having a back, movable and hinged connections between the back and one side of the casing, of a support extending from the back, a series of garment-hangers thereon and a compressing-frame movably mounted on the support and curved inwardly at its rear edge, and means for moving the frame relative the back to compress the garments.

12. In a garment-receptacle the combination with a body, an inner frame having a back, movable connections between the back and one side of the body, and a separate compartment on the opposite side of the body, of a bar arranged upon the back of the shell and having its end guided on the top of the compartment, garment-hangers mounted on the bar and means for securing the garments in the frame.

13. In a trunk the combination with a body, a frame therein having the back, and movable hinged connections between the shell and the side of the trunk, a separate compartment secured upon the opposite side of the trunk-body, of the bar secured to the shell and extending over the compartment having the support upon its lower side, the garment-hangers movably suspended on the support, and the frame curved upon its inner side and adapted to engage over the garments and means for operating the frame to compress the garments in the shell.

14. In a trunk the combination with a body, a frame movable therein having the back, and movable and hinged connections between the shell and the side of the trunk, a separate compartment arranged upon the opposite side of the body, and a bar secured to the back of the frame and extending over the compartment, when in the normal position and having the rod or support arranged on its lower side and connected at its outer end to the end of the bar, of a series of garment-supports mounted on the rod and movable longitudinally thereon, a compressing-frame suspended on the rod and a follower connecting the rod to the bar intermediate the frame and end of the bar.

15. In a trunk the combination with a body or receptacle having a back and provided with a top and bottom portion connected thereto, the latter being extended upon its forward edge beyond the corresponding edge of the top portion, the side portions extended to meet the forward edge of the bottom, and the front panel joining said extensions on the side portions, the door embodying the panel and having top and side portions thereon, of a casing mounted in the body at one side thereof, drawers therein having their faces in line with the inner side of the front panel, a separate frame or casing movably mounted in the body having its edge also arranged in line with the inner side of the front panel, and hinge connections between the door and the body, whereby as the latter is moved into a closed position, the panel thereof will be brought into line with the front panel and engage the faces of the drawers and the edge of the movable casing to secure them against movement.

16. In a wardrobe-trunk the combination with the main casing or receptacle, of a carriage movable within the casing and a garment-supporting frame pivoted to the carriage and adapted to be swung laterally when the carriage is moved outwardly.

17. In a wardrobe-trunk the combination with the main casing or receptacle, having the guides at one side and a lid or door, of a carriage movable on the guides and a garment-supporting frame pivoted to the carriage and adapted to be swung laterally of the guides when the carriage is moved outwardly.

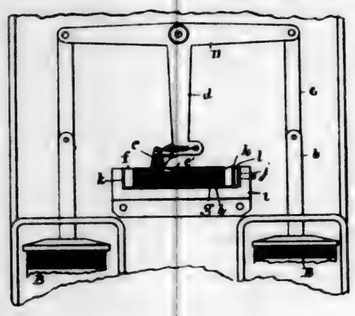
18. In a wardrobe-trunk the combination with the main casing or receptacle, having the guides and a lid or door, of a garment-supporting frame movable longitudinally of the guides and capable of swinging laterally of the guides when moved out of the casing.

19. In a wardrobe-trunk the combination with the main casing or receptacle having guides therein and a lid or door, of a garment-supporting frame movable longitudinally of the guides and capable of swinging laterally thereof when moved out of the casing.

20. In a wardrobe-trunk the combination with a main casing or receptacle having a lid or door, of a garment-frame supported at one end in the casing and movable in and out of the same and pivotally supported to swing laterally thereof.

705,561. REHOSTAT. WILLIAM H. CHAPMAN, Portland, Me. Filed Dec. 14, 1901. Serial No. 86,872. (No model.)

Claim.—In a rheostat, the combination of a swinging arm, a spring-pressed contact on said arm, a series of thin segment-plates on which said contact is adapted to travel, insulating-plates between said segment-plates, said segment-plates being closely clamped together at their front ends and spread apart at their rear ends, the upper half of the rear portion of every other plate and the lower half of the balance of the plates being cut away so that the rear ends of adjacent plates may be swung over each other.



705,562. LACING-HOOK. GARDNER W. CHIPLEY, Chicago, Ill. Filed Mar. 25, 1902. Serial No. 99,573. (No model.)

Claim.—1. A lacing-hook secured to and lying in substantially the same plane as the material to be laced and within the edge thereof; substantially as described.

2. A lacing-hook comprising a plate secured to the material to be laced and lying in substantially the same plane, said plate being provided with an opening which receives the lacing and enters within the edge of the material; substantially as described.

3. A lacing-hook comprising a plate secured to and lying in substantially the same plane as the material to be laced and provided with a curved opening entering an edge of the plate; substantially as described.

4. A lacing-hook comprising a plate lying in substantially the same plane as the material to be laced and having a spiral opening forming a hook-shaped portion 9 arranged within the line of the edge of the material; substantially as described.

5. A lacing-hook comprising a plate secured to and lying in substantially the same plane as the material to be laced and provided with an upwardly-extending spiral opening which receives the lacing and is located within the line of the edge of the material; substantially as described.

6. A lacing-hook comprising a plate having an opening whose portions on either side of a dividing-line are similar, said plate being adapted to be bent or folded over the edge of the material to be laced; substantially as described.

7. A lacing-hook comprising a plate secured to the material to be laced and having an opening 2, which, when the plate is folded has along the folded edge an entrance 6 for the lacing; substantially as described.

8. A lacing-hook comprising a plate to be secured to the material to be laced and having an opening which is longitudinal as to its middle portion and similarly upturned and curved as to its ends whereby when the plate is folded over said ends will register and an entrance will be formed at the folded edge for the lacing.

9. A lacing-hook comprising a plate to be secured to the material to be laced and having a substantially longitudinal opening with annular spiral-shaped ends, whereby when the plate is folded over at substantially its middle said ends will register, the middle portion of each opening being slightly enlarged to provide an enlarged opening 6 at the folded edge of the plate; substantially as described.

10. A lacing-hook comprising a plate 1 having an opening 2 and

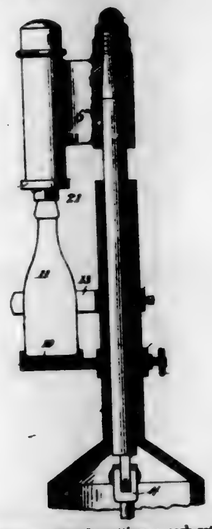
adapted to be bent transversely along the line 3 and teeth 4, 5, for securing the plate to the material to be laced; substantially as described.

11. A lacing hook comprising a plate adapted to be folded over an edge of the material to be laced and provided with an opening or passage for the lacing.

705,563. METALLIC TIE AND RAIL-JOINT. JOHN F. CLEARY, Hoytdale, Pa. Filed Apr. 7, 1902. Serial No. 101,601. (No model.)

Claim.—In a device of the character described, the combination of a metallic tie carrying at one end integral fish-plates, rails secured in said fish-plates, bolts extending through said fish-plates and webs of the rails, nuts secured to said bolts, the other end of the tie having formed therein a recess, an integral fish-plate formed on the outer end of the tie, a rail, a removable clamp provided at its outer end with an integral fish-plate and having a recess formed therein and carrying a downward extension seated in said recess formed in said tie, one edge of said extension being rounded to conform to the base of the rail, a flange formed on the inner edge of said clamp and engaging the upper face of the tie, and a securing-bolt extending through said clamp and engaging said tie, substantially as described and for the purpose set forth.

705,564. MACHINE FOR SEALING BOTTLES. WILLIAM H. DORMAN, New York, N. Y. Filed Sept. 5, 1901. Serial No. 74,383. (No model.)



Claim.—1. In a machine for setting a cork-retaining ring in the mouth of a bottle, a sliding retaining-ring holder depending from and slidably disposed in the hollow head and formed with a tapering chamber in its lower end to receive the said ring, and means for pushing the ring down through the chamber into the mouth of the bottle, substantially as described.

2. In a machine for setting a cork-retaining ring in the mouth of a bottle, a sliding retaining-ring holder depending from and slidably disposed in the hollow head and formed with a tapering chamber in its lower portion to receive the ring and a transverse slot through which the ring is passed into the chamber, and a reciprocating plunger to push the ring through the chamber into the mouth of a bottle, substantially as described.

3. In a machine for setting a cork-retaining ring in the mouth of a bottle, the combination with a reciprocating casing, of a yieldingly-held plunger in the casing, and a retaining-ring holder through which the plunger passes, said holder being formed with a tapering retaining-ring chamber and a transverse slot through which the ring is entered.

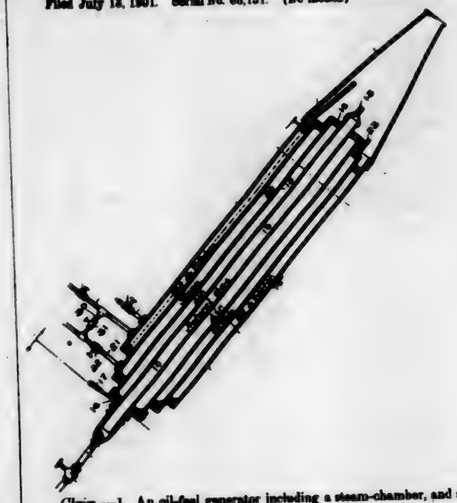
4. In a machine for setting a retaining-ring in the mouth of a bottle, the combination with a reciprocating casing, of a yieldingly-supported plunger in the casing formed with a recess at its lower end and a vertical clearance-groove leading therefrom, and a retaining-holder slidingly arranged in the lower end of the casing through which the plunger passes and formed with a tapering retaining-ring chamber, a transverse slot in the holder through which the ring is inserted and a vertical slot through which the stem of the ring descends, substantially as described.

5. A mechanism for setting a cork-retaining ring in the mouth of a bottle, comprising a reciprocating casing, a plunger in the casing formed with an annular collar, a spiral spring on the plunger above the collar, and a retaining-ring holder through which the plunger passes, formed with a tapering chamber, a transverse slot and a vertical slot intersecting each other substantially as described.

6. A mechanism for setting a cork-retaining ring in the mouth of a bottle, comprising a reciprocating casing, a yielding plunger in the casing formed with a shouldered lower end to fit in the retaining-ring and a recess and vertical groove, and a retaining-ring holder through which the plunger passes formed with a tapering retaining-ring chamber and transverse and vertical slots opening into the said chamber, and provided with an elastic gasket on its lower end, substantially as described.

7. In a machine for sealing bottles, the combination with the reciprocating hollow head having an internal annular flange at its lower end, the plunger and the spring on the plunger, of a depending ring-retaining sleeve having an external annular flange to ledge on the internal flange of the head and loosely depending from and slidably disposed in the lower end portion of the hollow head.

705,565. OIL-FUEL GENERATOR. WILLIAM H. DYE, Indianapolis, Ind., assignor of one-half to John M. Wharton, Indianapolis, Ind. Filed July 13, 1901. Serial No. 68,151. (No model.)



Claim.—1. An oil-fuel generator including a steam-chamber, and a water-and-oil chamber into which the steam-chamber extends for heating the contents thereof, the outlet from the water-and-oil chamber being at a higher point than the steam-chamber, whereby the water will envelop the steam-chamber and support the oil above and out of contact with the steam-chamber.

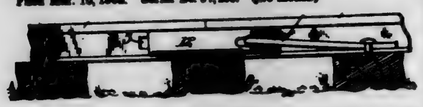
2. An oil-fuel generator including a cylindrical steam-chamber, a cylindrical water-and-oil chamber surrounding the steam-chamber, means for supplying steam to the steam-chamber, means for supplying oil to the water-and-oil chamber at one end, an outlet from the water-and-oil chamber above the steam-chamber at the other end, and an outlet from the steam-chamber at the same end near the bottom.

3. An oil-fuel generator including an air-chamber open at both ends, a steam-chamber surrounding the air-chamber, a water-and-oil chamber surrounding the steam-chamber, means at one end for supplying steam to the steam-chamber and oil to the oil-chamber, an outlet at the other end from the water-and-oil chamber near its top, and an outlet from the steam-chamber near its bottom.

4. An oil-fuel generator consisting of a natural-gas chamber, a pipe leading thereto to supply the same, an air-chamber surrounding the natural-gas chamber and held in place by perforated end caps that screw upon the natural-gas chamber, a steam-chamber surrounding the air-chamber and which screws upon the same at each end and provided with an outlet-opening near its bottom at one end and a steam-inlet opening near its top at the other end, a water-and-oil chamber surrounding the steam-

chamber, a steam-pipe and also an oil-pipe entering one end of said chamber near its top, and an outlet-opening at the other end of said chamber at a point above the steam-chamber, and a conical nozzle that screws upon the outlet end of said water-and-oil chamber, substantially as set forth.

705,566. RAIL-JOINT. CHARLES B. EDWARDS, Pittsburg, Pa. Filed Mar. 10, 1902. Serial No. 97,463. (No model.)

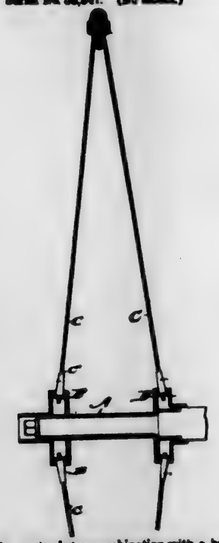


Claim.—1. In a rail-joint, the combination of fish-plates, one fish-plate carrying a projecting arm and having an aperture therein, and a fish-plate having apertures therein, said projecting arm extending through one of the apertures of the last-named fish-plate, and a locking-lever having one end of its ends projecting through the other apertures of the fish-plates for securing the same together, substantially as described.

2. In a rail-joint, the combination with the rails having apertures therein, of fish-plates arranged on opposite sides of the rails, one of said fish-plates carrying a projecting arm and provided in its opposite end with an aperture, the other fish-plate having an aperture therein and formed on its outer face with a raised portion, said projecting arm passing through one of the apertures in the rail and the adjacent fish-plate, a locking-lever in engagement with the other aperture of the fish-plates, and means for securing said locking-lever in a locked position, substantially as described.

3. In a rail-joint, the combination of a rail having an aperture therein, a fish-plate carrying a projecting arm and having an aperture therein, a fish-plate having apertures therein, said fish-plate carrying on its outer edge a raised portion, said raised portion performing a function of a wedge, a locking-lever, said locking-lever carrying a curved portion bent substantially at a right angle and having its end slightly inclined upwardly, and means for securing said locking-lever and fish-plates together, all parts being arranged and operating substantially as described.

705,567. WHEEL. ELLSWORTH J. EDWARDS, Aspen, Colo. Filed May 11, 1901. Serial No. 59,941. (No model.)



Claim.—1. In a wheel, the combination with a hub having flanged collars, of spokes having their ends extending through the said flanged collars, the tapering sleeves or nipples having flanges or collars, secured upon the ends of the spokes, and springs interposed between the flanged collars of the hub and the flanges or collars of the sleeves or nipples, substantially as set forth.

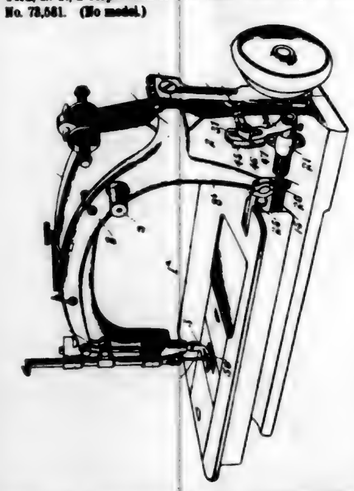
2. In a wheel, the combination with a hub having flanged collars, of the spokes having threaded ends passing through the said flanged collars, the tapering sleeves or nipples having flanges or collars, screwed upon the ends of the spokes and extending through the collar of the hub, the springs arranged between the hub-collar and the flanges or collars upon the sleeves or nipples, said sleeves or nipples passing through the said spring substantially as described.

3. In a wheel, the combination with a rim, of an internally-threaded sleeve arranged in said rim and having an eye at its end, a screw passing through the rim from the outside and arranged in the threaded sleeve and a U-shaped spoke passing through the eye of said sleeve, substantially as described.

705,568. RAILWAY-RAIL JOINT. JACOB C. FAIR, West Monterey, Pa. Filed Mar. 24, 1902. Serial No. 99,819. (No model.)

Claim.—A railway-rail joint comprising, in combination with the web of a rail having apertures therein, fish-plates with integral tapering lugs adapted to be inserted in the apertures in said web from opposite directions, a channeled bed-plate on which said rail and fish-plates rest, a wedge-shaped block having a series of ratchet-teeth on its outer wall, said block adapted to be inserted between one of said fish-plates and the wall of the channeled portion of the bed-plate, the upper inclined end of said wedge-block adapted to be held in contact with the overhanging wall of the channeled portion of the bed-plate, a spring fastened at one end in a recess in the channeled portion of the bed-plate, and having its free end disposed in the path of said ratchet-teeth, whereby the wedge-block is held in contact with the fish-plate, the free end of said spring adapted to be held out of the path of said ratchet-teeth by inserting a rod in an aperture in the bed-plate against the spring, as set forth.

705,569. STITCH-FORMING MECHANISM FOR SEWING-MACHINES. HENRY H. PEPEL, New York, N. Y., assignor, by mesne assignments, to New-York-Pittsburgh Manufacturing Company, New York, N. Y., a Corporation of New York. Filed Aug. 23, 1901. Serial No. 73,581. (No model.)



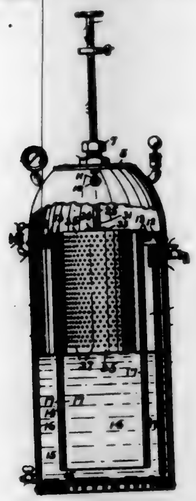
Claim.—1. In a sewing-machine, the combination of suitable stitch-forming mechanism including a needle and a looper, a driving-shaft, a cam or eccentric on said shaft, and suitable operating connections between said cam or eccentric and the needle and looper, whereby the needle will be reciprocated and the looper will be oscillated and reciprocated by said cam, substantially as set forth.

2. In a sewing-machine, the combination of suitable stitch-forming mechanism including a needle and a looper, a rock-shaft upon which the looper is mounted, a needle-operating rocker-arm, and connection between said needle-operating rocker-arm and the looper for causing the looper to reciprocate upon its rock-shaft, a driving-shaft, a cam or eccentric mounted upon said driving-shaft, a link connected with said needle-operating rocker-arm and engaged and operated by said cam or eccentric, and suitable connections between said link and the looper rock-shaft, substantially as set forth.

3. In a sewing-machine, the combination of suitable stitch-forming mechanism including a needle and a looper, a needle-operating locker-arm, a driving-shaft carrying a cam or eccentric, a link operated by said cam or eccentric and suitably connected with the needle-operating rocker-arm, a rock-shaft upon which the looper is mounted and by which it is oscillated, a rock-arm mounted upon said rock-shaft, suitable adjustable means connecting said rock-arm to said link, and an independent connection between the needle-operating rocker-arm and the looper for causing the looper to reciprocate upon its rock-shaft, substantially as set forth.

4. In a sewing-machine, the combination of suitable stitch-forming mechanism including a needle and a looper, a driving-shaft carrying a cam or eccentric, a link operated by said cam or eccentric and suitably connected with the needle for operating it, a rock-shaft upon which the looper is mounted and by which it is oscillated, means for reciprocating the looper upon its rock-shaft, a slotted rock-arm mounted upon said rock-shaft, and a rod connected with said link at one end and carrying at its other end a pin which is adjustably mounted in the slot of said rock-arm, and means for clamping the pin of said rod in the desired adjusted position upon the rock-arm, substantially as set forth.

705,570. APPARATUS FOR GENERATING CARBONIC-ACID GAS. FELIX A. FELDKAMP, Newark, N. J. Filed Oct. 5, 1901. Serial No. 77,650. (No model.)



Claim.—1. An apparatus for generating carbonic-acid gas, comprising an outer and an inner cylinder, a closing means between the upper and outer portions of said inner cylinder and the interior surface of the outer cylinder, forming an annular chamber between the outer surface of the inner cylinder and the interior surface of the outer cylinder, the said inner cylinder having an opening in communication with the said annular chamber, whereby, under normal conditions, an active liquid in both said cylinders will be at the same level, a carbonate-containing receptacle in said inner cylinder, consisting, essentially, of a cylinder having perforated sides and a closed top and open bottom, and means for slidably supporting the said carbonate-containing receptacle at different points within the said inner cylinder, comprising, a supporting-rod passing through a perforated plate secured to the top of said carbonate-containing receptacle, a slotted tube through which the said rod extends, said tube being secured within said receptacle, a bottom disk within the said carbonate-containing receptacle, and means for securing said disk in position to the lower end of the said supporting-rod, substantially as and for the purposes set forth.

2. In an apparatus for generating carbonic-acid gas, the combination, with a pair of concentric cylinders, having an open communication and an air-compression chamber, one of the said cylinders being provided with a removable closure, a supporting-rod extending through an opening in said closure and being slidably arranged therein, a carbonate-containing receptacle, a perforated plate secured to the top of said carbonate-containing receptacle through which the said supporting-rod passes, a slotted tube through which the said rod extends, said tube being secured within said receptacle, a bottom disk within the said receptacle, and means for securing said disk in position on the lower end of the said supporting-rod, substantially as and for the purposes set forth.

3. In an apparatus for generating carbonic-acid gas, the combination, with a chamber adapted to contain an active liquid, of a carbonate-containing receptacle, and means connected with said receptacle for setting said receptacle at different positions within said chamber, according to a predetermined pressure of the carbonic-acid gas to be produced, said means consisting, essentially, of a rod provided with graduations, a stop adjustably arranged on said rod, a perforated plate secured to said carbonate-containing receptacle through which said rod extends, a slotted tube within said receptacle secured to said plate, a bottom disk within said carbonate-containing receptacle, and means for securing the said disk in position to the lower end of the said supporting-rod, substantially as and for the purposes set forth.

4. In an apparatus for generating carbonic-acid gas, the combination, with a cylinder adapted to receive an active liquid, of a carbonate-containing receptacle, a rod for supporting said receptacle in said cylinder, a slotted tube on the lower end of said rod, a bottom disk encircling said tube, and means for attaching said disk to said rod, substantially as and for the purposes set forth.

5. In an apparatus for generating carbonic-acid gas, the combination, with a cylinder, a suspension-rod in said cylinder, and a bottom disk on said rod, of a slotted tube, and a receptacle adapted to receive a charge of carbonate, said tube and receptacle being slidably arranged upon said suspension-rod and acting by gravity on said charge of carbonate to constantly force the same down upon the said bottom disk, substantially as and for the purposes set forth.

705,571. LOCKING DEVICE FOR BOLTS. DAVID FERGUSON, Pittsburg, Pa., assignor of one-half to Jennie F. Wood, Pittsburg, Pa. Filed Dec. 14, 1901. Serial No. 86,080. (No model.)

Claim.—1. In a locking device for bolts, a threadless bolt having substantially a uniform body, a threadless nut having a bore adjacent to the bolt, and a wedging device having bolt-engaging serrations and adapted to be inserted in said bore when both nut and bolt are stationary, the nut having a portion displaced to prevent the retreat of the wedging device.

2. In a locking device for bolts, a threadless bolt having substantially a uniform body, a nut having a bore adjacent to the bolt, and wedging devices having bolt-engaging serrations and interlocking teeth, the nut having a portion displaced to prevent the retreat of the said devices.

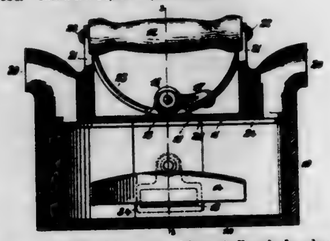
705,572. SAFETY-VALVE. WILLIAM C. FIELD, Decatur, Ill., assignor of three-fifths to William T. Deinhardt and William A. Shorb, Decatur, Ill. Filed Mar. 31, 1902. Serial No. 100,881. (No model.)

Claim.—1. The combination with a safety-valve, of a spring for closing said valve, a protruding valve-stem, a disk of fusible solder located outside of said valve to serve as a rest for said valve-stem for holding the valve normally open against the action of said spring, and non-conducting material interposed between said disk and the metal with which it would otherwise be brought into contact, whereby the cooling action of the adjacent metal upon said disk may be obviated, substantially as described.

2. The combination with a safety-valve of a spring for closing said valve, a protruding valve-stem, a disk of fusible solder located outside of

said valve to serve as a rest for said valve-stem for holding the valve normally open against the action of said spring, rings of non-conducting material located upon opposite sides of said disk to separate the same from its metallic support and non-conducting material interposed between said disk and valve-stem, substantially as and for the purpose specified.

705,573. SAD-IRON. GEORGE FIFE, Newark, N. J. Filed Dec. 4, 1901. Serial No. 84,602. (No model.)



Claim.—1. The sad-iron comprising a hollow body adapted to receive combustible material, the detachable cover, and the handle, said body being pointed at both ends and having the rigidly-fixed interior downwardly-extending elongated side flanges 14, the draft-apertures and gates at its opposite sides in line with the air-spaces formed between the inner sides of said body and said flanges, and the fixed flues 20, 20, extending upward from both ends of said body and being at opposite ends of said handle; substantially as set forth.

2. The sad-iron comprising the hollow body adapted to receive combustible material, the detachable cover, and the handle, said body having integral therewith the rigid interior downwardly-extending elongated side flanges 14, the draft-apertures at its opposite sides in line with the air-spaces formed between the inner sides of said body and said flanges, the exterior gates 34 applied upon the opposite sides of the iron for controlling the said draft-apertures, and the upwardly-extending flues 20, 20, at the opposite ends of said body and communicating with the hollow interior thereof, the said cover closing the upper end of said body except at said flues 20; substantially as set forth.

3. The sad-iron comprising the hollow body adapted to receive combustible material, said body having at its opposite sides the vertical standards 15 at whose rear edges, at their base, are formed the shoulders 18, combined with the eccentrics 16 pivotally secured to the inner vertical sides of said standards and having operating-handles 17, and the removable cover, for said body, carrying the handle and having at its opposite side edges shoulders 26, to contact with the said shoulders 18, said cover with the handle thereon being adapted to be moved to position lengthwise of said body and below said eccentrics 16 until said shoulders 26 contact with and are arrested by said shoulders 18; whereupon said cover may be locked in position by means of said eccentrics; substantially as set forth.

4. The sad-iron comprising the hollow body adapted to receive combustible material and having integral therewith the rigid interior downwardly-extending elongated side flanges 14, the draft-apertures at its opposite sides in line with the air-spaces formed between the inner sides of said body and said flanges, the exterior gates upon the opposite sides of said body for controlling said draft-apertures, the vertical standards 15 extending upward from the opposite sides of said body and having at their rear edges the shoulders 18, and the eccentrics 16 pivotally secured upon the inner vertical faces of said standards and having the operating-handles 17, combined with the cover 11 adapted to fit upon the upper end of said body and having at its opposite ends the upwardly and outwardly extending flues 20 and standards 21, the handle 12 secured between said standards, and the shoulders 26 formed on the opposite side edges of said cover for engagement with the said shoulders 18, the said standards being integral with the said flues 20 and the said cover being adapted to pass lengthwise of said body to its proper position below said eccentrics until arrested by the contact of said shoulders 26 with said shoulders 18, whereupon the said cover may be secured in position by means of said eccentrics; substantially as set forth.

5. The sad-iron comprising the body having the standards 15, eccentrics 16, and side draft apertures and gates, said body being pointed at both ends and of flat formation at its opposite sides from its base to the top of said standards, whereby said standards become parallel with each other and said gates may lie close to the sides of the iron, combined with the removable cover carrying the handle and adapted to fit upon said body between said standards and below said eccentrics, said cover at its opposite edges adjacent to said standards being also of flat formation; substantially as set forth.

705,574. LAST. ANDS G. FITS, Auburn, Me. Filed Oct. 2, 1901. Serial No. 77,289. (No model.)

Claim.—In a divided last, vertical kerfs in the adjacent ends, a union inserted in said kerfs to bind the parts together, a rivet passing through the wood of the last and the union, the wood of the last being pressed against the sides of the union in the region of the rivet and the rivet headed upon the wood thus compressed.

705,575. RAIL-JOINT. WILLIAM FLOEE, Meadow Lands, Pa. Filed May 2, 1902. Serial No. 105,641. (No model.)

Claim.—1. In a rail-joint, the combination with the rails having thickened web portions at the ends thereof, said web portions being cut away in their upper faces and provided with recesses and vertical grooves, of a cap-rail comprising a tread and depending fish-plates to fit in the cut-away portion of the rail ends and having interior ribs to engage in the recesses and vertical grooves of said thickened rail ends, substantially as described.

2. In a rail-joint, the combination with the rails having thickened web portions provided in one side with vertical grooves and in the upper faces with recesses, of a cap-rail fitting over said thickened portions and having interior ribs to fit in the recesses and grooves in said thickened portions, and securing-lugs carried by said cap-rail, substantially as described.

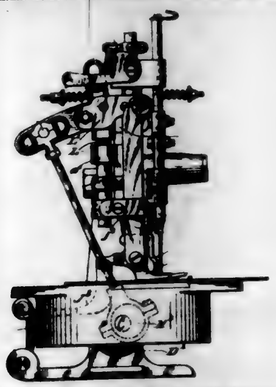
3. In a rail-joint, the combination with the rail ends having thickened portions provided with vertical grooves and recesses, and having stepped shoulders along one edge, of a cap-rail having stepped shoulders to match with the stepped shoulders on the rails, and interior ribs carried by the said cap-rail to engage in the grooves and recesses of the rails, substantially as described.

705,576. OVAL-CUTTING MACHINE. WILLIAM H. FORKER, Meadville, Pa. Filed Oct. 16, 1901. Serial No. 78,777. (No model.)

Claim.—An oval-cutting machine, comprising in combination with the base, the pivotal pin 2, the plate 5 having an elliptical groove, a handle 29 pivotally mounted on said pin, a movable guide mounted on said handle, a pivoted bar carried by said guide, a pin passing through the latter and traveling in the elliptical groove in plate 5, a bar 15 adjustably held on said pivoted bar, a knife-holder clamped to the lower end of bar 15, a knife and rack-bar secured to the face thereof, a pinion in engagement with the teeth of said rack-bar, a worm-wheel mounted in said holder, and in engagement with the teeth of said pinion-wheel, the rod 27, the link 25 connected to one end of said rod, with its other end mounted on the top of the pin, working in said elliptical groove, a collar carried by said pivoted bar, and through which the rod 28 passes, as set forth.

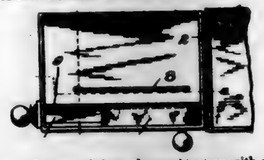
705,577. FEEDING MECHANISM FOR SEWING-MACHINES. CHARLES H. FOSTER, New York, N. Y., assignor to The Union Special Sewing Machine Company, Chicago, Ill., a Corporation of Illinois. Filed Nov. 9, 1901. Serial No. 81,686. (No model.)

Claim.—1. In a sewing-machine, the combination with the four-motion feed, of a feeding presser-foot opposed to the feed-dog and vibrated from the actuating mechanism thereof, a vertically-reciprocating needle presser-foot to one side of the feed-dog and serving to hold down the work and strip the needle, a vertically-reciprocating shaft parallel with the needle presser-foot bar and to which the upper end of the feeding presser-foot bar is pivoted, a bell-crank lever mounted at the upper end of said reciprocating shaft and pivotally connected with the needle presser-foot bar whereby said presser-foot bars are reciprocated vertically alternately in opposite directions, and mechanism connecting said bell-crank lever with the main shaft of the machine; substantially as described.



2. In a sewing-machine, the combination with the four-motion feed, of a feeding presser-foot opposed to the feed-dog and vibrated from the actuating mechanism thereof, a vertically-reciprocating spring-depressed needle presser-foot to one side of the feed-dog and serving to hold down the work and strip the needle, a vertically-reciprocating shaft parallel with the needle presser-foot bar and to the upper end of which the upper end of the feeding presser-foot bar is pivotally connected to receive its up-and-down motion, a bell-crank lever pivoted at its angle to the upper end of said vertically-reciprocating shaft, a sliding and pivotal connection between one arm of said bell-crank and the needle presser-foot bar, a line-shaft rocked from the main shaft and provided with a crank-arm and a sliding and pivotal connection between said crank-arm and the other arm of the bell-crank lever; substantially as described.

705,578. MATCH-BOX. JOHN B. FREDERICK, New Kensington, Pa. Filed Dec. 11, 1901. Serial No. 85,432. (No model.)

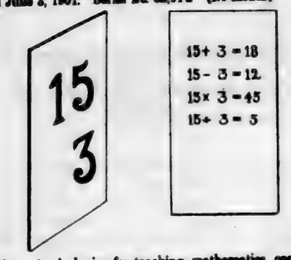


Claim.—1. In a match-box, the combination with a receptacle having a partition therein, secured to the ends thereof, with a space between the lower edge of the partition and the bottom of the receptacle, a spring-actuated guide comprising a casing, one side of which has an elongated slot therein, with a lug carried by one side of the receptacle, and being received in said slot, the other side of said casing engaging the one side of the partition with the top of the casing engaging the upper end of the partition, the rear edge of the casing carrying a lug for engagement with a single match, the end of the receptacle having an opening therein, for the passage of a match, an extension carried by the front end of the casing and operating through the said end of the receptacle, and carrying a knob for operating the guide-casing, substantially as described.

2. In a match-box, the combination with a receptacle having a partition secured therein, with a space between its lower edge and the bottom of the receptacle, a spring-actuated guide comprising a casing carrying an extension on its one end operating through an opening provided therefor, in the end of the receptacle and carrying a knob for operating the guide, the guide-casing engaging the partition, and means carried by the guide-casing for engagement with a match to eject the latter when the knob is operated, substantially as described.

3. In a match-box, the combination with a receptacle having a partition secured by its ends to the ends of the receptacle and having a space between its lower edge and the bottom of the receptacle, a guide comprising a casing carrying an extension operating through the front end of the box in an opening provided therefor, the casing having a top with walls on each side thereof engaging the inner face of one side of the casing, and the one side of the partition, a spring secured to the end of the box and the one wall of the casing, the front end of said extension carrying means for operating the casing and for closing the opening provided for the ejection of the match, and a lug for engagement with the match to eject the same, substantially as described.

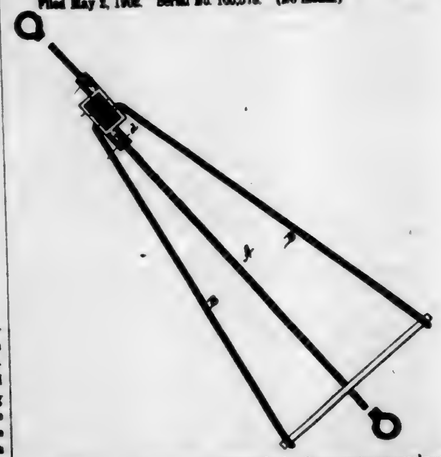
705,579. EDUCATIONAL CARD. JOHAN GIBSON, Partridge, Ill. Filed June 3, 1901. Serial No. 62,914. (No model.)



Claim.—1. A device for teaching mathematics, comprising a card bearing on one face numbers suggestive of certain mathematical combinations, and on the opposite face bearing data representing such combinations and the correct answer thereto, said data including the numbers on the first-mentioned face.

2. An educational device for the teaching of mathematics comprising a card having its opposite faces each provided with two numbers, the numbers on each face being similar to those of the opposing face, one of said faces having said numbers arranged to visually indicate mathematical problems and the results obtained in the working of said problems.

705,580. FIRE-ESCAPE. RICHARD HAMBERLY, New York, N. Y. Filed May 2, 1902. Serial No. 105,573. (No model.)



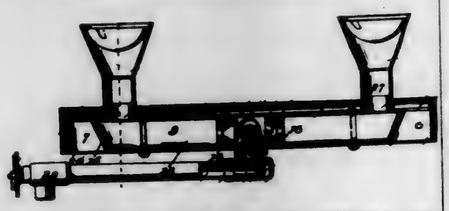
Claim.—1. A fire-escape composed of a frame, a transversely-extending tube, a weight-containing rope passing through the tube, a suspending-rope coiled around the tube, rope-guides at opposite ends of the frame, and brakes within said guides, substantially as specified.

2. A fire-escape composed of a frame, a transversely-extending tube, a weight-containing rope passing through the tube, a suspending-rope coiled around the tube, perforated tubular rope-guides at opposite ends of the frame, removable brake-shoes having laterally-extending pins engaging the rope-guide perforations, and set-screws engaging the shoes, substantially as specified.

705,581. GAS-BURNER. FRANK HARPER, Beverly, Ohio. Filed July 18, 1901. Serial No. 68,533. (No model.)

Claim.—1. A burner having a plurality of compartments, each having a gas-outlet, a supply-pipe, fittings in the length of the supply-pipe, one of the fittings constituting a valve-casing and having an extension formed with a series of passages, one for each compartment of the burner, a valve in said fitting for establishing communication between the said passages and pipe, the valve-stem passing through the other fitting and provided with operating means, a graduated disk, and a pointer secured

to the valve-stem and coöperating with the graduations of the said disk to indicate the position of the valve, substantially as set forth.



2. A burner having a mixing-chamber and a plurality of compartments grouped about the mixing-chamber and in communication therewith, air-inlets at opposite ends of the burner and in communication with the mixing-chamber, and means for admitting gas into the mixing-chamber in jets for any one or all of the aforesaid compartments, substantially as described.

3. A burner having compartments, a mixing-chamber in communication with each of the compartments, means for supplying air to the mixing-chamber, a pipe for supplying gas and having a portion extending into the mixing-chamber and provided with outlets directly opposite openings between the mixing-chamber and the said compartments of the burner, and a valve for controlling the said outlets to admit gas to any one or all of them, substantially as set forth.

4. A burner having compartments, a mixing-chamber, and having tapering openings establishing communication between the mixing-chamber and compartments, means for supplying air to the mixing-chamber, a feed-pipe having a portion entering the mixing-chamber and provided with outlets terminating opposite the openings between the mixing-chamber and compartments, and a valve for controlling the said outlets to admit gas to any one or all of them, substantially as set forth.

5. A burner comprising a centrally-disposed mixing-chamber and compartments at the ends and sides of and in communication with the said mixing-chamber, and independent means for supplying air and gas to the mixing-chamber, the gas-supplying means having a portion formed with outlets opposite the openings between the mixing-chamber and the respective compartments and including a valve for admitting gas to any one or all of the said outlets, substantially as set forth.

6. A burner subdivided by longitudinal and transverse partitions into a mixing-chamber and compartments, each of the latter having an outlet for the gas and a valve having a portion extended into the mixing-chamber and provided with an outlet for each compartment, the valve controlling the supply of gas to any one or all of the said compartments, substantially as set forth.

7. A burner subdivided by longitudinal and inner and outer transverse partitions into a mixing-chamber and compartments, the latter having an outlet for the gas, the inner transverse partitions being thickened and the middle portion of the longitudinal partitions being correspondingly thickened, the last-mentioned parts forming walls of the mixing-chamber and the said walls having outwardly-tapering openings, substantially as set forth.

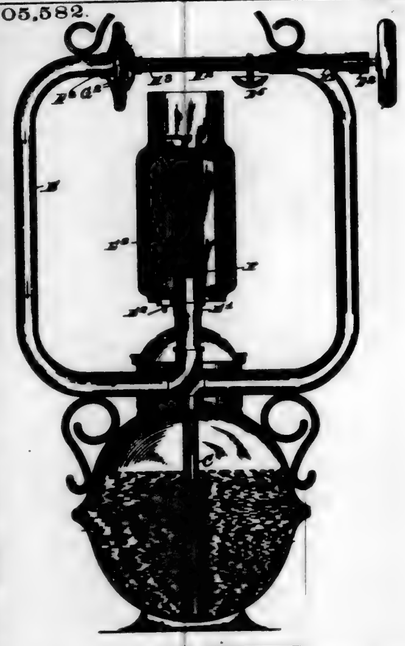
8. In a burner, a base or body portion subdivided into compartments, a diaphragm closing said compartments and securely fastened to the base or body, a cap arranged over the diaphragm and spaced therefrom, and tips secured to the diaphragm and having portions to overlap and engage with the cap and hold it in place, substantially as set forth.

9. In a burner, a base or body having a mixing-chamber and compartments in communication therewith and having air-inlets, a diaphragm closing the top side of the said compartments and set away opposite the mixing-chamber and air-inlets, and a cap arranged over the diaphragm and spaced therefrom, said space establishing communication between the mixing-chamber and air-inlets, substantially as set forth.

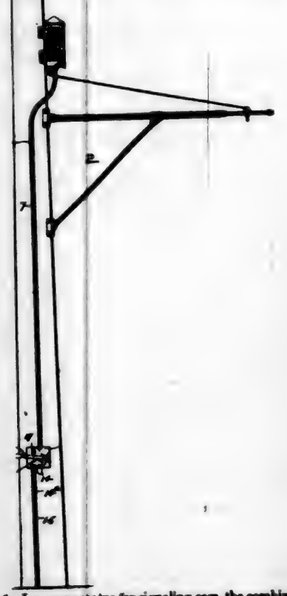
705,582. HYDROCARBON-LAMP. WILLIAM HAVEL, Chicago, Ill., assignor to Chicago Solar Light Company, Chicago, Ill., a Corporation of Illinois. Filed Oct. 17, 1899. Serial No. 33,370. (No model.)

Claim.—In a hydrocarbon-lamp, in combination, a needle-valve casing having a gearing-sleeve; a needle-valve stem fitting said sleeve snugly and being screw-threaded to form a channel for the passage of the hydrocarbon and gas within said sleeve, said stem being provided with a wire point of uniform diameter; a mixing-tube; and a mixing-ball provided with a perforated forward face having a central opening to receive the end of the needle-valve casing, the rear face of said ball being provided with a collar having a screw-thread connection with mixing-tube, to provide for an adjustment of said ball to and from the valve-casing.

705,582.



705,583. ELECTRIC SIGNAL. ARTHUR J. HATOUX, Mansfield, Ohio. Filed Apr. 10, 1902. Serial No. 102,936. (No model.)

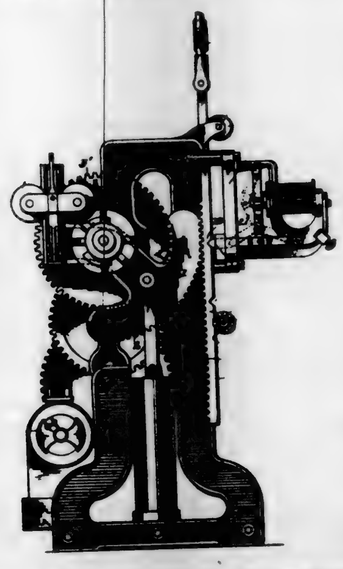


Claim.—1. In an apparatus for signaling cars, the combination with a line conductor, of a signal-box, a lamp located in said signal-box and having one terminal permanently connected with the line conductor, a switch-box, a switch-lever pivoted therein, a conductor permanently connecting the other terminal of the lamp with said switch-lever, a contact-block in the switch-box to coöperate with said switch-lever, a conductor connecting said contact-block with the ground, and means for normally holding the switch-lever away from the contact-block to maintain the lamp-circuit normally open.

2. In an apparatus for signaling cars, the combination with a casing having windows and an electric lamp in said casing, of a switch-box to be located in proximity to the road-bed, a pipe connecting said switch-box with said casing, a switch within said switch-box, a pipe connecting said switch-box with the ground, a feed-wire for the lamp in the casing, a wire extending through the first-mentioned pipe and connecting the lamp with the switch in the switch-box, and another wire extending through the pipe below the switch-box and connecting the switch with the ground.

3. In an apparatus for signaling cars on an electric railroad, the combination with the trolley-wire, of an electric lamp, a casing for inclosing said lamp, a feed-wire connected with the trolley-wire and a terminal of the lamp, a switch connected with the other terminal of the lamp and with the ground, and a spring connected with said switch for opening said switch and maintaining it normally open.

705,584. SIGNAL MECHANISM. REINHOLD HERMAN, Crofton, Pa. Filed Oct. 25, 1901. Serial No. 79,977. (No model.)

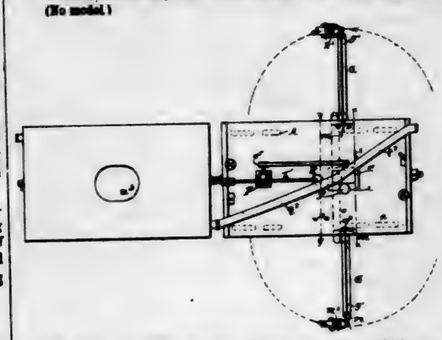


Claim.—1. In electrically-operated signals, the combination with a pair of supporting-standards, a drive-shaft journaled therein, and a toothed sector carried by the drive-shaft, of a rack-bar engaged by the sector and operated thereby in a vertical line, a signal-operating rod to which the upper end of the rack-bar is attached, and a lock for engagement with the rack-bar to hold the same in the position to which it is moved by the sector, substantially as described.

2. In electrically-operated signals, the combination with a drive-shaft, and a toothed sector carried by the drive-shaft, of a signal-operating rod, a vertically-disposed rack-bar connected to the signal-operating rod and in continuous engagement with the sector, said sector when rotated moving said rack-bar and signal-operating rod in a vertical line, and means for direct locking engagement with the rack-bar to hold the latter and the signal-operating rod in the position to which they have been moved, substantially as described.

3. In signals, the combination with the supporting-standards, a drive-shaft journaled therein, and a toothed sector carried by said drive-shaft, of a signal-operating rod, a vertically-disposed rack-bar attached at its upper end to said rod and having notches in its rear face, said rack-bar in continuous engagement with the sector and moved thereby in a vertical line, means for guiding said rack-bar in its vertical movement, and a locking device for engagement with the notches in the rear face of said bar to hold the same in the position to which it has been shifted, substantially as described.

705,585. PNEUMATIC DUST-COLLECTOR AND SWEEPER. JNO. T. HOPE, Kansas City, Mo. Filed July 20, 1901. Serial No. 68,801. (No model.)



Claim.—1. A pneumatic dust-collector comprising a vehicle, a motor, a suction and blast apparatus upon said vehicle, actuated by said motor, a transversely-extended air-suction and vacuum-forming dust-receiver having a longitudinal opening upon its under side for the entrance of the dust and movable upon the surface of the ground, conductors for the dust connected with said receiver and also connected with the induction-opening to the said suction and blast apparatus having swivel-joints, and aprons hinged to the said receivers, means for vibrating the receiver laterally in position on the side of the vehicle and elevating devices connected with said hinged aprons and adapted to raise and lower said aprons alternately.

2. A pneumatic dust-collector and sweeper, comprising a vehicle, a motor, a suction and blast apparatus upon said vehicle actuated by said motor, a transversely-extended air-suction and vacuum-forming dust-receiver having a longitudinal opening upon the under side for the entrance of dust, movable upon the surface of the ground, conductors for the dust connected with said receivers and also connected with the induction-opening to the suction and blast apparatus, having swivel-joint combined dust-brushes and aprons hinged at said receivers, means for vibrating said receivers laterally in position to the side of the vehicle, and elevating devices connected with the hinged brushes and aprons.

3. A pneumatic dust-collector and sweeper for streets comprising a vehicle, a motor, a suction and blast apparatus upon said vehicle actuated by said motor, a transversely-extended air-suction and vacuum-forming dust-collecting receiver upon the side of said vehicle and the surface of the street, having longitudinal openings upon its under side, a conductor for the dust connected with said receiver and also connected with the induction-opening to the suction and blast apparatus, combined brushes and aprons upon opposite sides of said receivers, hinged thereto, and means for raising and lowering the combined brushes and aprons upon opposite sides of the receiver alternately.

4. A pneumatic dust-collector comprising a vehicle, a motor, a suction and blast apparatus upon said vehicle actuated by said motor having induction and eduction openings and an air-suction and vacuum-forming receiver movable upon the surface of the street and conductors for the dust connected with said receiver and also connected with the induction-opening to the suction and blast apparatus, a receptacle for the dust having an opening in its top and oppositely-extended dust-conducting pipes connected with the eduction-opening to the suction and blast apparatus one of which pipes is connected with one side and end of the dust-receptacle and suitable valves in said pipes.

5. A dust-collector consisting of a longitudinally-extended receiver having an opening upon its under side for the reception of the dust, traveling supports for said receiver, flexible conductor connected with said receiver, an air-suction apparatus connected with said conductor, a hinged support upon said receiver and dust-collecting fibers upon said support, and an apron, substantially as described.

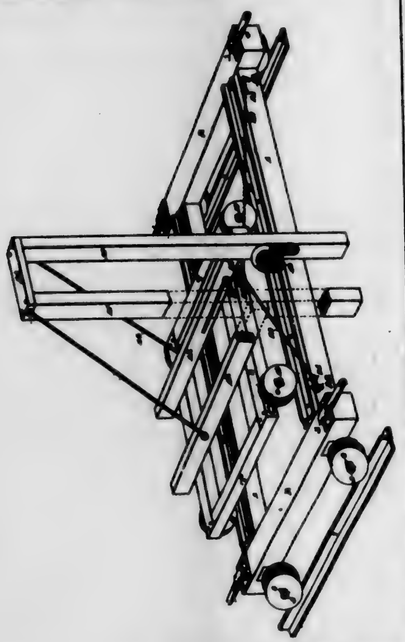
6. A dust-collector consisting of a longitudinally-extended receiver, having an opening upon its under side for the reception of the dust, traveling supports for said receiver, flexible conductor connected with said receiver, a receptacle for the collected dust, an air-suction apparatus connected with said conductor and a conductor leading from said apparatus to said dust-receptacle, a hinged support upon said receiver and dust-collecting fibers upon said support, and an apron, and means for raising and lowering said fibers and apron.

7. In a pneumatic dust-collector and sweeper, a vehicle, a motor, a suction and blast apparatus upon said vehicle, having induction and eduction openings, actuated by said motor, a longitudinally-extended, air-suction and vacuum-forming receiver upon the side of the vehicle and the surface of the ground, having a traveling support for the outer end thereof

and a conductor connected therewith and a conductor connected with the said receiver and also connected with the induction-opening to the suction and blast apparatus, having swivel and socket joints, of a crank-rod on the said vehicle, and a longitudinal rod connected with the outer end of said dust-receiver, and a hinged joint connecting said crank-rod with the rod on said receiver.

8. In a pneumatic dust-collector, a vehicle, suction and blast apparatus having induction and eduction openings, upon the platform of said vehicle, a motor actuating said suction and blast apparatus, a tube beneath the said platform, extending transversely thereto, and a conductor connected with said tube and the induction-opening to the suction and blast apparatus, elbows upon the ends of said tube and pivoted socket-joints connecting the said elbows and said tube, air-suction and vacuum-forming receivers on each side of said vehicle and swivel-joints connecting the said elbows with said receivers, means for operating said receivers on the swivel-joints, and a receiver beneath the said platform, and a conductor connected rigidly with said receiver and said tube beneath the platform, and hinged brushes and aprons upon said receivers, and devices upon the platform of said vehicle for operating the hinged brushes and aprons.

705,586. **PILE-DRIVER.** JOHN H. HAWKINS, Pennsylvania Way, Pa. Filed Oct. 22, 1901. Serial No. 79,497. (No model.)

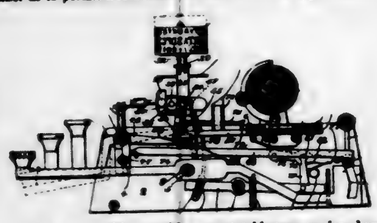


Claim.—1. In a device of the character described, the combination of a main truck having supplementary axles to receive the wheels of said trucks whereby the truck may be moved longitudinally or transversely, of an auxiliary truck mounted upon said main truck, pulleys carried by said auxiliary truck, and a rope or the like passing over said pulleys and secured to said main truck whereby the auxiliary truck may be moved independently of the main truck, substantially as described.

2. In a pile-driver, a main truck having axles carrying wheels secured thereto, supplementary axles secured to said main truck transverse to said first-named axles, whereby the said wheels may be removed from said first-named axles and secured to said supplementary axles to enable the truck to move in a transverse direction, a supplementary truck movably mounted on said main truck, and a rope or the like engaging the said supplementary truck and secured to said main truck whereby the supplementary truck may be moved independently of the main truck, substantially as described.

705,587. **TYPE-WRITING MACHINE.** CHARLES W. HOWELL, Jr., Newark, N. J. Filed July 19, 1900. Serial No. 24,168. (No model.)

Claim.—1. In a type-writing machine; a type-carrier having rotating and nutating movements; rotating means therefor; means including a spindle and pinion to enable rotation of said type-carrier; and an independent selecting-lever to actuate said rotating means, and jointed thereto by a loosely-moving intermediate connecting device in such a manner as to permit free nutative movement of said type-carrier.



2. In a type-writing machine; a rotatable type-carrier; key-levers provided with selecting devices; a selecting-lever operable by said key-levers through the medium of said selecting devices; and a rack-and-pinion connection intermediate said type-carrier and selecting-lever said rack and pinion being respectively movable relatively to each other and to said selecting-lever, to enable imprint.

3. In a type-writing machine; a rotatable type-carrier; a nutating rocker therefor; a selecting-lever; and a rack-and-pinion device movable with said carrier and connected with said type-carrier, said device having a guide projecting into the path of said lever and coöperating therewith to enable rotation of said type-carrier by said lever and to permit free nutative movement of said rocker at varying positions of said lever.

4. In a type-writing machine, the combination of a rotary type-carrier supported in a nutating frame or rocker, with a selecting-lever terminating in a ball and constructed to rotate the type-carrier.

5. In a type-writing machine; a rotatable type-carrier; a series of key-levers each having individual cam-slots to rotate the type-carrier positively to the desired character and positively back to normal position; vibrating members to be vibrated by the wall of the cam-slots; and latches operating independently of the key-returning means to hold the vibrating members positively in a normal position of rest.

6. In a type-writing machine; a rotatable type-carrier mounted in a rocker; a rack-and-pinion rotating device having on one side a rack, and on the other side a slot, groove or guideway; a selecting-lever having at its free end a ball or rounded surface entering or positioned coöperatively with respect to said slot, groove or guideway, to rotate the type-carrier through the rack-and-pinion rotating device and maintain same in selected rotative position during nutation for imprint.

7. In a machine of the class described; a frame, and a selecting-lever supported thereby, said lever comprising an upright member rotatable about its longitudinal axis and an arm extended therefrom and moving in a horizontal path; means to permit adjustment of said arm upon said upright; and a head member connected with said arm and adjustable relatively thereto.

8. In a machine of the class described; a type-carrier having rotating and nutating movements; rotating mechanism for said type-carrier, including a member provided with a guide device; and a selecting-lever presenting toward, and to be embraced by, said guide device, a rounded member to actuate said type-carrier rotatively, and permitting free, nutative movement of said type-carrier.

9. In a machine of the class described; a type-carrier rotatable upon an upright spindle mounted in a nutating rocker; a rack mounted slidingly on said rocker intermeshing with a pinion on said spindle, and presenting a guide device to move in a horizontal path; and a selecting-lever rotatable about an upright axis adjacent said rack, and presenting a rounded end to coöperate with said guide device.

10. In a machine of the class described; a type-carrier; a selecting-lever; and operating connections therebetween, including a guide device having a plurality of parallel, upright guide members, and a ball-ended arm on said lever to enter between said guide members and engage the same universally, substantially as described.

11. In a machine of the class described; selecting devices; a vibrating member to coöperate therewith; means tending normally to return said vibrating member to a position adjacent said selecting devices; and means independent of said returning means to maintain said vibrating member, when inoperative, in position for immediate coöperative engagement by said selecting devices respectively, substantially as described.

12. The combination with a vibrating member; of a latch device comprising a pivoted latch member having a portion to engage and hold said vibrating member; an operating device for said vibrating member; and means intermediate said latch and operating members to enable release of the former by the latter, said means acting to permit return of said latch to position for engagement of said vibrating member before normal return of said vibrating member to position for such engagement.

13. In a machine of the class described; a vibrating member; a key member; a latch for said vibrating member; and means to operate said latch by said key member, to release said vibrating member, including a movable strut device arranged to permit escape of said latch from its operative connection with said key member before normal return of the latter.

14. In a machine of the class described; a type-carrier and its nutating rocker having a throw approximating 60° (sixty degrees), key-levers; a pitman depending from said rocker at a point near the axis of the latter; an intermediate lever arranged to be operated by said key-levers at a point of wide arc of movement, and having its short arm connected with said pitman, to enable said rocker to be nutated or rocked by said key-levers and given a high momentum to secure distinct imprint of the characters presented by said type-carrier.

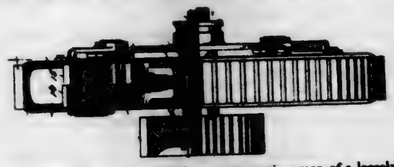
15. In a type-writing machine; a rotatable type-carrier mounted in a nutating frame or rocker; a plurality of pitmen or links having slots at their lower ends and operatively connected to said rocker; a plurality of universal bars or frames having at their shorter or forward ends studs engaging with said slots and operated by key members to nutate the rocker and type-carrier for imprint.

16. In a type-writing machine; a rotatable type-carrier; a selecting-lever mounted rotatively adjacent, and jointed to said type-carrier through the medium of a rack-and-pinion connection, to position said type-carrier rotatively; key-levers provided with selecting devices; a vibrating device adjacent and operable by, said selecting devices, respectively; and connections intermediate said vibrating device and selecting-lever to permit individual selective actuation of the latter by said key-levers respectively.

17. In a machine of the class described, a type-wheel mounted upon a spindle shiftable longitudinally in its bearings and having a nutative movement; and a key device provided with an arm projecting into the path of said spindle and movable to engage and shift said spindle in said path, said spindle having a segmental foot of a radius proportioned to the arc of nutative movement to be engaged by said operating-arm; and an antifriction device intermediate said arm and foot.

18. In a machine of the class described, a type-carrier mounted upon a spindle shiftable longitudinally in its bearings and nutatable; key devices arranged respectively to control said spindle in different longitudinal positions; and connections intermediate said key devices and spindle, to shift the latter longitudinally, said connections including arms adjacent the path of said spindle member and a plurality of segmental members connected with said spindle and proportioned to different arcs of nutation thereof, to be engaged by said arms respectively to hold said spindle in selected longitudinal position regardless of the nutative position thereof.

705,588. **COMPENSATING GEARING.** EDWARD HUBER, Marion, Ohio. Filed Jan. 13, 1902. Serial No. 89,301. (No model.)



Claim.—1. The combination, in a compensating gear, of a loosely-mounted main driving gear-wheel, a relatively large gear-wheel adapted to be operatively connected with one driving-wheel, a relatively small gear-wheel adapted to be operatively connected with the other driving-wheel, a relatively large pinion carried by the main driving gear-wheel and meshing with the larger gear-wheel, a relatively small pinion also carried by the main driving gear-wheel, meshing with the smaller gear-wheel, and bearing the same proportion thereto as does the larger pinion to the gear-wheel with which it meshes, and a third pinion meshing with the smaller pinion and united with the larger pinion to rotate in unison therewith, substantially as described.

2. The combination, in a compensating gear, of a loosely-mounted main driving gear-wheel having diametrically opposite systems of gears journaled thereon near its periphery, each system consisting of two pinions of different sizes so united as to rotate in unison, and a third pinion of the same size as the smaller of the two other pinions, and meshing therewith, a large gear-wheel meshing with the two larger pinions, and a smaller gear-wheel meshing with the third pinion of each system, and bearing the same relation thereto as does the larger gear-wheel to the pinion with which it meshes, said gear-wheels being respectively adapted to be connected to the two driving-wheels, substantially as described.

705,589. **APPARATUS FOR PRECIPITATING GOLD AND SILVER FROM THEIR SOLUTIONS.** ALFRED JAMES, London, England. Filed Mar. 10, 1900. Serial No. 8,256. (No model.)

Claim.—1. A metallurgical filter for separating precious metal from a solution containing said metal consisting of an iron vessel cast in one piece having an integral partition at one end thereof extending to a point near the bottom, said vessel and partition being provided with an inner coating of cement, an extension at the top of said vessel opposite said partition forming a chamber, and a spout leading from said chamber.

2. A metallurgical filter for separating precious metal from a solution containing said metal consisting of an iron vessel cast in one piece and having an integral partition extending to a point near the bottom thereof, said vessel and partition being provided with an inner coating of cement, said vessel being widened at one side near the top thereof and having an integral partition extending upward from said vessel and forming a chamber, said partition being lower than the tank and permitting the liquid to flow over the top thereof into said chamber, and a spout leading from said chamber.

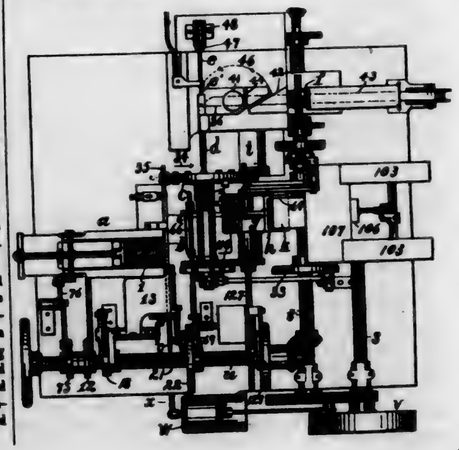
705,590. **METHOD OF TRANSFERRING DESIGNS.** CHARLES KRAFT, Chicago, Ill. Filed Jan. 30, 1902. Serial No. 91,921. (No specimens.)

Claim.—1. The method of transferring designs consisting in applying the design to paper in a substance soluble in water, saturating the parts of the paper not covered by the design with a substance which will render the paper impervious to water, applying the desired colors to the design, coating the design with an adhesive substance, applying the same to the surface to be decorated, and wetting and removing the paper.

2. The method of preparing designs for transferring consisting in rendering a suitable backing impervious to water except where it receives the design, applying colors to the design, and coating the same with an adhesive.

3. The method of preparing designs on paper for transferring, consisting in applying the design to the paper in a substance soluble in water but which renders the paper impervious to wet, saturating the remainder of the paper with wax, applying the desired colors to the design, and coating the same with an adhesive.

705,591. **MACHINE FOR MAKING INDIVIDUAL CIGARETTES.** FRANK J. LEMERTON, Waterbury, Conn. Filed Aug. 31, 1901. Serial No. 73,980. (No model.)



Claim.—1. In a machine for making individual cigarettes, a magazine having a stock of the cut blanks supported therein, a pusher operated to move the stock of blanks forward, an arbor for winding the blanks, means for seaming the edges of the blanks, and a crimping-mandrel and a crimping-roll for crimping the edges of the seamed blanks without pasting the same, substantially as herein set forth.

2. In a machine for making individual cigarettes, a magazine containing the blanks set on edge with a pusher to move the blanks forward, a winding-arbor having vacuum-ports to draw one blank from the magazine and wind it, a crimping-mandrel in line with the arbor with seaming-tube 24 adapted to seam the blank and rolls to crimp the seam, and means to shift the winding-blank to the crimping-tools.

3. In a machine for making individual cigarettes, a magazine containing the blanks set on edge with a pusher to move the blanks forward, a winding-arbor having vacuum-ports to draw one blank from the magazine and wind it, a crimping-mandrel in line with the arbor with seaming-tube 24 adapted to seam the blank and rolls to crimp the seam, a shifter embracing the arbor to push the blank forward, and a semicircular former 24ª to give a trough shape to the blank when wound by the arbor.

4. In a machine for making individual cigarettes, a magazine containing the blanks, a winding-arbor having vacuum-ports to draw one blank from the magazine and wind it, a crimping-mandrel in line with the arbor, a roll within the forward end of the mandrel, an adjacent roll adjustable to and from the mandrel, a former 24ª sustained at the side of the arbor, and a shifter embracing the arbor and operated to push the wound blanks through the seaming and crimping tools.

5. In a machine for making individual cigarettes, a magazine containing the blanks, a winding-arbor having vacuum-ports to draw one blank from the magazine and wind it, a crimping-mandrel in line with the arbor, with a seaming-tube 24 to seam the blank and rolls to crimp the seam, a carrier-disk with transverse holes to receive the shells, means for adjusting the holes successively in line with the crimping-mandrel, means to force the shells from the winding and crimping device into the said holes, means for molding the tobacco filler, such means being provided with a nozzle, means to discharge the filler from the nozzle, and means for shifting the carrier-disk to bring the shells successively to such nozzle.

6. In a machine for making individual cigarettes, the combination, with means for molding the tobacco filler and having a nozzle as set forth to discharge the fillers to the shells, of the carrier-disk having transverse holes, means for supplying the cigarette-shells to the holes, means for shifting the carrier-disk to bring the shells successively in line with the nozzle, a locator for pushing the shells successively upon the nozzle, means operating to retract the locator after pushing each shell, and means for forcing the filler into the shell with its outer end projected beyond the shell sufficiently to be trimmed.

7. In a machine for making individual cigarettes, the combination, with means for molding the tobacco filler and having a nozzle as set forth to discharge the filler to the shells, of the carrier-disk having transverse holes, means for supplying the cigarette-shells to the holes, means for shifting the carrier-disk to bring the shells successively in line with the nozzle, a locator for pushing the shells successively upon the nozzle, means operating to retract the locator after pushing each shell, means for forcing the filler through the shell to project it beyond the end of the shell, means for trimming such projecting end of the filler while the shell is upon the nozzle, and means for again forcing the filler outward to discharge the shell and the filler from the nozzle.

8. In a machine for making individual cigarettes, the combination with means for molding the tobacco filler and having a nozzle as set forth to discharge the filler to the shells, of the carrier-disk having transverse holes, means for supplying the cigarette-shells to the holes, means for shifting the carrier-disk to bring the shells successively in line with the nozzle, a locator for pushing the shells successively upon the nozzle, means operating to retract the locator after pushing each shell, means for forcing the filler through the shell with the filler projecting from both ends of the shell, means for trimming the outer end of the filler while the shell is upon the nozzle, means for again forcing the filler outward to discharge the shell and the filler from the nozzle, and means for shifting the carrier-disk past a cutter to trim the inner end of the filler.

9. In a machine for making individual cigarettes, the combination, with the carrier-disk having transverse holes, of means for supplying cigarette-shells to such holes, means to form the tobacco filler and insert the same in the shell, a cutter operating flush with the face of the carrier-disk, a locator for setting the end of the shell flush with the carrier-disk, and means for moving the cutter past the carrier-disk to trim the tobacco from the end of the shell.

10. In a machine for making individual cigarettes, the combination, with the carrier-disk having transverse holes, of means for supplying cigarette-shells to such holes, means to form the tobacco filler and insert the same in the shell, locators to set the ends of the filled shell alternately flush with the carrier-disk, and means operating flush with the carrier-disk for successively trimming the tobacco from such ends.

11. In a machine for making individual cigarettes, a filler-molding device embracing a drum with longitudinal peripheral grooves, a casing provided with inlet and outlet apertures, means for pressing a charge of tobacco through an inlet into one of the grooves, means for shifting such groove to the outlet, means for maintaining the compression of the tobacco in the groove, and means for discharging the filler longitudinally from the groove.

12. In a machine for making individual cigarettes, a filler-molding device embracing a drum with longitudinal peripheral grooves, a casing provided with inlet and outlet apertures, a shelf adjacent to the inlet-aperture, a tobacco-feeder above the shelf, a presser to crowd the tobacco toward the casing, a slide to compress the charge of tobacco upon the shelf, and a punch to crowd the charge through the inlet into one of the grooves, means to shift the drum to bring such groove to the outlet, and means for discharging the filler longitudinally from the grooves.

13. In a machine for making individual cigarettes, a filler-molding device embracing a drum with longitudinal peripheral grooves, a casing provided with inlet and outlet apertures, a shelf 111 adjacent to the inlet-aperture, a tobacco-feeder above the shelf, a punch *k* movable through the inlet, a presser 108 to crowd the tobacco upon the shelf toward the casing, means for retracting the punch flush with the presser, a slide *h* operating between the presser and casing to compact the tobacco, means for advancing the punch to force the charge through the inlet into one of the grooves, means for shifting such grooves to the outlet, and means for discharging the filler therefrom.

14. In a machine for making individual cigarettes, a filler-molding device embracing the drum having peripheral grooves, the casing provided with apertures forming an inlet and an outlet corresponding to the grooves, and discharge-nozzle upon the outlet-aperture, a shelf below the lateral or inlet aperture with vertical slide over the same, a punch movable through such inlet, a feeder for discharging tobacco upon the surface of the shelf, the presser 108 to crowd the tobacco upon the shelf toward the casing, means for retracting the punch flush with the presser, a slider 105 moving the presser and punch to compact the tobacco at the end of the punch, means for advancing the punch to force the charge through the inlet into one of the grooves, such punch and groove being shaped to form a cylindrical filler, means to shift the drum to bring the groove to the discharge-outlet, molding-jaws operating upon the drum over each groove to compress the filler, means for slightly retracting such jaws to release the filler, and means for discharging the filler from the groove.

15. In a machine for making individual cigarettes, a filler-molding device embracing a drum with longitudinal peripheral grooves, a casing provided with inlet and outlet apertures, means adjacent to the inlet for compacting a charge of tobacco laterally and vertically, and forcing it into the groove and simultaneously giving it a cylindrical shape, means for shifting the drum to bring the groove to the outlet, means for retaining the tobacco in cylindrical form in the groove, and means for discharging the tobacco from the groove.

16. In a machine for making individual cigarettes, a filler-molding device embracing a drum with longitudinal peripheral grooves, a casing provided with inlet and outlet apertures, means adjacent to the inlet for compacting a charge of tobacco laterally and vertically, and forcing it into the groove and simultaneously giving it a cylindrical shape, dies movable upon the drum adjacent to the groove and shaped to hold the tobacco in cylindrical form, means for shifting the drum to bring the groove to the outlet, means for slightly separating the dies, and a filler-punch to force the tobacco from the groove into the shell.

17. In a machine for making individual cigarettes, a filler-molding device embracing a drum with longitudinal peripheral grooves, a casing provided with inlet and outlet apertures, means adjacent to the inlet for compacting a charge of tobacco laterally and vertically, and forcing it into the groove and simultaneously giving it a cylindrical shape, segmental dies movable upon the drum at opposite sides of the groove, arms extended from each die to the center of the drum and pivoted upon a stud thereat, means for pressing the dies normally together, means for shifting the drum to bring the groove to the outlet, means for slightly separating the dies, and a filler-punch to force the tobacco from the groove into the shell.

19. In a machine for making individual cigarettes, the combination, with means for forming a cylindrical shell and inserting a mouthpiece therein, of the mouthpiece appliance comprising a winding-spindle with fork to engage the end of the blank, a bed extended laterally from the spindle with transverse and oblique cutters operated thereon, means for alternately operating the cutters, and for reversing the cut blank after each actuation of the oblique cutter.

19. In a machine for making individual cigarettes, the combination, with means for forming a cylindrical shell and inserting a mouthpiece therein, of the mouthpiece appliance comprising a winding-spindle with fork to engage the end of the blank, a bed extended laterally from the spindle with transverse and oblique cutters operated thereon, means for feeding the blank a distance exceeding its length past the oblique cutter, means for then operating the transverse cutter and rotating the spindle to wind the blank, means then operating for feeding the blank less than its own length, and for then operating the oblique cutter and reversing the blank to present its point to the winding-spindle, substantially as herein set forth.

20. In a machine for making individual cigarettes, the combination, with means for forming a cylindrical shell and inserting a mouthpiece therein, of the mouthpiece appliance comprising a winding-spindle with fork to engage the end of the blank, a bed extended laterally from the spindle with transverse and oblique cutters operated thereon, means between the transverse cutter and the winding-spindle for reversing the alternate blanks, feed-rolls for feeding the blank and geared to a ratchet-wheel having long and short teeth disposed as set forth, and means for actuating the ratchet, the cutters, and the winding-spindle successively, substantially as herein set forth.

21. In a machine for making individual cigarettes, the combination, with means for forming a cylindrical shell and containing it to receive a mouthpiece, of a mouthpiece winding-spindle with a stripping-sleeve fitted movably upon its shank, a guide-tube embracing the point of the spindle for receiving the coiled mouthpieces, means for cutting blanks with acute points and advancing them to the spindle, and the spindle and guide-tube being slotted to admit the point of the blank, means for advancing the stripper to force the coiled blank from the spindle within the guide-tube, and means for advancing the mouthpieces within the guide-tube to discharge them to the cigarette-shells.

22. In a machine for making individual cigarettes, the combination, with means for forming a cylindrical shell and containing it to receive a mouthpiece, of a mouthpiece winding-spindle with a stripping-sleeve fitted movably upon its shank, a guide-tube embracing the point of the spindle for receiving the coiled mouthpieces, means for reciprocating the spindle within the guide-tube to embrace the blank, means for cutting blanks with acute points and advancing them to the spindle, and the spindle and guide-tube being slotted laterally to admit the point of the blank, means for advancing the stripper to force the coiled blank from the spindle within the guide-tube, and means for discharging the mouthpieces successively from the guide-tube.

23. In a machine for making individual cigarettes, the combination, with means for forming a cylindrical shell and containing it to receive a mouthpiece, of a mouthpiece winding-spindle with a stripping-sleeve fitted movably upon its shank, a guide-tube embracing the point of the spindle for receiving the coiled mouthpieces, and slotted upon one side for the passage of fingers, means for feeding blanks to such spindle, means for advancing the stripper to discharge the mouthpieces when coiled from the spindle, and a finger-plate having lateral and longitudinal movements with fingers inserted successively behind such mouthpieces for moving them forward into the shells, substantially as herein set forth.

24. In a machine for making individual cigarettes, the winding-spindle *c* with fork to engage the end of the blank, a guide-tube embracing the end of the spindle and slotted to admit the blank, means for feeding the blank transversely to such spindle, means for advancing the fork of the spindle upon the point of the blank, means for rotating the spindle to wind the blank, means for reversing the rotation of the spindle to free the blank, and a stripping-sleeve fitted to the shank of the spindle and actuated, upon such reversal of the spindle, to strip the finished mouthpiece from the spindle, substantially as herein set forth.

25. In a machine for making individual cigarettes, the means for making the mouthpieces, comprising the mouthpiece winding-spindle *a* splined to the gear 47, the gear-segment 58 with connection to crank-pin 59 for reversibly rotating the gear 47, means for feeding a blank to such spindle, and lever and cam with connections to the winding-spindle for advancing the spindle upon the point of the blank, and the stripping-sleeve *c'* with means for reciprocating the same at the close of the winding operation to strip the mouthpieces from the spindle.

26. In a machine for making individual cigarettes, the means for making the mouthpieces comprising mouthpiece winding-spindle *a* with the stripping-sleeve *c'* fitted movably upon its shank, the guide-tube *d* embracing the point of the spindle for receiving the coiled mouthpieces and slotted upon one side for the passage of fingers, means for feeding blanks to such spindle, the slide 51 with connection to the stripping-sleeve *c'*, the finger-plate 54 having slot-and-pin connection to the slide 51 and fingers 57 movable within the guide-tube *d*, and means for reciprocating the slide 51 at the close of the winding operation to strip the mouthpieces successively from the winding-spindle and force them into the shells.

27. In a machine for making individual cigarettes, the combination, with a winding-spindle having a fork to engage the end of the blank, a bed extended laterally from the spindle with transverse and oblique cutters thereon, means for feeding a strip to the cutters and operated first to feed the strip a distance exceeding the length of one blank past the oblique cutter, means for then operating the transverse cutter and rotating the spindle to wind the blank, and means then operating for feeding the strip less than the length of one blank and for then operating the oblique cutter, of the reversing-disk arranged between the transverse cutter and the winding-spindle, and provided with a presser to grip the blank, and means for rotating the reversing-disk to reverse the blank and for lifting the presser to disengage the strip, substantially as herein set forth.

28. In a machine for making individual cigarettes, the combination, with means for forming the shells and delivering them to a carrier-disk *c*, of the filler-molding device embracing the drum 100 having peripheral grooves, the casing *g* provided with outlet-nozzle *j*, means for forming the fillers in the grooves and discharging them from the nozzle, the carrier-disk *c* intermediate to the shell-forming device and the filler-molding device, and provided with ratchet mechanism for turning the dial-plate intermittently and gearing connecting the dial-plate and the grooved molding-drum to turn the drum intermittently to bring the grooves successively in line with the nozzle *j* and holes in the dial-plate.

29. In a machine for making individual cigarettes, the means for trimming the cigarettes consisting of a carrier, as the carrier-disk *c*, with transverse holes to carry the shells with their contained fillers, two locators adapted to set the shells longitudinally in the holes in the carrier-disk, the revolving cutters 60 and 61 supported upon the arms 135 attached to the shaft 134, and means for actuating the carrier, the locators and the arms for the cutters at intervals to trim the opposite ends of the cigarettes successively.

30. In a machine for making individual cigarettes, the cutting mechanism for trimming the opposite ends of the cigarettes, comprising the two arms 135, the shaft 134 attached to the arms, and oscillated by the arm 136 and cam 137, the cutters 60 and 61 mounted in bearings upon the outer ends of the arms, and the gears 139½, 95 and 96 for rotating the cutters, the whole arranged to operate successively upon the opposite ends of the cigarettes, substantially as herein set forth.

31. In a machine for making individual cigarettes, the combination, with means for molding the tobacco filler and having a nozzle as set forth to discharge the fillers to the shells, of the carrier-disk having bushings to receive the cigarette-shells, means for supplying the cigarette-shells to the bushings, means for shifting the carrier-disk to bring the shells successively in line with the nozzle, a locator for pushing the shells successively upon the nozzle, means for adjusting the carrier-disk axially to and from the nozzle to set the outer end of the bushing flush with the outer end of the shell when the shell is upon the nozzle, a cutter movable transverse to the bushing to trim the filler, and means for adjusting the cutter to move close to the end of the bushing, substantially as herein set forth.

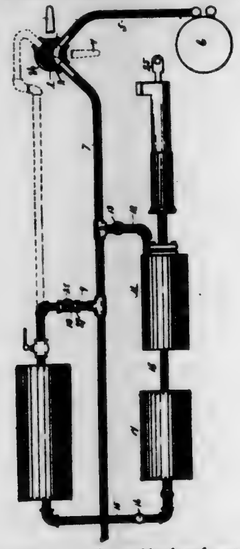
32. In a machine for making individual cigarettes, the combination, with means for molding the tobacco filler and having a nozzle as set forth to discharge the fillers to the shells, of the carrier-disk having bushings to receive the cigarette-shells, means for supplying the cigarette-shells to the bushings, means for shifting the carrier-disk to bring the shells successively in line with the nozzle, a locator for pushing the shells successively upon the nozzle, means for adjusting the carrier-disk axially to and from the nozzle to set the outer end of the bushing flush with the outer end of the shell when the shell is upon the nozzle, means for supplying the cigarette-shells to the holes, and means for adjusting the carrier-disk axially to and from the nozzle to vary the relation of the shells to the dial-plate when fitted to the nozzle.

33. In a machine for making individual cigarettes, the combination, with means for molding the tobacco filler and having a nozzle as set forth to discharge the fillers to the shells, of the carrier-disk having bushings to receive the cigarette-shells, means for supplying the cigarette-shells to the bushings, means for shifting the carrier-disk to bring the shells successively in line with the nozzle, a locator for pushing the shells successively upon the nozzle, means for adjusting the carrier-disk axially to and from the nozzle to set the outer end of the bushing flush with the outer end of the shell when the shell is upon the nozzle, a cutter movable transverse to the bushing to trim the filler, and means for adjusting the cutter to move close to the end of the bushing, substantially as herein set forth.

705,592. AIR-BRAKE SYSTEM. WILLIAM G. MACLAUGHLIN, Windsor, Canada, assignor to the MacLaughlin Railway Brake Company, Detroit, Mich., a Corporation of Michigan. Filed May 11, 1901. Serial No. 60,741. (No model.)

Claim.—1. In a brake mechanism, the combination of a brake-cylinder having a piston therein connected with a brake mechanism, a train-pipe connected with the forward end of the brake-cylinder upon one side of the piston therein, an auxiliary reservoir connected with the rear of the brake-cylinder upon the opposite side of the piston, a main reservoir connected with the train-pipe and adapted to carry pressure equal to the train-pipe pressure, means connecting the auxiliary reservoir with the main reservoir to reduce the pressure in said auxiliary and maintain it normally below that of the train-pipe, means for reducing the train-pipe pressure

below that of the auxiliary reservoir and means for restoring the train-pipe pressure to a point in excess of the pressure of said auxiliary.



2. In an air-brake system the combination of a main reservoir, a brake-cylinder, a piston in said cylinder connected with a brake mechanism, an air-pipe adapted to contain a relatively high pressure connected with the forward end of the brake-cylinder, an auxiliary reservoir adapted to normally contain a relatively low pressure connected to the opposite ends of the brake-cylinder by a pipe of comparatively small area, said auxiliary reservoir being also connected with the high-pressure pipe by way of the main reservoir, means for reducing the pressure in said air-pipe below that of the auxiliary reservoir and restore said pressure to the normal above that of the auxiliary.

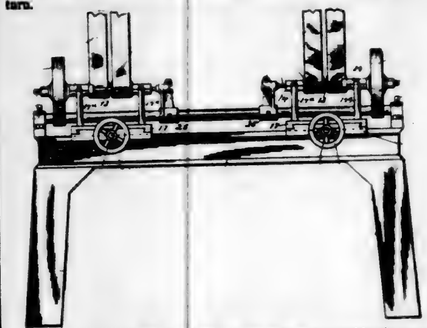
3. In an air-brake system, the combination of the brake-cylinder having a piston therein connected with a brake mechanism, a train-pipe connected with the brake-cylinder on one side of said piston, a main reservoir connected with the train-pipe by a pipe containing a valve which allows the air to flow from the train-pipe into said main reservoir, but prevents the flow of air from the main reservoir to the train-pipe, an auxiliary reservoir connected to the brake-cylinder on the side of the piston opposite to that of the train-pipe connection, means for connecting the main reservoir with the auxiliary reservoir adapted to allow of the passage of air into said auxiliary reservoir at a pressure below that of the main reservoir and the train-pipe, and means for alternately reducing the train-pipe pressure below that of the auxiliary and increasing it to a point above the auxiliary pressure.

4. In an air-brake system, the combination of a main reservoir, a brake-cylinder, a piston therein connected by a piston-rod with a brake mechanism, a train-pipe containing air-pressure connected with the brake-cylinder on one side of said piston and an auxiliary reservoir, normally containing a pressure below that of the train-pipe, means for reducing and restoring the pressure of the train-pipe, a pipe connecting the auxiliary reservoir to the train-pipe through the main reservoir and a pipe connecting the auxiliary reservoir to the brake-cylinder of a relatively small diameter to prevent a sudden expansion of the air in the rear of the brake-cylinder when the pressure in the forward end thereof is reduced.

5. In an air-brake the combination of a brake-cylinder having a piston therein, a main reservoir, a primary air system containing a relatively high pressure connected with the main reservoir, a closed secondary air system containing a relatively low pressure indirectly connected to the primary system through said main reservoir, means directly connecting said systems with the cylinder, the piston in the cylinder being interposed between said air systems, and means for varying the pressure in the primary air system without affecting the pressure in the secondary system.

705,598. GRINDING AND POLISHING MACHINE. CHARLES MALDANER, Chicago, Ill., assignor to Chicago Handle Bar Co., a Corporation of Illinois. Filed Aug. 12, 1901. Serial No. 73,009. (No model.)

Claim.—1. In a tube-polishing machine, a pair of polishing-wheels mounted in a common plane and spaced apart to receive a tube between them, means for rotating the wheels in the same direction, and a mandrel projecting between the wheels upon which the tube may slide and turn.



2. In a tube grinding and polishing machine, in combination, a pair of polishing-wheels, means for rotating the wheels in the same direction, and a longitudinally-movable mandrel projecting between the wheels to receive a tube held in the hands of the operator.

3. In a tube grinding and polishing machine, in combination, a pair of adjustable polishing-wheels, means for rotating the wheels in the same direction, an adjustable bracket, a removable mandrel carried by the bracket and projecting between the wheels to receive a tube held in the hands of the operator, and means for adjusting the wheels.

4. In a tube grinding and polishing machine, in combination, a supporting-table, a pair of polishing-wheels supported from the table and adapted to be so driven that their adjacent faces travel in opposite directions, a bracket, and a mandrel carried by the bracket and projecting between the wheels, the mandrel being designed to receive a tube held in the hands of the operator to be acted upon by the wheels.

5. In a tube grinding and polishing machine, in combination, a supporting-table, a pair of polishing-wheels adjustably supported from the table and adapted to be so driven that their adjacent faces travel in opposite directions, a bracket, and a mandrel carried by the bracket and projecting between the wheels, the mandrel being designed to receive a tube held in the hands of the operator to be acted upon by the wheels.

6. In a tube grinding and polishing machine, in combination, a supporting-table, a pair of polishing-wheels supported from the table and adapted to be so driven that their adjacent faces travel in opposite directions, a rod mounted on the table, a bracket carried by the rod, and a mandrel held by the bracket and projecting between the wheels, the mandrel being designed to receive a tube held in the hands of the operator to be acted upon by the wheels.

7. In a tube grinding and polishing machine, in combination, a supporting-table, a pair of polishing-wheels adjustably supported from the table and adapted to be so driven that their adjacent faces travel in opposite directions, a bracket, and a mandrel held by the bracket and projecting between and extending beyond the wheels, the mandrel being designed to receive a tube held in the hands of the operator to be acted upon by the wheels.

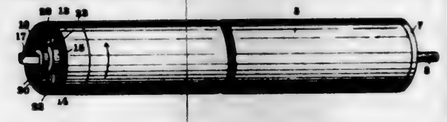
8. In a tube-polishing machine, a pair of polishing-wheels mounted in a common plane and spaced apart to receive a tube between them, means for rotating the wheels in the same direction, and a telescopically-extensible mandrel projecting between the wheels upon which the tube may slide and turn.

9. In a tube grinding and polishing machine, in combination, a pair of polishing-wheels adapted to be so driven that their adjacent faces travel in opposite directions, a bracket, and a yielding mandrel carried by the bracket and projecting between the wheels, the mandrel being designed to receive a tube held in the hands of the operator to be acted upon by the wheels.

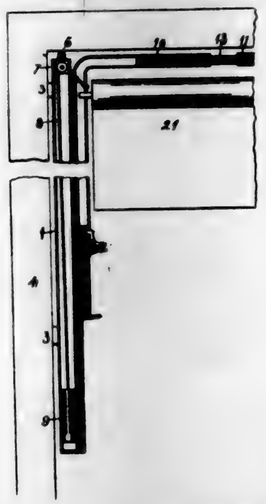
10. In a tube grinding and polishing machine, in combination, a supporting-table, a pair of polishing-wheels supported from the table, means for rotating the wheels in the same direction, a bracket carried by the table, a tubular mandrel-holder held by the bracket, a mandrel, having sliding engagement with the tubular holder, projecting between the wheels, and a spring located in the tubular holder and adapted to force the mandrel normally outward.

705,594. SHADE-ROLLER AND FIXTURE. GEORGE C. MATHERS, Indianapolis, Ind., assignor of one-third to Frank R. Wolf, Indianapolis, Ind. Filed Jan. 23, 1902. Serial No. 91,755. (No model.)

Claim.—A shade-roller consisting of a main body portion of cylindrical and usual form, a plate 10 secured directly to one end of said roller, the said plate having a socket 12 formed in its inner end, a pin 15 journaled in plate 10 and provided with an enlarged head 16 lying within the socket 12 so that the adjacent end of the roller is supported by and journaled upon said pin, a pawl 22 carried by plate 10 and adapted to engage a groove 23 formed in pin 15, a polygonal end 17 forming a part of pin 15; and a plate 7 provided with an extended pintle 8, said plate 7 being secured directly to that end of the roller 5 opposite to the end to which plate 10 is secured.



705,595. WINDOW-SHADE SUPPORT. FRANK R. MEARS, Freeport, Ill. Filed Sept. 30, 1901. Serial No. 77,108. (No model.)



Claim.—1. A window-shade support comprising two vertical guideways, tubular supports for the guideways, a frame formed with guides, a weight located within each tubular support, a roller for each tubular support, a connection between the weights and frame passing over the rollers and extensions for the frame having a movable connection therewith.

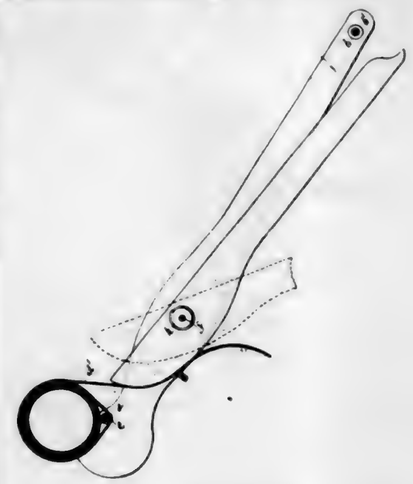
2. A window-shade support comprising two vertical guideways, tubular supports for the guideways permitting an oscillatory movement of the guideways, a frame formed with guides, a weight located within each tubular support, a roller for each support, and a connection between the weights and frame passing over the rollers.

3. A window-shade support comprising two vertical guideways, tubular supports for the guideways, a frame formed with guides, a weight located within each tubular support, a removable cap for each tubular support each supporting a roller, and a connection between the weights and frame.

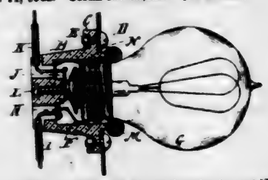
705,596. PIPE-WRENCH. JOSEPH G. MORITZ, Buffalo, N. Y. Filed Nov. 2, 1901. Serial No. 80,943. (No model.)

Claim.—1. In a pipe-wrench, the combination with a handle provided with a pipe-seat, of a flexible gripping-strap attached at its inner end to the handle near said pipe-seat and having its free portion provided with a longitudinal row of openings, and a tightening-lever pivoted to the handle in rear of said pipe-seat and provided with a stud adapted to engage with one of the strap-openings, substantially as set forth.

2. In a pipe-wrench, the combination with a handle composed of a pair of parallel side bars provided in one of their side edges with pipe-seats and connected adjacent to said seats by a transverse bolt, of a flexible gripping-strap attached at its inner end to said connecting-bolt and provided in its free portion with a longitudinal row of openings, and a tightening-lever pivoted between the side bars of the handle in rear of said pipe-seats and having its front arm provided with a stud adapted to engage with one of the strap-openings, substantially as set forth.



705,597. ELECTRIC SIGN. THOMAS R. MURRAY, New York, N. Y. Filed Feb. 11, 1902. Serial No. 93,590. (No model.)



Claim.—1. The combination in an electric sign of the type herein specified, of a lamp-socket support formed integrally of a thin plate in the shape of a letter or character, a glow-lamp socket having an annular projection entering said opening and a flange, and means for detachably securing said flange to said plate, substantially as described.

2. In an electric sign of the type herein specified, the combination of a letter-plate of metal, a glow-lamp socket of insulating material disposed in and extending through an opening in said plate, a flange on said socket, and means for detachably connecting said flange to said plate, substantially as described.

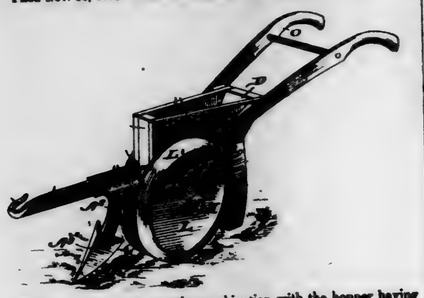
3. In an electric sign of the type herein specified, the combination of a letter-plate, a glow-lamp socket disposed in an opening in said plate and detachably secured to said plate and having within its recess a threaded lining *Y*, the curved contact-plate H disposed in the bottom of said recess and communicating with said lining, the contact-plate J also disposed in the bottom of said recess and between the arms of said U-shaped contact-plate H, and circuit-terminals connected to said contact-plates, substantially as described.

4. In an electric sign of the type herein specified, the combination with the letter-plate A of the cylindrical lamp-socket H having projection N entering an opening in said plate, flange C, contact-plates within said socket and circuit-terminals extending from said contact-plates through the wall of said socket and means for connecting said flange C to said plate, substantially as described.

5. In an electric sign of the type herein specified, the combination with a letter-plate, of a cylindrical glow-lamp socket attached on one side of said plate and having an annular projection extending through said plate, and means for securing said lamp in said socket so that the bulb of said lamp shall be surrounded and supported by said annular projection, substantially as described.

6. In an electric sign of the type herein specified, the combination with a letter-plate of a cylindrical glow-lamp socket attached on one side of said plate and having a projection extending through said plate, and an annular elastic cushion carried on the protruding end of said projection; the said cushion being constructed and arranged to inclose and support the lamp-bulb, substantially as described

705,598. COTTON-PLANTER. JOHN A. MCCAIN, Atlanta, Ga. Filed Nov. 16, 1901. Serial No. 83,557. (No model.)



Claim.—1. In a planter, the combination with the hopper having converging sides, axles journaled in the said sides and carrying ground-wheels at their outer ends, and the stirrer-wheels arranged upon the inner ends of said axles, substantially as described.

2. In a planter the combination with a hopper having converging sides, the rear end of said hopper being wider than the front end, stub-axles journaled in the converging sides, the ground-wheels rigidly mounted upon the outer ends of said axles, a corrugated disk mounted upon the inner end of one axle, and a tooth-disk arranged upon the inner end of the other axle, substantially as described.

3. In a planter, the combination with a hopper having converging sides, ground-wheels having their axles journaled in the said converging sides, a stationary plate arranged upon the bottom of one side piece of the hopper, and an adjustable plate arranged upon the bottom of the other side piece of the hopper, said hopper being broader at its rear end than at the forward end, substantially as described.

4. The combination with a main beam having a standard attached thereto, the hopper-supporting beams attached to the main beam, the front and rear ends of the hopper arranged between the said hopper-supporting beams, the rear end of the hopper being broader than the forward end, and also arranged at an angle, the upper side pieces of the hopper arranged substantially parallel to each other, the lower side pieces of the hopper converging at their lower end, stub-axles journaled in the said lower side pieces of the hopper, the ground-wheels mounted upon the outer end of said stub-axles, and the stirrer-wheels arranged upon the inner ends of said stub-axles, substantially as set forth.

705,599. STOKING MECHANISM FOR FURNACES. WILLIAM MCCLAVE, Scranton, Pa., assignor to McClave-Brooks Company, Scranton, Pa., a Corporation of Pennsylvania. Filed Dec. 26, 1901. Serial No. 87,615. (No model.)

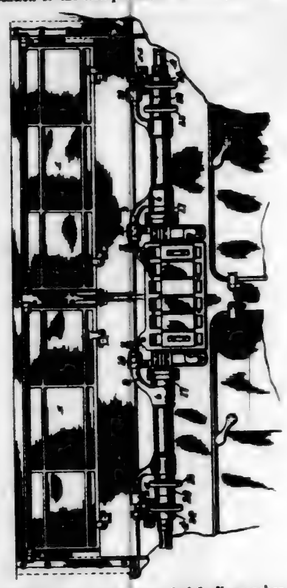
Claim.—1. A stoking mechanism, comprising a rock-shaft, a pusher operating in the fuel-hopper, means for reciprocating the same, comprising a rocking sleeve on said shaft, means projecting from the rock-shaft and directly engaging the rocking sleeve, and means for adjusting the rocking sleeve with respect to the said projection for altering the throw of said sleeve and thereby the extent of the movement of the pusher, substantially as described.

2. A stoking mechanism for furnaces, comprising a reciprocating pusher adapted to feed fuel upon a grate, a power-shaft, an actuating projection thereon, a rocking-sleeve journaled on said shaft and connected with the said pusher, means upon the said shaft for adjusting the sleeve with respect to the said projection for varying the amount of movement imparted by the rock-shaft to the said rocking sleeve, substantially as described.

3. A stoking mechanism, comprising a reciprocating pusher operating in connection with a fuel-hopper, a rock-shaft, and a rocking member, comprising a sleeve journaled on said shaft, pitmen connecting said sleeve with the pusher, and longitudinally-adjustable means on the rock-shaft for varying the amount of movement imparted to said sleeve and thereby the throw of the pusher, substantially as described.

4. A stoking mechanism, comprising a pusher operating in connection with a fuel-hopper, a rock-shaft for imparting movement thereto, a rocking member journaled upon the said rock-shaft, comprising a sleeve having arms projecting therefrom, wrist-pins carried by the said arms, pitmen connecting the wrist-pins with the pusher, and means adjustable longitudinally of the rock-shaft for altering the amount of movement received by the sleeve from the rock-shaft in accordance with the extent to which it is desired to operate the pusher, substantially as described.

5. A stoking mechanism, comprising a pusher operating in connection with a fuel-hopper, a rock-shaft for actuating the same, a rocking sleeve provided with a recess and adjustable longitudinally on said shaft and having end bearings journaled thereon, arms springing from said sleeve and extending parallel with the rock-shaft, wrist-pins carried by the ends of said arms and having comparatively long bearings formed thereon, pitmen connecting the said wrist-pins with the said pusher at a plurality of points, a collar upon the rock-shaft having a lug adapted to engage a recess formed in said sleeve, and means limiting the longitudinal movement of the sleeve on the rock-shaft for regulating the extent to which said recessed sleeve engages said lug for controlling the extent of the reciprocation of the said pusher, substantially as described.



6. A stoking means, comprising a fuel-feeding pusher, a rock-shaft for actuating the same, adjusting mechanism interposed between the rock-shaft and the pusher, comprising a sleeve journaled on the rock-shaft, pitmen connecting the sleeve with the pusher, a lug carried by the said rock-shaft having a tapering contour, the said sleeve having a recess of correspondingly-tapering shape, and adjusting-nuts for holding the sleeve in engagement with the said lug, the movement received by the said sleeve corresponding to the extent to which the same is forced against the said lug, substantially as described.

7. A stoking means, comprising a reciprocating pusher operating in a fuel-supply mechanism, a rock-shaft, a sleeve journaled upon and capable of moving longitudinally thereon, pitmen connected at one end with the pusher and at their outer ends with the rocking sleeve, brackets on the furnace-front for holding the pitmen in position, and means for limiting the longitudinal movement of the sleeve on the rock-shaft to regulate the movement of the pusher, the said brackets preventing the pitmen from being moved sidewise out of proper alinement when the sleeve is adjusted, substantially as described.

8. A stoking mechanism, comprising fuel-feed pushers, a rock-shaft for moving the same, sleeves journaled upon the rock-shaft opposite each pusher, means connecting the sleeves and the pushers, means for connecting the sleeves so that they will operate simultaneously, and means for limiting the longitudinal movement of one of the sleeves upon the rock-shaft with the same or a less movement than the movement of the rock-shaft, for operating both sleeves and varying the throw of the pusher, substantially as described.

9. A stoking mechanism, comprising stoking-pushers, a rock-shaft for moving them, sleeves, journaled on the rock-shaft opposite each pusher, means connecting the said sleeves, journals formed in the metal in said connecting means, pitmen engaging said journals and connecting them with the pushers, and means for actuating one of the sleeves from the rock-shaft, so that both will be operated to move the pushers, substantially as described.

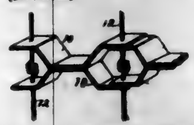
705,600. VEHICLE-AXLE. JAMES A. MCLAUGHLIN, Statesboro, Ga., assignor of two-thirds to Leonard Carter and Walter P. Darough, Valdosta, Ga. Filed May 28, 1902. Serial No. 109,068. (No model.)

Claim.—1. In a vehicle-axle a collar at the base of the spindle, a pin thereon, a sleeve adapted to rest against said collar, and a hole in said sleeve to engage said pin for the purpose specified.

2. In a vehicle-axle a sleeve having oblique, slanting, terminal slits, extending inwardly, in the direction of the revolution of the hub, and into the oil-chamber, for the purposes specified.

3. In a vehicle-axle a collar at the base of the spindle, an extension on said collar of reduced diameter, a sleeve resting against said extension, a washer on said extension, a pin on the collar at the base of the spindle, a hole in the sleeve to engage said pin, an oil-chamber in said sleeve and slits in the ends of the sleeve to enter said chamber substantially as herein set forth.

705,601. FLEXIBLE METAL FLOOR-MAT. GEORGE W. MCNEELY and HENRY MCNEELY, Marshalltown, Iowa. Filed Dec. 13, 1901. Serial No. 85,786. (No model.)



Claim.—1. In a flexible metal mat a plurality of transverse rows of short pieces of flat metal bent laterally at their central portions and perforated at their ends and the contiguous rows pivotally connected by a plurality of short wires linked together to produce flexure along lines extending at right angles to the wires for the purposes stated.

2. In a flexible metal mat, a binding-plate made of sheet metal and the parallel edges doubled inward twice to produce three overlying portions at each edge of the plate and then doubled along a longitudinal central line to produce six overlying portions at the outer edge of the finished binding-plate and provided with a plurality of transverse slots in the inner edge of the plate and adapted to be pivotally connected with the ends of an end row of short pieces of flat metal bent laterally at their centers and perforated at their ends in the manner set forth for the purpose stated.

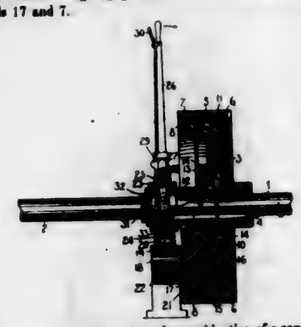
3. An improved flexible metal floor-mat comprising parallel transverse rows of short pieces of flat metal bent laterally at their center portions and perforated at their ends, a plurality of straight pieces of wire extended through the overlying perforated ends of the short metal pieces bent laterally at their central portions and the contiguous ends of the wires linked together and binding-plates made of sheet metal having six overlying parts at their outer edges and transverse slots at their inner edges pivotally connected with the ends of the mat, arranged and combined to operate in the manner set forth for the purposes stated.

705,602. BROOM. KIRBY WELLER, Cleveland, Ohio, assignor to the Osborn Manufacturing Company, Cleveland, Ohio, a Corporation of Ohio. Filed Nov. 26, 1900. Serial No. 238,542. (No model.)

Claim.—A broom consisting of a handle provided near one end with two holes piercing it transversely, two staples passing respectively from each side through said holes and secured, bent bristles passing through said staples and bound intermediately of their bent portions and ends, substantially as set forth.

705,603. REVERSING MECHANISM. STEPHEN FURLONG, Brooklyn, N. Y. Filed Feb. 14, 1902. Serial No. 94,026. (No model.)

Claim.—1. In a reversing mechanism, the combination of a driving-wheel as 3 rotating constantly in one direction, a friction-clutch as 10 normally in engagement therewith and driven thereby, a friction-wheel as 7 also constantly driven with the first-mentioned wheel, a friction-wheel as 13 adapted to be driven always with the friction-clutch, a friction-wheel as 17 normally disengaged from the wheel 7 but adapted to be driven thereby, a friction-wheel as 16 adapted to be driven with the wheel 17 and normally disengaged from the wheel 13 but adapted to drive the same and the clutch 10, and means for disengaging the clutch 10 from the wheel 3 and causing engagement between the wheels 13 and 16 and the wheels 17 and 7.



2. In a reversing mechanism, the combination of a constantly-driven wheel as 3, a friction-clutch as 10, a spring for holding said clutch normally in engagement with the wheel 3, a friction-wheel as 13 connected with the clutch 10, a friction-wheel as 7 connected with the wheel 3, a friction-wheel 17 adapted to engage with the wheel 7, a friction-wheel as 16 adapted to engage with the wheel 13, and a lever for breaking the engagement between the clutch 10 and wheel 3 and causing engagement in succession between the wheels 13 and 16 and the wheels 17 and 7.

3. In a reversing mechanism, the combination of a driving-shaft, a wheel 3 secured thereon to revolve always therewith, a driven shaft 2, a friction-clutch connected to revolve said shaft and also to slide thereon and arranged normally to frictionally engage said wheel 3, a friction-wheel as 7 connected to the wheel 3, a friction-wheel as 17 mounted on a stud or axle, a friction-wheel as 16 connected to said wheel 17, a friction-wheel as 13 connected with the friction-clutch 10, and means for moving the clutch 10 on its shaft to disengage it from the wheel 3 and cause frictional engagement between the wheels 13 and 16 and the wheels 7 and 17 so as to reverse the motion of the shaft 2.

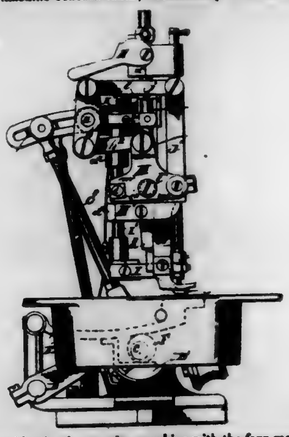
4. In a reversing-gear, the combination of a constantly-driven shaft, a wheel 3 having an interior beveled surface, a friction-clutch 10 having a beveled periphery to match said interior beveled surface and normally in engagement therewith, a driven shaft 2 upon which said clutch 10 is secured and upon which it is adapted to slide, a spring for maintaining the surfaces of the clutch 10 and wheel 3 normally in engagement, a ring 7 connected to the wheel 3 and having an interior surface beveled in a direction opposite to that of the wheel 3, a wheel 17 having its periphery beveled to match that of the ring 7, a boss 16 having a beveled periphery, and a boss 13 on the clutch 10 having a beveled periphery to match that of the boss 16, and means for sliding the clutch 10 on its shaft and breaking the frictional engagement thereof with the wheel 3 and causing frictional engagement between the bosses 13 and 16 and the wheel 17 and the ring 7.

5. In a reversing mechanism, the combination of a constantly-driven shaft having secured thereto a wheel 3 having an interior beveled friction-surface, a ring 7 secured to said wheel and having an interior friction-surface beveled in the opposite direction, a stud or axle, a wheel 17 on said stud or axle and having its periphery beveled to match the interior bevel of said ring, a boss 16 on said wheel 17 and having a beveled periphery, a spring for said wheel 17, a clutch 10 having a beveled periphery to match that of the wheel 3 and having a boss 13 with a beveled periphery to match that of the boss 16, a shaft 2 upon which said clutch 10 is mounted, a hub or sleeve connected to said clutch 10, a spring within said hub or sleeve for holding said clutch normally in frictional engagement with the wheel 3, and a lever mechanism connected to said hub or sleeve for moving said wheel against the tension of its spring and to disengage it from the wheel 3 and cause frictional engagement between the bosses 13 and 16 and the ring 7 and wheel 17.

705,604. FEEDING MECHANISM FOR SEWING-MACHINES. LARKIN GREENWOOD and ARTHUR A. MERRITT, New York, N. Y., assignors to The Union Special Sewing Machine Company, Chicago, Ill., a Corporation of Illinois. Filed Nov. 5, 1901. Serial No. 81,799. (No model.)

Claim.—1. In a sewing-machine, the combination with the two independently-operating presser-feet bars, means for imparting vertical

movement to the bars alternately in opposite directions and means for oscillating one of the bars, of a stop device to limit the downward movement of both presser-bars to prevent the presser-feet from contacting with the parts of the machine beneath them; substantially as described.



2. The combination in a sewing-machine with the four-motion feed, of a vertically-reciprocating spring-depressed shaft or rod on the machine-head, a vertically-rocking lever pivoted to the said vertically-reciprocating shaft and operatively connected above the pivot to the main shaft of the machine, a vertically-reciprocating needle presser bar pivotally connected to said vertically-rocking lever in rear of its axis for operation thereby and provided with a presser-foot to hold the work down on the throat-plate and strip the needle, a feeding presser-bar pivoted to said vertically-rocking lever in front of the axis thereof for vertical reciprocation thereby toward and from the feed-dog, and operative connections between the feeding presser-foot bar and the feed mechanism; substantially as described.

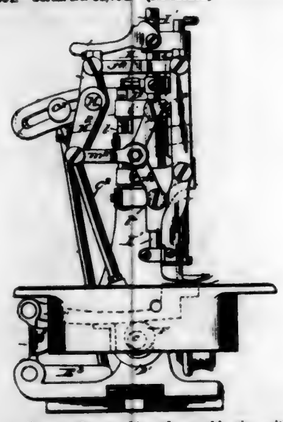
3. The combination in a sewing-machine with the four-motion feed, of a vertically-reciprocating spring-depressed shaft or rod on the machine-head, a vertically-rocking lever pivoted to the said vertically-reciprocating shaft and operatively connected above the pivot to the main shaft of the machine, a vertically-reciprocating needle presser-bar pivotally connected to said vertically-rocking lever in rear of its axis for operation thereby and provided with a presser-foot to hold the work down on the throat-plate and strip the needle, a four-motion feeding presser-bar pivoted between its ends to said vertically-rocking lever in front of the axis thereof for vertical reciprocation thereby toward and from the feed-dog, and operative connections between the upper end of the feeding presser-foot bar and the feed mechanism; substantially as described.

4. In a sewing-machine, the combination with the four-motion feed, of a vertically-reciprocating spring-depressed shaft or bar mounted on the machine-head, a rocking lever pivoted to said shaft or bar and actuated above its axis from the main shaft, a vertically-reciprocating needle presser-foot bar pivotally connected to said rocking lever in rear of the axis thereof and provided with a presser-foot to hold the work down on the throat-plate and strip the needle, a four-motion feeding presser-foot bar pivoted between its ends to the said rocking lever in front of the axis thereof for vertical movement thereby, and provided at its lower end with a presser-foot opposed to the upper face of the feed-dog to clamp and feed the work operative connections between the rocking lever above its axis, and the feed-dog-operating mechanism, and a horizontal stop secured to the head under the lower horizontal edge of said rocking lever to limit the downward movement of said lever and the presser-feet bars pivoted thereto; substantially as described.

5. In a sewing-machine, the combination with the four-motion feed including a rock-shaft actuated from the main shaft, and two upper rock-shafts along the rear of the gooseneck; one of said shafts being rocked from the first rocker-shaft and the other from the main shaft, of a vertically-reciprocating spring-depressed shaft or bar on the machine-head, a vertically-rocking lever pivoted to said shaft and linked above the axis to the outer cranked end of that rock-shaft which is actuated from the main shaft, a vertically-reciprocating needle presser-foot bar pivotally connected to the vertically-rocking lever in rear of the axis thereof and provided with a presser-foot to hold the work down on the throat-plate and strip the needle, a four-motion feeding presser-foot bar pivoted between its ends to the rocking lever in front of the axis thereof and provided with a presser-foot opposed to the upper face of the feed-dog to clamp the work thereon and feed it positively, a link connecting the upper end of the feeding presser-foot bar with the cranked outer end of the other of said two upper rock-shafts for oscillation from the feed-dog rock-shaft, and a lifting-cam adapted to engage a projection on said vertically-reciprocating shaft and simultaneously raise the rocking lever and the two presser-bars connected therewith; substantially as described.

705,605. FEEDING MECHANISM FOR SEWING-MACHINES.

LAMBERT ONDERDONK, New York, N. Y., assignor to The Union Special Sewing Machine Company, Chicago, Ill., a Corporation of Illinois. Filed Nov. 9, 1901. Serial No. 81,764. (No model.)



Claim.—1. In a sewing-machine, the combination with the stitch-forming mechanism, of a vertically-reciprocating cross-head, a vertically-reciprocating needle presser-foot to hold the work on the throat-plate around the needle and strip the needle, a feeding presser-bar pivoted to the cross-head for vertical movement thereby and having a presser-foot on its lower end, mechanism for positively vibrating the said feeding presser-bar in both directions, a rock-shaft actuated from the main shaft of the machine, and operative connections between the said rock-shaft, the cross-head and the needle presser-bar; substantially as described.

2. The combination, in a sewing-machine, with the stitch-forming mechanism, of a vertically-reciprocating cross-head, a vertically-reciprocating needle presser-foot to hold the work on the throat-plate around the needle and strip the needle, a feeding presser-bar pivoted between its ends to the cross-head and having a presser-foot at its lower end, means for vibrating the feeding presser-bar, a rock-shaft actuated from the main shaft of the machine, and a toggle-lever connecting said rock-shaft with the said cross-head and needle presser-bar; substantially as described.

3. The combination, in a sewing-machine, with the four-motion feed including a rock-shaft having a rocker-arm to impart the throw to the feed-dog and actuated from the main shaft, a rock-shaft along the gooseneck and actuated from the first-named rock-shaft, a second rock-shaft along the gooseneck and actuated from the main shaft, a vertically-reciprocating needle presser-bar having a foot to hold the work at the needle, a vertically-reciprocating cross-head on the machine-head, a three-link toggle-lever connecting the last-named rock-shaft to the cross-head and the needle presser-bar to move them alternately in opposite directions, a four-motion feeding presser-bar pivoted between its ends to said cross-head and at its upper end linked to the second-named rock-shaft to operate in unison with the feed-dog, and provided at its lower end with a foot opposed to said feed-dog; substantially as described.

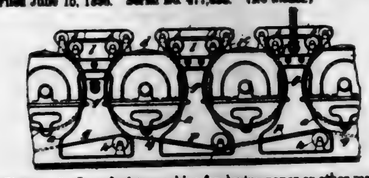
4. The combination, in a sewing-machine, with the four-motion feed including a rocker, of a four-motion presser-bar having a presser-foot opposed to the feed-dog to cooperate therewith, means for oscillating the said presser-bar positively in both directions from the feed-rocker, including an adjustable member for changing the throw of the said feeding presser-bar, a needle presser-bar having a foot to hold the work to the throat-plate at the needle-opening therein; and means for imparting vertical movement to said presser-bars alternately in opposite directions; substantially as described.

5. In a sewing-machine, the combination with the four-motion feed, of a four-motion presser-bar oscillated positively in both directions from the feed mechanism and provided with a foot opposed to feed-dog to cooperate therewith in feeding the work, a vertically-reciprocating needle presser-bar having a foot to hold the goods to the throat-plate at the needle-opening therein, operative connections between the two presser-bars for reciprocating them alternately up and down in opposite directions, a rock-shaft for actuating said operative connections, and adjustable connection between the main shaft and the said rock-shaft to increase or diminish the movement thereof, whereby the vertical movement of said two presser-bars may be adjusted for different grades of work; substantially as described.

6. In a sewing-machine, the combination with a four-motion feed, of a vertically-reciprocating needle presser-foot bar having a presser-foot to hold the work down on the throat-plate and strip the needle, a four-motion feeding presser-foot bar, connections between the bars for reciprocating them vertically and alternately in opposite directions, means for imparting a positive oscillating movement to the feeding presser-bar in both directions from the four-motion feed, and a cam-lever for simultaneously raising both presser-foot bars without affecting their relative arrangement; substantially as described.

705,606. PAPER-DRYING MACHINE.

ANDREW G. PAUL and HERBERT A. JOSLIN, Boston, Mass.; said Joslin assignor to said Paul. Filed June 15, 1898. Serial No. 477,626. (No model.)



Claim.—1. In a drying-machine for drying paper or other material, in combination with revolving drying-cylinders and an ironing-belt moving with the cylinders and suitable means for supporting the material to be dried and the ironer between the drying-cylinders so as to separate them between the cylinders, an air-circulating device for producing a circulation of air close to the ironing-belt whereby the vapor or moisture that rises from the ironing-belt while it is passing between the cylinders is prevented from coming into contact with the material to be dried and the ironing-belt is more thoroughly dried, substantially as set forth.

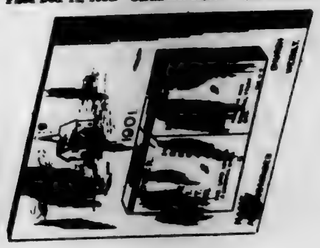
2. In a drying-machine for drying paper or other material, in combination with revolving drying-cylinders and an ironing-belt moving with the cylinders and suitable means for supporting the material to be dried and the ironing belt between the drying-cylinders so as to separate them between the cylinders, an exhausting device for producing a circulation of air close to the ironing-belt whereby the vapor or moisture that rises from the ironing-belt while it is passing between the cylinders is prevented from coming into contact with the material to be dried and the ironing-belt is more thoroughly dried, substantially as set forth.

3. In a drying-machine for drying paper or other material, in combination with revolving drying-cylinders and an ironer moving with the cylinders below the material to be dried and suitable means for supporting the material to be dried and the ironer between the drying-cylinders so as to separate them between the cylinders, a box or chamber inclosing or covering the ironer between the cylinders, an exhaust-pipe leading from the box or chamber, and an exhausting device connected with the exhaust-pipe, substantially as set forth.

4. In a drying-machine for drying paper or other material, in combination with revolving drying-cylinders and an ironer moving with the cylinders below the material to be dried and suitable means for supporting the material to be dried and the ironer between the drying-cylinders so as to keep them separate between the cylinders, a box or chamber inclosing or covering the ironer between and upon the cylinders, an exhaust-pipe leading from the box or chamber, and an exhausting device connected with the exhaust-pipe, substantially as set forth.

705,607. COLLECTION-CALENDAR.

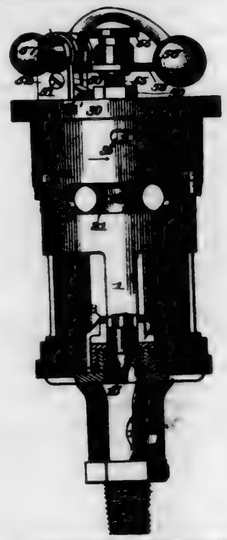
EDWIN O. PETERSON, Elgin, Nebr. Filed Dec. 11, 1901. Serial No. 85,695. (No model.)



Claim.—A collection-calendar as an improved article of manufacture, the same consisting of a base or card suitably inscribed, a pile of envelops or like receptacles bound together and attached to said base and having their open ends uppermost and unobstructed, the envelops bearing upon their front sides the name of the month, the days of the week and the numerals corresponding to the days of the month, each envelop being adapted to be detached and to have its contents sealed, substantially as set forth.

705,608. LUBRICATOR.

JOHN M. PFAUDLER, Rochester, N. Y. Filed Jan. 6, 1902. Serial No. 88,566. (No model.)



Claim.—1. In a lubricator the combination with a cup having an exit-passage provided with two separate valve-seats, a valve-head engaging one of the seats to normally close the exit-passage when the cup is not in operation, of a closure on the cup, connections between the closure and valve-head whereby the latter may be operated relative to one of the valve-seats to open the exit-passage when the cup is in operation and engaged with the other seat to close said passage when the cup is opened.

2. In a lubricator the combination with a cup, having an exit-passage provided with a valve-seat, a non-rotatable valve-head normally engaging therewith to close the passage when the cup is not in operation, a second valve-seat arranged above the head, and means for operating the valve-head relative to the first-mentioned seat, of a closure for the cup, and connections between the closure and valve-head operating to move the head into engagement with the second valve-seat when the cup is opened.

3. In a lubricator the combination with a cup having an exit-passage, a valve-seat and a valve-head engaging therewith to normally close the passage, and a second valve-seat located above the head, of an operating mechanism for adjusting the head relative to the first-mentioned seat, a closure movable vertically on the cup to open it, a connection between the closure and the valve-head and means for supporting the closure in open position with the head in engagement with the second seat to close the exit-passage.

4. In a lubricator the combination with a cup having an exit-passage, a valve-seat therein and a valve-stem having the head lying beyond the seat, of a closure movable longitudinally on the cup, connections between the closure and valve-stem, means for retaining the closure in the open position with the head in engagement with the valve-seat, and operating devices tending to move the head to its normal position out of engagement with the valve-seat and to return the closure when the latter is released.

5. In a lubricator the combination with a cup having an exit-passage provided with a valve-seat, a stem having the head engaging the seat to normally close the passage, and a guide having a step, of a step on the stem cooperating with that on the guide to limit the closing movement of the stem, one of said steps being capable of adjustment relative to the valve-seat, and an operating mechanism for moving the stem to open the valve.

6. In a lubricator, the combination with a cup having vertically-extending sides provided with an aperture located near its upper edge, of a cap having the depending flange normally covering said aperture and movable vertically on the cup, said flange being provided with recesses extending from the lower edge toward the upper edge of the flange and having horizontally-extending portions at their ends, and said cup being provided with pins lying in the recesses and supporting the flange above the aperture in the cup when engaged by the lower horizontal portions of the recesses.

7. In a lubricator, the combination with a cup having vertically-extending sides provided with an aperture, of a cap having the depending flange normally extending over the aperture and provided with recesses, pins on the cup having the ends lying in the recesses, and a shoulder on the cup arranged below the aperture and adapted to be engaged by the end of the flange when the cap is in the closed position.

8. In a lubricator, the combination with a body having apertures, a shoulder arranged upon the interior of the body above the apertures, a head removably secured to the body below said apertures, and a shell of transparent material arranged in the body and secured between the shoulder and head, of a cap mounted upon the upper end of the body having the depending flange extending into the latter, and means for causing the flange to normally engage the annular shoulder to close the body.

9. In a lubricator, the combination with a cup having an exit-passage, a valve-seat, and a valve-stem having the end engaging therewith to normally close the passage, and a spring operating the stem toward the seat, of a lever pivoted at one side of the stem having the end engaging the stem, and a latch for securing the lever in the operative position against the tension of the spring to hold the valve-stem out of engagement with the valve-seat.

10. In a lubricator, the combination with a cup having an exit-passage, a valve-seat, and a valve-stem cooperating therewith to normally close the passage, of a lever pivoted on the cup, adjustable connections between the lever and stem to regulate the movement of the latter relative to the valve-seat and a latch operating automatically to engage the lever and support the stem out of engagement with its seat.

11. In a lubricator, the combination with a cup having an exit-passage, a valve-seat, and a valve-stem having the end engaging therewith, of an adjustable nut on the stem, an operating-lever pivoted to the cup at one side having the end extending beneath the nut, and a latch device engaging the lever to hold the valve-stem in operative position.

12. In a lubricator, the combination with an oil-cup having the exit-passage, a valve-seat in said passage and a stem having the end engaging therewith, and a spring tending to move the stem toward the valve-seat, of a bell-crank lever pivoted on the cup having one end extending over the stem and the other engaging therewith when moved in one direction, and a latch device for holding the lever in operative position against the action of the spring on the stem.

13. In a lubricator, the combination with an oil-cup having the bottom provided with an exit-passage, and a valve-seat, a stem having the end engaging therewith to close the passage, and a support having the cup adjustable thereon relative to the valve-seat and surrounding the stem forming a guide therefor, of a spring arranged beneath the cup and engaging the stem to operate it toward its seat, a stop on the stem engaging the cup, and an adjustable projection on the outer end of the stem, a lever pivoted to the cup having the end lying beneath the projection, and a latch engaging the lever to hold the valve-stem elevated from its seat against the tension of the spring.

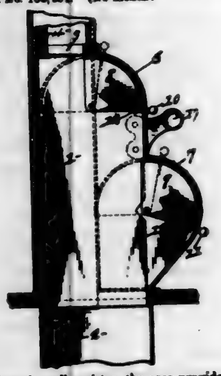
14. In a lubricator, the combination with an oil-cup having exit-passages in the bottom, a valve-seat and a valve-stem having the end engaging the seat and provided with a valve-head, and a second valve-seat arranged above the first, both seats being below said passages, of a movable closure for the cup, connections between the closure and stem to cause the head thereon to move into engagement with the second valve-seat, and a lever pivoted on the closure and connected to the stem to move it relative to the first valve-seat independently of the movement of the closure.

15. In a lubricator, the combination with an oil-cup having the bottom provided with a valve-seat therein, a valve-stem having a head, a support forming a guide for the stem having the end forming a valve-seat arranged above the head, and a spring operating to hold the latter normally in engagement with the first-mentioned seat, of a closure movably mounted on the cap, connections between the closure and stem for operating the head on the latter into engagement with the second valve-seat when the closure is opened, a projection on the valve-stem, and a lever pivoted on the closure having the end engaging therewith to move the stem relative to the first seat independently of the movement of the closure.

16. In a lubricator, the combination with a cylindrical body having the bottom provided with a valve-seat, a second valve-seat arranged above the latter, a valve-head adapted to engage either of said seats, and a rim on the body, a closure on the upper end of the body movable vertically relative thereto, and a depending flange on the closure, of a guide within the body, a stem movable in the guide and attached to said valve-head and having its end extending through the closure and engaging the outer side thereof, whereby the valve-head is moved into engagement with the second seat when the closure is opened, an adjustable projection on the stem, a lever pivoted on the closure having the end engaging the projection to adjust the valve-head relative to the first valve-seat, and a spring operating to return the movable parts to their normal position and to hold the depending flange of the closure in engagement with the rim on the body.

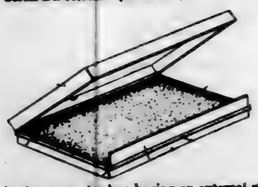
17. In a lubricator, the combination with the body having the exit-passage, a valve-seat surrounding the latter, and a movable cap for the upper end of the body, of a valve-stem engaging the cap and having a head for closing the exit-passage and a spring operating on the stem to hold the valve on its seat and to hold the cap on the body.

705,609. HOT-AIR WALL-REGISTER. JESSE H. POST, Toledo, Ohio, assignor of one-third to Daniel W. Miller, Toledo, Ohio. Filed Mar. 22, 1902. Serial No. 100,401. (No model.)



Claim.—In a hot-air wall-register, the case provided with an open bottom and the top opening 3, the front for the case having the upper slotted arc-shaped portion 6, and the lower slotted arc-shaped portion 7, the pivoted deflector 8, adapted to control the passage of hot air through the portion 6 and the opening 3, the pivoted deflector 9 adapted to control the passage of hot air through the portion 7, and means for adjusting the deflectors, as set forth.

705,610. INK-PAD BOX. JAMES GRANT, Jr., Boston, Mass., assignor to F. S. Webster Company, Boston, Mass.; New York, N. Y.; Chicago, Ill., and London, England, a Corporation of Maine. Filed Mar. 24, 1902. Serial No. 99,602. (No model.)



Claim.—1. A rectangular box having an external stop at its upper edge, a correspondingly-shaped sheet-metal lid hinged to the box and adapted to rest at its free edge upon the stop when the lid is shut, an ink-pad secured in the box and leaving a clearance between its front side and the adjacent wall of the box, and a support temporarily inserted in the clearance between the top of the lid and the bottom of the box when the lid is shut, to limit closing movement of the lid and prevent collapsing thereof upon the box or pad.

2. A rectangular box having an external stop at its upper edge, a correspondingly-shaped sheet-metal lid hinged to the box and adapted to rest at its free edge upon the stop when the lid is shut, an ink-pad secured in the box and leaving a clearance between its front side and the adjacent wall of the box, and a longitudinal support equal in depth to the distance between the bottom of the box and the top of the lid when shut, said support entering the clearance and limiting the closing movement of the lid independently of the stop on the box or pad.

705,611. ADJUSTABLE BRAKE-HEAD. GILBERT P. RITTER, Chicago, Ill. Filed May 15, 1902. Serial No. 107,478. (No model.)

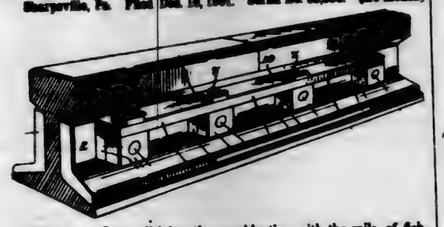
Claim.—1. The combination with a brake-head having a journal-opening, of a strap grip-tongue coincident with the journal-opening and anchored to the brake-head, substantially as and for the purposes specified.

2. The combination with a brake-head having a journal opening, of a curved spring grip-tongue coincident with the journal-opening and anchored to the brake-head, substantially as and for the purposes specified.

3. The combination with a brake-head having a journal-opening of a grip-tongue coincident with the journal-opening, and a set-screw which bears on the grip-tongue, substantially as and for the purposes specified.

4. The combination with a brake-head of a curved spring grip-tongue having its curve coincident with the journal-opening, and a set-screw which bears on the curved spring grip-tongue, substantially as and for the purposes specified.

705,612. NUT-LOCK FOR RAIL-JOINTS. CHARLES W. ROBINSON, Sharpsville, Pa. Filed Dec. 18, 1901. Serial No. 86,206. (No model.)



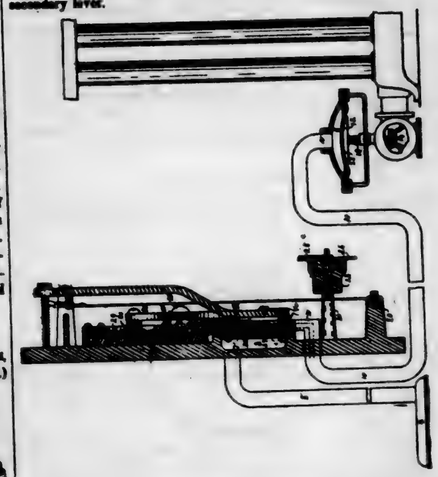
Claim.—1. In a rail-joint, the combination with the rails, of fish-plates, bolts secured in said fish-plates, nuts secured to said bolts, locking-nuts secured on said bolts carrying screw-threaded shanks, a locking-plate secured upon said nuts and controlling said shanks, and securing-nuts arranged on the upper portion of said shanks, substantially as described.

2. In a device of the character described, the combination of the rails, fish-plates, bolts extending through said rails and fish-plates, locking-nuts carrying screw-threaded shanks, a locking-plate through which said shanks extend, and securing-nuts engaging said shanks and the upper face of said locking-plate, substantially as described, and for the purpose specified.

705,613. TEMPERATURE-REGULATOR. ALFRED ROSSER, Bridgeport, Conn., assignor to Davis & Rosser Temperature Controlling Company, New York, N. Y., a Corporation of New Jersey. Filed Mar. 14, 1900. Serial No. 8,869. (No model.)

Claim.—1. In a temperature-regulator, the combination with the base having a primary and a secondary chamber therein, a duct leading from said primary chamber to said secondary chamber and therefrom to exhaust, and another duct leading from said primary chamber and adapted to connect with the actuating means of a heat-controller, and therefrom to exhaust, the said primary chamber in open communication with a source of fluid-pressure supply, of a primary and a secondary lever supported upon said base, a thermostatic device for controlling the movements of the primary lever, a diaphragm in communication with said secondary chamber, for controlling the movements of said secondary lever, two spring-actuated inlet-valves within said primary chamber, one for each duct leading therefrom, an exhaust-valve carried by each of the said levers, and stems between the said inlet and exhaust valves, whereby the valves for said first-mentioned duct are controlled by the movements of the primary lever, and the valves for the second-mentioned duct are controlled by the movements of the secondary lever, substantially as set forth.

2. In a temperature-regulator, the combination with a base having a primary and a secondary chamber therein, two ducts leading from within the said chamber to exhaust, one of the said ducts being of larger size than the other, a branch duct leading from the smaller of said ducts to the secondary air-chamber, and a branch duct leading from the larger of said ducts and adapted to connect with the actuating means of a heat-controller, the said primary chamber in open communication with a source of fluid-pressure supply, of a primary lever supported upon said base, a thermostatic device for controlling the movements of the said lever, a secondary lever supported upon said base, a diaphragm, in communication with said secondary chamber, for controlling the movements of said secondary lever, and inlet and exhaust valves arranged at opposite ends of both of the two first-mentioned ducts, the valves for the smaller duct controlled by the primary lever, and the valves for the larger duct controlled by the secondary lever.



705,614. RADIATOR. CHARLES W. ROGERS, Chicago, Ill., assignor of twelve twenty-fifths to Julius W. Matzke and Eugene Worthing, Chicago, Ill. Filed Mar. 1, 1901. Serial No. 49,431. (No model.)

Claim.—1. A radiator or the like, comprising a pair of metal sheets attached together at their ends or borders, one of said sheets being formed with an attaching-border, and a corrugated main body the corrugations of which are at right angles to the direction of the longest dimension of the body and lie wholly to one side of the sheet, the other of said sheets being formed with an attaching border portion and a main body portion disposed in a plane away from such border portion, substantially as set forth.

2. A radiator or the like, comprising a pair of metal sheets attached together at their ends or borders and rolled or shaped into a convolute or helicoidal form, one of said sheets being formed with an attaching-border and a corrugated main body the corrugations of which are at right angles to the direction of the longest dimension of the body and lie wholly to one side of the sheet, substantially as set forth.

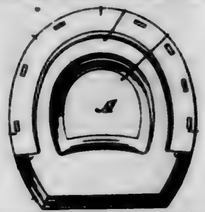
3. A radiator or the like, comprising a pair of metal sheets attached together at their ends or borders and rolled or shaped into a convolute or helicoidal form, one of said sheets being formed with an attaching-border and a corrugated main body the corrugations of which are at right angles to the direction of the longest dimension of the body, and lie wholly to one side of the sheet, the other of said sheets being formed with an attaching-border and a main body disposed in a plane away from such border, substantially as set forth.

4. A radiator or the like, comprising a pair of metal sheets attached

together at their ends or borders, one of said sheets being formed with an attaching-border, and a corrugated main body the corrugations of which are at right angles to the direction of the longest dimension of the body, and lie wholly to one side of the sheet, the other of said sheets being formed with an attaching-border and a main body disposed in a plane away from such border, and a bushing arranged in depressions in said borders to constitute an outlet for the radiator, substantially as set forth.

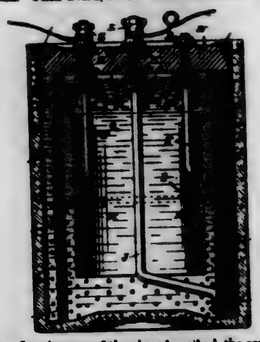
5. A radiator or the like, comprising a pair of metal sheets attached together at their ends or borders and rolled or shaped into a convolute or helicoidal form, one of said sheets being formed with an attaching-border and a corrugated main body the corrugations of which are at right angles to the direction of the longest dimensions of the body and lie wholly to one side of the sheet, the other of said sheets being formed with an attaching-border and a main body disposed in a plane away from such border, and a series of bushings arranged in depressions in said borders, to constitute outlets from the different convolutions of the radiator, substantially as set forth.

705,615. YIELDING HOOF-PAD. THOMAS RYAN, Germantown, Pa. Filed Apr. 4, 1902. Serial No. 101,234. (No model.)



Claim.—A horse-hoof pad, whereof one surface is provided with a recessed projection and solid heel portion and whereof the other surface is provided with a flat face merging into a wide chamber having end-contracted extensions and a combined inlet and outlet passage in the wall of said heel portion, in combination with a leather strip applied to one face of said pad, and a metal shoe in position bearing on the projection of said pad and leather strip beyond the periphery of said pad, substantially as and for the purposes described.

705,616. GALVANIC BATTERY. CHARLES B. SHERRERMAN, Waterbury, Conn. Filed Dec. 1, 1900. Serial No. 38,324. (No model.)



Claim.—1. In a battery of the class described, the combination with a jar, of perforated sheet-metal tubes located therein to form a receptacle for a depolarizer, an expansible wire interior of said part or parts adapted to force them outward and retain them rigidly against the jar, a zinc located interior of said depolarizer and means for the attachment of a wire to each of said elements, substantially as shown and described.

2. The combination with a battery-jar, of an expansible corrugated sheet-metal tube arranged interior thereof, an expansible perforated sheet-metal tube interior of said corrugated tube and an expanding device interior of the inner tube to force both of said tubes outward against the jar to insure their snugly engaging the same and being retained in position, a depolarizer arranged within the corrugations of the outer tube and a zinc central of said parts.

3. In a battery, the combination with a corrugated tube adapted to fit into a jar, of a perforated sheet-metal expansible tube inside of the corrugated tube and an expansible device interior of said inner tube adapted to force the same snugly against the corrugated tube.

4. The combination with a battery-jar, of an expansible tube located therein forming a pocket or pockets intermediate of it and the jar, an expanding device interior of the tube to insure its snugly impinging against the jar in a manner to prevent its displacement, substantially as described.

5. The combination with a jar, of an expansible tube interior thereof, a depolarizer intermediate of the tube and jar, an expanding device interior of the tube to force the latter outward against the depolarizer, and means for suitably inclosing and sealing the jar.

6. In a battery of the class described, the combination with the other parts of an annular depolarizer-receptacle having a detachable adjustable interior wall, an expansible wire ring adapted to fit against said adjustable wall in a manner to force the same outward, as, and for the purpose set forth.

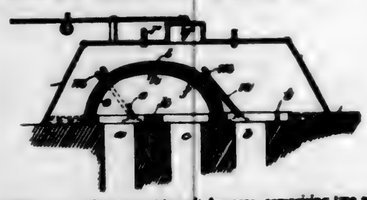
7. The combination in a galvanic battery, of a negative element comprising a series of vertical pockets, an oxid-of-copper element within said pockets, connections therefrom for the field-wire, a positive element interior of the said negative element, a cover supported upon said negative element and supporting the positive element, and means for sealing the cover to the jar, substantially as shown and described.

705,617. METALLIC TIE AND RAIL-FASTENER. AUGUST SCHOLER, Pittsburg, Pa. Filed Mar. 3, 1902. Serial No. 96,443. (No model.)

Claim.—1. In a metallic tie and rail-fastener, the combination of the rails, a metallic tie having tapering openings formed therein, a locking-plate rigidly secured to the under face of the tie having openings formed therein corresponding with said openings formed in the tie, said locking-plate being recessed and having seats formed therein transversely to said openings, and a fastener carrying a shank to be seated in said seats, substantially as shown and described.

2. In a metallic tie and rail-fastener, the combination of the rails, a hollow metallic tie having openings formed therein, a recessed locking-plate having openings formed therein corresponding with said openings formed in the tie, a rivet to secure said locking-plate to the tie, said locking-plate having seats formed therein extending transversely to the openings, and a fastener adapted to be seated in said seats, substantially as described.

705,618. VALVE FOR HEATING-FURNACES. WILLIAM F. BURNS, ROBERT J. LEHMAN, and ISAAC J. WALKER, Duquesne, Pa. Filed Apr. 28, 1902. Serial No. 104,595. (No model.)



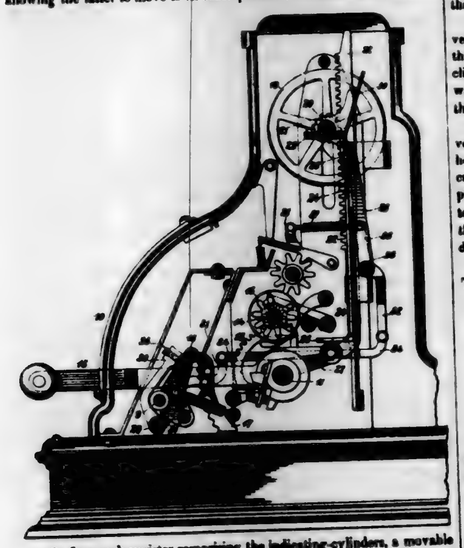
Claim.—A valve for seating-pit furnaces, comprising two semicircular castings with a water-space therebetween, the outer casing having an opening in its top, cross-bars at the top and bottom of said casing for spacing the same apart, and means connected to the outer casing for sliding the valve longitudinally, substantially as described.

705,619. CASH-REGISTER. ELMER S. SMITH, Boundbrook, and CARL A. SMESTAD, South Boundbrook, N. J., assignors to Ideal Cash Register Company, New Boundbrook, N. J., a Corporation of New Jersey. Filed May 16, 1902. Serial No. 107,871. (No model.)

Claim.—1. In a cash-register comprising the indicating-cylinders, a movable frame whose position governs the concealment or exposure of said cylinders, and the series of setting-levers 16, the rock-shaft 33 carrying the pawl-arm 28 for engaging said frame and supporting it in one of its positions, the rock-shaft 29 having the crank-arms 30 corresponding in number with said levers, means connecting said shafts 29, 33, for communicating motion from one to the other thereof, and means for effecting the engagement of said pawl-arm 28 with said frame, combined with means for actuating said crank-arms 30 from said setting-levers upon the movement of the latter for removing said pawl-arm from said frame and allowing the latter to move to its other position; substantially as set forth.

2. In a cash-register comprising the indicating-cylinders, a movable frame whose position governs the concealment or exposure of said cylinders, and series of setting-levers 16, the rock-shaft 33 carrying the pawl-arm 28 for engaging said frame and supporting it in one of its positions, the rock-shaft 29 having the crank-arms 30 corresponding in number with said levers, the crank-arm 31 on said shaft 29, the crank-arm 32 on said shaft 33, the rod 34 connecting said crank-arms 31, 32, for communicating motion from one of said rock-shafts to the other thereof, and means for effecting the engagement of said pawl-arm 28 with said frame, combined with means for actuating said crank-arms 30 from said setting-levers upon the movement of the latter for removing said pawl-arm from said frame and allowing the latter to move to its other position; substantially as set forth.

3. In a cash-register comprising the vertically-movable frame carrying the indicating-cylinders 19, series of setting-levers 16 having the toothed bars 17, and series of locking-dogs 18 engaging said bars 17, the rock-shaft 33 carrying the pawl-arm 28 for engaging said frame and supporting it in its upper position, the rock-shaft 29 having the crank-arms 30 in position to be acted upon by said dogs when the latter are moved by said bars 17, and means connecting said shafts 29, 33, for communicating motion from one to the other thereof, combined with means for effecting the engagement of said pawl-arm 28 with said frame, the movement of said crank-arms 30 under the action of said dogs serving to trip said pawl-arm from said frame for allowing the indicating-cylinders to descend to their concealed position; substantially as set forth.



705,620. BUCKLE. ROBERT T. STREET, Chicago, Ill., assignor of one-half to Ernest A. Eastman, Chicago, Ill. Filed Jan. 2, 1902. Serial No. 88,101. (No model.)

Claim.—1. A buckle adapted to coöperate with a strap and consisting of the vertical sides connected by the three horizontal cross-pieces forming two horizontal slots between them, the upper edge of the middle cross-piece being inclined outwardly, and the lower edge of the top cross-piece being inclined inwardly and having the central portion thereof extending farther down than the ends thereof so as to reduce the width of the upper slot in its central portion; substantially as and for the purpose described.

2. A buckle adapted to coöperate with a strap and consisting of the vertical sides having the inwardly-turned edges connected by the three horizontal cross-pieces, the edges of the middle cross-piece being inclined outwardly, and the lower edge of the top cross-piece being inclined inwardly and having the central portion thereof extending farther down than the ends; substantially as and for the purpose described.

3. A buckle adapted to coöperate with a strap and consisting of the vertical sides provided with strengthening means and connected by the three horizontal cross-pieces, the edges of the middle cross-piece being inclined outwardly, and the edge of the top cross-piece being inclined inwardly and having the central portion thereof extending farther down than its ends; substantially as and for the purpose described.

4. A buckle adapted to coöperate with a strap and consisting of the vertical sides connected by the three horizontal cross-pieces forming two horizontal slots between them, the upper and lower edges of the middle cross-piece being inclined outwardly, and the lower edge of the top cross-piece being inclined inwardly and having the central portion thereof extending farther down than the ends thereof so as to reduce the width of the upper slot in its central portion; substantially as and for the purpose described.

705,621. CAST-OFF CONNECTION FOR SUSPENDERS. ROBERT T. STREET, Chicago, Ill., assignor of one-half to Ernest A. Eastman, Chicago, Ill. Filed Mar. 11, 1902. Serial No. 97,750. (No model.)

Claim.—1. In a device of the class described, the combination with the main strap and the tab, of the cast-off connection therefor consisting of the single rigid metallic member having the elongated transverse opening at the top for the main strap and the opening beneath it for the eyelet and terminating in the hook, together with the strap having the fastener-cap therein, the fastener-head, and the eyelet connecting the parts substantially as described.

2. In a device of the class described, the cast off connection consisting of the single rigid metallic member having the elongated transverse opening at the top and the opening beneath it for the eyelet and terminating in the hook, together with the strap having the two openings therein and the fastener-cap at one end thereof, the fastener-head, and the eyelet passing through the lower opening in the metallic member, the two openings in the strap and coöperating with the fastener-head to secure the parts substantially as and for the purpose described.

3. In a device of the class described, the cast-off connection therefor consisting of the single rigid metallic member formed of a wire rod bent into shape to form the elongated transverse opening at the top and the smaller opening beneath it and terminating in the hook, together with the strap having the openings *a* and *c* therein and the fastener-cap at the bottom thereof, the fastener-head, and the eyelet *k* adapted to pass through the openings in the strap and the lower opening in the metallic member and coöperating with the fastener-head to secure the parts together substantially as described.

4. In a device of the class described, the cast-off connection consisting of the single rigid metallic member formed of the wire rod bent into shape to have the elongated transverse opening at the top with the lower portion thereof narrowed by the offsets *f*, and with the smaller opening beneath the transverse opening and terminating in the flattened hook *l*, together with the strap *h* having the openings *a* and *c* therein and the fastener-cap in the bottom thereof, the fastener-head having the flange *q*, and the eyelet *k* passing through the openings *a* and *c* in the strap and the smaller opening in the metallic member, and having the flange *r* coöperating with the flange *q* to clamp the parts together substantially as shown and described.

5. In a device of the class described, the combination with the main strap and the tab, of the cast-off connection therefor consisting of the single rigid metallic member made of wire having the elongated transverse opening at the top for the main strap and the opening beneath it for the eyelet and terminating in the hook, the bushing about said hook, together with the strap having the fastener-cap therein, the fastener-head, and the eyelet connecting the parts substantially as described.

705,622. CAST-OFF. ROBERT T. STREET, Chicago, Ill., assignor of one-half to Ernest A. Eastman, Chicago, Ill. Filed Jan. 2, 1902. Serial No. 88,100. (No model.)

Claim.—1. In a device of the class described, the combination with the main-strap connection and the tab connection, of a resilient integral

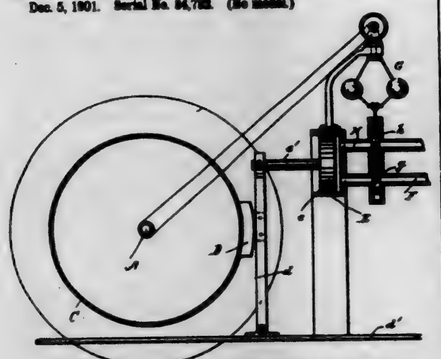
cast-off clip between them having a loop embracing one connection and a pair of jaws the other, said connections and cast-off being so shaped that any pull on the connections tends to cause the jaws to hold the connection which they embrace more firmly.

2. In a device of the class described, the combination with the main-strap connection and the tab connection, of a resilient integral cast-off clip between them having an angular loop embracing one connection and a pair of crossed jaws embracing the other connection, the operation of a pull between the connections being to cause the connection in the loop to expand the clip to bring the jaws more firmly together upon the other connection.

3. In a device of the class described, the combination with the main-strap connection and the tab connection, of a resilient integral cast-off clip between them having the loop *j* embracing the upper cross-piece of the tab connection and having the jaws *k* separated by the recess *l* through which the jaw *m* passes, the said jaws embracing the lower cross-piece of the main-strap connection; substantially as described.

4. In a device of the class described, the combination with the main-strap connection and the tab connection, of a resilient integral cast-off clip between them having a loop embracing one connection and a pair of crossed jaws the other connection, one of said connections being provided with the slot *o'* into which the end of the jaw *m'* is adapted to pass; substantially as and for the purpose described.

705,623. **BRAKE.** GEORGE W. STEVENS, Boston, Mass. Filed Dec. 5, 1901. Serial No. 84,782. (No model.)



Claim.—The combination, with a brake-wheel, and a pivoted brake-lever provided with a brake for bearing against the said brake-wheel; of a cylinder provided with a piston and a piston-rod for operating the brake-lever, an inlet-valve and an outlet-valve connected with the said cylinder, and a speed-governor operatively connected with the said brake-wheel and operating to open the inlet-valve and close the outlet-valve when the brake-wheel is revolved too quickly, substantially as set forth.

705,624. **MOTION-TRANSMITTING DEVICE.** CHARLES F. STOKES, Chicago, Ill., and CHARLES B. MCELHENNY, Highlandville, Mass.; said McElhenny assignor to said Stokes. Filed Nov. 9, 1899. Serial No. 736,402. (Model.)

Claim.—1. In angle-gearing, the combination of the drive-gear having curved interdental spaces and teeth of greater length at the base than at the extremity, and a driven gear having rounded teeth extending at an angle from the center of rotation, substantially as described.

2. In angle-gearing, the combination of a drive-gear having the drive-teeth and curved interdental spaces, and having the sides of the interdental spaces formed to maintain line-contact with the driven-gear teeth, and a driven gear having teeth extending at an angle from the center of rotation and adapted to be engaged by the drive-teeth at the extremity of both, such engagement being in line-contact and gradually moving radially of both teeth, substantially as described, whereby the operation of the gears is effected with the most advantageous leverage, as set forth.

3. In angle-gearing, the combination with the driven gear having round-faced teeth extending at an angle from the center of rotation, of a driving-gear frusto-conical in form with curved interdental spaces, the bases of which are substantially parallel with the drive-shaft, the parts being arranged substantially as described, whereby the drive-teeth engage the driven teeth in a line changing gradually in a spiral centripetal direction, substantially as set forth.

4. In angle-gearing, the combination with a driven gear having rotatory teeth extending at an angle from the center of rotation, of a frusto-conical drive-gear having outward-extending conical teeth and curved interdental spaces, the bases of which present a line substantially parallel with the drive-shaft, the parts being arranged to operate substantially as described, whereby the pressure-contact between the teeth is on a spirally-varying line leading toward the center of the driven gear and sliding friction is reduced, substantially as set forth.

5. In angle-gearing, the combination with the driven gear having round-faced teeth, of a drive-gear frusto-conical in shape and having bevel-teeth and curved interdental spaces, said interdental spaces being warped at their rear extremities to afford freedom of movement of the extremity of the driven-gear teeth in its movement through its arc, substantially as described.

6. In angle-gearing, the combination with the driven gear having the round-faced radially-extending teeth, of a drive-gear frusto-conical in shape and presenting interdental spaces of greater expanse at the rear than at the forward end and having the edges of the teeth at the front rounded to permit ready withdrawal of the teeth extremities from between the driven teeth in the movement of the gear, substantially as described.

7. In angle-gearing, the combination of a frusto-conical drive-gear having peripheral interdental spaces cut transversely of the gear-body on a line substantially parallel with the drive-shaft, whereby the depth of the interdental space is greater at the face of the gear than at the heel, and a driven gear having radially-projecting rotatory teeth supported substantially as described.

8. In angle-gearing, the combination of a frusto-conical drive-gear having peripheral interdental spaces cut transversely of the gear-body on a line substantially parallel with the drive-shaft, whereby the depth of the interdental surface is greater at the face of the gear than at the heel, and a driven gear having radially-projecting rotatory frusto-conical teeth supported substantially as described.

9. In angle-gearing, the combination with the driven gear having radially-projecting frusto-conical teeth supported at both ends, of a drive-gear frusto-conical in form with curved interdental peripheral spaces cut transversely of the gear-body on a line substantially parallel with the drive-shaft, whereby the interdental space is deeper at the outer than at the inner end thereof relative to the teeth, the said teeth being of a length to engage the surface of the driven teeth without shock between the gear members, and in the driving operation the driving-teeth move in a line spirally upon the driven teeth and toward the center of the driven gear, and friction is reduced by the rotation of the driven-gear teeth on their axes, all as set forth.

10. In angle-gearing, the combination with a driven gear having round-faced teeth projecting at an angle from the center of rotation, of a drive-gear having radially-projecting teeth and interdental spaces, the sides of which are formed to conform to the opposing face of the driven-gear teeth during driving engagement in their movement through their arc of rotation to preserve line-contact during said engagement, substantially as described.

11. In angle-gearing, the combination with the driven gear having round-faced outward-extending teeth supported at opposite ends as described, of a drive-gear frusto-conical in shape with curved interdental spaces the bases of which are parallel with the driven-gear teeth at the moment of most intimate meshing of the gears, and the sides of which are formed to maintain line-contact with the driven-gear teeth throughout the period of the application of driving power, substantially as described.

705,625. **MOISTURE-PROOF COATING FOR BRICK OR STONE.** WILLIAM A. THEISS, Terre Haute, Ind., assignor of one-half to WILLIAM B. ADAMS, Clarksdale, Ind. Filed Apr. 7, 1902. Serial No. 101,805. (No specimens.)

Claim.—A moisture-proof coating for brick and stone consisting of beeswax, paraffin, Venice turpentine, gine, linseed-oil, and cosi-oil, substantially in the proportions specified.

705,626. **METALLIC STRAP.** BENNIE H. VOSS, Brooklyn, N. Y. Filed Mar. 17, 1902. Serial No. 98,855. (No model.)

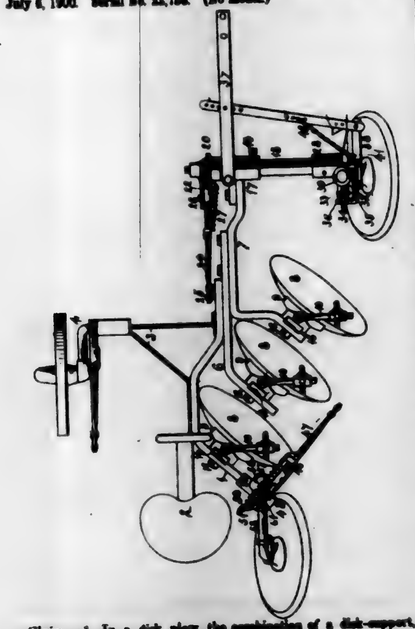
Claim.—1. A strap of sheet metal formed with split barbs cut and stamped from the body of the strap, the halves of said split barbs having their adjacent sides parallel and in close proximity to each other at their junction with the body of the strap being formed with diverging points, substantially as and for the purpose described.

2. A strap of sheet metal formed with split barbs and with V-teeth cut and stamped from the body of the strap, the halves of the split barbs being formed with diverging points, and the V-teeth being opposed to the barbs, substantially as and for the purpose set forth.

3. A strap of sheet metal formed with split barbs cut and stamped from the body of the strap, the halves of the said split barbs being formed with diverging points and the adjacent barbs being formed out of line with each other laterally to insure contact with different portions of the grain of the wood substantially as set forth.

4. A strap of sheet metal formed with split barbs cut and stamped from the body of the strap, the halves of said split barbs being formed with diverging points, and the split between them extending into the body of the strap, substantially as and for the purpose described.

705,627. **DISK PLOW.** LEWIS R. WATERMAN, Rockford, Ill., assignor to Emerson Manufacturing Company, Rockford, Ill. Filed July 6, 1900. Serial No. 22,754. (No model.)



Claim.—1. In a disk plow, the combination of a disk-support, a disk, and a wedge-shaped block located between the disk and its support, the block having a curved face and the disk made adjustable in connection with the curved face.

2. In a disk plow, the combination of a transverse support, a hollow shaft adjustable in the support, a furrow-wheel supported by one end of the shaft and an adjusting-lever supported by the other end of the shaft.

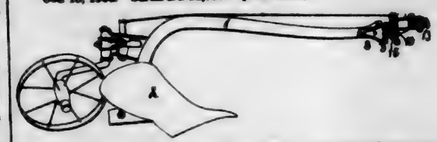
3. In a disk plow, the combination of a transverse support, a hollow shaft adjustable in the support, a rod located within the shaft, a furrow-wheel supported by the shaft in a vertical adjustable manner, a connection between the furrow-wheel support and rod, a hand-lever having a connection with the rod, and a toothed segment for the hand-lever supported by the shaft.

4. In a disk plow, the combination of a furrow-wheel, an overner-support, a link connection between them, and a stop supported by the link.

5. In a disk plow, the combination of a furrow-wheel, an overner-support, a link connection between them and a chain connecting the furrow-wheel and link.

6. In a disk plow, the combination of a main frame, a sleeve loosely mounted thereon, a segment secured to the main frame, a hand-lever having a pivotal connection with the segment, and a connection with the sleeve, a caster-wheel, and a caster-wheel support having a pivotal connection with the sleeve.

705,628. **WHEELED PLOW.** LEWIS R. WATERMAN, Rockford, Ill., assignor to Emerson Manufacturing Company, Rockford, Ill. Filed Oct. 13, 1900. Serial No. 32,936. (No model.)



Claim.—In a wheeled plow, the combination of a plow-beam, a caster-wheel, means for holding the caster-wheel, in proper position for plowing, an overner-clevis having a connection with the plow-beam, a yoke pivotally supported by the overner-clevis and a connection between the yoke and the holding means of the caster-wheel.

705,629. **SAFETY HITCHING DEVICE.** LESLIE R. ABNER, Denver, Colo. Filed Nov. 12, 1901. Serial No. 82,049. (No model.)

Claim.—1. A hitching or holding device comprising a body part having a base-plate, provided with two downwardly-inclined apertured extensions located at the front and rear respectively, two separated upright parts having openings in their upper extremities, a fulcrum-pin engaging said openings, and a cam-lever mounted on the arm and provided with two separated parts having openings through which the pin passes, the space between the upright parts being closed in front and at the bottom, the front of the cam being provided with an upwardly-projecting thumb-piece, and a spring coiled around the pin and connected with the body part at one extremity and the cam at the opposite extremity.

2. A hitching device comprising a body part having a base-plate, and apertured extensions below the base-plate to receive the strap, and two separated upright parts, a fulcrum-pin mounted on said parts, a cam-lever mounted on the pin, a spring coiled around the pin and connected with the body part at one extremity, and the cam at the opposite extremity, the spring being arranged to form a stop against the movement of the cam rearwardly farther than is necessary, substantially as described.

3. In a device of the class described, the combination of a body part having a base-plate, and apertured extensions below the base-plate and located at its opposite extremities, the said plate being provided with upright parts or projections, a spring-held cam-lever mounted on said projections and arranged to engage a strap passed above the base-plate, the said cam-lever being provided with an extension forming a thumb-piece, substantially as described and for the purpose set forth.

705,630. **SEPARATOR FOR ELECTRIC ACCUMULATOR-PLATES.** RICHARD ALEXANDER-KANN, Berlin, Germany. Filed Oct. 18, 1901. Serial No. 78,185. (No model.)

Claim.—1. A non-conducting separator for electric accumulator-plates comprising in combination two wide-meshed gratings, wherein the intersections of the one cross the open spaces of the other, the outer edges of said gratings all being in the same plane.

2. A non-conducting separator for electric accumulator-plates comprising in combination marginal bars and two wide-meshed gratings where-

of the intersections of the one cross the open spaces of the other, the outer edges of said gratings all being in the same plane and flush with surfaces of the marginal bars.

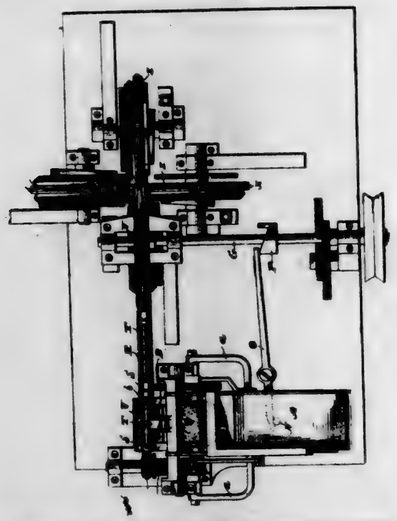
3. A non-conducting separator for electric accumulator-plates comprising in combination two wide-meshed gratings, whereof the intersections of the one cross the open spaces of the other, the outer edges of said gratings all being in the same plane, and being made integral with one another.

4. A non-conducting separator for electric accumulator-plates comprising in combination marginal bars and two wide-meshed gratings whereof the intersections of the one cross the open spaces of the other, the outer edges of said gratings all being in the same plane and flush with surfaces of the marginal bars, and being made integral with one another and with the marginal bars.

5. A non-conducting separator for electric accumulator-plates comprising in combination two wide-meshed gratings, whereof the intersections of the one cross the open spaces of the other, the outer edges of said gratings all being in the same plane, and terminating at their meeting surfaces in a plane.

6. A non-conducting separator for electric accumulator-plates comprising in combination marginal bars and two wide-meshed gratings whereof the intersections of the one cross the open spaces of the other, the outer edges of said gratings all being in the same plane and flush with surfaces of the marginal bars, and terminating at their meeting surfaces in a plane bisecting said marginal bars.

705,631. **PRINTING-PRESS.** MARK ANTHONY, New York, N. Y., assignor, by mesne assignments, to the Diamond Match Company, a Corporation of Illinois. Filed May 11, 1897. Serial No. 635,993. (No model.)



Claim.—1. The combination of printing mechanism for printing on splints and the like, a carrier that delivers splints endwise thereto, a hopper for splints and a drum adapted to support splints with their lengths parallel with the axis of the drum, said drum receiving splints from the hopper and delivering them to said carrier, the axis of the drum being parallel with the direction of travel of the carrier, whereby splints are delivered from the drum thereto, with their lengths extending in the direction of travel of said carrier, substantially as described.

2. The combination of printing mechanism for printing on splints and the like, a feeding belt or apron that delivers splints endwise thereto, a hopper for splints, a drum having longitudinal, peripheral grooves, whose axis extends in the direction of the line of travel of the belt, substantially as and for the purpose described.

3. The combination of a splint-containing hopper, means for vibrating the same, a plate that has contact with the splints that control the outlet from the hopper, and means to vibrate said plate, independent of the hopper, substantially as and for the purpose described.

4. The combination of a hopper for splints having a bottom provided with surfaces in different planes, from the higher to the lower one of which splints move, and a piece that is reciprocable over such surfaces, that extends sufficiently close to the higher surface, to prevent the passage of splints between it and the surface, when it is over the latter, but not close enough to the lower surface, to prevent the passage of splints between the same and the piece, substantially as and for the purpose described.

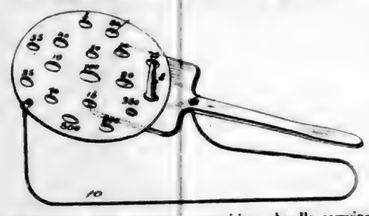
5. The combination of a hopper for splints, having a bottom provided with surfaces in different planes, from the higher to the lower one of which, splints move, and a piece that is movable to and fro from over one surface to the other, that extends sufficiently close to the higher surface to prevent the passage of splints between it and the surface, when it is over the latter, but not close enough to the lower surface, to prevent the passage of splints between the same and the piece, substantially as and for the purpose described.

6. The combination of a hopper for splints, a carrier that receives splints from the hopper, a wheel to brush back from the carrier, irregularly-placed splints, and a vibrating plate interposed between the mass of splints in the hopper and the brush-wheel substantially as and for the purpose described.

7. The combination of a hopper for splints, a carrier that receives splints from the hopper, a plate within the hopper, a slide to which said plate is attached, grooved to fit over the edge of a side of the hopper, and means to reciprocate said slide, substantially as and for the purpose described.

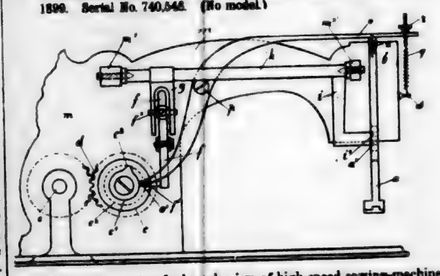
8. The combination of printing mechanism, including a type-wheel, a guide for the object to be printed, and a dog movably mounted on the type-wheel, so as to normally project beyond the periphery thereof, said dog being interposed in the path of the object to be printed, when it comes from said guide, substantially as described.

705,632. **TOY GAME.** RAFFAELLO ASTARITA, New York, N. Y. Filed Aug. 31, 1901. Serial No. 73,917. (No model.)



Claim.—A game apparatus, comprising a handle carrying a platform with a pin rising from it, a disk containing a plurality of numbered perforations whereby said disk is adapted to be caught on said pin, with the plane of the disk at right angles to the axis of the pin and a cord connecting said disk and said handle.

705,688. **FEED MECHANISM FOR SEWING-MACHINES.** JOHN A. BATCHELOR and FRANCIS R. HALL, London, England. Filed Dec. 16, 1899. Serial No. 740,546. (No model.)

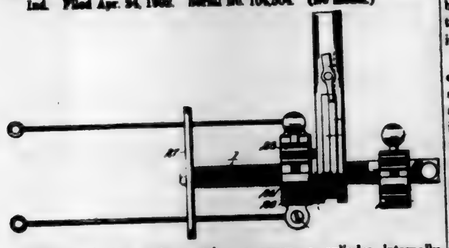


Claim.—1. In top-feed mechanism of high-speed sewing-machines having a horizontal rear driving-shaft, a vertically and horizontally movable presser, a rocking shaft together with a cam-and-lever mechanism situated between the driving-shaft and the presser, the combination of the said driving-shaft with a vertically and horizontally movable presser, means for imparting to it a vertical motion, a grooved cam adapted to receive continuous rotary motion from the driving-shaft, a rocking shaft situated between the presser and the driving-shaft and adapted to turn in bearings secured to the machine-frame, and adjustable lever mechanism adapted to transmit motion from the grooved cam to the rocking shaft and from the rocking-shaft to the presser both forward and backward at an adjustable rate of transmission, without the aid of a spring, substantially as described and for the purpose specified.

2. In top-feed mechanism of high-speed sewing-machines having a horizontal rear driving-shaft, a vertically and horizontally movable presser, a rocking shaft together with a cam-and-lever mechanism situated between the driving-shaft and the presser, the combination of the driving-shaft, rocking shaft and presser, with means for imparting to the presser a vertical motion, a grooved cam adapted to receive continuous rotary motion from the driving-shaft, a one-armed lever mounted on the rear end of the rocking shaft, a two-armed lever adapted to receive motion from the grooved cam at one end, and to transmit it to the said rear lever at the other end by means of an adjustable pin and a slot adapted to vary the rate of transmission, and a one-armed lever mounted on the front end of the rocking shaft and connected with the presser by means of a pin and slot, adapted to produce the forward and backward motion of the same, substantially as described and for the purpose specified.

3. In top-feed mechanism of high-speed sewing-machines having a horizontal rear driving-shaft, a vertically and horizontally movable presser, and a rocking shaft together with cam-and-lever mechanism situated between the driving-shaft and the presser, the combination of the driving-shaft *e*, rocking shaft A and presser *a*, with means for imparting to the presser a vertical motion, a grooved cam *c* geared together with the driving-shaft, a slotted lever *g* mounted on the rear end of the rocking shaft, a lever *f* having on one arm a roller running in the groove of the cam *c* and on the other arm an adjustable block *f'* connected with the slotted lever *g*, and a lever *i* mounted on the front end of the rocking shaft A and connected with the presser by means of a pin *i'* and a slot a^3, substantially as described and for the purpose specified.

705,684. **WIRE-STRETCHER.** SAMUEL BATES, North Liberty, Ind. Filed Apr. 24, 1902. Serial No. 104,504. (No model.)



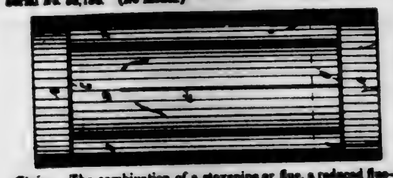
Claim.—1. In a wire-stretcher, a screw, a cylinder internally threaded to engage the screw, a yoke swiveled on the cylinder, a lever pivoted on the cylinder, pawls carried thereby, teeth on the cylinder engaged by the pawls, a clamp on the screw and a clamp on the yoke as and for the purpose described.

2. In a wire-stretcher, a screw, a cylinder internally threaded to engage the screw, a yoke swiveled on the cylinder, a lever pivoted on the cylinder, pawls carried thereby, teeth on the cylinder engaged by the pawls, rods extending from the yoke and a guide on the end of the screw through which the rods extend.

3. In a wire-stretcher, a screw, a clamp secured thereto, a cylinder threaded on the screw, means for rotating the cylinder, a yoke on the cylinder, a clamp carried by the yoke, and rods extending from the yoke.

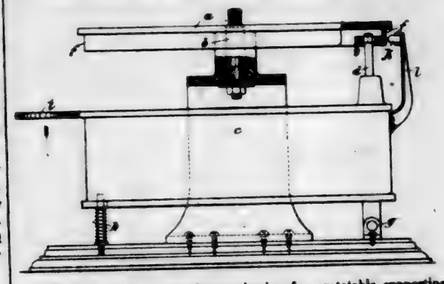
4. In a wire-stretcher, a screw, a clamp secured thereto, a cylinder threaded on the screw, means for rotating the cylinder, a yoke comprising two sections embracing the cylinder and loosely connected therewith, rods connected to the yoke, a guide on the end of the screw having slots through which the rods extend.

705,685. **DEVICE FOR PROMOTING AND CONTROLLING COMBUSTION.** ERNEST RAMSBOTTOM, Fairview, Pa. Filed Jan. 7, 1902. Serial No. 88,739. (No model.)



Claim.—The combination of a stovepipe or flue, a reduced flue-section inserted therein, annular collars on the upper and lower ends of said reduced flue-section fitting the inside of the pipe or flue in which it is inserted, vertical partitions at each side of the reduced flue extending from the lower collar nearly to the upper collar thereon, an air-inlet opening or openings in the front of the pipe or flue, communicating with the space between the reduced flue-section and the outer flue at one side of said partitions, and an air-discharge opening or openings, through the lower collar at the rear of the flue, on the opposite side of said partitions, substantially as and for the purpose set forth.

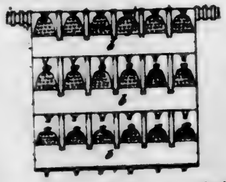
705,686. **DRIVING MECHANISM FOR ROTARY GRAMOPHONE TURN OR SUPPORTING PLATES.** THEODORE BERNAUR, Berlin, Germany. Filed Oct. 18, 1901. Serial No. 79,251. (No model.)



Claim.—1. In an actuating mechanism for a rotatable supporting plate, the combination with such plate, of a casing pivotally supported at one side, a driven shaft *d* journaled in the casing, a friction-disk carried by the shaft and adapted to engage the plate, and a spring-support for the casing opposite its pivotal support normally tending to force the disk into engagement with the plate, substantially as set forth.

2. In an actuating mechanism for a rotatable supporting-plate, the combination with such plate, of a casing pivotally supported at one side, a driven shaft *d* journaled in the casing, a friction-disk carried by the shaft and adapted to engage the plate, a spring-support for the casing opposite its pivotal support normally tending to force the disk into engagement with the plate, and a brake-shoe carried by the casing and normally out of engagement with said plate, said brake-shoe being supported to engage the plate when the casing is rocked on its pivot to disengage the disk from the plate, substantially as set forth.

705,687. **MEANS APPLICABLE FOR USE IN TRANSPORTING FRUIT.** RICHARD R. BLANDY, Kensington, England. Filed Apr. 15, 1901. Serial No. 55,962. (No model.)



Claim.—1. For use in transporting oranges and other kinds of fresh fruit, a sheet of fabric furnished with series of pockets or troughs comprising horizontal strips of fabric severally connected along their upper edges to the sheet by means of tapes and having their lower edges and extremities also attached to the sheet whereby the pockets are adapted to receive and support the fruits arranged singly, and to prevent their being subjected to pressure.

2. For use in transporting oranges and other kinds of fresh fruit, a carrier consisting of a sheet of fabric to which a number of horizontal strips of fabric are severally attached one above another by stitching the inner or lower edge and the extremities of each strip to the sheet and tapes connecting the outer edge of each strip with the sheet, thus constituting troughs or pockets, and a pole or bar to which the sheet is attached for the purpose of supporting the fruit while in course of transportation, substantially as herein described.

705,688. **GLYCOSURIA ANTIDOTE AND PROCESS OF PRODUCING SAME.** FERDINAND BLUM, Frankfort-on-the-Main, Germany, assignor to Firm of E. Merck, Darmstadt, Hessen, Germany. Filed Apr. 24, 1902. Serial No. 104,594. (No specimens.)

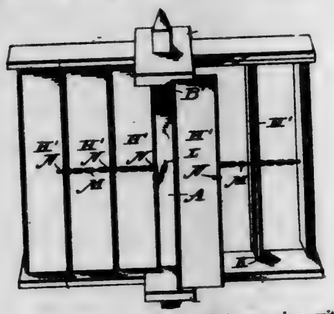
Claim.—1. The process of producing an antidote or antitoxin for the treatment of diseases due to the faulty or imperfect action of the suprarenal glands, which consists in injecting subcutaneously into an animal the

juice of suprarenal glands, thereafter drawing blood from the animal, and obtaining the serum thereof; substantially as described.

2. The process of producing an antidote or antitoxin for the treatment of diseases due to the faulty or imperfect action of the suprarenal glands, which consists in injecting subcutaneously into an animal successively-increasing doses of the juice of suprarenal glands, thereafter drawing blood from the animal, and obtaining the serum thereof; substantially as described.

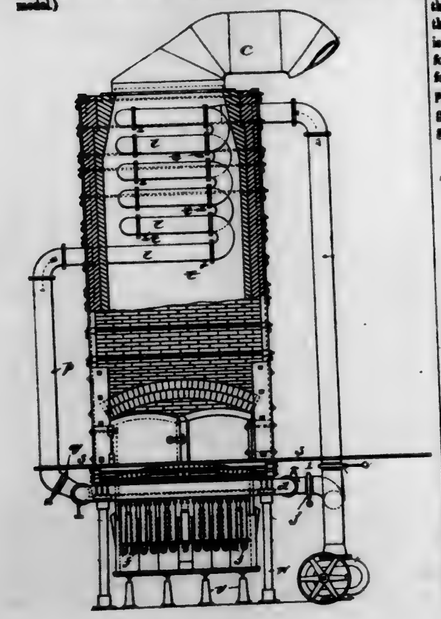
3. As a new substance, glycocoarin antidote or antitoxin, consisting of the serum of the blood of an animal into whose veins has been injected the juice of suprarenal glands; substantially as described.

705,639. WIND-WHEEL. ANDREW J. BOLTON, Pleasant Site, Ala. Filed May 14, 1902. Serial No. 107,314. (No model.)



Claim.—A wind-wheel comprising a shaft, cross-pieces with shoulders arranged in reverse order on the opposite ends of said cross-pieces, blades having integral pivotal pins along their inner marginal edge journaled in apertures adjacent to said shoulders, and a chain anchored at its inner end to said shaft and having connection with the swinging edges of said blades to limit their outer throw, as shown and described.

705,640. HOT-BLAST FURNACE. EDWARD T. BRADFORD, Denver, Colo.; Mary C. G. Bradford, administratrix of said Edward T. Bradford, deceased, assignor to Standard Smelter Company, Denver, Colo., a Corporation of Colorado. Filed July 7, 1900. Serial No. 22,811. (No model.)



Claim.—1. A hot-blast furnace, provided with blast-heating pipes, located within the furnace and arranged to conduct the blast from the upper and cooler to the lower and hotter portions of said pipes, and twyers connected to the hotter end of the said heating-pipes, a portion of said heating-pipes consisting of pairs of horizontal pipe-sections supported on transverse supports, said pairs being arranged in zigzag order, so as to economize space and more effectually intercept the rising products of combustion, and a series of U-sections secured to the said straight pipe-sections to complete the system, substantially as described.

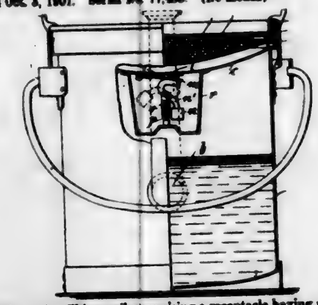
2. A hot-blast furnace, provided with blast-heating pipes located within the furnace and adapted to conduct the blast from the upper and cooler to the lower and hotter portions of said pipes, twyers connected to the hotter end of the said heating-pipes, blower mechanism for supplying air to the cooler end of said heating-pipes, and a non-conducting refractory lining in the portion of the furnace surrounding the heating-pipes, a portion of the said heating-pipes within the said refractory lining consisting of series of horizontal pipe-sections arranged in zigzag order and supported on transverse supports, and a series of substantially similar U-sections provided with flanges and secured to the said horizontal sections at the said flanges; substantially as described.

3. A hot-blast furnace provided with blast-heating pipes located within the furnace and adapted to conduct the blast from the upper and cooler to the lower and hotter portions of said pipes, twyers connected to the hotter end of said heating-pipes, said pipes consisting of a series of separable horizontal flanged sections supported in pairs, flanged U-shaped connections horizontally connecting said sections in pairs at one end, and other U-shaped connections at the opposite ends of the horizontal sections connecting said horizontal sections with those above or below, the elements of said pipe structure mutually supporting each other throughout, and means for suspending the entire pipe structure within the path of the products of combustion of the furnace; substantially as described.

705,641. CORSET-FASTENER. JAMES BETTRELL, High Wycombe, England. Filed Apr. 22, 1901. Serial No. 56,966. (No model.)

Claim.—In corset-fasteners the combination with an eyelet attachment on one of the busks of a disk pivoted thereto and whose pivotal axis is eccentric with the center of the hole in the eyelet, a hole in said disk the same size as the eyelet-hole, a curved slot extending from one side of the hole in the disk but of lesser width than said hole and whose radius is struck from the pivotal axis of the disk, two notches or projections formed on the disk, for engaging with a stud or stop on the eyelet-plate, for limiting its motion to its locked and unlocked positions, and a stud or pin on the disk for operating the same, a stud on the opposite busk engaging with the hole and slot in the disk for fastening the two busks together, substantially as described.

705,642. MILK-PAIL. SALOMON BRUCKMANN, Crefeld, Germany. Filed Oct. 3, 1901. Serial No. 77,455. (No model.)



Claim.—A milking-pail comprising a receptacle having a perforated funnel located at the top, a hinged flap controlling the communication between funnel and receptacle, and a device for automatically closing said flap on the pail being overturned, consisting of a stirrup secured to the bottom of said funnel and provided with a vertical pin, a sleeve turning and sliding on said pin, and a weighted double-armed lever pivoted to said sleeve and in its normal position supporting the flap in open condition, all substantially as described.

705,648. CASEIN PHOTOGRAPHIC FILM AND PROCESS OF MAKING SAME. OTTO DOBE, Rheinfelden, Switzerland. Filed Nov. 26, 1901. Serial No. 83,316. (No specimens.)

Claim.—1. The process of producing actinic films, which consists in forming a solution of casein, coating a suitable support therewith, rendering the casein film substantially insoluble and then sensitizing the film, substantially as described.

2. The process of producing actinic films, which consists in forming a solution of casein, coating a suitable support therewith, rendering the casein substantially insoluble by a solution of a metallic salt free from silver, and then sensitizing the coating, substantially as described.

3. The process of producing actinic films, which consists in forming a solution of casein, adding thereto a softening agent, coating a suitable support therewith, rendering the casein substantially insoluble, and then sensitizing the coating, substantially as described.

4. The process of producing actinic films, which consists in producing a solution of casein with an organic acid, adding thereto glycerin, coating a suitable support therewith, rendering the casein substantially insoluble by means of a solution of a haloid salt free from silver, and then sensitizing the coating, substantially as described.

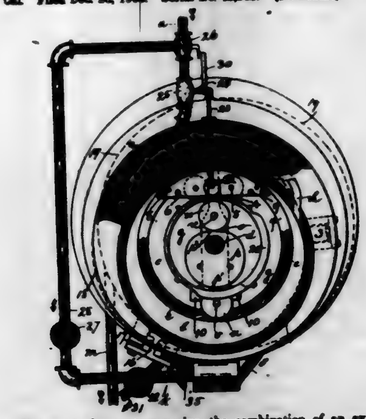
5. An actinic layer for photographic purposes, consisting of free casein and a sensitizing medium, substantially as and for the purpose set forth.

6. An actinic layer for photographic purposes consisting of free casein removed substantially insoluble and a sensitizing medium, substantially as and for the purpose set forth.

7. An actinic layer for photographic purposes consisting of substantially insoluble free casein, a softening agent and a sensitizing medium, substantially as described.

8. An actinic layer for photographic purposes consisting of substantially insoluble free casein, glycerin and a sensitizing medium, substantially as described.

705,644. ROTARY ENGINE. JULIAN H. CARY, San Francisco, Cal. Filed Dec. 20, 1900. Serial No. 40,583. (No model.)



Claim.—1. In a rotary engine, the combination of an expansion-chamber, a revolving body, a shaft and rotating piston, said piston comprising a head and extension-arm, said head containing thin laminations and a flexible material supporting said laminations and enabling them to act independently, a roller for actuating said extension-arm longitudinally and an eccentric cam for controlling said roller, substantially as described.

2. In a rotary engine, an expansion-chamber, a revolving body, a shaft supporting said body, a rotary piston, which comprises a head and a lever-arm, said head being provided with thin laminations and an individual yielding mechanical support therefor, said lever-arm being elongated sufficiently to be used in transmitting propelling power at points on opposite sides of the shaft, substantially as described.

3. In a rotary engine, the combination of an expansion-chamber, a shaft, a revolving body, a piston which comprises a head and extension-arm, said head being provided with laminations having individual independent supports, said extension-arm passing beyond the axis of motion, a roller-bearing near the piston-head through which propelling power is transmitted to the revolving body, and a bearing on the opposite side of the center of motion through which a reciprocal propelling power is transmitted from the extension-arm of the piston, substantially as described.

4. In a rotary engine, the combination of an annular cylinder having an eccentric wall, a piston, rollers carried thereby at a fixed distance from each other, and a cam between said rollers for reciprocating said piston through the medium of said rollers, said cam being suitably shaped to permit both of said rollers to remain in contact with said cam throughout the entire revolution of the piston, thus providing a positive control of the piston in both directions by the cam, substantially as described.

5. In a rotary engine, the combination of an annular cylinder having an eccentric wall, a rotating piston, rollers carried thereby substantially at a fixed distance from each other, and a cam between said rollers for reciprocating said piston through the medium of said rollers, said cam being suitably shaped to permit both of said rollers to remain in contact with said cam substantially on opposite sides of the cam in the revolution of the piston, thus providing a positive control of the piston in both directions by the cam, substantially as described.

6. In a rotary engine, the combination of a cylinder having an inlet and an outlet, a rotating shaft extending longitudinally through the cylinder, a wheel secured to, and rotating with said shaft, having a wide rim and a thin web, said wheel having a radial cut therein, straps secured to the sides of the rim, rollers axially mounted in said straps on both sides of said web and adjacent to said cut, a piston reciprocating in said cut and bearing against said rollers, and a cam for reciprocating said piston, substantially as described.

7. In a rotary engine, an annular expansion-chamber, with an inlet and an outlet, a shaft, a rotary piston, a revolving wheel or drum whose periphery forms a wall of said chamber, said wall being provided with pockets and being suitably removed from the inlet that the jet of steam may have an uninterrupted flow thereby and also give a free discharge of steam from the pocket at the beginning of the impact in said pocket for the purpose of giving clearance, substantially as described.

8. In a rotary engine, a cylinder, an expansion-chamber with inlet and outlet contained therein, a piston, a revolving body whose periphery forms a wall of the expansion-chamber, impact-pockets, said revolving body being suitably disposed in said cylinder so that when in rotation the jet of the motive fluid from the inlet shall have a free admission into said expansion-chamber independently of the position or operation of the pockets, as shown and described.

9. An engine with an annular expansion-chamber, a revolving body, a piston supported by said body, a shaft on which said body is mounted, an inlet and an outlet in combination with a series of impact-pockets arranged along the periphery of the revolving body in said chamber, said pockets having their front and rear walls alined with the inflowing jet of steam for the purpose of obtaining the full force of the impact in the direction of rotation, as shown and described.

10. In a rotary engine, an expansion-chamber having an inlet and an outlet, a rotating piston, a shaft, a revolving body mounted upon said shaft, whose periphery forms the convex wall of said expansion-chamber, said convex wall being provided with a series of impact-pockets conformed with their front and rear walls at an angle corresponding in pitch with that of the inflowing jet of motive fluid, as shown and specified.

11. In a rotary engine, an annular expansion-chamber having an inlet and an outlet, a rotating wheel whose periphery forms a wall of said chamber, a shaft supporting said wheel, a piston carried thereby, a resiliently-yielding gate, and means operating at each revolution of the shaft for depressing the gate while the piston passes from any desired point between the outlet and gate to any desired point at or near the inlet, to open a steamway and permit the escape of the residual steam in a forward direction thereby avoiding back pressure due to the compression of residual steam, substantially as described.

12. In a rotary engine, a cylinder having an inlet and an outlet, a wheel rotating in the cylinder eccentric with respect thereto and having a point of closure therewith, a shaft supporting said wheel, a piston carried thereby, and means operating at each revolution of the shaft for separating, from contact with each other, the concave wall of the cylinder and the corresponding face of the piston-head while the piston passes a portion of the cylinder adjacent to the closure whereby free circulation of the steam at that part is permitted and back pressure due to compression or vacuum is avoided, substantially as described.

13. In a rotary engine an annular expansion-chamber having an inlet and an outlet, a revolving wall which constitutes a wall of the said chamber, a piston moving with said wall, a shaft supporting said wall in combination with a resiliently-yielding gate, and means operating at each revolution of the shaft for depressing said gate for the purpose of obtaining an unobstructed passage of the steam and piston, substantially as described.

14. In a rotary engine the combination of an annular expansion-chamber having an inlet and an outlet, a rotating piston, a revolving body moved by said piston, a shaft supporting said revolving body with a gate

applied so as to close the recess between the outlet and inlet and means for holding said gate open while the piston passes from the gate or a point near thereto, to the inlet or a point near thereto for the purpose of overcoming vacuum, substantially as described.

15. In a rotary engine an expansion-chamber having an inlet and an outlet, a point of closure between said inlet and outlet, a rotating piston, a revolving body supporting said piston, a shaft on which said revolving body is mounted, the walls of said expansion-chamber being suitably conformed and the piston suitably operated so that an escape for the back pressure of the motive fluid shall be provided as the piston passes from the outlet toward the point of closure, substantially as described.

16. In a rotary engine the combination of an expansion-chamber having an inlet and an outlet, a means for establishing a closure in said expansion-chamber between said inlet and outlet, a rotating piston, a revolving body supporting said piston, a shaft supporting said revolving body, and means provided whereby the motive fluid or air may freely pass between the piston-head and the walls of the expansion-chamber as said piston passes from the point of closure toward the inlet, for the purpose of overcoming vacuum, substantially as described.

17. A rotary engine having two or more annular cylinders having a common shaft and operated only by party-walls thus forming one compact body, said cylinders being connected to be operated in series as a compound engine, being provided with means for dividing the series to form two primary or high-pressure cylinders, an independent cut-off valve for each primary cylinder, and valve-actuating mechanism suitably arranged for controlling said valves to unison and operative when the series of engines is divided, substantially as described.

18. In a rotary engine two or more circular expansion-cylinders with suitable inlets and outlets, the necessary rotating pistons, a shaft arranged in common for the rotating pistons, means for rotating said pistons with said shaft, two of said cylinders being contained between their vertical walls to form a compact body, said cylinders being connected so as to be operated in series as a compound engine and means for disconnecting said series when desired, a primary live-steam way connecting with the high-pressure chamber of the said series and a second live-steam way connected to a second of the chambers of the series, and a cam device, arranged, when the said series are disconnected, to control the passage of the motive fluid through each of the said steamways simultaneously, substantially as described.

19. In a rotary engine, the combination of an annular expansion-chamber, a rotating piston supported by a shaft and rotating in said chamber, the head of said piston carrying thin laminations and individual metallic springs for pressing said laminations outwardly against the concave wall of the chamber, substantially as described.

20. In a rotary engine, comprising an annular cylinder having an inlet and an outlet, a shaft and a piston rotating on said shaft, the head of the piston comprising a block, a spring for pressing outwardly said block, thin plates of metal and individual springs interposed between said blocks and plates, substantially as described.

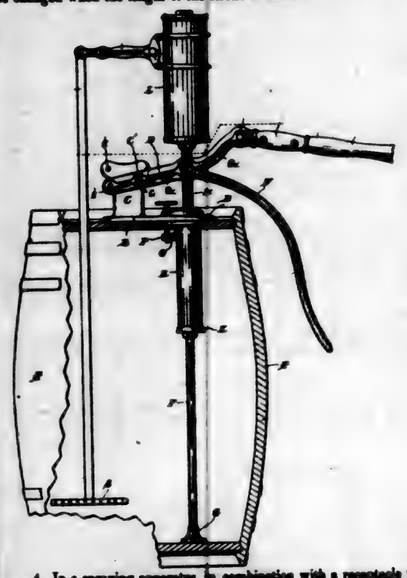
21. A rotary engine comprising two cylinders contained between three vertical walls, each cylinder being provided with concave and convex annular walls, and all constituting one compact body, with a horizontal shaft common to the cylinders, said cylinders being provided with the necessary pistons and being connected in series so as to be operated as a compound engine, and means for disconnecting when desired, having also an auxiliary live-steam way to a low-pressure cylinder and a cam on the common shaft for controlling the passage of steam in the latter steamway and in the steamway to the original high-pressure cylinder in unison, substantially as described.

705,645. SPRAYING APPARATUS. MYRON J. CASWELL, Sandusky, Ohio, assignor to Latham & Company, Sandusky, Ohio, a Firm. Filed Aug. 8, 1901. Serial No. 70,935. (No model.)

Claim.—1. In a spraying apparatus, a cylinder, a valve in the bottom of said cylinder, a hollow plunger-rod, a piston-head on the lower end of said rod, a valve to close the lower end of said rod, oppositely-extended branches forming a T at the upper end of said rod and forming a place of attachment for a hose, a divided handle embracing the rod and having openings to receive the branch pipes of the T, and a stand to which said handle is pivoted.

2. In a spraying apparatus, in combination with a receptacle for liquid, a cylinder having an upper open end extending into the receptacle, a pipe secured in the bottom of said cylinder and extending into the bottom of the receptacle, a valve in the bottom of the cylinder, a hollow plunger-rod, a piston-head on the lower end of said rod within said cylinder, a valve to close the lower end of said rod, a branch pipe at the upper end of said rod for the attachment of a hose, a handle mounted on said branch and free to turn thereon, and a stand to which the handle is pivoted.

3. In a spraying apparatus, in combination with a receptacle for liquid, a casting secured to the top of the receptacle and having an opening therein, and a stand provided with openings to receive the pivot-pin of the pump-handle, extending upward therefrom, a cylinder having an upper open end secured within said opening in said casing, a valve in the lower end of said cylinder, a hollow plunger-rod, a piston-head on said rod, a valve within said piston-head to close the lower end of said hollow rod, a T at the upper end of the hollow rod, a divided handle embracing the rod and said stand and pivoted to the former by being provided with openings to receive the branches of the T and to the latter by a pivot-pin adapted to engage the openings in the stand, said openings being arranged one nearer the top of the stand and farther from the plunger-rod than the other whereby the pivotal point of said handle may be changed when the length of the stroke is varied.

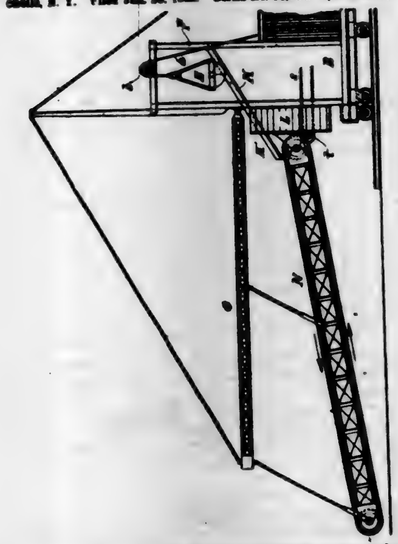


4. In a spraying apparatus, in combination with a receptacle for a liquid, a casting secured to the top of said receptacle and provided with an opening, a cylinder having an upper open end secured within said opening and extending into the receptacle and provided with lateral openings near its upper end, a pipe secured to the lower end of the cylinder, a valve to close the upper end of said pipe, a hollow plunger, a piston-head on said plunger, a valve to close the lower end of said plunger, an air-chamber on the upper end of said plunger, branch pipes forming a T near the upper end of the plunger, a hose attached to one of said branches and a cap for the opposite branch, a casting forming a portion of the pump-handle and made in halves to embrace the plunger and stand on which it is fulcrumed and provided with openings to receive the branch pipes of the plunger, a stand for said pump-handle extended longitudinally thereof and provided with bearings for the same, one nearer the top of the stand and farther from the plunger than the other, and a grip bantion of the handle adjustably secured to the divided portion of the handle.

5. In a spraying apparatus, in combination with a receptacle for the liquid, a cylinder within said receptacle having an upper open end projecting through the top of the receptacle and an opening in its side within the receptacle, a cap to cover the said opening, means for adjusting and holding said cap over the opening, a hollow plunger, a piston-head on said plunger within the cylinder, and a valve to close the lower end of said plunger.

6. In a spraying apparatus, in combination with a receptacle for liquid; a casting having an opening secured to the top of the receptacle; a cylinder having an upper open end secured in said casting and extending into the receptacle and provided with lateral openings near its upper end; a cap to cover said openings; a thumb-screw journaled in said casting and engaging a screw-threaded opening in said cap to adjust the same; a pipe secured in the bottom of said cylinder; a strainer-casting on the bottom of said pipe; a valve-seat formed in the bottom of said cylinder above said pipe; a valve on said seat; an apertured cap for said valve; a hollow plunger having an enlarged lower end and externally screw-threaded to engage a sleeve and internally screw-threaded to engage a cap having a central opening and openings around the same for the passage of the liquid; flanges on said sleeve and cap; a packing-ring engaged and held by said flanges; a valve-seat formed on said cap; a valve engaging the seat and provided with a stem to engage the central opening in the cap; a T near the upper end of said hollow plunger; hose attached to said T; a stand provided with pivots for the pump-handle; a pump-handle consisting of two parts, a grip portion provided with a head and a divided portion to embrace the stand, the plunger and the head of the grip portion; a pivot-pin to engage the openings in the stand; a bolt to secure the head between the parts of the divided handle portion; and an air-chamber on the upper end of the plunger.

705,646. SEWER-DREDGE. ISRAELIS CRAQUETTE, New Rochelle, N. Y. Filed Jan. 29, 1902. Serial No. 91,761. (No model.)



Claim.—1. The above-described dredge for laying sewers and other pipes which consists of a car, a dredge-frame mounted thereon, a dredge adapted to rise and fall through said frame, a main receiving-trough, a diverging trough whereby the excavated material is delivered at the sides of said car, and an apron whereby the excavated material may be delivered at a suitable distance behind said car for refilling the trench.

2. A dredge for laying sewers and other pipes which is provided with a building-box suspended from a suitable frame, mechanism whereby said box is driven into the ground surrounding the dredge as the same is cut away, mechanism whereby shoring-planks are driven into the ground to support the sides of the trench thus formed and means for lifting said box away from said trench for the next operation, substantially as shown and described.

705,647. CONICAL PENDULUM. FRANK M. CLARK, Tilton, N. H., assignor to George L. Clark, Worcester, Mass. Filed Feb. 19, 1901. Serial No. 47,971. (No model.)

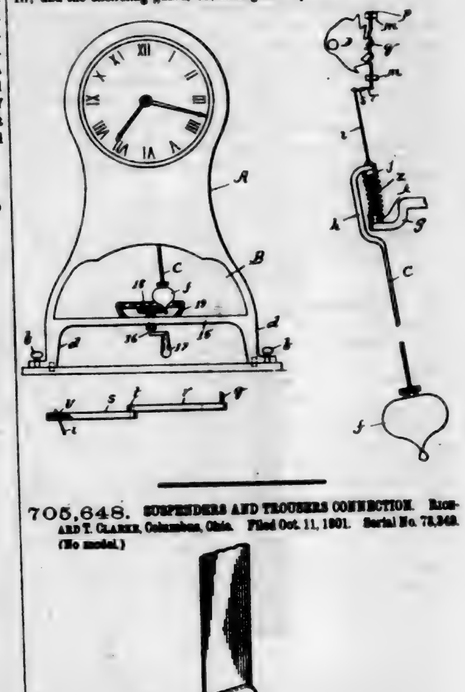
Claim.—1. In a clock a conical spring arranged with its base-coil horizontally nearer the clock-base than is its apex; a conically-moving pendulum supported from the apex of said spring; and devices for driving said pendulum from its upper end substantially as described.

2. In a clock a conical spring arranged with its base-coil horizontally nearer the clock-base than is its apex; a conically-moving pendulum supported from the apex of said spring; a worm driven by the escapewheel of said clock and a crank connection between the upper end of said pendulum and said worm whereby the pendulum may be guided positively above its point of suspension substantially as specified.

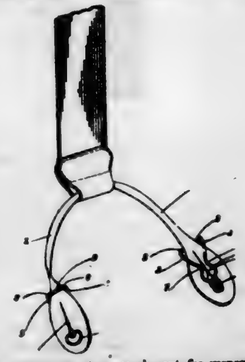
3. In a clock the pendulum, C, in combination with the spiral, z, supporting said pendulum; the escape-wheel, D, and mechanism actuated by said wheel for guiding the end of said pendulum above its fulcrum-point in a circle.

4. In a clock provided with a conically-moving pendulum the cam in combination with the crank-actuated disk disposed in position to contact the pendulum-weight when at rest.

5. In a clock of the class described the case; the crank-actuated disk; 18; and the encircling guard, 19, arranged as specified.



705,648. SUSPENDERS AND TROUSERS CONNECTION. RICHARD T. CLARKE, Columbus, Ohio. Filed Oct. 11, 1901. Serial No. 78,349. (No model.)



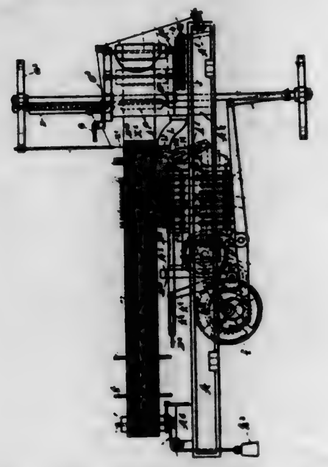
Claim.—In a button-engaging attachment for suspender-ends, the combination with the suspender-end having a buttonhole or other opening therein, of a button-engaging device comprising a centrally-doubled body S having its doubled end portion formed with an upwardly and downwardly bent termination, a socket formed above said terminal portion and an upper flaring portion receiving as described a suspender-end, substantially as specified.

705,649. LOOM. DRAKE F. CONKLIN and TRESCHEL G. SUSSEX, Hoboken, N. J. Filed Mar. 1, 1901. Serial No. 49,650. (No model.)

Claim.—1. In a loom for vertical weaving, the loom-frame, having bars running lengthwise of the loom, provided with an arched portion having a vertical groove to permit the free passage of the vertical needle and filling, in combination with double-pointed shuttles having a flat face, and adapted to traverse said arched portion of said bars, a rocking shaft, rocking arms secured thereto, cradles pivoted in said rocking arms, and adapted to hold said shuttles with their flat faces toward said arched bars, springs secured to said rocking arms, and adapted to restrict or limit the pivotal movement of said cradles and to maintain loosely, but in proper position, said shuttles, the main driving-shaft of the loom, and connections between said driving-shaft and said rocking shaft, to cause said shuttles to travel back and forth, describing an arc in passing the vertical slots in said arched bars, substantially as set forth.

2. The combination with the loom-frame and means thereon adapted to carry a number of sets of warp lengthwise of the loom on edge, one thread above the other in each set of warp, the sets of warp being par-

allel with, and in close proximity to, each other, of a series of heddles adapted to have a traverse motion, crosswise of the loom, to form and control simultaneously the sheds of the various sets of warp, means for thus operating said heddles, a reed movable lengthwise of the loom having dents arranged horizontally therein, one above the other, and adapted to receive the threads of the various sets of warp, and to beat the weft up to the fell the loom-shaft and operative connections between the reed and loom-shaft, a series of vertically-operated weft-needles adapted to carry the weft through the sheds so formed and to form loops of weft below them, a series of selvage-thread shuttles, means for thus operating said needles, and means for propelling said shuttles through the successive loops of weft, so formed below the warps, at each movement of the shuttles, substantially as set forth.



3. The combination with the loom-frame, and means thereon adapted to carry a number of sets of warp lengthwise of the loom one thread above the other in each set of warp, the sets of warp being parallel with each other, of a series of heddles adapted to have a traverse motion crosswise of the loom, means for thus operating said heddles, a reed or reeds movable lengthwise of the loom and means for operating the same, a series of vertically-arranged weft-needles adapted to carry the weft through the sheds so formed and to form loops of weft, and means to engage said loops, substantially as described.

705,650. ARTIFICIAL STONE. VALENTIN COSTI, GEORGE DE GENFOT, and GUSTAVE LE GALL, DE TENTZ, Paris, France. Filed Oct. 22, 1901. Serial No. 79,567. (No specimens.)

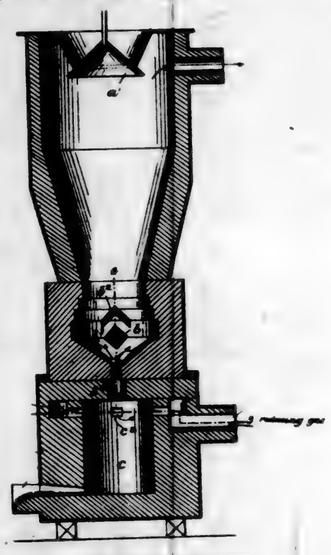
Claim.—An artificial stone, cement or similar product, consisting of the following elements combined in substantially the weight proportions named, viz: sulfate of aluminium fifteen parts; pulverized kieselguhr fifteen parts; calcinated magnesia fifty parts; chlorid of magnesium twenty-five parts; sulfate of magnesium seventy-five parts, and inert matter, as described, to give the required density and specific gravity, substantially as set forth.

705,651. REDUCTION OF METALS FROM THEIR ORES, &c., IN ELECTRICALLY-HEATED FURNACES. RAOUL C. COUTARDO, Sèvres, France. Filed Dec. 1, 1897. Serial No. 660,604. (No specimens.)

Claim.—1. The process of obtaining metal direct from the ore consisting in subjecting the lower end of a descending column of ore to a high temperature by a voltaic arc set in physical contact with the ore, and simultaneously causing a current of heated reducing-gas to flow upwardly through the column of ore, substantially as set forth.

2. The process herein described of obtaining metal direct from the ore, which consists in subjecting the ore to a high temperature solely by radiation and convection from a voltaic arc, and simultaneously causing a current of reducing-gas containing a carburizing agent to flow through the ore, whereby approximately the exact amount of carbon desired may be combined with the iron.

3. The process herein described of obtaining metal direct from the ore which consists in heating the ore solely by radiation and convection from a voltaic arc, whereby a temperature sufficiently high is obtained to fuse ores more refractory than iron ore, and causing a current of heated reducing-gas to flow upwardly through the ore.



705,652. UNION GARMENT. GERALDINE O. COOK, Boston, Mass. Filed May 31, 1898. Serial No. 682,103. (No model.)

Claim.—1. A union garment having a back extended substantially to the top of the shoulder and a front or bust-covering portion connected with the back at substantially the bottom of the arm-eyes to have an opening extending from the shoulder of the garment to the bottom of each arm-eye, and wings coöperating with the bust-covering portion to close the said opening, said wings being freely elastic in lateral direction, and means to detachably unite the wings to the bust-covering portion of the garment in substantially parallel vertical lines, leaving the front portion of the garment free to yield and conform to the contour of the bust.

2. A union garment having a back extended substantially to the top of the shoulder, and a front or bust-covering portion connected with the back at substantially the bottom of the arm-eyes only, the front portion being shorter than the back and presenting a transverse upper edge a' and downwardly-divergent free side edges a^2 leading therefrom to the bottom of the arm-eyes, sleeves having wings extended from their front portions and joined to the back at the top of the shoulder, said wings coöperating with the bust-covering portion to close the shoulder-openings, at each side of the neck-opening, and being freely elastic in lateral direction, whereby the entire front of the garment from one to the other arm-eye is free to yield and conform to the contour of the bust, and means to detachably unite the wings and bust-covering portion in substantially

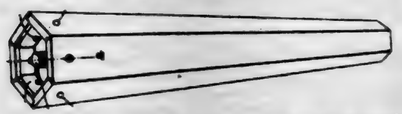
parallel vertical lines at a distance each side of the center line of the front portion.

3. A union garment presenting at its upper portion a back part, and a shorter front part, the front part covering the bust and having a top edge and inclined free side edges unattached to the back or sleeve of the garment to form shoulder-openings at each side of the neck-opening, said front covering the bust, sleeves having attached wings integral therewith and freely elastic in lateral direction, the sleeves being attached to the back of the garment from the bottom of the arm-eye to the top of the shoulder, the lateral edge of said wing being attached to the top edge of the back at the top of the shoulder, leaving the said wing and front free to overlap at the front of the shoulder, and close the shoulder-openings, said wings covering only a part of the bust next the shoulder, leaving a considerable portion of the upper edge of the front part of single thickness to cross the bust, said front being unrestrained against distension, between the arm-eyes, whereby it may yield and freely adapt itself to the contour of the bust, and suitable fastening devices located in substantially parallel lines to unite the free vertical edges of the said wings to the front of the garment, substantially as described.

4. A union garment presenting a back and a front united thereto substantially at the bottom of the arm-eyes, the top of said front being prolonged by knitted fabric presenting a top edge a' with side edges a^2, the said prolongation being knitted with a double-rib stitch or elastic knitted wales standing vertically with relation to the body of the garment, sleeves having attached wings freely elastic in lateral direction, and united to the back of the garment from the bottom of the arm-eye to the shoulder, and along the top of the shoulder to the neck, leaving two free parallel and substantially vertical edges of said wings to partially overlap the top edge of the front of the sleeves with the body, and fastenings arranged in parallel, substantially vertical lines to secure said wings at a considerable distance apart to the front of the garment, leaving the vertical wales at the top of the front entirely uncovered, in order that the front of the garment may freely adapt itself to the bust of the wearer, substantially as described.

5. A union garment having a back extended substantially to the top of the shoulder, a sleeve, a wing connected with the front half of the sleeve and attached at its upper edge to the back at the shoulder, the wing overlapping part of the bust, a front or bust-covering portion connected only with the back of the garment at substantially the bottom of the arm-eye, said front portion being unconnected with the front of the sleeve and said wing, providing an opening from the shoulder to the bottom of the arm-eye.

705,653. LEG OR STANDARD FOR FURNITURE, &c. WILBER G. DAVIS, Newton Center, Mass., assignor to Mellen Bray, Newton, Mass. Filed Oct. 7, 1901. Serial No. 77,762. (No model.)



Claim.—1. A leg or standard comprising a plurality of tapering stripe united at their edges to form a hollow tapering structure or shell which is polygonal in cross-section, and a spider having a flange to which said stripe are attached, and an attaching-screw carried by said spider within said structure at the center of its larger end, said screw being below the said larger end and separated from the surrounding walls of the structure by a space formed to receive a projecting socket on a body to be supported.

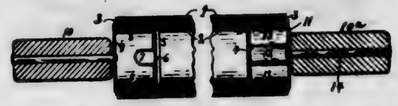
2. A leg or standard comprising a plurality of tapering stripe united at their edges to form a hollow tapering structure or shell which is polygonal in cross-section, a spider seated on the interior of said structure below its larger end and having a flange to which said stripe are attached, and an attaching-screw affixed to the center of the spider and projecting outwardly therefrom.

3. A leg or standard comprising a plurality of tapering stripe united at their edges to form a hollow tapering structure or shell which is polygonal in cross-section, a spider seated on the interior of said structure below its larger end and having a flange to which said stripe are attached, and an attaching-screw affixed to the center of the spider and projecting outwardly therefrom, said screw being separated from the surrounding walls of the structure by a space formed to receive a projecting socket on a body to be supported.

4. A leg or standard comprising a plurality of tapering stripe united at their edges to form a hollow tapering structure or shell which is polygonal in cross-section, a spider having on its margin a tapering polygonal flange seated on the interior of said structure below its larger end, said flange projecting outwardly from the spider, and at its center an inwardly projecting tubular boss and an attaching-screw inserted in and secured to said boss and projecting outwardly from the spider.

5. A leg or standard comprising a plurality of tapering stripe united at their edges to form a hollow tapering structure or shell which is polygonal in cross-section, a spider seated on the interior of said structure below its larger end and having a flange to which said stripe are attached, and a terminal secured to the lower end of said structure.

705,654. ROLLING-PIN. BERTHA DIUP, Stambaugh, Mich. Filed Mar. 13, 1902. Serial No. 97,979. (No model.)



Claim.—1. In a rolling-pin the combination with a hollow cylindrical body, of the internal removable cover 6 securable some distance inside the end of the roller, a sleeve 4 secured some distance in from the other end of the roller, and two handles 10 and 10^a having each a cylindrical portion adapted to be inserted and friction-held in the ends of the cylindrical body outside of said sleeve and cover 6.

2. In a rolling-pin the combination with a hollow cylindrical body, of the internal removable cover 6 securable some distance inside the end of the roller a sleeve 4 secured some distance in from the other end of the roller and two handles 10 and 10^a, having each a cylindrical portion adapted to be inserted and friction-held in the ends of the cylindrical body outside of said sleeve and cover 6, said cylindrical portions of the handles being formed one into a doughnut-cutter and the other into a biscuit-cutter.

705,655. GRAIN-DOOR ATTACHMENT. GABRIEL T. DOUTHIT, Vanwinkle, Ga. Filed Apr. 27, 1901. Serial No. 57,770. (No model.)

Claim.—1. In a device of the kind described, the combination with the door, of a perforated angle-plate, the forked hinge-like locking member having hooked ends to engage the perforations in the angle-plate, and means for attaching said locking member to the door, substantially as described.

2. The combination with the door, of the perforated angle-plate, the forked hinge-like locking member having hooked ends, the opposite end of said locking member being slotted, the eyebolt or staple over which the slotted end fits, the guide-eyes upon which the forks of the locking member rest, and the locking-pins passing through the eyes and connecting the door and member, substantially as described.

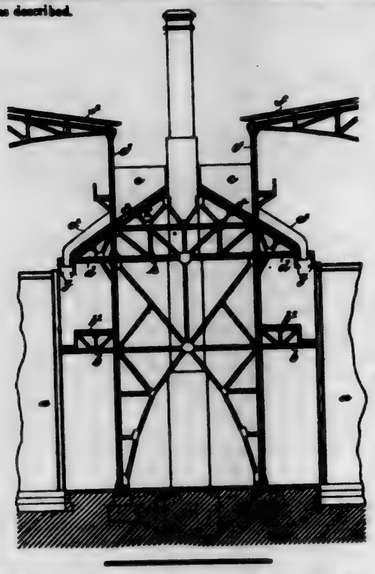
705,656. MEANS FOR CHARGING GAS-RETORTS. EDUARD DIETZ, Berlin, Germany. Filed May 3, 1902. Serial No. 105,515. (No model.)

Claim.—1. The combination with furnaces arranged to have a clear space between them, independent roof structures, posts to support the roof structures, beams connecting the posts supporting the independent roof structures and coal-bins supported on said beams within the free space between the roof structures, substantially as described.

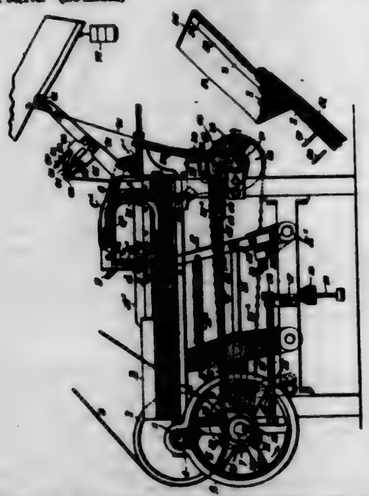
2. The combination with rows of furnaces arranged to have a clear space between them, independent roof structures, posts to support the roof structures, simple beams connecting the posts supporting the roof structures, coal-bins supported on said beams between the posts of adjacent roof structures and within the clear space and having inclined bottoms, coal-chutes forming a continuation of the inclined bottoms projecting within the building and cantilevers to support said coal-chutes, substantially as described.

3. The combination with furnaces arranged to have a clear space between them, independent roof structures, posts to support the roof structures independent of the furnaces, simple built-up beams connecting posts

supporting opposite roof structures, coal-bins supported on said beams between posts and within the clear space and having inclined bottoms, coal-chutes forming continuations of the inclined bottoms projecting within the building, cantilevers to support said chutes and a track supported on the under side of the cantilevers and below the ends of said chutes, substantially as described.



705,657. DOWELING-MACHINE. WILLIAM J. EDWARDS and WILLIAM H. WALTERS, Bayonne, N. J. Filed Mar. 14, 1902. Serial No. 98,178. (No model.)



Claim.—1. In a doweling-machine, the combination of a dowel-holder adapted to detachably hold a dowel, a fixed table upon which the boards to be doweled may be placed on opposite sides of the dowel-holder, means for pressing the edges of the boards together within the dowel entered therein, and means for automatically placing a dowel in the holder after each operation.

2. In a doweling-machine, a fixed table to receive the boards, a dowel-holder adapted to detachably hold a dowel and free to move longitudinally of the table, means for pressing the edges of the boards together to cause the dowel to enter them, and means for automatically placing a dowel in the holder after each operation.

3. In a doweling-machine, the combination of a table or support for the boards, a dowel-holder mounted to move longitudinally of the table and adapted to detachably hold the dowel, means for pressing the edges of the boards together to cause the dowel to enter them, a dowel-receptacle, a dowel-hopper, means for automatically transferring dowels from the hopper to the receptacle and means for transferring a dowel from the receptacle to the holder after each operation.

4. In a doweling-machine, the combination of a feed table or support for the boards, a dowel-holder free to move longitudinally of the table, adapted to detachably hold a dowel and be moved out of the path of the boards, a movable board-pressing member on one side of the dowel-holder, an abutment on the other, a dowel-receptacle and means for automatically introducing a dowel into the holder after each operation.

5. In a doweling-machine, the combination of a dowel-holder comprising opposed members whose opposite edges are formed with convergent bevels and between the faces of which a dowel may be detachably held, a feed-table upon which the boards may be placed on opposite sides of the dowel-holder and means for pressing the edges of the boards together to cause them to engage the dowel and move the dowel-holder out of the way.

6. In a doweling-machine, the combination of a dowel-holder comprising opposite members whose opposite edges are formed with convergent bevels and between the faces of which a dowel may be clamped, springs which force the two faces of the dowel-holder together to clamp a dowel between them, a feed-table upon which the boards may be placed on opposite sides of the dowel-holder and means for pressing the edges of the boards together to engage the dowels and displace the members of the dowel-holder.

7. In a doweling-machine, the combination of a feed-table upon which the boards to be doweled may be placed, a dowel-holder mounted to slide or move longitudinally of the feed-table from its normal central position and constructed to removably hold a dowel and to be pressed by the edges of the board out of the way, a sliding head at one end of the feed-table and an abutment at the other between which two members the boards are pressed to cause their edges to engage the dowel and move the dowel-holder out of the way and means for automatically placing a dowel in the dowel-holder after each operation.

8. In a doweling-machine, the combination of a feed-table upon which the boards to be doweled may be placed, a dowel-holder mounted to slide or move longitudinally of the feed-table from its normal central position and constructed to removably hold a dowel and to be pressed by the edges of the boards out of the way, a sliding head at one end of the feed-table and an abutment at the other between which two members the boards are pressed to cause their edges to engage the dowel and move the dowel-holder out of the way, means, acting after the doweling of two boards, to move the dowel-holder to and from the abutment and means for supplying the holder with another dowel while the holder is adjacent the abutment.

9. In a doweling-machine, the combination of a feed-table, a sliding head mounted at one end of the feed-table, an abutment and dowel-receptacle located at the other end of the table, a dowel-holder constructed and adapted to removably hold a dowel and be moved out of the way by pressure of the edges of the boards, means, acting after the doweling of two boards, for moving the dowel-holder into operative relation with the dowel-receptacle, means for then ejecting a dowel from the receptacle into the holder, and means for then returning the dowel-holder to its normal position.

10. In a doweling-machine, the combination of a feed-table, a sliding head mounted at one end of the feed-table, an abutment and dowel-receptacle located at the other end of the table, a dowel-holder constructed and adapted to removably hold a dowel and be moved out of the way by pressure of the edges of the boards, means, acting after the doweling of two boards, for moving the dowel-holder into operative relation with the dowel-receptacle, means for then ejecting a dowel from the receptacle into the holder, means for then returning the dowel-holder to its normal position, and means for automatically supplying the dowel-receptacle with dowels.

11. In a doweling-machine, the combination of a dowel-holder comprising opposed members whose opposite edges are formed with convergent bevels and between the faces of which a dowel may be detachably held, a feed-table upon which the abutment may be placed on opposite sides of the dowel-holder, a presser bearing upon the boards and holding them flat upon the feed-table while their edges are being forced together and means for pressing the edges of the boards together to engage the dowel and move the dowel-holder out of the way.

12. In a doweling-machine, the combination of a dowel-holder comprising opposite members whose opposite edges are formed with convergent bevels and between the faces of which a dowel may be clamped, springs which force the two faces of the dowel-holder together to clamp a dowel between them, a feed-table upon which the boards may be placed on opposite sides of the dowel-holder, a presser bearing upon the boards and holding them flat upon the feed-table while their edges are being forced together and means for pressing the edges of the boards together to engage the dowels and displace the members of the dowel-holder.

13. In a doweling-machine, the combination of a feed-table upon which the boards to be doweled may be placed, a presser bearing upon the boards and holding them flat upon the feed-table while their edges are being forced together, a dowel-holder mounted to slide or move longitudinally of the feed-table from its normal central position and constructed to removably hold a dowel and to be pressed by the edges of the boards out of the way, a sliding head at one end of the feed-table and an abutment at the other between which two members the boards are pressed to cause their edges to engage the dowel and move the dowel-holder out of the way and means for automatically placing a dowel in the dowel-holder after each operation.

14. In a doweling-machine, the combination of a feed-table upon which the boards to be doweled may be placed, a presser bearing upon the boards and holding them flat upon the feed-table while their edges are being forced together, a dowel-holder mounted to slide or move longitudinally of the feed-table from its normal central position and constructed to removably hold a dowel and to be pressed by the edges of the boards out of the way, a sliding head at one end of the feed-table and an abutment at the other between which two members the boards are pressed to cause their edges to engage the dowel and move the dowel-holder out of the way, means, acting after the doweling of two boards, to move the dowel-holder to and from the abutment and means for supplying the holder with another dowel while the holder is adjacent the abutment.

15. In a doweling-machine, the combination of a feed-table, a presser bearing upon the boards and holding them flat upon the feed-table while their edges are being forced together, a sliding head mounted at one end of the feed-table, an abutment and dowel-receptacle located at the other end of the table, a dowel-holder constructed and adapted to removably hold a dowel and to be moved out of the way by pressure of the edges of the boards, means, acting after the doweling of two boards, for moving the dowel-holder into operative relation with the dowel-receptacle, means for then ejecting a dowel from the receptacle into the holder, and means for then returning the dowel-holder to its normal position.

16. In a doweling-machine, the combination of a feed-table, a presser bearing upon the boards and holding them flat upon the feed-table while their edges are being forced together, a sliding head mounted at one end of the feed-table, an abutment and dowel-receptacle located at the other end of the table, a dowel-holder constructed and adapted to removably hold a dowel and be moved out of the way by pressure of the edges of the boards, means, acting after the doweling of two boards, for moving the dowel-holder into operative relation with the dowel-receptacle, means for then ejecting a dowel from the receptacle into the holder, means for then returning the dowel-holder to its normal position, and means for automatically supplying the dowel-receptacle with dowels.

17. In a doweling-machine, comprising a feed-table, a sliding plunger at one end thereof, an abutment and a dowel-receptacle at the other end thereof, a dowel-holder adapted to removably hold a dowel and be forced out of the way by the edges of the boards, a dowel-holder frame slidable or movable longitudinally of the table to and from the dowel-receptacle and a feed device for ejecting a dowel from the receptacle and delivering it to the dowel-holder, the combination of a continuously-driven driving-shaft, an intermittently-driven main shaft and mechanism for respectively operating the sliding head, the dowel-holder and the dowel-feed devices for the purposes herein set forth.

18. In a doweling-machine comprising a feed-table, a sliding plunger at one end thereof, an abutment and a dowel-receptacle at the other end thereof, a dowel-holder adapted to removably hold a dowel and be forced out of the way by the edges of the boards, a dowel-holder frame slidable or movable longitudinally of the table to and from the dowel-receptacle, a feed device for ejecting a dowel from the receptacle and delivering it to the dowel-holder and a presser-plate for holding boards against the table, the combination of a continuously-driven driving-shaft, an intermittently-driven main shaft and mechanism for respectively operating the sliding head, the dowel-holder and the dowel-feed devices for the purposes herein set forth and for raising and lowering the presser-plate.

19. In a doweling-machine comprising a feed-table, a sliding plunger at one end thereof, an abutment and a dowel-receptacle at the other end thereof, a dowel-holder adapted to removably hold a dowel and be forced out of the way by the edges of the boards, a dowel-holder frame slidable or movable longitudinally of the table to and from the dowel-receptacle, a feed device for ejecting a dowel from the receptacle and delivering it to the dowel-holder, a dowel-hopper and means for automatically delivering dowels from the hopper to the dowel-receptacle, the combination of a continuously-driven driving-shaft, an intermittently-driven main shaft and mechanism for respectively operating the sliding head, the dowel-holder and the dowel-feed devices for the purposes herein set forth and for automatically transferring dowels from the hopper to the dowel-receptacle.

20. In a doweling-machine, the combination of a feed-table, a sliding head at one end thereof, an abutment at the other, a pair of dowel-holders independently movable longitudinally of the table and constructed and adapted to removably hold dowels and to be moved out of the way by the pressure of the edges of the boards and means for automatically supplying each holder with a dowel after each operation.

21. In a doweling-machine, the combination of a feed-table, a sliding head mounted at one end thereof, at the other end thereof an abutment and two dowel-receptacles, a pair of dowel-holders independently movable longitudinally of the table and each constructed to removably hold a dowel and be pressed out of the way by the edges of the boards, means, acting after the doweling of the two boards, for moving the two dowel-holders into operative relation to the respective dowel-receptacles, means for then transferring a dowel from each receptacle to its corresponding dowel-holder and means for returning the dowel-holders to their normal position.

22. In a doweling-machine, the combination of a feed-table, a sliding head at one end thereof, at the other end thereof an abutment and two dowel-receptacles, a pair of dowel-holders independently movable longitudinally of the table and each constructed to removably hold a dowel and be pressed out of the way by the edges of the boards, means, acting after the doweling of the two boards, for moving the two dowel-holders into operative relation to the respective dowel-receptacles, means for then transferring a dowel from each receptacle to its corresponding dowel-holder, means for returning the dowel-holders to their normal position and means for automatically supplying dowels to the dowel-receptacle.

23. In a doweling-machine, the combination of a feed-table, a presser-plate for holding the boards against the table while being doweled, a sliding head mounted at one end of the table, at the other end thereof an abutment and two dowel-receptacles, a pair of dowel-holders independently movable longitudinally of the table and each constructed to removably hold a dowel and be moved out of the way by the edges of the boards, means, acting after the doweling of the two boards, for moving the two dowel-holders into operative relation to the respective dowel-receptacles, means for then transferring a dowel from each receptacle to its corresponding dowel-holder and means for returning the dowel-holders to their normal position.

24. In a doweling-machine, the combination of a feed-table, a sliding head mounted at one end thereof and an abutment at the other, dowel-holders mounted at the front and rear edges of the table and constructed to slide independently of each other, toward the abutment end of the table, under the stress of the advancing board and each constructed to removably hold a dowel and be pressed out of the way by the edges of the board, dowel-receptacles at the abutment end of the table arranged respectively in line with the dowel-holders, means for positively moving the dowel-holders into operative relation to each receptacles, means for then delivering a dowel from each receptacle to its corresponding dowel-holder and means for returning the dowel-holders to their normal position.

25. In a doweling-machine, the combination of a feed-table, a sliding head mounted at one end thereof and an abutment at the other, dowel-holders mounted at the front and rear edges of the table and constructed to slide independently of each other, toward the abutment end of the table, under the stress of the advancing board, and each constructed to removably hold a dowel and be pressed out of the way by the edges of the board, dowel-receptacles at the abutment end of the table arranged respectively in line with the dowel-holders, means for positively moving the dowel-holders into operative relation to each receptacles, means for then delivering a dowel from each receptacle to its corresponding dowel-holder, means for returning the dowel-holders to their normal position, a dowel-hopper and means for automatically feeding dowels from the hopper to the dowel-receptacles.

26. In a doweling-machine, the combination with a feed-table, sliding head, dowel-holder, and dowel-receptacle, of a part or bracket having a dowel-channel communicating with the receptacle, an oscillating dowel-hopper mounted at the upper end thereof and comprising a bottom with inclined convergent parts with a slot at the line of intersection thereof and a channeled piece located below the slot and registering with the dowel-channel before mentioned when the hopper is in one of the positions into which it may be oscillated.

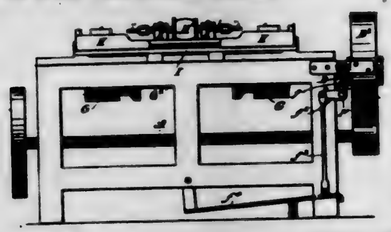
27. In a doweling-machine, the combination with a feed-table, sliding head, dowel-holder and dowel-receptacle, of a part of bracket having a dowel-channel communicating with the receptacle, an oscillating dowel hopper mounted at the upper end thereof and comprising a bottom with inclined convergent parts with a slot at the line of intersection thereof, a channeled piece located below the slot and registering with the dowel-

channel before mentioned when the hopper is in one of the positions into which it may be oscillated, and means, acting upon the dowels in the last-named dowel-channel, for permitting them to slide one by one into the dowel-receptacle.

20. The combination with the dowel-receptacle of a part or bracket, as 52, having therein an inclined dowel-channel opening to the receptacle at its lower end, an oscillating hopper mounted at the upper end of said channel and comprising a bottom portion formed by the convergent parts with a slot at the intersection of said parts and in rear of the axis of oscillation and a channeled piece arranged below the slots and communicating with the channel 52 when the hopper is in one of the positions into which it may be oscillated.

20. The combination with the dowel-receptacle of a part or bracket, as 52, having therein an inclined dowel-channel opening to the receptacle at its lower end, an oscillating hopper mounted at the upper end of said channel and comprising a bottom portion formed by convergent parts with a slot at the intersection of said parts and in rear of the axis of oscillation, a channeled piece arranged below the slots and communicating with the channel 52 when the hopper is in one of the positions into which it may be oscillated, and final devices acting upon the dowels in the channel of part 53 to permit them to slide, one by one, into the dowel-receptacle.

705,658. MACHINE FOR DRILLING EDGES OF BOARDS. WILLIAM J. EDWARDS and WILLIAM H. WALTERS, Bayonne, N. J. Filed Mar. 14, 1902. Serial No. 98,171. (No model.)



Claim.—1. The combination of a main frame, parallel drill-spindles mounted in bearings thereon and adapted to move freely endwise in their bearings and each equipped with right and left hand drills at their opposite ends, carriages mounted opposite the ends of the spindles and means for simultaneously advancing the carriages toward the drills and then retracting them.

2. The combination of a main frame, a drill-spindle mounted in bearings thereon and adapted to move freely endwise in its bearings and equipped with right and left hand drills at its opposite ends, carriages mounted opposite the ends of the spindle and means for simultaneously advancing the carriages toward the drills and then retracting them.

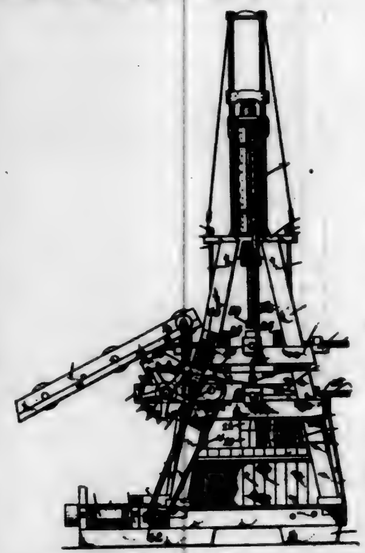
3. The combination of a main frame, a continuously-rotated driving-shaft mounted in bearings thereon, a pinion on the shaft, a normally stationary main shaft, a gear loosely mounted thereon and engaging the pinion, clutch devices between the normally stationary shaft and the gear thereon whereby at the will of the operator the normally stationary shaft may be driven through one revolution, cams sliding on the normally stationary shaft and connected to move together, carriages mounted to slide toward and from each other during each revolution of the normally stationary shaft, means for so actuating them from the cams, and parallel drill-spindles, mounted in bearings between the carriages, adapted to move freely endwise and each equipped, with a driving-pulley located between its bearings and with right and left hand drills at its opposite ends.

4. The combination of a main frame, a drill-spindle mounted in bearings thereon, adapted to move freely endwise in its bearings and equipped with right and left hand drills at its opposite ends, carriages mounted opposite the ends of the spindle, cams coupled to slide together on their driving-shaft parallel with the drill-spindle and connections between the cams and carriages for simultaneously advancing the latter toward the drills and then retracting them.

5. The combination of a main frame, a drill-spindle mounted in bearings thereon, adapted to move freely endwise in its bearings and equipped with right and left hand drills at its opposite ends, carriages mounted opposite the ends of the spindle and mechanism, for simultaneously advancing the carriages toward the drills and then retracting them, comprising driven mounted to move together in a direction parallel with the line of motion of the carriages for the purpose set forth.

705,659. WOOD-SPLITTING MACHINE. OMAR S. BALDWIN, Aiken, Pa. Filed Aug. 6, 1901. Serial No. 70,995. (No model.)

Claim.—1. A machine for splitting wood or other material having stationary splitting mechanism, mechanism adapted to support the wood or other material while it is being split and mechanism adapted to drive the wood or other material against the splitting mechanism.



2. A machine for splitting wood or other material comprising a frame, splitting mechanism in said frame, gripping mechanism above the splitting mechanism, and a hammer device above the gripping mechanism adapted to drive a log in the gripping mechanism upon the splitting mechanism.

3. A machine for splitting wood or other material comprising a frame, splitting mechanism in said frame having a plurality of splitting devices each having a different number of blades, gripping mechanism, means for driving a log in the gripping mechanism upon the splitting mechanism and means for adjusting the splitting mechanism to arrange the desired splitting device beneath the gripping mechanism.

4. A machine for splitting wood or other material comprising a frame, splitting mechanism in said frame, a hammer device, gripping mechanism between the splitting mechanism and the hammer device; said hammer device being adapted to drive a log in the gripping mechanism against the splitting mechanism.

5. A machine for splitting wood or other material comprising a frame, splitting mechanism in said frame having a plurality of splitting devices each having a different number of blades, gripping mechanism, means for driving a log in the gripping mechanism against the splitting mechanism and means for adjusting the splitting mechanism to operatively arrange the desired splitting device with respect to the gripping mechanism.

6. A machine for splitting wood comprising splitting mechanism, gripping mechanism above the splitting mechanism, hammer mechanism above the gripping mechanism, side conveying mechanism on each side of the splitting mechanism and end conveying mechanism transverse to the side conveying mechanism.

7. A machine for splitting wood comprising splitting mechanism having a lateral adjusting movement only, hammer mechanism having a path of movement toward or from the splitting mechanism; gripping mechanism between the splitting mechanism and the hammer mechanism and mechanism for shifting the splitting mechanism.

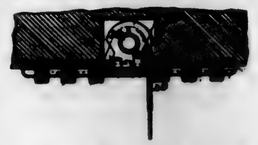
8. A machine for splitting wood comprising splitting mechanism gripping mechanism above the splitting mechanism, hammer mechanism above the gripping mechanism adapted to drive the wood or other material to be split against the splitting mechanism and conveying mechanism.

9. In a splitting-machine, a splitting device comprising a plurality of independent portions and each portion having a different number of splitting-blades, means for laterally adjusting said splitting device, hammer mechanism, and gripping mechanism between the splitting device and hammer mechanism.

10. In a splitting-machine, the combination of splitting mechanism, hammer mechanism and gripping mechanism between the splitting mechanism and hammer mechanism comprising a series of movable gripping-blocks.

11. In a splitting-machine, the combination of splitting mechanism, hammer mechanism having a path of movement toward or from the splitting mechanism, and gripping mechanism adapted to hold a log or other article in position between the splitting mechanism and hammer mechanism.

705,660. LOCK. ALAN R. FERGUSON, New York, N. Y. Filed Apr. 24, 1901. Serial No. 57,177. (No model.)



Claim.—1. In a lock mechanism, the combination of a bolt, means for controlling said bolt and adapted to be shifted by a key; means adapted to engage and positively prevent movement of said controlling means except when operated by its key; and push devices for controlling said preventing means.

2. In a lock mechanism, organized to be operated by a key or by independent means, the combination of a bolt, means adapted to be engaged and actuated by a key for shifting said bolt; and push devices for controlling the operation of said means independent of said key.

3. In a lock mechanism, the combination of a bolt; rotary means having peripheral key-engaging projections for controlling said bolt and adapted to be shifted by a key; means for preventing movement of said controlling means; and means for controlling said preventing means; the organization being such that the preventing means is ineffective to prevent the operation of said bolt by the proper key, but is effective to prevent the operation of such bolt in the absence of such key until the proper manipulation of the combination.

4. In a lock mechanism, the combination of a bolt; key-operated means for controlling the bolt; means engaging and locking the controlling means; and one or more push devices operative to release said locking means.

5. In a lock mechanism, the combination of a rotary bolt adapted to be shifted by a key; rotary means having peripheral key-engaging projections for controlling it; locking means for said rotary means; and push-buttons for controlling said locking means.

6. In a lock mechanism, the combination of a rotary bolt adapted to be shifted by a key; rotary means having peripheral key-engaging projections for controlling it; locking means for said rotary means; push-buttons for controlling said locking means; and means for shifting said controlling means after it is unlocked.

7. In a lock mechanism, the combination of a rotary bolt adapted to be shifted by a key; rotary means for controlling it; locking means for said rotary means; push devices for controlling said locking means; and means embodying gearing for shifting said controlling means after it is unlocked.

8. In a lock mechanism, the combination of a bolt; a tumbler adapted to be actuated by a key; means for locking each tumbler against movement; and a plurality of push-buttons for controlling the operation of said locking means.

9. In a lock mechanism, the combination of a bolt maintained in its locking position by a spring and shiftable by a key against the action of such spring, means for controlling the movement of said bolt independently of the key, and comprising a plurality of push devices, a part thereof being assembled in combination, whereby on the operation of the proper devices the bolt may be withdrawn from its locking position and on the operation of any part of such devices not comprised in the combination the bolt is more positively locked in its locking position.

10. In a lock mechanism, the combination of a bolt adapted to be shifted by a key, means for controlling the movement of said bolt independently of the key, and comprising a plurality of push devices, a part thereof being assembled in combination whereby on the operation of the proper devices the bolt may be withdrawn from its locking position and on the operation of any part of such devices not in the combination the bolt is thereby more positively locked in its locking position, the organization being such that the key may operate the bolt independently of any previous manipulation of the push devices.

11. In a lock, the combination of a bolt automatically shiftable under certain conditions into its unlocking position and also shiftable into its unlocking position by a key; and means for preventing the automatic operation of said bolt and controlled by combination means.

12. In a lock mechanism organized to be operated by a key or by independent means, the combination of a rotary bolt; means engaged and actuated by a key for rotating said bolt into its unlocking position on the insertion of such key; and push-buttons for controlling the operation of said bolt independently of said key.

13. In a lock mechanism organized to be operated by a key or by independent means, the combination of a rotary bolt; means having key-engaging projections for rotating said bolt on the insertion of the proper key; and for controlling said bolt independently of said key.

14. In a lock mechanism organized to be operated by a key or by independent means, the combination, with a rotary and oscillatory bolt, of means having key-engaging projections for rotating said bolt on the insertion of the proper key, and means for controlling said bolt independently of said key.

15. In a lock, the combination of a bolt; means for automatically shifting said bolt under certain conditions into its unlocking position, said bolt also shiftable into its unlocking position by a key; and means for preventing the automatic operation of said bolt and controlled by push devices.

16. In a lock mechanism, the combination of a bolt; means for automatically shifting said bolt under certain conditions into its unlocking position, said bolt also shiftable into its unlocking position by a key; means for preventing the automatic operation of said bolt and controlled by push devices, the improper manipulation of which will more positively lock the bolt against automatic movement.

17. In a lock, the combination of a bolt; means for shifting said bolt in one direction into its unlocking position under certain conditions, said bolt also shiftable in another direction into its unlocking position by a key, and combination means for controlling its movement in the first-mentioned direction.

18. In a lock, the combination of a bolt, means for automatically shifting said bolt in one direction into its unlocking position under certain conditions, said bolt also shiftable in another direction into its unlocking position by a key; and one or more push devices for controlling the automatic operation of said bolt.

19. In a lock mechanism, the combination of a bolt adapted to be operated by a key; push-button mechanism for controlling the operation of said bolt independently of said key and comprising a bar having notches; and means coöperating with the bolt for preventing its movement except when shifted by the key, and push devices having parts projecting into the notches of said bar for preventing the movement of such bar.

20. In a lock mechanism, the combination with a spring-controlled bolt operative by a key under certain conditions, of means for locking said bolt against movement except when operated by the key; and means for controlling said locking means and comprising a plurality of push-buttons, a part thereof being assembled in combination whereby on the operation of the proper buttons the unlocking of the bolt is effected, and on the operation of any part of such buttons not in the combination the bolt is maintained in its locking position.

21. In a lock mechanism, the combination, with a spring-actuated rotary bolt, of rotary means for controlling it; and means in engagement with said rotary means for preventing the rotation thereof and embodying a plurality of push-pins.

22. In a lock mechanism, the combination, with a bolt, of means adapted to be actuated by a key for controlling it; means for locking said means against movement and comprising a device having a part thereof in engagement with said controlling means; and a push-pin for releasing said device.

23. In a lock mechanism, the combination, with a spring-actuated bolt, of a tumbler connected therewith and adapted to be shifted by a key to shift said bolt; means for preventing the movement of said tumbler in the absence of a key and comprising a member in engagement with said tumbler and having a plurality of recesses; and a plurality of push-pins having projections entering said recesses, the organization being such that on the release of said push-pins from said recessed member the bolt will be shifted.

24. In a lock mechanism, the combination, with a spring-actuated rotary bolt, of a tumbler connected therewith and adapted to be shifted by a key to shift said bolt; means for preventing the movement of said tumbler in the absence of the key and comprising a sliding member in engagement with said tumbler and having a plurality of recesses; and a plurality of push-pins having projections entering said recesses, the organization being such that on the release of said push-pins from said recessed member the bolt will be shifted.

25. In a lock mechanism, the combination, with a spring-actuated bolt, of a tumbler connected therewith and adapted to be shifted by a key; means for preventing movement of the bolt in the absence of a key and comprising a shiftable member having a series of recesses; and a plurality of push pins or buttons having projections in engagement with said shiftable member, the organization being such that on the release of certain of the push-buttons from the shiftable member the bolt will be

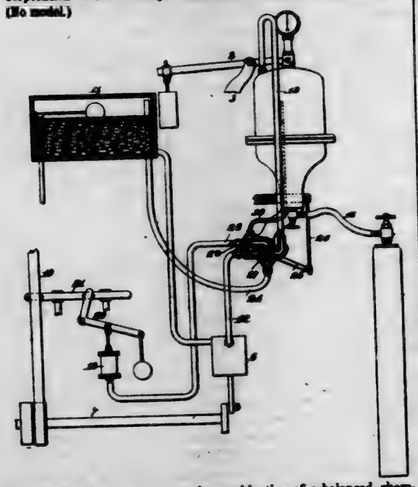
shifted into its unlocking position, and on the manipulation of certain of the push-buttons the bolt will be further locked against movement.

26. In a lock mechanism, the combination, with a spring-actuated rotary bolt, of a tumbler connected therewith and having one or more projections thereon and adapted to be operated in one direction by a key having recesses corresponding with said projections; means for preventing the movement of said bolt in an opposite direction and comprising a sliding bar having a plurality of recesses; and push-pins having projections in engagement with said recesses, the organization being such that on the release of the projections from the bar the bolt is shifted by its spring into an unlocking position.

27. In a lock mechanism, the combination with a bolt, of a spring-actuated tumbler for controlling it; shiftable means in engagement with the tumbler for preventing the movement of said tumbler; and combination-operated means effective to release said shiftable means and thereby permit the operation of the tumbler.

28. In a lock mechanism, the combination, of a bolt adapted to be operated by a key, a tumbler; and means for controlling the movement of said tumbler independently of the key and comprising a plurality of push pins or buttons and means connected therewith and with said tumbler and effective to lock the tumbler against movement until the proper manipulation of the push-buttons.

705,661. CARBONATOR. GUSTAV A. FLEISCH, Brooklyn, and HERBY A. HALL, New York, N. Y., and JOHN DOHERTY, Ashbrook, N. J., assignors to the American Soda Fountain Company, Boston, Mass., a Corporation of New Jersey. Filed Mar. 7, 1901. Serial No. 50,306. (No model.)

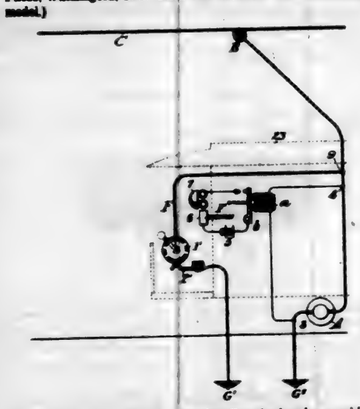


Claim.—1. In a carbonator, the combination of a balanced chamber for containing carbonated liquid, a pump for supplying liquid to said chamber, a controlling-cylinder for starting and stopping the pump, a regulating-valve between the pump and said chamber, said valve also normally providing an exhaust from said cylinder, means for operating said valve by vertical movements of the chamber, a passage connecting the pump with said cylinder, and a relief-valve in said passage, substantially as and for the purposes set forth.

2. In a carbonator, the combination of a balanced chamber for containing carbonated liquid, a pump for supplying liquid to said chamber, a controlling-cylinder for starting and stopping the pump, a regulating-valve between the pump and said chamber, said valve also normally providing an exhaust from said cylinder, means for operating said valve by vertical movements of the chamber, a passage connecting the pump with said cylinder, and an overbalanced relief-valve in said passage, substantially as and for the purposes set forth.

3. In a carbonator, the combination of a balanced chamber for containing carbonated liquid, a pump for supplying liquid to said chamber, a controlling-cylinder for starting and stopping the pump, a regulating-valve between the pump and said chamber, said valve also normally providing an exhaust from said cylinder, means for operating said valve by vertical movements of the chamber, a passage connecting the pump with said cylinder, an overbalanced relief-valve in said passage, and a pipe connecting the space above said relief-valve with the interior of the chamber, substantially as and for the purposes set forth.

705,662. ELECTRIC SIGNAL FOR RAILWAY-CARS. JOSEPH W. PRICE, Washington, D. C. Filed Jan. 28, 1902. Serial No. 91,182. (No model.)



Claim.—1. In an electric cab-signaling device the combination of the stationary generator D, the line C, contact traveler B, and motor A, with a signaling-magnet included in a shunt around the said motor and a transmitting device at a distant station included in the circuit of the generator substantially as described.

2. In an electric signaling device the combination of a stationary generator D, the line C carrying a current from the said generator, a contact traveler, and a cab-motor receiving its current from the line through the said contact traveler, with a comparatively high-resistance receiving device included in a shunt around the said motor, all at one station, and a transmitting device at another station on the line of the said conductor and connected with the same, substantially as described.

3. In an electric cab-signaling device the combination of the stationary generator D, the line C, contact traveler B, and motor A, with a relay-magnet of high resistance included in a shunt around the said motor, said relay controlling a local circuit, and a definite and distinctive signal-transmitting device at a distant station controlling the circuit of the generator, substantially as described.

4. In an electric cab-signaling device the combination of the stationary generator D, the line C, contact traveler B, and motor A, with a receiving device included in a shunt around the said motor, a transmitting device, also in a shunt around the said motor, and duplicate apparatus at a second station, substantially as described.

5. In an electric signaling device the combination of a stationary generator D, line C, contact traveler B and motor A, with a receiving-magnet of comparatively high resistance included in a shunt around the said motor, a definite signal-transmitting device, also included in a shunt around the motor, at one moving station, and a definite signal-transmitting device at a ground-station controlling the circuit of the line C, together with a shunt around the said transmitting device, including a receiving-magnet, substantially as described.

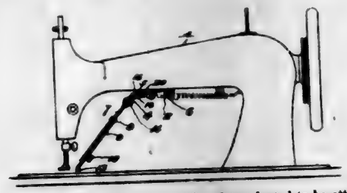
6. In an electric signal device, the combination of a stationary generator D, the line C carrying a current from the said generator, a contact traveler, and a cab-motor receiving its current from the line through the said contact traveler, with a comparatively high resistance receiving-magnet included in a shunt around the said motor, all at one station, and a transmitting device at another station on the line of the said conductor and connected with the same, substantially as described.

7. In an electric cab-signaling device, the combination of the stationary generator D, the line C, contact traveler B and motor A, with a signal-receiving device between the said contact traveler and the ground or common return, and a distinct signal-transmitting device at another station controlling the said receiving device and connected to said line C, substantially as described.

8. The combination of the definite and distinctive transmitting device and the generator D, both at one station; the line C and the contact traveler B; together with the motor A and a definite and distinctive signal-transmitting device and a receiving device both in the motor branch between the said contact traveler and the common return, at a second station, substantially as described.

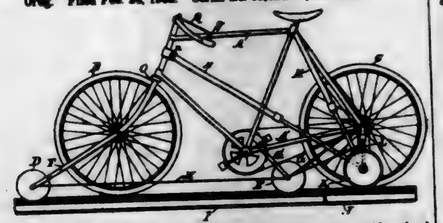
705,663. GUIDE FOR SEWING-MACHINES. FRANK W. GERLACH and FRANK W. MOORE, Keeton, Ohio. Filed Feb. 6, 1902. Serial No. 92,826. (No model.)

Claim.—1. The combination with a gage, of a plate adapted to be attached to the arm of a sewing-machine, an extension hinged to said plate by a transverse pivot, a vertical pivot for hinging the upper end of said gage to the outer end of said extension, and means for holding the gage in elevated position under the arm of the sewing-machine, said means consisting of a catch-hook projecting from said plate, substantially as set forth.



2. The combination with a gage, of a plate adapted to be attached to the arm of a sewing-machine, an extension hinged to said plate by a transverse pivot, a vertical pivot for hinging the upper end of said gage to the outer end of said extension, means for holding the gage in elevated position under the arm of the sewing-machine, and means for limiting the outward movement of the gage with respect to the extension, said means consisting of a stop-lip projecting downwardly from the gage and adapted to abut against the extension, substantially as set forth.

705,664. BICYCLE ATTACHMENT. FRANK GOSCH, Shelburn Oreg. Filed Feb. 24, 1902. Serial No. 95,894. (No model.)



Claim.—1. The combination with a bicycle, of a flanged guide-wheel in front of each bicycle-wheel, the forks F G G', which respectively connect the guide-wheels D E with the axles of the front and rear wheels of the bicycle and with the fork A', rods H H, unflanged wheel K and lateral brace-rods L M N, as and for the purpose set forth.

2. The fork G' combined with the guide-wheel E and the bicycle-fork A' as shown and described.

3. The fork Q having the arms q q at one end and clamped at the other to the handle-bar, for the purpose set forth.

705,665. CORE-OVEN. THOMAS L. GRIFFITH, Cincinnati, Ohio. Filed May 27, 1901. Serial No. 62,047. (No model.)

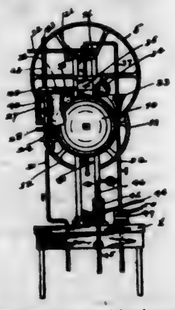
Claim.—1. In a core-oven the front frames having shelf-openings and perforated bosses arranged centrally on dividing cross-rails, the rear shell secured to the front frame, the bottom perforated to receive the heated gases from the furnace and the top perforated to allow the escape of the gases and vapors from the oven, the door for closing the front openings having centrally-perforated bosses in alinement with the bosses on the cross-rails of the front frame, the rod or shaft passing through said bosses centrally pivoting the doors to the front frame, the semicircular shelves secured to the inside of the doors, and the furnace for heating the oven, substantially as shown and described.

2. The herein-before-described front for core-ovens consisting of the metal frame having openings to receive the core-supporting shelves, the cross-rails of said frame having centrally-arranged perforated bosses, the doors for closing the openings in the frames having also centrally-perforated bosses in alinement with the bosses on the cross-rails of the frame, the vertical rod or shaft pivoting the doors to the front frame, and the semicircular shelves secured to the inside faces of the door.

3. In a portable core-oven the combination of the oven-body semicircular in cross-section the front of which has shelf-openings, the top perforated to permit the escape of gases and vapors, the bottom plate perforated to admit the gases from the furnace and having guides on its under side parallel with the side of said opening to receive the outwardly-turned flanges of the furnace, the doors for closing the front of the furnace centrally pivoted between the cross-rails of the furnace-front, the semicircular shelves secured to the inner faces of the doors, the furnace comprising the fire-chamber, ash-pit and suitable doors for the same, the top of the fire-chamber having lateral flanges to slide in the guides on the bottom of the oven, and the legs to support the oven-body, substantially as hereinbefore set forth.

4. In a core-oven the combination substantially as hereinbefore set forth of the oven-body, the removable legs supporting it above the floor, the bottom of said oven-body having a rectangular perforation of substantially the size of the fire-chamber of the furnace, guides on the bottom of the oven to receive flanges projecting laterally from the top of the furnace, the furnace secured in said flanges, the centrally-pivoted doors in front of the oven-body, the semicircular shelves secured to the inner faces of said doors, the escape-opening in the top of the oven and the perforated plate larger than the opening in the bottom of the oven and having legs at its corners to rest upon the bottom of the oven whereby the gases arising from the furnace are evenly distributed through the oven-body and core-shelves before reaching the escape or pipe at the top of the oven.

705,666. COLLAR TURNING AND IRONING MACHINE. CHAS. C. GRIDLEY, Columbus, Ohio. Filed Sept. 5, 1900. Serial No. 29,624. (No model.)



Claim.—1. In a collar turning and ironing machine, the combination with a framework, a curved turner-head 33 having a steam-passage therethrough, a rotating grooved collar-guide wheel 34 adjacent to said turner-head and a fixed hollow ironing-head 35 having an under side groove and having a steam-pipe connection therewith, of a rotating disk 10 having its edge portion adapted to turn through the groove of said ironing-head, substantially as specified.

2. In a collar turning and ironing machine, the combination with a framework, a curved turner-head 33 having a steam-passage therethrough, a rotating grooved guide-wheel 34 adjacent to said turner-head, a fixed hollow steam-supplied ironing-head 35 having a grooved under side and rotating concave-convex disk 10 having its edge running through said ironing-head groove, of a steam-heated journaled cylinder 30 and a rotating cloth-covered roll adjacent thereto, substantially as specified.

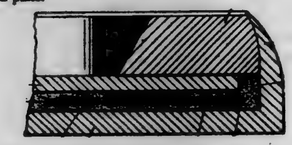
705,667. PROCESS OF SOLIDIFYING FORMALDEHYDE. ROBERT GRIFFIN, Berlin, Germany. Filed Aug. 3, 1901. Serial No. 70,253. (No specimens.)

Claim.—The process for the manufacture of solidified solutions of formaldehyde which consists in mixing small quantities of sodium soap with an aqueous solution of formaldehyde and dissolving the soap in the formaldehyde solution with the application of a gentle heat.

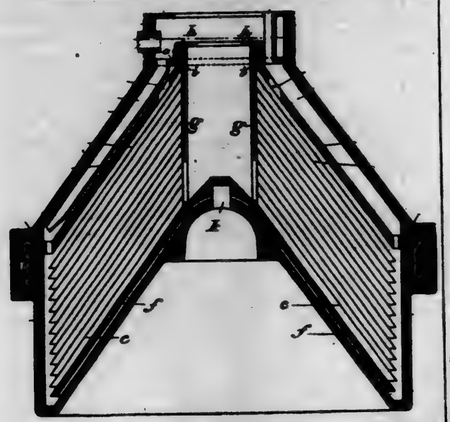
705,668. ELECTRIC HEATER. WILLIAM S. HADAWAY, Jr., New York, N. Y. Filed Sept. 24, 1898. Serial No. 691,703. (No model.)

Claim.—1. In an electric heater, an outer shell having an upturned edge narrowing upward, a resistance within said shell, a layer of mica under pressure on each side of said resistance, a compression-plate, and a ring between said plate and said narrowed edge.

2. In an electric heater, an outer shell having an upturned edge narrowing upward, a heat-producing agent and a diffusion agent both within said shell, a compression-plate for closing said shell and a ring of metal cast between the narrowed portion of said upturned edge and said compression-plate.



705,669. LIQUID-SEPARATOR. SOREN C. HANSEN Copenhagen Denmark. Filed Jan. 15, 1902. Serial No. 43,261. (No model.)



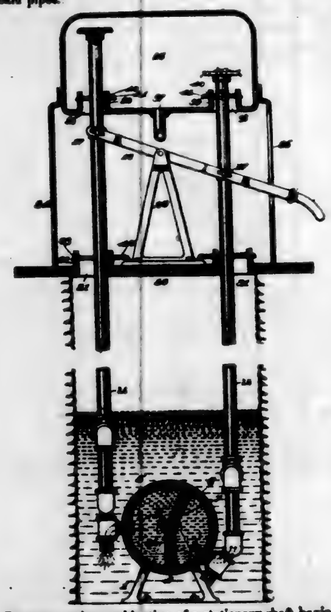
Claim.—1. In a separator of the character herein set forth, in combination, a two-part outer drum, an inner conical plate, and conical partitions attached to said plate, the lower margin of the said plate being clamped between the upper and lower parts of the drum, substantially as and for the purposes explained.

2. In a separator of the character herein set forth, in combination, a two-part outer drum, an inner conical plate of which the lower margin is clamped between the two parts of the drum, conical partitions, a second conical plate within the drum, a central feed-pipe, a nut upon the top of the latter, and a gudgeon fixed to the bottom of the drum and projecting into a cavity in the second conical plate, the parts being arranged substantially as and for the purposes explained.

705,670. PUMP. ROBERT T. HERRON, Atlica, Kans. Filed Mar. 21, 1902. Serial No. 98,203. (No model.)

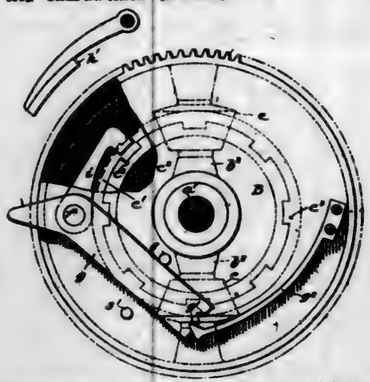
Claim.—1. A pump comprising a stationary shaft having a rigid arm, a cylinder mounted to oscillate upon the shaft and housing and having a water-tight joint with said arm, and provided with a radial partition or piston having a water-tight joint with said shaft, couplings secured to said cylinder at equal distances from said piston, valves in the lower ends of said couplings to admit water alternately to the cylinder, valves in the upper ends of said couplings to alternately permit water to mount them and pass upward, vertical pipes communicating by a pivotal or swivel relation with said couplings above the last-named valves, and a lever suitably fulcrumed and having a pin-and-slot connection with said pipes.

2. A pump comprising a stationary shaft having a rigid arm, a cylinder mounted to oscillate upon the shaft and housing and having a water-tight joint with said arm, and provided with a radial partition or piston having a water-tight joint with said shaft, couplings secured to said cylinder at equal distances from said piston, valves in the lower ends of said couplings to admit water alternately to the cylinder, valves in the upper ends of said couplings to alternately permit water to mount them and pass upward, vertical pipes communicating by a pivotal or swivel relation with said couplings above the last-named valves, a lever suitably fulcrumed and having a pin-and-slot connection with said pipes, a housing for the upper portion of said pipes, provided with a water-chamber in which said pipes discharge, a discharge-spout for said chamber, and slide-plates closing the openings of the housing through which said pipes extend, and fitting slidingly on said pipes.



3. In a pump, the combination of a stationary shaft having an arm, a cylinder journaled on said shaft and having a water-tight joint with said arm, and provided with an arm or piston having a water-tight joint with said shaft, couplings secured to and communicating with the cylinder and provided at their lower ends with valves which open alternately to admit water to the cylinder, and at their upper ends with valves which alternately open to permit water to be expelled from the cylinder, a pair of vertical discharge-pipes, a pair of sleeves connected to the lower ends of said discharge-pipes, T-pipes having their heads swiveled in said sleeves and their stems connected to said couplings, and a lever having a pin-and-slot connection with said pipes 26, and fulcrumed midway between them.

705,671. DIFFERENTIAL GEAR FOR SELF-PROPELLING VEHICLES. ARTHUR HERRMANN, New York, N. Y. Filed June 21, 1901. Serial No. 65,267. (No model.)



Claim.—1. In a vehicle, the combination of a shaft in two parts, two traction-wheels driven respectively by the said parts, a compensating gear interposed between the parts, means for locking the parts of the compensating gear together to thereby destroy its compensating function and means for controlling said locking means from a distance.

2. The combination of a shaft in two parts, a bevel-gear fixed upon each part, a concentric drum adapted to be driven, a radial shaft supported by said drum, a pinion on said radial shaft said pinion being in mesh with both of said bevel-gears, one of said bevel-gears having a notched flange, a pawl carried by the drum and means for causing said pawl to engage and disengage the notches in said gear.

3. The combination of a shaft in two parts, a bevel-gear fixed upon each part, a concentric drum adapted to be driven, a radial shaft supported by said drum, a pinion on said radial shaft said pinion being in mesh with both of said bevel-gears, one of said bevel-gears having a notched flange, a shaft mounted in said drum, a pawl on said shaft adapted to engage with said flange, a lever on said shaft and means for throwing the lever, for the purpose set forth.

705,672. ASH OR GARBAGE RECEPTACLE. THOMAS W. HUGHES, Trenton, N. J., assignor of two-thirds to L. H. Clayton and A. Bugbee, Trenton, N. J. Filed May 5, 1902. Serial No. 105,996. (No model.)

Claim.—1. The combination with a receptacle provided with a hinge-pin; of a cover for said receptacle having a bail on its lower side to engage said hinge-pin and permit of a sliding movement of said cover across the top of the receptacle and a swinging movement of the cover to a position parallel with the sides of the receptacle, and guard-plate secured to the receptacle and spaced apart, two of said plate adapted to receive between them when the cover is in a vertical position the lower end of the bail and act as a stop against lateral movement of the cover with respect to the receptacle, substantially as specified.

2. The combination with a receptacle provided with a hinge-pin; of a cover for said receptacle having a bail on its lower side to engage said hinge-pin and permit of a sliding movement of said cover across the top of the receptacle and a swinging movement of the cover to a position parallel with the sides of the receptacle, a handle secured to the top, and a handle secured to the lower end of the receptacle beneath the handle of the top when said top is in a vertical position, substantially as and for the purpose set forth.

705,673. IGNITER. ALFRED H. HUMPHREY, Kalamazoo, Mich. Filed June 26, 1900. Serial No. 21,033. (No model.)

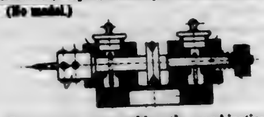
Claim.—1. In an igniter for a cluster of gas-burners, the combination of a coupling C for insertion into the gas-supply passage; an upwardly-extending pipe C' therefrom; the Bunsen burner; a valve held normally closed by a spring; a chain or connection J for opening the same; a tube E' extending up within the Bunsen burner to deliver a jet of undiluted gas; a tube or holder H and an igniter composed I supported within the tube or holder in the jet of undiluted gas; a head F embracing the top of said Bunsen burner having radiating tubes or passages F' therefrom with restricted passages along the top thereof to carry the flame out to the ends of the same and deliver it in jets at each burner of the cluster, all coacting substantially as described for the purpose specified.

2. In an igniter for chandeliers or a cluster of burners, the combination of a central Bunsen burner; a passage for undiluted gas; an igniter material supported within such undiluted-gas jet; and tubes leading from the central Bunsen burner laterally toward the burners of the cluster or group and containing restricted apertures along the same to carry the flame outwardly to the ends to ignite the burners of the group, for the purpose specified.

3. In an igniter for chandeliers or cluster-burners, the combination of a central auxiliary burner; an igniter material supported within the jet of said auxiliary burner; and tubes leading from the auxiliary burner laterally toward the burners of the cluster or group, the said tubes containing restricted apertures to carry the flame outwardly to ignite the burners of the group, as specified.

4. In an igniter for chandeliers or cluster-burners, the combination of a central auxiliary burner; an igniting means for each burner; tubes leading from the auxiliary burner laterally toward the several burners of the cluster or group, the said tubes containing restricted apertures to carry the flame outward to ignite the burners of the group.

705,674. SPINDLE-BEARING FOR ENGRAVING-MACHINES. GERHARD B. JAY, Leipsic, Germany. Filed Jan. 20, 1902. Serial No. 90,220. (No model.)



Claim.—In an engraving-machine, the combination of a rest having a pair of bearings and a front socket, with a headed tool-spindle mounted in the bearings, a nut and disk mounted upon the rear end of the spindle, and a spring between the nut and disk which is adapted to draw the tool-head against the base of the front socket, substantially as specified.

705,675. STOPPER-FASTENER. JOHN A. JOHN, New York, N. Y. Filed Feb. 19, 1901. Serial No. 47,904. (No model.)

Claim.—1. The combination with a bottle-neck adapted to receive a stopper and having internal projecting holding means and a seat, of a flexible stopper, and a substantially flat peripherally-corrugated wire stopper-fastener in engagement with the under side of said holding means and with the outer end of said stopper and expansile and contractile substantially in its own flatwise plane and having a multiplicity of deep corrugations forming a circuit of deep salient bends disposed close together and a circuit of deep reëntrant bends alternating with said salient bends said circuits of bends constituting a pressure-resisting and pressure-exerting element extending over the major portion of the outer end of the stopper and serving to hold the stopper in position under all conditions of pressure.

2. The combination with a bottle-neck adapted to receive a flexible stopper and having an internal retaining-groove and a seat, of a stopper, and a substantially flat peripherally-corrugated wire stopper-fastener seated in said groove and in engagement with the outer end of said stopper and expansile and contractile substantially in its own flatwise plane and having a multiplicity of deep corrugations forming a circuit of deep salient bends disposed close together and a circuit of deep reëntrant bends alternating with said salient bends said circuits of bends constituting a pressure-resisting and pressure-exerting element extending over the major portion of the outer end of the stopper and serving to hold the stopper in position under all conditions of pressure.

3. The combination with a bottle-neck adapted to receive a stopper and having internal holding means and a seat, of a substantially flat peripherally-corrugated wire stopper-fastener in engagement with the under side of said holding means and with the outer end of the stopper and expansile and contractile substantially in its own flatwise plane and adapted to compress and hold the stopper in position under all conditions of pressure, and a flexible stopper between and in engagement with the stopper-fastener and said seat.

4. The combination with a bottle-neck adapted to receive a stopper and having an internal retaining-groove and a seat, of a substantially flat peripherally-corrugated wire stopper-fastener seated in said groove and in engagement with the outer end of the stopper and expansile and contractile substantially in its own flatwise plane and adapted to compress and hold the stopper in position under all conditions of pressure, and a flexible stopper between and in engagement with the stopper-fastener and said seat.

5. The combination with a bottle-neck adapted to receive a stopper and having a short stopper-receiving bore with an annular groove at the upper end and a seat at the lower end thereof, of a substantially flat removable annular stopper-fastener seated in said groove and expansile and contractile substantially in its own flatwise plane and adapted to compress

and hold the stopper down against its seat under all conditions of pressure, and a short expansible stopper filling said bore and located below said groove and held in place between said stopper-fastener and said seat.

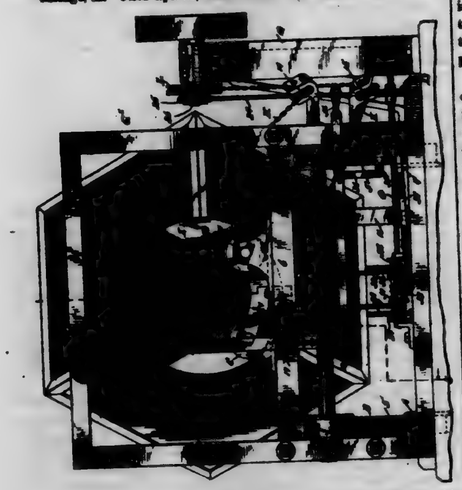
6. The combination with a bottle-neck adapted to receive a stopper and having a short tapered stopper-receiving bore with an annular groove at the upper end and a seat at the lower end thereof, of a substantially flat removable annular stopper-fastener seated in said groove and expansible and contractile substantially in its own flatwise plane and adapted to compress and hold a stopper down against its seat under all conditions of pressure, and a short expansible stopper filling said tapered bore and located below said groove and compressed in place between the stopper-fastener and said seat.

7. The combination with a bottle-neck adapted to receive a stopper and having a short stopper-receiving bore with an annular groove at the upper end and a seat at the lower end thereof, of a substantially flat removable internal stopper-fastener seated in said groove and expansible and contractile substantially in its own flatwise plane and having a circuit of holding members in engagement with the stopper and with the walls of said groove and adapted to compress and hold the stopper down against its seat under all conditions of pressure, and a short expansible stopper filling said stopper-receiving bore and located below said groove and compressed in place between the stopper-fastener and said seat.

8. The combination with a bottle-neck adapted to receive a stopper and having a short stopper-receiving bore with an annular groove at the upper end and a seat at the lower end thereof, of a substantially flat removable internal wire stopper-fastener seated in said groove and expansible and contractile substantially in its own flatwise plane and having two circuits of holding members one engaging the walls of said groove and the other engaging the stopper and adapted to compress and hold the stopper down against its seat under all conditions of pressure, and a short expansible stopper filling said stopper-receiving bore and located below said groove and compressed in place between the stopper-fastener and said seat.

705,676. MACHINE FOR MIXING CONCRETE OR THE LIKE.

WILLIAM J. JUDD, New York, N. Y., assignor to Frederick C. Austin, Chicago, Ill. Filed Apr. 15, 1902. Serial No. 102,960. (No model.)



Claim.—1. In a mixing-machine for concrete and the like, a cubiform rotary mixing-receptacle provided at diagonally opposite corner portions with charging and discharge openings respectively for receiving a batch of materials, and for discharging the mixed-up batch, said mixing-receptacle being arranged to revolve about a tilting axis which can be tilted in opposite directions for the purposes set forth.

2. In a mixing-machine for concrete and the like, a rotary cubiform mixing-receptacle arranged to revolve about a tilting axis passing through diagonally opposite corner portions, and provided at such corner portions with oppositely-positioned charging and discharge openings adapted respectively receiving a batch of materials and for discharging the mixed-up batch; and a tilting support for the rotary, cubiform mixing-receptacle arranged to tilt in opposite directions about an axis transverse to the axis of rotation of said mixing-receptacle.

3. In a batch-mixing machine for concrete and the like, a polyhedric mixing-receptacle arranged to revolve about a tilting axis passing through opposite corners or vertices formed by intersecting planes, and provided at such portions with oppositely-positioned charging and discharge openings adapted for respectively receiving a batch of materials and discharging the mixed-up batch; and a tilting support for the rotary, polyhedric mixing-receptacle arranged to tilt about an axis transverse to the axis of rotation of said mixing-receptacle and relatively between the charging and discharge openings of the latter.

4. In a mixing-machine for concrete and the like, a rotary, cubiform mixing-receptacle provided at diagonally opposite corner portions with hollow journals forming charging and discharge openings adapted for respectively receiving and discharging a batch; and a tilting support for said mixing-receptacle provided with bearings for the hollow journals of the latter and arranged to tilt about an axis transverse to the axis of rotation of the rotary, cubiform mixing-receptacle and relatively between the hollow journals of such mixing-receptacle.

5. In a batch-mixing machine for concrete and the like, a rotary cubiform mixing-receptacle provided at diagonally opposite corner portions with hollow journals forming charging and discharge openings adapted for respectively receiving and discharging a batch; a tilting support for said mixing-receptacle provided with bearings for the hollow journals thereof and arranged to tilt about an axis relatively between such hollow journals and transverse to the axis about which the mixing-receptacle revolves; power-transmitting mechanism for continuously rotating the mixing-receptacle whereby it can be revolved while receiving, mixing, and discharging; and mechanism for operating the tilting support so as to tilt the axis of rotation of the mixing-receptacle.

6. In a batch-mixing machine for concrete and the like, a substantially cubiform, rotary mixing-receptacle provided at diagonally opposite corner portions with hollow journals forming charging and discharge passages or openings adapted for respectively receiving and discharging a batch; a tilting support for the mixing-receptacle having antifriction-rolls which engage the hollow journals; mechanism for tilting said support; mechanism for rotating the mixing-receptacle; and means for applying the driving power to the mechanism employed for tilting the support.

7. In a machine for mixing concrete and the like, a substantially cubiform rotary mixing-receptacle having charging and discharge openings at diagonally opposite corner portions; a tilting support for the rotary mixing-receptacle; mechanism for applying the driving power to the rotary mixing-receptacle; and mechanism for applying the driving power to the tilting support so as to tilt the same.

8. In a machine for mixing concrete and the like, a substantially cubiform, rotary mixing-receptacle having charging and discharge openings at diagonally opposite corner portions; a tilting support for the rotary mixing-receptacle; mechanism for tilting said support in opposite directions; mechanism for arresting the tilting action of the support; and mechanism for applying the driving power to actuate the mechanism for tilting the support.

9. In a machine for mixing concrete and the like, a substantially cubiform, rotary mixing-receptacle having charging and discharge openings at diagonally opposite corners; power-actuated mechanism respectively for rotating the mixing-receptacle and tilting the support therefor; mechanism involving a clutch for applying and disconnecting the power to and from the tilting support so as to tilt the latter when the power is thus applied, and arrest the tilting action of such support when the power is disconnected therefrom.

10. In a machine for mixing concrete and the like, a rotary, polyhedric mixing-receptacle substantially as set forth provided at opposite corner portions vertices with hollow journals forming charging and discharge passages; a tilting support for the polyhedric mixing-receptacle; and a movable hopper having a discharge-neck adapted to couple with and uncouple from one of the said hollow journals.

11. In a machine for mixing concrete and the like, a rotary mixing-receptacle; and a tilting support for the rotary mixing-receptacle having a curved bearing portion arranged to traverse a rotary bearing so as to tilt the rotary mixing-receptacle.

12. In a machine for mixing concrete and the like, a rotary mixing-receptacle having oppositely-arranged charging and discharge openings and arranged to revolve about an axis extending through its charging and discharge openings; a tilting support for the rotary mixing-receptacle consisting of a frame having a segmental base; and rotary bearings forming a way along which the segmental base is arranged to move in a curvilinear path.

13. In a machine for mixing concrete and the like, a rotary mixing-receptacle; a support for the rotary mixing-receptacle comprising a tilting frame having a curved base; and antifriction-rolls engaging said curved base and supporting the tilting frame; the curved base and the supporting-rolls being relatively arranged to permit the tilting frame to turn about an axis transverse to the axis about which the mixing-receptacle revolves and to thereby tilt such axis.

14. In a machine for mixing concrete and the like, a rotary mixing-receptacle; a support for the rotary mixing-receptacle arranged to turn about an axis transverse to the axis about which the mixing-receptacle revolves; rotary bearings upon which the support for the mixing-receptacle moves in direction to tilt the latter; and mechanism for rotating the mixing-receptacle while the support thereof is being turned and tilted.

15. In a machine for mixing concrete and the like, a tilting frame having segmental bearing portions; a rotary mixing-receptacle journaled at opposite ends of the tilting frame which latter turns about an axis transverse to the axis about which the mixing-receptacle revolves; rotary bearings upon which the tilting support is arranged to move; mechanism for revolving the mixing-receptacle while it is being tilted; and mechanism for arresting the tilting motion of the support for the mixing-receptacle.

16. In a machine for mixing concrete and the like, a rotary mixing-receptacle; a tilting support for the rotary mixing-receptacle; and power-transmitting connection for operating the rotary mixing-receptacle comprising a power-driven endless chain or belt passing about pulleys respectively connected with the rotary mixing-receptacle and the tilting support thereof so as to maintain an invariable relationship.

17. In a machine for mixing concrete and the like, a rotary mixing-receptacle; a tilting support for the rotary mixing receptacle; a driving-pulley positioned to rotate about an axis transverse to the axis of revolution of the mixing-receptacle, the said pulley and the tilting support being arranged to operate about an axis common to both of them; a pulley fixed on the rotary mixing-receptacle; guide-pulleys arranged upon the tilting support; and an endless chain or belt arranged to pass about all of said pulleys.

18. In a mixing-machine for concrete and the like; a rotary mixing-receptacle; a tilting support for the rotary mixing-receptacle; a rotary winding-drum; a chain or cable passing about the rotary winding-drum and connected with opposite end portions of the tilting support; and a clutch device for connecting and disconnecting the winding-drum with and from suitable driving power.

19. In a machine for mixing concrete and the like, a rotary mixing-receptacle; a tilting support for the rotary mixing-receptacle; a pair of loosely-mounted winding-drums; chains or cables passing about the winding-drums respectively in reverse directions and connected with opposite end portions of the tilting support; and a clutch device alternately connecting the winding-drums with suitably-applied driving power.

20. In a machine for mixing concrete and the like, a rotary mixing-receptacle; a tilting support for the rotary mixing-receptacle; two loosely-mounted winding-drums; chains or cables passing about the winding-drums respectively in reverse directions and connected with opposite end portions of the tilting support; a clutch device for alternately connecting the winding-drums with the driving power; a step on one of the chains or cable; and a clutch-shifting device which is actuated by said step when the tilting support reaches either end of its required movement.

21. In a machine for mixing concrete and the like, a rotary mixing-receptacle; a tilting support for the rotary mixing-receptacle; mechanism for applying the driving power to the tilting support so as to tilt the same in either direction; and means for reversing the driving power thus applied to the tilting support, and comprising a rotary power-driven shaft, a double clutch device, and a clutch-shifting lever.

22. In a machine for mixing concrete and the like, a rotary mixing-receptacle; a tilting support for the rotary mixing-receptacle; and mechanism for reversibly applying the driving power to the tilting support so as to tilt the latter alternately in opposite directions, and involving a vibratory controlling-lever.

23. In a machine for mixing concrete and the like, a rotary mixing-receptacle; a tilting support for the rotary mixing-receptacle; mechanism for reversibly applying the driving power to the tilting support so as to tilt the latter alternately in opposite directions; and an automatic stop device applied to automatically disconnect the driving power from the tilting support.

24. In a machine for mixing concrete and the like, a rotary mixing-receptacle; a tilting support for the rotary mixing-receptacle; mechanism for reversibly applying the driving power to the tilting support so as to tilt the same alternately in opposite directions; a starting-lever M, and power-transmitting connection between said lever and the mechanism for reversibly applying the driving power to the tilting support.

25. In a machine for mixing concrete and the like, a rotary tilting mixing-receptacle provided with charging and discharge openings; and a movable hopper arranged to couple with the charging-opening of the rotary mixing-receptacle, the hopper being supported for movement in directions to permit it to couple with the charging-opening of the rotary mixing-receptacle, when the latter is in receiving and mixing position, and to uncouple and move away from the rotary mixing-receptacle in order to permit the latter to tilt.

26. In a machine for mixing concrete and the like, a rotary, tilting mixing-receptacle provided with charging and discharge openings; and a vibratory, pendent hopper adapted and arranged for coupling with and uncoupling from the charging-opening of the rotary, tilting mixing-receptacle when the latter is in receiving and mixing position.

27. In a machine for mixing concrete and the like, a rotary, tilting mixing-receptacle provided with oppositely-arranged charging and discharge openings and having its charging-opening formed or extended through a hollow neck; and a movable hopper having its discharge-opening through a hollow neck adapted to telescope with said hollow neck of the rotary mixing-receptacle, the hopper being movable in directions to couple with and uncouple from the rotary mixing-receptacle.

28. In a machine for mixing concrete and the like, a rotary, tilting mixing-receptacle; and a vibratory hopper arranged to automatically couple with the rotary mixing-receptacle when the latter is tilted into position for receiving and mixing.

29. In a machine for mixing concrete and the like, a rotary mixing-receptacle provided with oppositely-arranged hollow journals respectively forming charging and discharge passages; a tilting support for the rotary mixing-receptacle provided with antifriction-rolls forming bearings for the hollow journals of the rotary mixing-receptacle; and a pendent, swinging hopper having a hollow neck or short spout adapted to couple with and uncouple from one of the hollow journals of the rotary mixing-receptacle.

30. In a machine for mixing concrete and the like, a rotary mixing-receptacle provided with oppositely-arranged charging and discharge openings; a tilting-support for the rotary mixing-receptacle; a movable hopper which is normally in position to connect with and discharge into the rotary mixing-receptacle; and a stop device for automatically stopping the tilting support when the latter is brought into position to place the charging-opening of the rotary receptacle in register with the discharge-opening of the hopper.

31. In a machine for mixing concrete and the like, a rotary, tilting mixing-receptacle having oppositely-arranged charging and discharge openings; a movable hopper having a laterally-arranged discharge-opening, and normally in position to place its discharge-opening in alinement with the charging-opening of the rotary mixing-receptacle when the latter is in mixing and receiving position.

32. In a machine for mixing concrete and the like, a rotary mixing-receptacle; a tilting support for the rotary mixing-receptacle; a vibratory hopper; a stop device for stopping the tilting support when the rotary mixing-receptacle is in position to connect a movable member arranged for swinging the hopper away from the mixing-receptacle and tilting support therefor.

33. In a machine for mixing concrete and the like, a rotary mixing-receptacle having charging and discharge apertures; a tilting support for the rotary mixing-receptacle; and a valve or door hung upon the tilting support and arranged for automatically opening and closing the discharge-aperture of the rotary mixing-receptacle according to the directions in which such receptacle is tilted.

34. In a machine for mixing concrete and the like, a rotary mixing-receptacle having charging and discharge apertures; a tilting support for the rotary mixing-receptacle; and a gravity valve or door H hinge-supported upon the tilting support and arranged for opening and closing the discharge-aperture of the rotary mixing-receptacle, said valve or door being hung so that when the mixing-receptacle is tilted into position for discharging its contents, its discharge-aperture will relatively move away from the suspended valve or door and thereby open to permit the discharge.

35. In a machine for mixing concrete and the like, a rotary, polyhedric mixing-receptacle supported to revolve about a tilting axis, and having oppositely-arranged charging and discharge openings respectively adapted to receive the materials for a batch, and for discharging the mixed-up batch, the charging and discharge openings being formed at opposite corners or vertices formed by the planes of the sides of the receptacle, and the latter being supported to permit its axis of revolution to be tilted into an inclined position so as to depress the discharge-opening and allow the mixed-up batch to discharge through the same.

705,677. WHEEL-MAKING MACHINE.

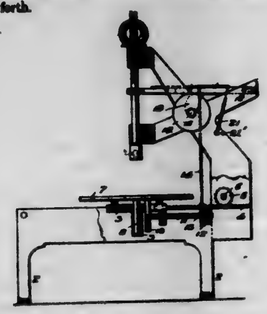
VOLNEY P. KELLER, Waynesville, N. C. Filed Oct. 5, 1901. Serial No. 77,889. (No model.)

Claim.—1. In a machine of the class described, a rotary reciprocatory stem, combined with a movable face-plate, and a reciprocatory carriage carrying said face-plate, fictional means engaging said plate for rotating the same as set forth.

2. In a machine of the class described, a rotary reciprocatory stem, a rotary face-plate, and a reciprocatory carriage carrying the face-plate, fictional means engaging said plate for rotating the same as set forth.

3. In a machine of the class described, a rotary reciprocatory stem, means for reciprocating the same, a rotary face-plate, and a reciprocatory carriage carrying the same, fictional means engaging said plate for rotating the same as set forth.

4. In a machine of the class described, a rotary stem, means for reciprocating the same, a rotary face-plate, a carriage on which the same is rotatably held, and means for adjusting the carriage to adjust the face-plate to its work, frictional means engaging said plate for rotating the same as set forth.

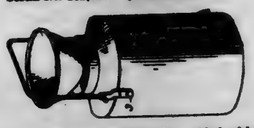


5. In a machine of the class described a rotary face-plate, a rotary stem, a lever adapted to move the same vertically, a driving-shaft and a cam on said shaft adapted to engage said lever, frictional means engaging said plate for rotating the same as set forth.

6. In a machine of the class described a rotary face-plate, a rotary stem, a lever by which it is moved vertically, a driving-shaft, a cam thereon adapted to engage said lever, and means for adjusting the pressure or force given the blow by the dropping of said stem, frictional means engaging said plate for rotating the same as set forth.

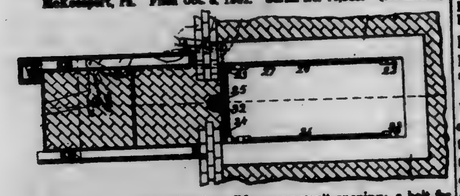
7. In a machine of the class described, a rotary stem, means for reciprocating the same, a rotary face-plate, a sliding carriage, a friction-wheel for rotating the face-plate, a driving-shaft, a cam thereon, and a connection between said cam and the friction-wheel, all as and for the purpose specified.

705,678. MILK-PAIL. JOHN H. KING, Garrity, Ala. Filed Apr. 10, 1902. Serial No. 102,515. (No model.)



Claim.—In a non-spillable milk-pail provided with a neck, in combination with a cover having a depending outer flange to engage the neck, a depending inner flange, and an aperture surrounded by the said inner flange, a strainer secured across the opening to said inner flange, a receiving-bowl having a depending flange to engage the inner flange and provided with an opening, an inverted cup-shaped strainer covering said opening, and a valve located between said strainers and of a diameter greater than said opening, substantially as set forth.

705,679. VAULT-COVER. PARK S. KNAPP and JACOB STEINBERG, McKeesport, Pa. Filed Oct. 8, 1901. Serial No. 77,988. (No model.)

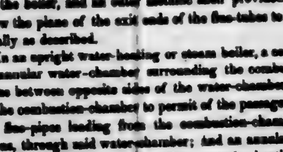


Claim.—1. A cover fitted to slide over a vault-opening; a bolt for locking the cover; a key provided with a crank and journaled to rotate in fixed bearings, and a lever connecting the said bolt and crank, substantially as described.

2. In vault-covers; a frame having ways extending along at the sides of the opening and beyond the end thereof; a cover fitted to travel upon the said ways and having a stud projecting from its lower face; guards journaled in bearings along the sides of the opening below the path of the said cover and adapted to be swung up above the face of the frame and having operating-arms; an elbow-lever pivoted to the frame and having one arm slotted to be engaged by the aforesaid stud and connections between its other arm and the said guard-operating arms, substantially as described.

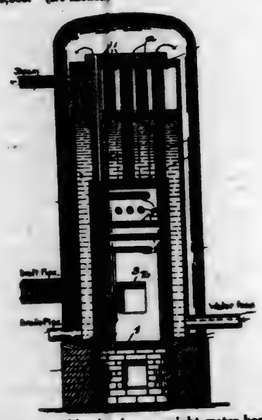
705,680 WITHDRAWN.

705,681. PROCESS OF MAKING THE INTERIOR OF COKE-OVENS OR OTHER KILNS TIGHT. RUDOLF KEIL, Bruch, Germany. Filed Apr. 15, 1902. Serial No. 103,008. (No specimens.)



Claim.—A process of making the interior of coke-ovens and other kilns tight which consists in mixing fine ore-dust with fine-ground coke or other dusty material and then blowing the mixture into the hot chamber, the walls or sides of which are intended to be tightened, the effect being that the dust will keep floating for a while and then settle by degrees in the pores and cracks and thereby make the walls perfectly tight.

705,682. STEAM-GENERATING AND WATER-HEATING BOILER. FERDINAND LOGAN, Phoenixville, Pa. Filed May 11, 1901. Serial No. 60,803. (No model.)



Claim.—1. The combination in an upright water-heating or steam boiler, of an inner boiler-cylinder having a combustion-chamber, a plurality of water-tubes across the interior of the cylinder in the combustion-chamber, arranged in parallel planes of different heights and at different planes in relation to the axis of the boiler whereby each layer or series of water-tubes intersect interstices between adjacent series, an outer boiler-shell forming a water-space between the two shells or cylinders, a plurality of vertical flue-tubes extending from the crown of the inner boiler-shell through the head of the outer boiler-shell, inlet and outlet pipes for the boiler, and an outer metallic shell provided with an outlet-pipe below the plane of the exit ends of the flue-tubes to direct the draft, substantially as described.

2. In an upright water-heating or steam boiler, a combustion-chamber; an annular water-chamber surrounding the combustion-chamber; connections between opposite sides of the water-chamber and extending through the combustion-chamber to permit of the passage of water therethrough; flue-pipes leading from the combustion-chamber, above said connections, through said water-chamber; and an annular draft-flue surrounding said water-chamber to provide an exterior heating to the water-chamber, substantially as described.

3. The combination in an upright water-heating boiler, of an inner boiler-cylinder having a combustion-chamber, a plurality of water-tubes disposed across the combustion-chamber arranged in parallel planes at different heights, and in different planes in lateral relation to each other, whereby each layer or series intersect interstices between adjacent series, an outer boiler-shell longer and of greater diameter than the inner one, a water-space being formed between the two boiler-shells, a plurality of vertical pipe-flues extending from the crown of the combustion-chamber through the head of the outer boiler-shell, inlet and outlet pipes for the boiler, and an outer inclosing metal shell covering the boiler and arranged to form an annular draft-space surrounding the boiler between its inner face and the outer face of the boiler and provided with a draft-pipe adjacent to its lower end, substantially as described.

4. The combination in an upright water-heating or steam boiler, of an inner boiler-cylinder formed with an annular base-flange, an outer boiler-cylinder of greater diameter than the inner cylinder and formed with an annular base-flange adapted to set upon the base-flange of the inner cylinder, fastening-bolts extending through the superimposed base-flanges, and vertical fire-tubes extending between and connecting the crown of the inner boiler-cylinder and the head of the outer cylinder whereby said inner and outer cylinders will form a unitary structure secured at the base thereof, substantially as described.

5. The combination in an upright water-heating or steam boiler, of an inner boiler-cylinder formed with an annular base-flange, an outer boiler-cylinder over the inner cylinder and formed with an annular base-flange adapted to set upon the base-flange of the inner cylinder, fastenings securing the superimposed flanges together, water-tubes across the interior of the inner boiler-cylinder arranged in parallel planes at different heights and at different planes in relation to the axis of the boiler whereby each layer or series of water-tubes intersect interstices of adjacent series, and fire-tubes opening from the crown of the inner cylinder and extending through the head of the outer cylinder, whereby said inner and outer cylinders will form a unitary structure secured at the base thereof, substantially as described.

6. The combination in an upright water-heater and steam-boiler, of an inner boiler-cylinder formed with an annular base-flange, an outer boiler-cylinder over the inner cylinder and formed with an annular base-flange to set upon the flange of the inner cylinder, fastening-bolts through the superimposed base-flanges, water-tubes across the interior of the inner boiler-cylinder arranged in parallel planes at different heights and at different planes in relation to the axis of the boiler, so that each layer of the series intersect the interstices of adjacent series, fire-tubes opening from the crown of the inner cylinder and extending through the head of the outer cylinder, a feed-pipe to conduct water to the boiler, a steam-pipe to convey steam from the boiler, and a pipe to discharge water from the boiler, an outer inclosing case covering the boiler and arranged to form an annular draft-space between its inner face and the outer face of the boiler, and a draft-pipe adjacent to its lower end, substantially as specified.

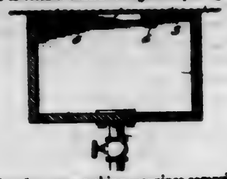
705,683. BOLSTER-ROLL. JOHN R. LEES, Chillicothe, Ohio. Filed June 18, 1901. Serial No. 64,909. (No model.)

Claim.—A knockdown bolster-roll, comprising opposite heads 7, having corresponding marginal notches 8, pins 10 carried by the heads of the notches and wholly within the same, a rigid arcuate brace situated midway between the two heads and provided also with notches aligning with those of the head, turn-buttons 12 mounted on pivots upon the marginal edges of the heads, each button being located adjacent to one of the notches and of a length to overlap the same, a single-piece flexible body adapted to embrace the marginal edges of the heads and an arcuate brace and provided with central and marginal stiffening-strips, the ends of said strips being constructed to be seated within the corresponding notches of the brace and the heads, and said strips having on their inner faces sockets for the reception of the pins 10, the opposite edges of the body terminating at the notches having the turn-buttons, substantially as specified.

705,684. SUCTION-BOX FOR PAPER-MAKING MACHINES. JOHN B. LYNDE, South Glens Falls, N. Y. Filed Sept. 21, 1901. Serial No. 76,092. (No model.)

Claim.—1. A suction-box for paper-making machines comprising a body portion having an open top, and a series of short sections of wood arranged transversely across said top, said sections being separated to form the opening in the box and having the grain of the wood running transverse to said box.

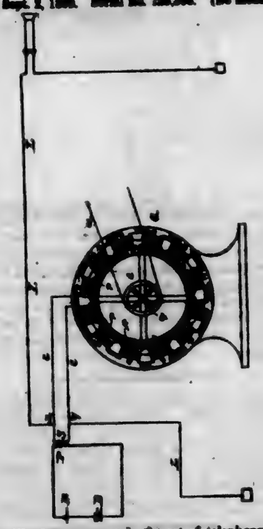
2. A suction-box for paper-making machines comprising a body portion having an open top, a series of short sections of wood arranged transversely across said top with the grain of the wood also running transversely, and means for supporting the inner ends of said sections, the latter being separated to form a central elongated opening.



3. A suction-box for paper-making machines comprising a body portion having an open top, longitudinal supporting-bars mounted in the ends of said box, and a series of short sections of wood having their inner ends supported by said bars and arranged with the grain running transversely of said top, the inner ends of said sections being separated to form an elongated opening.

4. A suction-box for paper-making machines, comprising, a body portion having a top consisting of a series of short sections of wood arranged transversely across said body portion and having their grain disposed transverse thereto.

705,685. TELEPHONY. JOSEPH LYNN, Chestnut, Pa., assignor to American Telephone and Telegraph Company, a Corporation of New York. Filed Sept. 3, 1900. Serial No. 728,969. (No model.)



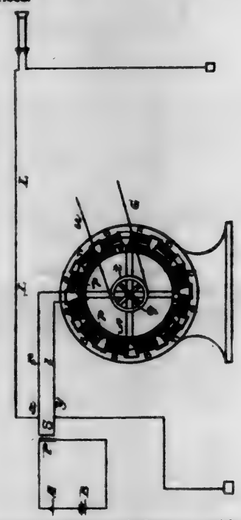
Claim.—1. The improvement in the art of telephony, which consists in causing telephone-currents produced upon a line to establish an initial magnetic field or fields the lines of force of which intersect circuits closed upon themselves, and producing a relative movement between the field structure and closed circuits with a speed exceeding the number of periods of the telephone-current of highest frequency divided by half the number of poles of the field, substantially as described.

2. The method of telephoning telephone-currents upon a line, by causing such currents to produce an initial magnetic field, and rotating within the latter a closed electric circuit or circuits, with a speed exceeding the number of periods of the telephone-current of highest frequency, divided by half the number of poles of the field, substantially as described.

3. The method of telephoning telephone-currents upon a line, by causing such currents to produce an oscillating magnetic field of force, and rotating within the latter a circuit or circuits of low resistance, closed upon themselves, with a speed exceeding the number of periods of the current impulses of highest frequency, divided by half the number of poles of the field, substantially as described.

705,686. TELEPHONY. JOSEPH LYNN, Washington, D. C., assignor to American Telephone and Telegraph Company, a Corporation of New York. Original application filed Sept. 3, 1900, Serial No. 728,969. Divided and this application filed Apr. 23, 1902. Serial No. 104,004. (No model.)

Claim.—1. A system of telephony comprising a line upon which telephone-currents are impressed, a field magnet or magnets charged by currents from the line, and an armature composed of circuits closed upon themselves, capable of being rotated within the field thus produced, with a speed exceeding the number of periods of the currents of highest frequency on the line, divided by half the number of poles of the field, substantially as described.

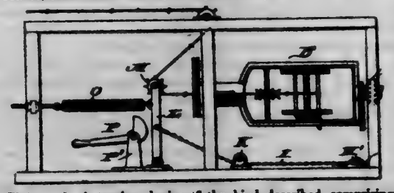


2. A system of long-distance telephony, comprising a transmitter, a receiver, and a line composed of two or more sections that are inductively connected together; with a field magnet or magnets for each section of the line, charged by currents from the same, and a circuit or circuits of low resistance closed upon themselves, for each field-magnet or system of field-magnets, and means for rotating each circuit or system of circuits within the corresponding field, each with a speed exceeding the number of periods of the telephone-currents of highest frequency, divided by half the number of poles of the corresponding field, substantially as described.

705,687. PROCESS OF PRODUCING VEGETABLE PARCHMENT FREE FROM GERMS. ALBERT HAGENMEIER, Darmstadt, Germany. Filed Nov. 30, 1901. Serial No. 84,260. (No specimens.)

Claim.—The process of treating vegetable parchment, which consists in dissolving boracic acid in boiling glycerin, cooling the mixture to form a wax-like mass, dissolving said mass in a glycerin-bath, and drawing the parchment through said bath, substantially as specified.

705,688. TENSION DEVICE FOR BARBED-WIRE MACHINES. PETERSON W. HACKE and MATTHEW MILLER, Kokomo, Ind. Filed Oct. 26, 1901. Serial No. 80,126. (No model.)

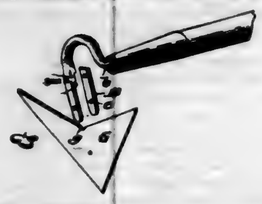


Claim.—1. A tension device of the kind described, comprising a spring-yoke carrying brake-blocks, a spring-actuated lever carrying an idler at its upper end, and means for connecting the said lever and spring-yoke, substantially as shown and described.

2. In a tension device of the kind described, the combination with a lever carrying an idler at its upper end, of a spring connected to the said lever and a cam-pressing lever arranged adjacent to the first-mentioned lever and adapted to operate thereon to distend the spring, substantially as shown and described.

3. In a tension device of the kind described, the combination with the spring-yoke carrying brake-blocks, of the spring-actuated lever carrying idler at its upper end, the chain connected to said lever, the elbow-lever connected to the opposite end of said chain, and the adjustable hook-rod connecting one end of the spring-yoke, and the elbow-lever, substantially as described.

705,689. ADJUSTABLE HANDLE FOR GARDEN-TOOLS. WILLIAM V. MAGEE, Harvey, N. D., assignor of one-half to Robert J. Pratt, Harvey, N. D. Filed Mar. 15, 1902. Serial No. 98,205. (No model.)



Claim.—1. A garden-tool, comprising a handle having a head connected therewith, the said head having a shoulder formed thereon, a spring-bar connected to the head adjacent to the shoulder, a blade having a notch in which the said shoulder fits, and means for clamping the blade to the head, substantially as shown and described.

2. A garden-tool comprising a handle, having a head connected therewith, the said head comprising a shank member and an upwardly and downwardly projecting portion, the said downwardly-projecting portion being cut out upon its rear surface to provide a shoulder and a seat portion respectively, a spring-bar held to the said seat portion, a blade arranged between the said downwardly-projecting portion and spring-bar and having a notch formed therein that is adapted to be engaged by the said shoulder, and a screw for engaging the said downwardly-projecting portion, blade and spring-bar, substantially as shown and for the purpose described.

3. The combination with a shank having a depending portion, the inner face of which is cut away providing a shoulder and a seat, of a clamping-plate secured at its upper end upon the seat, a tool-blade adapted to be inserted between the depending portion of the shank and the clamping-plate, and having a notch in its upper edge adapted to engage the shoulder, and means for securing the said tool between the downwardly-projecting portion of the shank and bar, substantially as shown and described.

705,690. GARMENT-SUPPORTER AND WAIST-ADJUSTER. ADDIE L. MATLACK, Chestnut Hill, Pa. Filed Oct. 26, 1901. Serial No. 80,115. (No model.)

Claim.—1. In a device of the class described, the combination of a supporting provision carrying studs at the waist rear and a perforated plate adapted to fit over said studs.

2. In a device of the class described, the combination with a supporting provision carrying at the waist rear headed studs, of a perforated plate adapted to fit over said studs whereby the headed portions of the latter will project through the perforations in the plate.

3. In a device of the class described, the combination with a supporting provision carrying at the waist rear headed studs, of a perforated plate adapted for the passage of the studs, and loops for engaging said studs and provided with skirt-engaging means.

4. In a device of the class described, the combination with a supporting provision carrying at the waist rear headed studs, of a perforated plate adapted for the passage of the studs, skirt-engaging provision, and means F at the waist front having a hook beneath which the skirt-waistband engages.

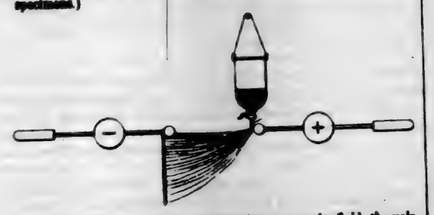
5. In a device of the class described, the combination with a supporting provision carrying at the waist rear headed studs, of a perforated plate adapted for the passage of the studs, depending loops engaging said studs and having safety-pins for engaging the skirt.

6. In a device of the class described, the combination with an inner waist-tape having a buckle connection, and carrying at its rear headed studs, of an outer waist-tape having a buckle connection and provided with a rear perforated plate adapted for the passage of the studs.

7. In a device of the class described, the combination with an inner waist-tape having a buckle connection and carrying at its rear headed studs, of an outer waist-tape having a buckle connection and provided with a rear perforated plate adapted for the passage of the studs, and skirt-engaging provision depending from said studs.

8. In a device of the class described, the combination with an inner waist-tape having a buckle connection and a rear metal slide provided with headed studs, of an inner waist-tape having a buckle connection and a perforated plate through which the studs are adapted to project.

705,691. METHOD OF DISPERSING FLUIDS. WILLIAM J. MORTON, New York, N. Y. Filed Feb. 20, 1900. Serial No. 5,905. (No specimens.)



Claim.—1. The process of separating from composite fluids the volatile component and breaking up the fixed component thereof, which consists in delivering the fluid into the path of a convective discharge of high-tension electricity, disrupting the composite fluid, thereby evaporating the volatile component and simultaneously solidifying the fixed component, substantially as described.

2. The process of separating from composite fluids the volatile component and fibering the fixed component thereof, which consists in delivering the fluid in a viscous condition into the path of a convective discharge of high-tension electricity, breaking up or disrupting the viscous composite fluid thereby, and solidifying the fixed component into multiple fibers, substantially as described.

3. The process of separating from composite fluids the volatile component and fibering the fixed component thereof, which consists in delivering the fluid in a viscous condition into the path of a convective discharge of high-tension electricity, breaking up or disrupting the viscous composite fluid thereby, evaporating the volatile component, and simultaneously solidifying the fixed component into multiple fibers, substantially as described.

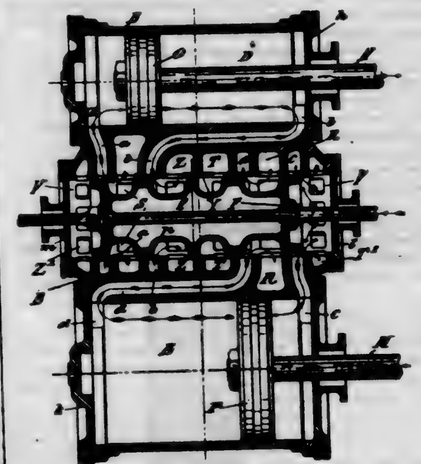
4. The process of separating the volatile liquid component from the component of fixed substances in composite fluids composed thereof, which consists in conducting a supply of composite fluid to a field of convective action of high-tension electricity, causing a delivery of the said composite fluid in a free and attenuated form therein, thus disrupting the composite fluid thereby, and collecting the separated product of the fixed substances resulting from the disruptive action of the convective field upon the composite fluid, substantially as described.

5. The process of separating the volatile liquid component from the component of fixed substances in composite fluids composed thereof, which consists in conducting a supply of the composite fluid to a field of convective action of high-tension electricity, causing a delivery of the said composite fluid in a free and attenuated form therein, thus disrupting the composite fluid thereby, simultaneously volatilizing the volatile liquid component and setting the component of fixed substances while in a filamentous condition, and collecting the separated filamentous products of the fixed substances, substantially as described.

6. The process of separating the volatile liquid component from the component of fixed substances in composite fluids composed thereof, which consists in conducting a supply of the composite fluid to a field of convective action of high-tension electricity, causing a delivery of the said fluid in a free and attenuated form therein, thus disrupting the composite fluid thereby, simultaneously volatilizing the volatile liquid component and fibering the component of fixed substances into multiple fibers and causing the same to set while still in a fibrous condition, and collecting the fibrous products of the fixed substances, substantially as described.

705,692. COMPOUND LOCOMOTIVE-ENGINE. CHARLES H. HUSTON, Philadelphia, Pa. Filed Mar. 20, 1901. Serial No. 52,023. (No model.)

Claim.—1. In a compound locomotive-engine the combination of high and low pressure cylinders, a single valve-chamber common to both cylinders, a single steam-distribution valve common to both cylinders and which always prevents the passage directly through itself of steam from the high to the low pressure cylinder, an intercepting-valve chamber, a steam-inlet to the valve-chamber, a steam-exhaust from the valve-chamber, passages from the valve-chamber to the high-pressure cylinder and to the intercepting-valve chamber and to the low-pressure cylinder and to exhaust whereby a path is established for steam to pass to the high-pressure cylinder and thence to the intercepting-valve chamber by way of the valve-chamber, and an intercepting-valve for passing steam received from the high-pressure cylinder directly to exhaust or low-pressure cylinder by way of the valve-chamber so that the engine can run either single or compound, substantially as described.



2. In a compound locomotive-engine the combination of high and low pressure cylinders, a single valve-chamber common to both cylinders, a single steam-distribution valve common to both cylinders and which always prevents the passage directly through itself of steam from the high to the low pressure cylinder, an intercepting-valve chamber, a steam-inlet to the valve-chamber, a steam-exhaust from the valve-chamber, passages from the valve-chamber to the high-pressure cylinder and to the intercepting-valve chamber and to the low-pressure cylinder and to exhaust, whereby a path is established for steam to pass to the high-pressure cylinder and thence in the intercepting-valve chamber by way of the valve-chamber, an intercepting-valve for passing steam received from the high-pressure cylinder to exhaust or low-pressure cylinder by way of the valve-chamber, and means for introducing live steam to low-pressure cylinder by way of its ports in the distribution-valve to run both cylinders single expansion, substantially as described.

3. The combination of the described cylinder structure comprising high and low pressure cylinders, and steam-passages and admission-passages and a main exhaust, a steam-valve, an intercepting-valve consisting of a cylinder open at one end and having three openings cut on its circular surface and so arranged with respect to the steam-passages in the cylinder structure that by a turn of said intercepting-valve the high-pressure exhaust will either communicate with the admission-passages of low-pressure cylinder or with the main exhaust-passage from low-pressure cylinder to stack, thus enabling the engineer to change the working of the engine from compound into single expansion, and vice versa, substantially as described.

4. The combination in a cylinder structure for compound locomotive-engines, of passages T T' for admitting steam from the distribution-valve to the low-pressure cylinder and a passage W communicating with both passages T and T' and whereby live steam is introduced into these passages, high and low pressure cylinders, a steam-distribution valve common to both cylinders and having its low-pressure-cylinder ports communicating with the passages T T', a distribution-valve having provisions for always preventing direct communication through it between the two cylinders, and a steam-pipe X, substantially as described.

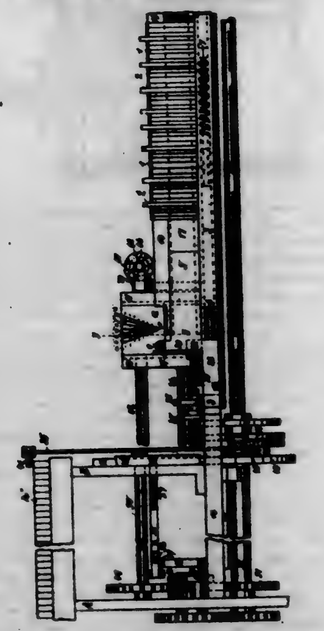
5. The combination in a compound locomotive, of a high-pressure cylinder, a low-pressure cylinder, a single steam-distribution valve common to both cylinders and having provisions for the independent admission and exhaust to both cylinders and having provisions for always preventing direct communication through it between the two cylinders, an intercepting-valve for directing exhaust-steam from the high-pressure

cylinder directly to the admission portions of said distribution-valve that appertain to the low-pressure cylinder or directly to the exhaust provisions of said distribution-valve, and a steam-supply to the admission portions of said distribution-valve that appertain to the low-pressure cylinder, substantially as described.

6. The combination with a compound locomotive having high and low pressure cylinders and their complemental single steam-distribution valve having provisions for always preventing direct communication through it between the two cylinders, of an intercepting-valve and its connections for receiving the exhaust from the high-pressure cylinder by way of the distribution-valve and passing it directly to the main exhaust or directly to the parts of said distribution-valve that appertain to the low-pressure cylinder, whereby the engine may be run either single or compound, substantially as described.

7. The combination with a compound locomotive having high and low pressure cylinders and the single steam-distribution valve common to both and having provisions for always preventing direct communication through it between the two cylinders, of a steam-admission pipe X and proper connections to the boiler for admitting steam to the parts of the distribution-valve which appertain to the low-pressure cylinder, and means for causing exhaust direct from the high-pressure cylinder, whereby the low-pressure cylinder can be run with live steam, substantially as described.

705,698. MECHANISM FOR JUSTIFYING LINES COMPOSED OF TYPES OR MATRICES. HERMANN HELLEBRANDT, Berlin, Germany. Filed Jan. 28, 1899. Serial No. 703,262. (No model.)



Claim.—1. A type-justifying mechanism comprising, in combination, means operating to measure a line of type independently for each justifying-space to be elevated, a contact-piece having space-value-determining surfaces, and an element cooperating with said contact-piece the relative positions of said element and contact-piece being separately determined by each measurement of the line.

2. A justifying mechanism comprising, in combination, spacing mechanism for inserting justifying-spaces in a line, a movable line-holder adapted to carry a line of type to the spacing mechanism, and space-value-determining devices movable with the line under justification, and comprising a contact-piece having space-value-determining elements and a part cooperating with said contact-piece.

3. A justifying mechanism comprising, in combination, spacing mechanism for inserting justifying-spaces in a line, a movable line-holder adapted to carry a line of type to the spacing mechanism, and space-value-determining devices movable with the line under justification, and comprising line-measuring devices having two relatively movable parts engaging the ends of the line.

4. A justifying mechanism comprising, in combination, spacing mechanism for inserting justifying-spaces in a line in lieu of temporary spaces, means for moving a line of type intermittently relatively to said spacing mechanism, measuring devices including two relatively movable parts engaging the ends of the line for measuring the line prior to the insertion of each space, and means controlled by said measurement for selecting the proper justifying-space to be inserted after each measurement.

5. A justifying mechanism comprising, in combination, spacing mechanism for inserting justifying-spaces in a line in lieu of separators, means for moving a line of type and separators past said spacing mechanism, means for intercepting the movement of the line each time a separator reaches the spacing mechanism, means independent of the separators for measuring the line before each separator is removed, and space-value-determining devices controlled by the successive measurements thereof, said devices in turn controlling the selection of the justifying-spaces to be inserted in lieu of the separators.

6. A justifying mechanism comprising, in combination, means for moving a line of type and separators to a spacing mechanism, means for stopping the line as each separator reaches the spacing mechanism, means independent of the separators for measuring the line as many times as there are separators therein, and space-value-determining devices controlled by said measurements, each measurement controlling the selection of a suitable justifying-space to be inserted in lieu of one of the separators.

7. A justifying mechanism comprising, in combination, means for ejecting separators from a line and inserting justifying spaces, means for moving the line to said spacing mechanism, and space-value-determining elements movable with the line, said elements consisting of a measuring device, a contact-piece having space-value-determining surfaces, and a part adapted to cooperate with one or other of said surfaces as may be determined by the measurement of a line.

8. A justifying mechanism comprising, in combination, a movable type-line holder, space-value-determining elements having a relative movement depending upon the measurement of a line of type under justification and a bodily movement with the line-holder, said elements consisting of a contact-piece having space-value-determining surfaces, and a pin movable into contact with one or other of said surfaces, depending upon the measurement of the line.

9. A justifying mechanism comprising, in combination, a contact-piece having a series of angular space-determining surfaces, a contact-point movable to register with any one of said surfaces, and means for controlling the relative adjustment of said contact-piece and pin by the length of the line under justification.

10. A justifying mechanism comprising, in combination, a contact-piece having a series of space-value-determining devices, said devices being triangular in outline and converging to a common center, means for adjusting said contact-piece according to the number of separators in a line to be justified, a contact-point cooperating with said contact-piece, and means for adjusting said contact-point relatively to the contact-piece in accordance with the measurement of a line.

11. A justifying mechanism comprising, in combination, a contact-piece having a series of stepped space-value-determining surfaces, a contact-point movable to engage one or other of said surfaces, means for adjusting the point relatively to the contact-piece in accordance with the measurement of a line, and means for selecting justifying-spaces controlled in accordance with the amount of movement required to bring said point into contact with the opposing step of the contact-piece.

12. A justifying mechanism comprising, in combination, a contact-piece having a series of space-value-determining surfaces, means for moving a line of type and projecting separators, means operated by the projecting separators for adjusting the contact-piece in accordance with the number thereof, a contact-point cooperating with the contact-piece, and means for adjusting the contact-point in accordance with the measurement of the line, said contact piece and point operating to determine the values of justifying-spaces for the line.

13. A justifying mechanism comprising, in combination, a contact-piece having a series of angular stepped surfaces radiating from a common center, and means for adjusting said contact-piece in accordance with the number of separators in a line to be justified.

14. A justifying mechanism comprising, in combination, a contact-piece having a series of space-value-determining surfaces, a contact-point cooperating with said surfaces, means for moving a line of type and separators to a spacing mechanism, means for moving said contact-piece and contact-point with the line, means for counting the separators as the line is moved to the spacing mechanism, means for adjusting the contact-piece in accordance with the number of word-spaces, and means for adjusting the contact-point by the measurement of the line, and for readjusting said point by a remeasurement of the line after each separator is substituted by a justifying-space.

15. A justifying mechanism comprising, in combination, a contact-piece having a series of space-value-determining surfaces, a contact-point cooperating with said surfaces, means for measuring a line of type to be justified, and means for moving said contact-point relatively to the contact-piece a multiple of the movement of the measuring device.

16. In a justifying mechanism, means for spacing a line of type composed with separators, comprising a wedge-shaped piece movable through the line and adapted to remove the separator and open the line, and a pusher arranged to insert a justifying-space in the opening in combination with mechanism constructed to predetermine the space-values of justifying-spaces and deliver such spaces to the pusher.

17. In a justifying mechanism, means for spacing a line of type composed with separators, comprising a wedge-shaped piece movable through the line and adapted to remove a separator and open the line, and an independently-movable pusher arranged to insert a justifying-space in the opening so created in the line.

18. In a justifying mechanism, means for spacing a line of type composed with separators comprising a wedge-shaped piece, means for moving the same through a line with the thin edge foremost whereby the separator is removed and the line opened to receive a justifying-space, and a pusher arranged to move a justifying-space into the opening, said pusher being timed to enter the justifying-space in the line before the wedge-piece leaves the same in combination with mechanism constructed to predetermine the space-values of justifying-spaces and deliver such spaces to the pusher.

19. In a mechanism for justifying lines of type composed with separators, a wedge-piece movable through the line to remove a separator, said piece being arranged to always enter the line at one side and leave it at the other, and means for pushing a justifying-space into the line in the rear of the wedge-piece.

20. In a mechanism for justifying lines of type composed with separators, a segmental wedge-piece mounted on an intermittently-rotating shaft, said wedge-piece being adapted to remove separators and open the line to receive justifying-spaces and an independently-movable pusher arranged to insert justifying-spaces in the openings so created.

21. In mechanism for justifying lines of type composed with separators, in combination, a rotating segmental wedge-piece adapted to remove separators, and a reciprocating pusher adapted to thrust justifying-spaces into the line in the rear of the wedge-piece.

22. A justifying mechanism comprising, in combination, a series of channels for justifying-spaces, a space-ejecting element, two links connected to and supporting said element, a cam and connections for moving one of said links to bring said ejecting element into register with the proper space-channel, and a second cam and connections for moving the other link to cause said element to eject a selected space.

23. A justifying mechanism comprising, in combination, a series of channels for justifying-spaces, a space-ejecting element, two links connected to and supporting said element, a cam and connections for moving one of said links to bring said ejecting element into register with the proper space-channel, a second cam and connections for moving the other link to cause said element to eject a selected space, a common shaft upon which said cams are mounted, and means for rotating said shaft intermittently.

24. A justifying mechanism comprising, in combination, a series of channels for justifying-spaces, a space-ejecting element, a space-pusher to which the ejected spaces are delivered, a wedge-piece adapted to move through the line to open the same, means for feeding the line intermittently to the spacing mechanism, space-value-determining means movable with the line, and a sliding connection between said space-value-determining means and said spacing means whereby the latter may be operated by the former at any position of the line under justification.

25. A justifying mechanism comprising, in combination, a series of channels for justifying-spaces, a space-ejecting device including a rock-shaft and a bell rigidly carried by said rock-shaft, means for feeding a line of type and separators intermittently, means movable with the line of type and adapted to determine the values of justifying-spaces required for the line, and a sliding connection between said space-determining means and said rock-shaft bell whereby the space-ejector may be adjusted at any position of the moving line.

26. In a justifying apparatus, the combination of a line-carrier provided with a fixed abutment for one end of the line and with a movable abutment to bear against the other end of the line, a pin connected with one of the abutments, a contact-piece connected with the other abutment to cooperate with the said pin and provided with triangle-shaped sections converging toward a common center and corresponding each to a certain value of spaces, means for adjusting the pin and contact-piece to each other in accordance with the number of intervals contained in the line, means for successively readjusting the pin and contact-piece in conformity with the insertion of the spaces, means for releasing the spaces and means for controlling the releasing of the spaces by the cooperation of the said pin and contact-piece.

27. In a justifying apparatus, the combination of a line-carrier provided with a fixed abutment for one end of the line and with a movable abutment to bear against the other end of the line, a pin connected with one of the abutments, a contact-piece connected with the other abutment to cooperate with the said pin and provided with triangle-shaped sections converging toward a common center and corresponding each to a certain value of spaces, means for adjusting the pin and contact-piece to each other in accordance with the number of intervals contained in the line, means for successively readjusting the pin and contact-piece in conformity with the insertion of the spaces, means for releasing the spaces and means for controlling the releasing of the spaces by the cooperation of the said pin and contact-piece.

28. In a justifying apparatus, the combination of a movable line-carrier, a guideway for the traveling line-carrier provided with opposite openings for removing separators from and inserting justifying-spaces into the line respectively, a rotary wedge-shaped ejector to remove the separators and at the same time enlarge the opening of the line to the extent of the thickest justifying-space, a reciprocating pusher to insert the justifying-spaces, and means for successively stopping the line-carrier with the separators in line with the said openings and at the same time rotating the ejector and the pusher to perform one revolution and reciprocation respectively.

29. In a justifying apparatus, the combination of a line-carrier provided with a fixed abutment for one end of the line and with a movable abutment to bear against the other end of the line, a pin connected with one of the abutments, a contact-piece connected with the other abutment to cooperate with the said pin and provided with sections corresponding each to a certain value of justifying-space, a cam-shaft, a lever-and-rod system controlled by the same of the cam-shaft and connected with the said pin, a pusher for ejecting justifying-spaces connected to the said lever-and-rod system, and means for temporarily releasing the cam-shaft to perform one revolution.

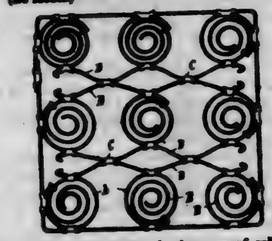
30. In a mechanism for justifying a line of type composed with separators having parallel sides, devices operating to measure the length of the line as many times as there are separators in the line, in combination with means, controlled by said devices in accordance with the respective measurements, for determining the respective spaces for justifying the line.

31. In a mechanism for justifying a line of type composed with separators, devices operating to measure the length of the line as many times as there are separators in the line, said devices comprising relatively movable parts engaging the ends of the line, in combination with means controlled by said devices, in accordance with the respective measurements, for selecting the respective spaces for justifying the line.

32. In a mechanism for justifying a line of type composed with separators, devices operating to measure the line as many times as there are separators in it, means for counting the separators, means controlled by the successive measurements and by the number of separators for selecting the respective spaces for justifying the line.

33. In a mechanism for justifying a line of type composed with separators, devices operating to measure the line as many times as there are separators in it, means for counting the separators, means controlled by the successive measurements and by the number of separators for selecting the respective spaces for justifying the line, and means for replacing the separators with the selected justifying-spaces.

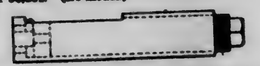
705,694. FRAMEWORK FOR SPRING SEATS OR BEDS. WILLIAM A. MURRAY, Cincinnati, Ohio. Filed Mar. 10, 1902. Serial No. 97,620. (No model.)



Claim.—1. In a spring-bottom having rows of coiled springs, the combination of two oppositely-curved wires between the rows coupled side by side at intervals and sinuous thereto diverging to points alongside of the top loops of the springs in the adjacent row and there coupled to the springs, substantially as shown and described.

2. In a spring-bottom having rows of coiled springs the combination of two oppositely-curved wires between the rows lying side by side at intervals and sinuous thereto diverging to points alongside of the top loops of the springs, and clips coupling the wires to one another and to the top loops of the coils at the meeting-points, substantially as shown and described.

705,695. TOOL FOR CUTTING METAL. OLEF McKOEN and DANIEL J. HEATH, county of Surrey, England. Filed Feb. 27, 1902. Serial No. 96,091. (No model.)



Claim.—1. A cutter for cutting cylindrical lengths consisting of a segment of a metal ring, the front or working end of which has an outer surface lying in a plane at right angles to the axis of the cutter, and having also a curved recess the inner surface of which gradually deepens as it extends around the axis, the inner portion of one of the radial edges of the segment forming the cutting edge, while the similar inner portion of the other radial edge is at the inner end of the gradually-deepening recess in rear of the cutting edge.

2. The combination of a cutter for cutting cylindrical lengths of metal consisting of a segment of a metal ring the inner portion of one of the radial edges forming the cutting edge while the similar inner portion of the other radial edge is not in the same plane with it a gradually-deepening recess being formed in the face of the segment with a tubular holder one end of which has an inwardly-projecting flange and in which a portion of the side is cut away and means for holding the cutter stationary within the tubular holder.

3. The combination of two or more cutters for cutting cylindrical lengths of metal each consisting of a segment of a metal ring the inner portion of one of the radial edges forming the cutting edge while the similar inner portion of the other radial edge is not in the same plane with it a gradually-deepening recess being formed in the face of the segment, and a distance-piece inserted between said cutters, with a tubular holder one end of which has an inwardly-projecting flange and in which a portion of the side is cut away and means for holding the cutters stationary within the tubular holder.

4. The combination of a cutter for cutting cylindrical lengths of metal consisting of a segment of a metal ring the inner portion of one of the radial edges forming the cutting edge while the similar inner portion of the other radial edge is not in the same plane with it a gradually-deepening recess being formed in the face of the segment, and a cutter for pointing the end of the metal length, with a tubular holder one end of which has an inwardly-projecting flange and in which a portion of the side is cut away and means for holding the cutters stationary within the tubular holder.

5. The combination of two or more cutters for cutting cylindrical lengths of metal each consisting of a segment of a metal ring the inner portion of one of the radial edges forming the cutting edge while the similar inner portion of the other radial edge is not in the same plane with it a gradually-deepening recess being formed in the face of the segment, a distance-piece inserted between said cutters, and a cutter for pointing the end of the metal length, with a tubular holder one end of which has an inwardly-projecting flange and in which a portion of the side is cut away and means for holding the cutters stationary within the tubular holder.

705,696. WATER-FILTER. ADOLPH G. HAAS, Cleveland, Ohio. Filed Aug. 5, 1901. Serial No. 70,911. (No model.)

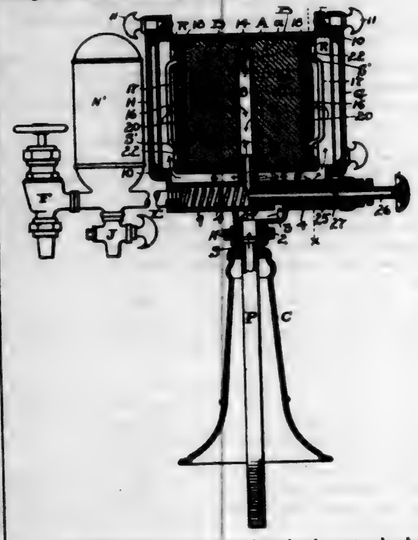
Claim.—1. A filter-casing and a filtering-block therein, in combination with a ring confining said block, a cloth and loose filtering material over the outside of said block and a removable ring engaging the edge of the cloth and locked on the ring which confines said block, substantially as described.

2. A filter having a suitable filtering block or stone and a ring to confine the same, a loose filtering material over said block or stone and a cloth spread over the same, and a ring with a handle adapted to be rotated and serving to press against the edge of the cloth and fasten it in place, substantially as described.

3. A filter comprising a casing having an inwardly-extending ring at its center, in combination with a pair of filtering-blocks resting against the sides of said ring, means to confine each block in place, a head on each end of the casing set apart from said blocks to have the fluid-space between them, and means to reverse the flow of water through said blocks, said means comprising channel 6 open to each end of the casing, fluid-inlet chamber 4 and a fluid-passage therefrom into said channel, duct 7 from said chamber into the casing between the filtering-blocks, and means in said chamber to control the flow of fluid into the said casing, substantially as described.

4. A filter-casing having open ends and inclosing heads therefor and constructed to support a filter block or stone in each end, and having in its bottom a water-channel leading to each end and a separate walled water-chamber lengthwise outside said channel, said outer water-chamber connected by a fixed duct with the interior of the casing and by an opening with said water-channel, substantially as described.

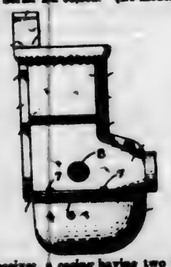
5. The filter-casing open at both ends, and inclosing heads therefor, and adapted to receive separate filtering-stones in each end with a fresh-water outlet between them, a water-channel on the bottom of said casing open to both its ends and a tubular chamber outside said channel and in communication therewith by an opening, a water-supply connection with said chamber and a valved water-outlet therefrom, a duct connecting the interior of the said casing with said chamber and mechanism in said chamber adapted to slide therein and change the direction of flow of water through the filter, substantially as described.



6. The filter-casing and a water-channel and a water-chamber, respectively, at its bottom, a duct 5 connecting said chamber and channel, a duct 7 from said chamber into the casing, and ducts at the ends of said channel into the ends of the casing, and a double slidable valve in said chamber constructed to change the direction of the flow of water therethrough, substantially as described.

7. A filter constructed to be cleansed by flowing the pressure-water through the same in a reverse direction, and having an inclosing cylinder, in combination with a water-inlet chamber and openings therefrom into both the ends and the center of the said cylinder, a tubular valve-stem and a pair of valves thereon in said chamber controlling said openings, said stem having a passage through the same from its inner end, and a spring pressing against the inner end of said stem, substantially as described.

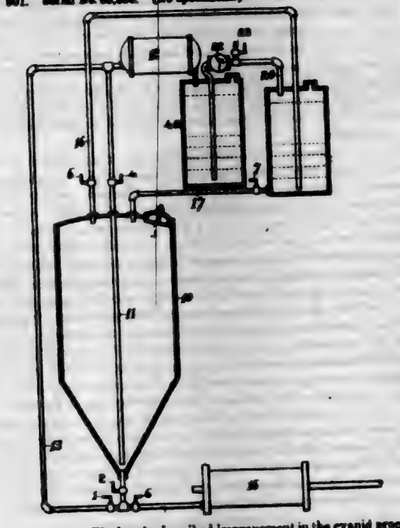
705,697. STREET-RECEIVER. THOMAS J. O'BRIEN, Buffalo, N. Y. Filed July 15, 1901. Serial No. 68,202. (No model.)



Claim.—1. In a receiver, a casing having two interior opposite diagonally-extending flanges provided with pivot-seats, and a pivotal valve-plate having a portion wider than the distance between the flanges, a portion narrower than the distance between the flanges, oppositely-disposed lugs projecting laterally from the narrower portion and pivot-pins adapted to rest in the pivot-seats in the flanges secured rigidly in the lugs, substantially as set forth.

2. A receiver having a curb-casing provided with oppositely-extending flanges provided with beveled edges converging toward each other from the rear to the front, substantially as set forth.

705,698. CYANID PROCESS OF WORKING GOLD, SILVER, OR OTHER ORES. ROBERT H. OPPERS, JAMES W. HILL, JOSEPH E. BENSHER, and FRANK H. OPPERS, Salt Lake City, Utah. Filed June 10, 1901. Serial No. 63,890. (No specimens.)

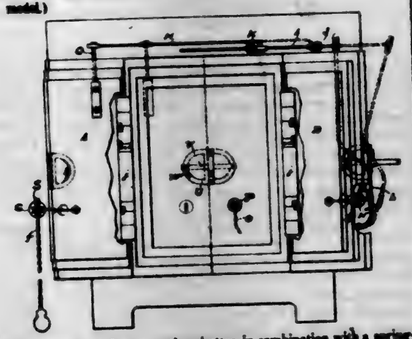


Claim.—1. The herein-described improvement in the cyanid process of recovering precious metals from ores, slimes, tailings or concentrates consisting in treating the ore, slime, tailings or concentrates with a suitable cyanogen compound and passing the hydrocyanic-acid gas set free by such treatment through a regenerating caustic solution, as and for the purpose described.

2. The herein-described improvement in treating the foul or spent solution resulting from the cyanid process of extracting gold and silver from ores, consisting in passing sulfurous-acid gas through said solution and then filtering and washing to recover the metals precipitated by the acidification.

3. The herein described improvement in treating ores by the cyanid process consisting in agitating the pulp containing the cyanid solution by a suitable gas under pressure, passing the gas and the hydrocyanic-acid gas liberated from the solution through a regenerating solution and using the gas after passing through said regenerating solution to agitate a fresh quantity of pulp.

705,699. AUTOMATIC FIRE-PROTECTING SHUTTER. TADASHI OSHIO, Takagi, Japan. Filed Jan. 17, 1902. Serial No. 89,158. (No model.)



Claim.—1. A fire-protecting shutter, in combination with a spring-inclosing hinge upon which it opens against the stress of the spring, an eye projecting from the outer side of said shutter, an easily-fusible ring connected to said eye, a link connected to the ring, and an eye secured to the exterior wall of the building, to which said link is hinged, whereby the shutter is held open by connection with the wall until released by the fusing of the ring and then closed by the action of its spring-hinge.

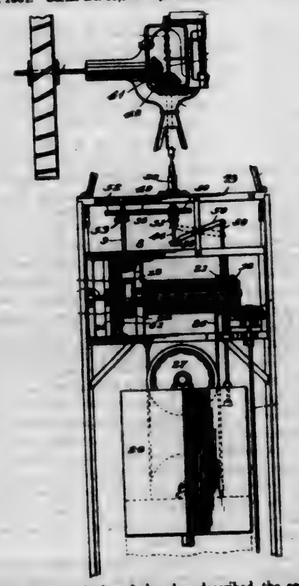
2. A fire-protecting shutter, in combination with a spring-inclosing hinge upon which it opens against the stress of the spring, an eye projecting from the outer side of said shutter, an easily-fusible ring connected to said eye, a link connected with said ring, an eye secured to the exterior wall of the building, and a readily-removable pin connecting the link to said eye, whereby the door may be released by hand, and allowed to close without destruction of said ring.

3. In automatic fire-protecting apparatus, the combination of two counting door-wings or shutters opening upon spring-inclosing hinges against the stress of said springs, a connection readily destructible by heat holding one of said shutters open, and connections between said shutter and the other whereby the latter is concurrently held open, said connections being actuated by the first shutter in its closing movement to release the other and permit it to close immediately following the first.

4. In automatic fire-protecting apparatus, the combination of two counting door-wings or shutters opening upon spring-inclosing hinges and against the stress of the springs therein, a connection readily destructible by heat holding one of said shutters open, a locking-pin holding the second shutter open, connections between the first shutter and said pin, actuated by said shutter in its closing movement to withdraw said pin and cause the second shutter to close immediately following the first, a catch upon the outer face of the first shutter and a latch-bar upon the outer face of the second shutter, whereby the shutters are latched as they close.

5. In an automatic fire-protecting apparatus, the combination of the shutters A and B, their spring-hinges, the fusible ring D, the eyebolt E on shutter A, the link F, the forked eyebolt G connected to the wall, coupling-pin S uniting said link and bolt, standard Q, rods H and K, lever L, locking-pin M jointed to said lever, the forked eyebolt N into which the locking-pin takes, the link O matching into said latter eyebolt and coupled thereto by the locking-pin and the forked eyebolt P on shutter B, and to which the other end of said link O is hinged.

705,700. APPARATUS FOR EQUALIZING, CONTROLLING, AND STORING POWER. LAFAYETTE H. OSTRUM, Springvalley, Minn. Filed June 20, 1901. Serial No. 65,378. (No model.)



Claim.—1. In a device of the class described, the combination of the inner and outer concentric shafts, a main gear, a central gear or pinion mounted on the inner shaft, and an intermediate gear or pinion connected with the outer shaft and meshing with the said gears and adapted to communicate motion from the main gear to the central gear and capable also of revolving around the latter in either direction, substantially as and for the purpose described.

2. In a device of the class described, the combination of the inner and outer concentric shafts, a main gear, a central gear connected with the inner shaft, and a pair of intermediate gears arranged at opposite sides

of and connected with the outer shaft and meshing with the said gears and adapted to communicate motion from the main gear to the central gear and capable of revolving backward and forward around the latter, substantially as described.

2. In a device of the class described, the combination of an inner shaft designed to be connected with the device to be operated, an outer shaft, a main gear designed to be connected with the power, a central gear connected with the inner shaft, an intermediate gear meshing with the central gear and with the main gear and connected with the outer shaft, and capable of revolving around the central gear in either direction and means connected with the outer shaft for resisting the movement of the intermediate gear around the central gear for controlling the application of the power and for storing any excess of power, substantially as and for the purpose described.

4. In a device of the class described, the combination of an inner shaft designed to be connected with the device to be operated, an outer shaft, a main gear, a central gear connected with the inner shaft, an intermediate gear meshing with the said gears and connected with the outer shaft and capable of moving around the central gear in either direction, and a weight also connected with the outer shaft, substantially as and for the purpose described.

5. In a device of the class described, the combination of a main gear designed to be connected with the power, an inner shaft, an outer shaft, a central gear connected with the inner shaft, the intermediate gears meshing with the said gears and connected with and located at opposite sides of the outer shaft and mounted independently of the main gear, whereby it is adapted to move freely around the central gear in either direction, a flexible connection arranged to be wound up by the rotation of the outer shaft, and a weight supported by the flexible connection, substantially as described.

6. In a device of the class described, the combination of an inner shaft, a main gear, a central pinion connected with the inner shaft, an outer shaft, intermediate gears connected with the outer shaft and meshing with the main gear and with the central pinion and capable of moving around the latter in either direction independently of the main gear, a drum carried by the outer shaft, a weight, and a flexible connection supporting the weight and connected with the drum, substantially as described.

7. In a device of the class described, the combination of inner and outer shafts, a main gear-wheel provided with internal and external teeth, a central pinion mounted on the inner shaft, intermediate gears meshing with the central pinion and with the internal teeth of the main gear and connected with the outer shaft, a drum carried by the outer shaft, a flexible connection attached to and adapted to be wound around the drum, a weight supported by the flexible connection, the shaft 9 designed to be connected with the motive power and provided with a pinion meshing with the external teeth of the main gear, and gearing for connecting the inner shaft to the device to be operated, substantially as described.

8. In a device of the class described, the combination of the inner and outer shaft, a central pinion connected with the inner shaft, a main gear having ratchet-teeth, intermediate gears connected with the outer shaft and meshing with the central pinion and with the main gear and capable of revolving around the central pinion in either direction independently, a weight connected with the outer shaft, and a pawl mounted independently of the support of the intermediate gears and adapted to engage the ratchet-teeth of the main gear to lock the same against backward movement, substantially as and for the purpose described.

9. In a device of the class described, the combination of inner and outer shafts, a main gear-wheel provided with internal and external teeth and having a ratchet, a central pinion mounted on the inner shaft, intermediate gears meshing with the central pinion and with the internal teeth of the main gear and connected with the outer shaft, a drum carried by the outer shaft, a flexible connection attached to and adapted to be wound up by the drum, a weight supported by the flexible connection, the shaft 9 designed to be connected with the motive power and having a pinion meshing with the external teeth of the main gear, gearing for connecting the inner shaft with the device to be operated, and a pawl for engaging the ratchet, substantially as described.

10. In a device of the class described, the combination of a main gear having internal and external teeth, a central gear designed to be connected with the device to be operated, an intermediate gear meshing with the central gear and with the internal teeth of the main gear and adapted to communicate motion from the latter to the former and capable of revolving around the central gear, and means for resisting the movement of the intermediate gear around the central gear, substantially as described.

11. In a device of the class described, the combination of a main gear, a central gear designed to be connected with the machine or device to be operated, means for connecting the main gear with the motive power, a pair of intermediate gears located at opposite sides of the central gear and meshing with the same and with the main gear and capable of revolving around the central gear in either direction, and means for resisting the movement of the intermediate gears around the central gear, substantially as and for the purpose described.

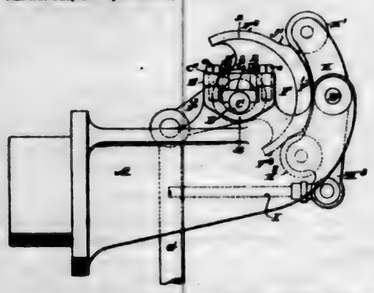
12. In a device of the class described, the combination with a windmill provided with means for drawing the wind-wheel out of the wind, a main gear, a central gear, intermediate gears meshing with the main gear and with the central gear and adapted to communicate motion to the latter and to revolve around the same, a weight connected with the intermediate gears, a lifting-rod arranged in the path of the weight and connected with the means for drawing the wind-wheel out of the wind, and gearing for connecting the main gear with the windmill, substantially as described.

13. In a device of the class described, the combination with a windmill provided with a hinged vane, and having means for swinging the same, of a main gear, a central gear, intermediate gears meshing with the main gear and with the central gear and arranged to revolve around the latter, a weight connected with the intermediate gears, gearing for connecting the main gear with the windmill, a clutch for coupling said gearing to the windmill, a lever arranged to operate the clutch and to actuate the means for swinging the vane, and a lifting-rod connected with the lever and arranged in the path of the weight, substantially as described.

14. In a device of the class described, the combination with a source of power and a machine or device to be operated, of a vertically-movable weight, and gearing connecting the weight with the source of power and with the machine or device, said gearing being provided with an element capable of moving backward and forward independently of either the source of power or the machine or device, substantially as described.

15. In a device of the class described, the combination with a source of power, and a machine or device to be operated, of a vertically-movable weight, a drum, a flexible connection connecting the weight with the drum, and gearing connecting the drum with the source of power and with the machine or device to be operated, and adapted to permit the weight to operate independently of the former to actuate the latter and equalize the former, and also to store energy, substantially as described.

705,701. CAM MECHANISM. GERRAY B. FRENCH, Philadelphia, Pa., assignor to the Southwark Foundry & Machine Company, Philadelphia, Pa., a Corporation of Pennsylvania. Filed July 31, 1897. Serial No. 646,622. (No model.)



Claim.—1. Cam mechanism consisting of a pivoted cam having a segmental elevated face F' connected by symmetrical inclines f' at each end with depressed segmental faces F² in combination with a rock-lever as H having cam-contacting faces or rollers H' H² arranged at equal distances from the pivotal center of the lever and at a distance apart which will maintain both rolls always in contact with the cam-face while permitting them to pass alternately from the elevated to the depressed or from the depressed to the elevated cam-faces and means for adjusting the cam and rock-lever pivots to and from each other to maintain a close fit between the cam-face and rollers.

2. Cam mechanism consisting of a pivoted cam having a segmental elevated face F' connected by segmental inclines f' at each end with depressed segmental faces F² in combination with a rock-lever as H having cam-contacting faces or rollers H' H² arranged at equal distances from the pivotal center of the lever and at a distance apart which will maintain both rolls always in contact with the cam-face while permitting them to pass alternately from the elevated to the depressed or from the depressed to the elevated cam-faces and means for adjusting the cam-pivot to and from the pivot of the rock-lever to maintain a close fit between the cam-face and rollers.

3. Cam mechanism consisting of a pivoted cam having a segmental elevated face F' connected by symmetrical inclines f' at each end with depressed segmental faces F² in combination with a rock-lever as H having cam-contacting faces or rollers H' H² arranged at equal distances from the pivotal center of the lever and at a distance apart which will maintain both rolls always in contact with the cam-face while permitting them to pass alternately from the elevated to the depressed or from the depressed to the elevated cam-faces, an eccentric pivot-bearing for the cam and means for shifting said eccentric and clamping it in position to adjust the cam to the lever-rollers.

705,702. COLLIMATOR-GYROSCOPE FOR OBTAINING ARTIFICIAL HORIZONS. PROSPER PETITJEAN and LÉON THÉODORE, Paris, France. Filed Mar. 11, 1902. Serial No. 97,727. (No model.)

Claim.—1. In a collimator-gyroscope operating in vacuum for obtaining an artificial horizon, a cylindrical horizontal case provided with two diametrically opposite windows, one of the windows of the said horizontal case being closed by a transparent pane, the other window being closed by a roughened glass, the window with the transparent pane being placed at the front extremity of the collimator, a cock placed at the center of the horizontal case upon which the gyroscope is mounted, the gyroscope being provided at the middle of its periphery with vanes opposite which are two horizontal conduits pierced obliquely in the wall of the horizontal case, the gyroscope being provided with a chamber, the said chamber being pierced with two diametrically opposite windows of which the axis is in the same horizontal plane as that of the windows of the horizontal case, a lens located opposite one of the windows of the chamber surrounding the gyroscope, and a blackened pane upon which are traced transparent lines placed opposite the other window and at the focus of the lens, substantially as described.

2. In a collimator-gyroscope operating in vacuum for obtaining an artificial horizon, a cylindrical horizontal case provided with two diametrically opposite windows, a cock placed at the center of the horizontal case upon which the gyroscope is mounted, the gyroscope being provided with vanes at the middle of its periphery opposite which are two horizontal conduits pierced obliquely in the wall of the horizontal case, two vertical conduits pierced in the wall of the horizontal case in connection at their upper extremities with the horizontal conduits pierced obliquely in the wall of the horizontal case and at their lower extremities with a conduit pierced horizontally in the enlargement of the base of the horizontal case, a conduit pierced horizontally in the enlargement of the base and in perpendicular connection at one of its extremities with the one already in connection with the two vertical conduits and in connection at its other extremity with a conduit pierced perpendicularly in the base of the horizontal case and upon which is disposed a cock, a conduit pierced perpendicularly in the base of the horizontal case in connection with the interior of said case, a cock located in this conduit and an air-tube mounted upon the said cock, substantially as described.

3. In a collimator-gyroscope operating in vacuum for obtaining an artificial horizon, a cylindrical horizontal case provided with two diametrically opposite windows, one of the windows of the said horizontal case being closed by a transparent pane and the other by a roughened pane, the window with the transparent pane being placed at the front extremity of the collimator, a cock placed at the center of the horizontal case upon which the gyroscope is mounted, the gyroscope being provided at the middle of its periphery with vanes opposite which are two horizontal conduits pierced obliquely in the wall of the horizontal case, the gyroscope being provided with a chamber, the said chamber being pierced with two diametrically opposite windows of which the axis is in the same horizontal plane as that of the windows in the horizontal case, one of the windows being opposite a blackened glass at the focus of the lens placed opposite the other window, and an electric lamp inserted in a tube and placed in the focus of the lens located upon the same line as the center of the window of the horizontal chamber closed by roughened glass, substantially as described.

4. In a collimator-gyroscope operating in vacuum for obtaining an artificial horizon, a cylindrical horizontal case provided with two diametrically opposite windows, one of the windows of the said horizontal case being closed by a transparent pane and the other by a roughened glass, the window having the transparent pane being placed at the front extremity of the collimator, a cock placed at the center of the horizontal case upon which the gyroscope is mounted, the gyroscope being provided at the middle of its periphery with vanes opposite which are two horizontal conduits pierced obliquely in the wall of the horizontal case, the gyroscope being provided with a chamber, the said chamber being pierced with two diametrically opposite windows of which the axis is in the same horizontal plane as that of the windows of the horizontal case, one of the windows being opposite a blackened glass in the focus of the lens located opposite the other window, the blackened glass, an electric lamp inclosed in a tube and placed in the focus of a lens located in the same line as the center of the window of the horizontal chamber which is closed by a roughened glass, an axle carried by the tube which contains the electric lamp and, articulated upon the said axle, panes of various colored glasses adapted to be placed one on the other between the roughened glass of the horizontal cylindrical case and the lens at the focus of which the electric lamp is placed, substantially as described.

5. In a collimator-gyroscope operating in vacuum for obtaining an artificial horizon, a cylindrical horizontal case provided with two diametrically opposite windows, one of the windows of the said horizontal case being closed by a transparent pane, the other window being closed by a roughened glass, the window with the transparent pane being placed at the front extremity of the collimator, a cock placed at the center of the horizontal case upon which the gyroscope is mounted, the gyroscope being provided with vanes at the middle of its periphery opposite which are two horizontal conduits pierced obliquely in the wall of the horizontal case, the gyroscope being provided with a chamber, the said chamber being pierced with two diametrically opposite windows of which the axis is in the same horizontal plane as that of the windows in the horizontal case, a lens placed opposite one of the windows of the chamber surrounding the gyroscope, a blackened glass upon which are traced transparent lines located opposite the other window and at the focus of the lens, an axle journaled in the lower part of the cylindrical horizontal case, this axle being furnished with a central journal located in the wall of the horizontal case which it crosses, the larger base of the central journal being on the exterior of the case while the other cylindrical journal of said axle is located in a cavity in the wall of the horizontal case, an operating-lever keyed upon the squared end of the axle adjacent to the central journal, and a fork and a bent wire fixed upon the axle with two journals, substantially as described.

6. In a collimator-gyroscope operating in vacuum for obtaining an artificial horizon, a cylindrical horizontal case provided with two diametrically opposite windows, a chamber placed at the center of the horizontal case upon which the gyroscope is mounted, the gyroscope being provided with vanes at the middle of its periphery opposite which are two horizontal conduits pierced obliquely in the wall of the horizontal case, two vertical conduits pierced in the wall of the horizontal case in connection at their upper extremity with the horizontal conduits pierced obliquely in the wall of the horizontal case and at their lower extremity with a conduit pierced horizontally in the base of the horizontal case, a conduit pierced horizontally in the base and in perpendicular connection by one of its extremities with the one already in connection with the two vertical conduits, and in connection at its other extremity with a conduit pierced perpendicularly in the base of the horizontal case and upon which a cock is mounted, a conduit pierced perpendicularly in the base of the horizontal case in connection with the interior of this case, a cock located upon this conduit and an air-tube mounted upon the said cock, the gyroscope being provided with a chamber mounted upon the upper part of the horizontal case in communication with the interior of the latter, and a vacuum-indicator placed on the interior of the said chamber, substantially as described.

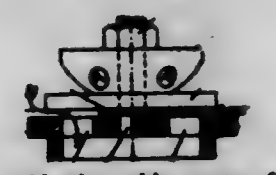
705,708. STEM-WINDING WATCH. WILLIAM S. PORTER, New Haven, Conn., assignor to the New Haven Clock Company, New Haven, Conn., a Corporation of Connecticut. Filed Jan. 28, 1902. Serial No. 91,722. (No model.)

Claim.—1. In a watch, the combination with the movement-supporting plate, having a slot extending to its periphery; of a wheel mounted on a post, which post is adapted to fit within said slot, and is prevented from longitudinal withdrawal therefrom; and a spring closing the open end of said slot, and normally tending to force said post toward the closed end of said slot, substantially as described.

2. In a watch, the combination with a movement or supporting plate, having a slot extending to its periphery; of a winding-train mounted on said plate; a rotary stem; a wheel mounted on a post, and when in position actuated by said stem, said post being adapted to fit within said slot, and being prevented from longitudinal withdrawal therefrom;

and a spring closing the open end of said slot, and yieldingly holding said wheel in engagement with said winding-train, substantially as described.

705,704. WATER-SEALED AIR-PUMP. HERMAN PONTHIER, Amsterdam, Netherlands. Filed Nov. 8, 1901. Serial No. 81,551. (No model.)

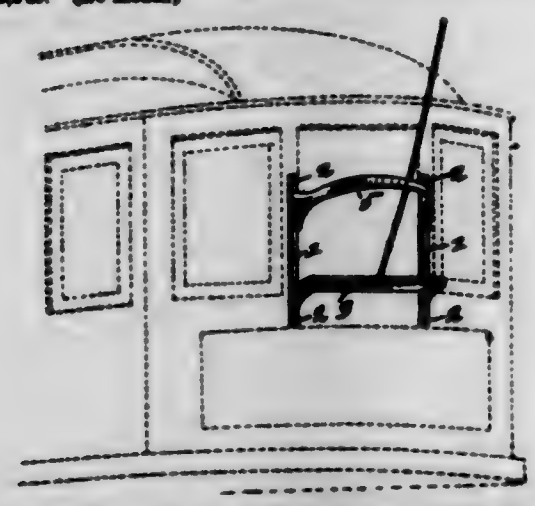


Claim.—1. The combination with a valve for water-sealed air-pumps of a metal flap located against the face of the valve and covering a portion only of the same and adapted to momentarily hold a part of the valve away from its seat when the valve begins to close substantially as described.

2. A valve for water-sealed air-pumps consisting of a leather or rubber disk, a guard-plate, and a metal flap located against the face of the disk between the disk and valve-casting, and adapted to cover a portion of the valve-casting and to momentarily hold a part of the valve off the seat when the valve begins to close substantially as described.

3. A valve for water-sealed air-pumps consisting of a leather or rubber disk, a guard-plate, and an adjustable metal flap located against the face of the disk between the disk and valve-casting and adapted to cover different portions of the valve-seat and to momentarily hold a part of the valve off the seat when the valve begins to close, substantially as described.

705,705. SAFETY ATTACHMENT FOR TROLLEY-CAR VESTIBULES. SAMUEL H. PRESSLAND, Toledo, Ohio. Filed May 5, 1902. Serial No. 105,949. (No model.)



Claim.—1. In a safety device for trolley-car vestibules, the combination with the window-frame of a car-vestibule, of an outwardly-extending curved back bar provided with tapered attaching-grooves, and tapered tongues secured upon the side frames of the vestibule-window adapted to coöperate with the tapered grooves in the back bar to permit attachment or detachment of the back bar.

2. In a safety device for trolley-car vestibules, the combination with the window-frame of a car-vestibule, of side bars secured to the side frames of the vestibule-window, the seat supported at the lower ends of the side bars, tapered tongues provided upon the side bars, and an outwardly-extending curved back bar provided with tapered grooves adapted to engage the tapered tongues upon the side bars to permit the attachment or detachment of the back bar, as set forth.

705,706. STEREOSCOPE. HENRY E. RIEMENSCHNEIDER, Westwood, N. J. Filed Nov. 4, 1901. Serial No. 81,078. (No model.)

Claim.—1. In a stereoscope, a lens-frame holder, a ring having an inwardly-projecting part or flange against which the lens may rest, a mat for holding the lens in place, a projection in the ring for holding the mat in place, and an outwardly-projecting flange on the ring resting against the holder.

2. A stereoscope lens-frame, consisting of a ring having an inwardly-projecting part or flange against which a lens may rest, means for holding the lens in place, and another ring over one end of the first-mentioned ring.

3. A stereoscope lens-frame consisting of a ring having an inwardly-projecting flange against which the lens may rest, a mat for holding the lens in place, and another ring surrounding the first-mentioned ring.

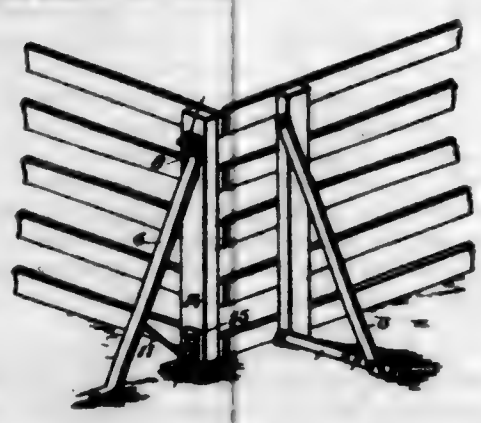
4. In a stereoscope, a lens-frame holder having an opening therein, a ring having an inwardly-projecting flange against which the lens may rest, a mat for securing the lens in place, an outwardly-projecting integral flange on the ring resting against the outer face of the holder, and means for securing the ring within the holder.

5. In a stereoscope, a lens-frame holder having an opening therein, a ring in the holder having an inwardly-projecting flange against which the lens may rest, a mat in the ring to hold the lens in place, outwardly-projecting flanges on the ring resting against the outer face of the lens-frame holder, an outer ring surrounding the first-mentioned ring and having an outwardly-projecting flange, the said outer ring adapted to hold the inner ring in place in the lens-frame.

6. In a stereoscope, a lens-frame holder having an opening therein, an inner ring adapted to be secured in the opening in said holder, said ring having an inwardly-projecting flange against which one face of a lens may rest, a mat adapted to press upon the other face of the lens and hold the lens in place, inner projections on the ring to hold the mat in place, an outwardly-projecting flange on said ring adapted to rest against the outer face of the frame-holder, an outer ring fitting tightly over the inner ring and having a flange adapted to rest against the inner face of the holder and hold the inner ring in place in the holder.

7. In a stereoscope, a lens-frame holder having an opening therein, a tapered ring in the holder having an inwardly-projecting flange against which the lens may rest, a mat in the ring to hold the lens in place, outwardly-projecting flanges on the ring resting against the outer face of the lens-frame holder, the outer ring surrounding the first ring and having an outwardly-projecting flange, the said outer ring adapted to hold the inner ring in place in the frame.

705,707. ADJUSTABLE BRACE OR SUPPORT FOR MOVABLE STRUCTURES. JAMES G. ROSSMAN, Boston, Mass. Filed Nov. 7, 1901. Serial No. 81,462. (No model.)



Claim.—A brace for portable objects comprising a main brace with bent ends, each having a hole, the body of said brace having a series of holes in combination with an auxiliary brace having ends bent at right angles, and a base for attachment to the lower end of the portable structure and connected by the auxiliary brace with the main brace, as set forth.

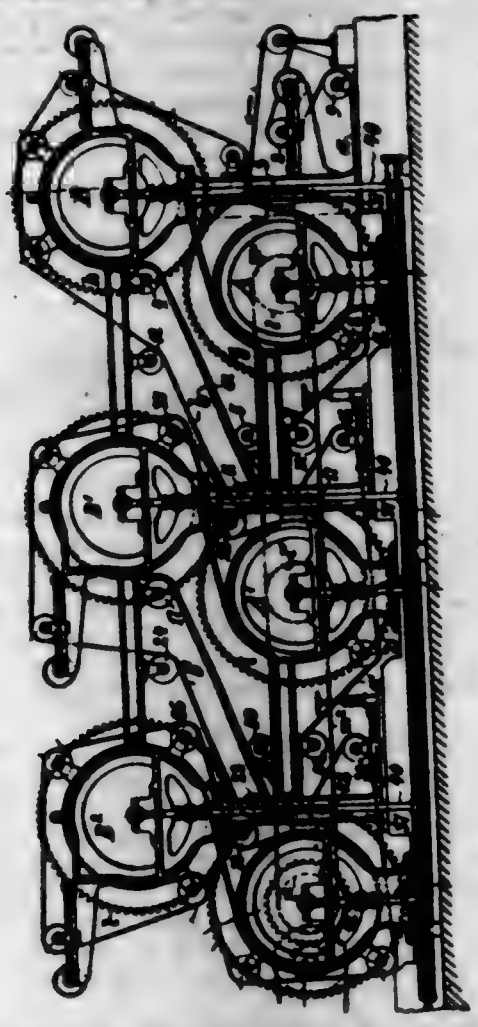
705,708. VENEER-DRYING MACHINE. MARTIN ROSSOW, Duesseldorf, Germany. Filed Nov. 4, 1901. Serial No. 81,092. (No model.)

Claim.—1. In a machine for drying veneer, a number of pairs of heater-drums, pairs of carrier-belts passing around both drums of a pair and carrying the veneer between them, each pair of belts arranged to deliver the veneer between the pair of belts of the succeeding pair of drums, substantially as described.

2. In a machine for drying veneer, a number of pairs of heater-drums, pairs of carrier-belts passing around both drums of a pair to carry the veneer between them, each pair of belts arranged to deliver the veneer between descending portions of the next pair of belts and said drums distanced from one another to heat the veneer first on one side and then on the other during its passage through the machine.

3. In a machine for drying veneer, a number of pairs of superposed heater-drums, an upper and a lower carrier-belt to contact with each pair of drums and carry the veneer between them, and deliver it in a downward direction between downwardly-traveling portions of the next succeeding pair of belts at the lower one of the next succeeding pair of

drums, means for driving all the lower drums and a gear on each lower and each upper drum, whereby the drums of a pair are geared together.



4. In a machine for drying veneer, a number of pairs of superposed heater-drums, an upper and a lower belt passing around each pair of drums, a portion of the lower carrier-belt of the first pair of drums arranged to receive the veneer before meeting the down-coming portion of the upper belt, all the pairs of carrier-belts arranged to deliver the veneer between the down-coming portions of the next pair of belts, said drums distanced from one another to heat the veneer first on one side and then on the other, means for driving the lower drums, a gear on each of the lower drums and a gear on each upper drum driven by that on the lower one of a pair of drums, substantially as described.

705,709. TYPE-WRITER OR ANALOGOUS KEY CAP. WILLIAM B. SAVELL, Newark, N. J. Filed Feb. 17, 1902. Serial No. 94,496. (No model.)

Claim.—1. A key-cap having a reversible teeth member supported above the top of the key when in use.

2. A key-cap having a reversible teeth member supported above the top of the key when in use said teeth member capable of reversal to bring either side uppermost, and provided with a designating symbol.

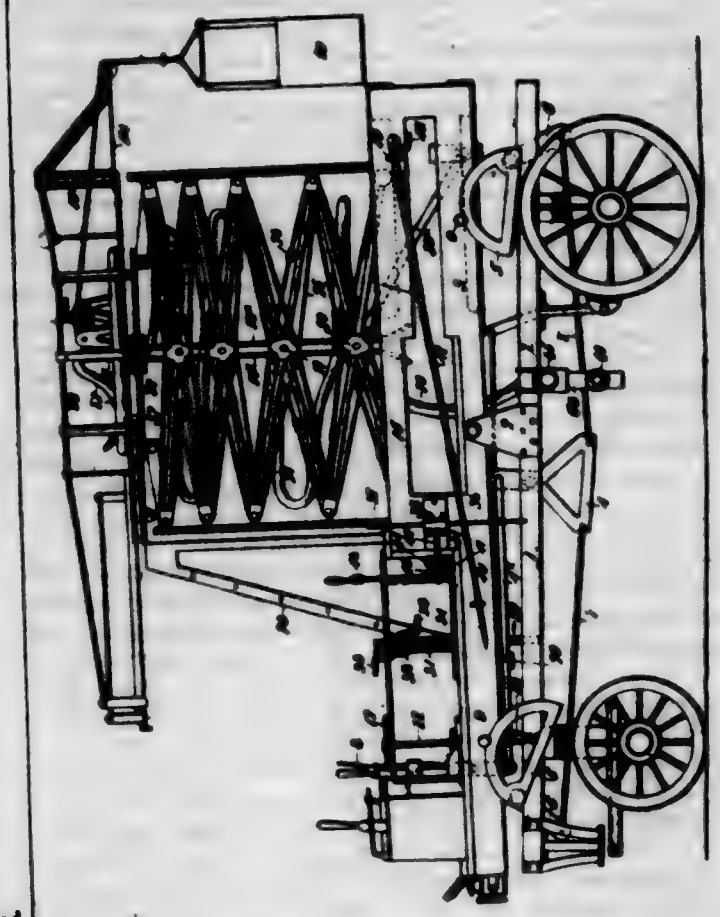
3. A key-cap having a teeth member supported above the top of the key when in use said member capable of reversal to bring either side uppermost and both of said sides having a designating character.

4. A key-cap having a reversible teeth member supported above the key when in use and having a designating character in each side, one of said characters being different from the other.

5. In a device of the character described, the combination of a member, as a rim or band, a reversible teeth member of yielding material, one of said members having a peripheral groove and the other member having a projection or flange to detachably engage said groove, and means for elevating the under side of the teeth member above the top surface of the key.

705,710. COMBINED FIRE-ESCAPE AND WATER-TOWER. CARL SEWARD, Quincy township, and WILLIAM C. BRYANT, Franklin township, Houghton county, Mich. Filed Feb. 7, 1902. Serial No. 93,078. (No model.)

Claim.—1. In a fire-escape, a wheeled truck, a tower-supporting frame or platform centrally pivoted upon said truck, cam-plates pivotally secured to said truck upon opposite sides of the pivotal point of said engaging said tower-supporting frame or platform, and means for moving said cam-plates to thereby adjust said tower-supporting frame or platform, substantially as described.



2. In a fire-escape, a wheeled truck, a tower-supporting frame or platform centrally pivoted upon said truck, cam-plates arranged upon opposite sides of the pivotal point of said frame or platform and supporting the same, and means for moving said cam-plates to thereby adjust said tower-supporting frame or platform, substantially as described.

3. In a fire-escape, a wheeled truck, a tower-supporting frame or platform pivotally mounted upon said truck, cam-plates also pivotally secured to said truck and engaging said tower-supporting frame or platform, a bell-crank lever arranged upon said truck, connections between said cam-plates and bell-crank lever, and a handle or lever pivoted in said tower-supporting frame or platform and connected with said bell-crank lever, whereby said cam-plates may be shifted to adjust said tower-supporting frame or platform, substantially as described.

4. In a fire-escape, the combination with a wheeled truck, a tower-supporting frame or platform pivotally mounted upon said truck and adapted to be adjusted with relation thereto, of a locking-plate secured to said truck, and means for binding said plate against said tower-supporting frame or platform to retain it in adjusted position, substantially as described.

5. In a fire-escape, the combination with a wheeled truck, a tower-supporting frame or platform pivotally mounted upon said truck, and means for adjusting said tower-supporting frame or platform with relation to said truck, of a locking-plate secured to said truck, a hand-wheel and staff mounted in said frame or platform, and a connection between said staff and locking-plate, whereby said locking-plate may be drawn tight against said frame or platform to lock it in adjusted position, substantially as described.

6. In a fire-escape, a wheeled truck and an extension hay-tongs tower supported thereupon, each member of said hay-tongs tower comprising a one-piece central socket-piece having lateral lugs, bars secured in said socket-piece, socket-pieces secured to the ends of said bars, and a brace wire or rod secured to said end sockets and engaging the lateral lugs of said central socket-piece, the said socket-pieces having holes or perforations to receive the connecting pivots or bars, substantially as described.

7. In a fire-escape, an extension hay-tongs tower, each member of which comprises a one-piece central socket-piece having notched lateral lugs, tubular bars secured in said socket-piece, socket-pieces secured to the ends of said bars, brace wires or rods fitted to said end sockets and engaging the notches of the lateral lugs of said central socket-piece, the said socket-pieces having holes or perforations to receive the connecting pivots

or bars, and turn-buckles applied to said wires or rods, substantially as and for the purpose described.

8. In a fire-escape, a wheeled truck, a tower-supporting frame or platform mounted upon said truck, an extension lazy-tongs tower provided with central cross-bars and having one end fixed to said frame or platform, a bar fitted to slide in said frame or platform, and connected with the other end of said lazy-tongs tower, an independent cross-bar also fitted to slide in said frame or platform, rods or links connecting said independent cross-bar with the lower central pivot-bar of said lazy-tongs tower, a screw-shaft engaging said independent cross-bar, and means for rotating said screw-shaft, whereby said tower may be raised or lowered, substantially as described.

9. In a fire-escape, a wheeled truck, a tower-supporting frame or platform mounted upon said truck, an extension lazy-tongs tower provided with central cross-bars and having one end fixed to said frame or platform, a bar fitted to slide in said frame or platform, and connected with the other end of said lazy-tongs tower, an independent cross-bar also fitted to slide in said frame or platform, rods or links connecting said independent cross-bar with the lower central pivot-bar of said lazy-tongs tower, a screw shaft engaging said independent cross-bar, means for rotating said screw-shaft, comprising a crank-shaft mounted upon said frame or platform, and gearing connecting said crank-shaft with said screw-shaft, whereby said tower may be raised or lowered, substantially as described.

10. In a fire-escape, a wheeled truck, a tower-supporting frame or platform mounted upon said truck, an extension lazy-tongs tower provided with central cross-bars, a platform supported upon said tower, means for raising and lowering said tower, and downwardly-extending bars or rods secured to said tower-platform having their lower ends bent outwardly and arranged and adapted to pass upon opposite sides of the central cross-bars of said tower, substantially as and for the purpose described.

11. In a fire-escape, the combination with a wheeled truck, a tower-supporting frame mounted upon said truck, an extension lazy-tongs tower mounted thereupon, and means for raising and lowering said tower, of means for locking said tower comprising a bracket secured to said frame or platform, an arm or plate carried by said tower, and means for forcibly engaging said arm or plate with the bracket, substantially as described.

12. In a fire-escape, the combination with a wheeled truck, a tower-supporting frame or platform mounted upon said truck, an extension lazy-tongs tower carried by said frame or platform, and means for raising said tower, of means for locking said tower in its raised position, comprising a slotted bracket fixed to said frame or platform, a segmental arm or plate pivotally hung to and carried by one of the members of said lazy-tongs tower and passing through said slotted bracket, a cam or eccentric arranged in said bracket and engaging said arm or plate with the bracket, substantially as described.

13. In a fire-escape, the combination with a wheeled truck, a tower-supporting frame or platform mounted upon said truck, an extension lazy-tongs tower carried by said frame or platform, and means for raising said tower, of means for locking said tower in its raised position, comprising slotted brackets arranged upon opposite sides of the frame or platform, segmental arms pivotally hung to and carried by one of the members of the lazy-tongs tower and passing through said slotted brackets, cams or eccentrics arranged in said slotted brackets and engaging said arms, a rock-shaft and handle therefor mounted upon said frame or platform, and connections between said rock-shaft and cams or eccentrics to move said cams or eccentrics to forcibly engage said arms with the brackets, substantially as described.

14. In a fire-escape, an extension-tower, a turn-table supported upon the upper end of said tower, a crane hinged to said turn-table and provided with a sheave or pulley, a salvage-basket, and a rope or chain for supporting said basket passing over said sheave or pulley, a windlass mounted upon said turn-table and receiving said rope or chain, and a button or enlargement on said rope between said basket and sheave and adapted to engage said sheave to raise said crane, to thereby bring the basket in proximity to the turn-table, substantially as described.

15. In a fire-escape and water-tower, an extension lazy-tongs tower provided with central cross-bars, combined with a hose-pipe carried by said tower and arranged alternately upon opposite sides of adjacent central cross-bars, substantially as and for the purpose described.

16. In a combined fire-escape and water-tower, the combination with a wheeled truck, a tower-supporting frame mounted upon said truck, and an extension lazy-tongs tower mounted upon said frame and provided with central cross-bars, of a valved hose connection secured to said truck and provided with a valved drain-pipe, a section of hose-pipe connected with said hose connection and extending upwardly through said tower and arranged upon alternate or opposite sides of adjacent central cross-bars thereof, and a connection for said hose-pipe at the upper end of said tower, substantially as described.

17. In a fire-escape, an extension-tower, a turn-table supported upon the upper end of said tower, a crane hinged to said turn-table and provided with a sheave or pulley, a salvage-basket, and a rope or chain for supporting said basket passing over said sheave or pulley, a windlass mounted upon said turn-table and receiving said rope or chain, and a button or enlargement on said rope between said basket and sheave and adapted to engage said sheave to raise said crane, to thereby bring the basket in proximity to the turn-table, substantially as described.

18. In a fire-escape, the combination with a wheeled truck, a tower-supporting frame or platform mounted upon said truck, an extension lazy-tongs tower carried by said frame or platform, and means for raising said tower, of means for locking said tower in its raised position, comprising slotted brackets arranged upon opposite sides of the frame or platform, segmental arms pivotally hung to and carried by one of the members of the lazy-tongs tower and passing through said slotted brackets, cams or eccentrics arranged in said slotted brackets and engaging said arms, a rock-shaft and handle therefor mounted upon said frame or platform, and connections between said rock-shaft and cams or eccentrics to move said cams or eccentrics to forcibly engage said arms with the brackets, substantially as described.

14. In a fire-escape, an extension-tower, a turn-table supported upon the upper end of said tower, a crane hinged to said turn-table and provided with a sheave or pulley, a salvage-basket, and a rope or chain for supporting said basket passing over said sheave or pulley, a windlass mounted upon said turn-table and receiving said rope or chain, and a button or enlargement on said rope between said basket and sheave and adapted to engage said sheave to raise said crane, to thereby bring the basket in proximity to the turn-table, substantially as described.

15. In a fire-escape and water-tower, an extension lazy-tongs tower provided with central cross-bars, combined with a hose-pipe carried by said tower and arranged alternately upon opposite sides of adjacent central cross-bars, substantially as and for the purpose described.

16. In a combined fire-escape and water-tower, the combination with a wheeled truck, a tower-supporting frame mounted upon said truck, and an extension lazy-tongs tower mounted upon said frame and provided with central cross-bars, of a valved hose connection secured to said truck and provided with a valved drain-pipe, a section of hose-pipe connected with said hose connection and extending upwardly through said tower and arranged upon alternate or opposite sides of adjacent central cross-bars thereof, and a connection for said hose-pipe at the upper end of said tower, substantially as described.

17. In a fire-escape, an extension-tower, a turn-table supported upon the upper end of said tower, a crane hinged to said turn-table and provided with a sheave or pulley, a salvage-basket, and a rope or chain for supporting said basket passing over said sheave or pulley, a windlass mounted upon said turn-table and receiving said rope or chain, and a button or enlargement on said rope between said basket and sheave and adapted to engage said sheave to raise said crane, to thereby bring the basket in proximity to the turn-table, substantially as described.

705,711. EXTENSION-TABLE. HENRY C. SETTERDEN, North Bellingham, Wash. Filed Mar. 27, 1901. Serial No. 53,094. (No model.)

Claim.—1. In a table, the combination of a table-top; apertured plates connected therewith, with an intervening space between the plate and table-top; legs having their upper ends fitted to said plates; slotted bolts, round in cross-section, extending longitudinally from the legs and adapted to project through the apertures in the plates; and tapered keys adapted to enter the slots in said bolts above the plates, with their lower edges bearing on the latter, whereby the legs may be rigidly secured in position.

2. In an extension-table, the combination with a table-top; of leg-supporting-brackets secured thereto comprising a central of dependent arms 3 and leg-receiving plates 4, with a central aperture 5 in each leg-receiving plate; legs provided with slotted bolts projecting longitudinally from their upper ends, and adapted to enter said apertured bracket-plates; and keys adapted to be inserted between the arms 3 of the brackets, and to fit in the bolt-slots, said keys being wedge-shaped in form with a maximum width greater than the length of the bolt-slots, whereby, when forced into position in said slots, the legs are securely bound to the bracket-plates 4.

3. In a table, the combination of a table-top; apertured plates connected therewith, with an intervening space between the plate and top; legs having their upper ends fitted to said plates; slotted bolts extending longitudinally from the legs and adapted to project through the apertures in the plates; and tapered keys adapted to enter the slots in said bolts, above the plates, with their lower edges bearing on the latter; said apertures in the plates being adapted to permit the bolts to turn freely after their insertion, whereby the legs may be adjusted to any desired position.

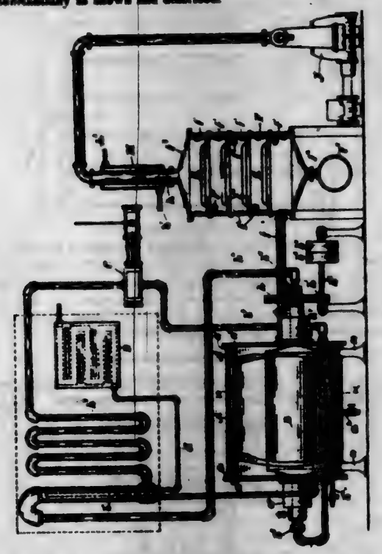
705,712. APPARATUS FOR REFINING GLYCERIN. HERMAN I. SCHMIDT, Cincinnati, Ohio, and OMAR T. JOHLIN, New York, N. Y. Filed Apr. 9, 1897. Serial No. 631,988. (No model.)

Claim.—1. In a still the combination of the outer case, a drum mounted to revolve therein, said drum having hollow journals extending to the outside of the case to receive and pass the heating medium for said drum, the heating-coil, pipes from said heating-coil to convey the heating medium to and from said drum, a pump interposed in one of said pipes to cause the heating medium to circulate through the drum and heating-coil, a pipe to convey the liquid to be distilled to the bottom of the case and in contact with the revolving drum, and a pipe to convey the distillate from the case, whereby a thin film of the liquid is taken up by the drum, distilled by its heating, and the distillate passed from the case, substantially as shown and described.

2. In a still the combination of the outer case, an interior case forming a jacketed space between the outer and inner cases, partitions for dividing the jacket into two chambers, the upper one to receive the heating medium and the lower one to exclude the heating medium from that portion of the case which contains the liquid to be distilled, a drum mounted to revolve in the case said drum having hollow journals to receive and pass the heating medium into and from said drum, a heating-coil, pipes from the terminal of said coil, one of said pipes to connect with one of the hollow journals of the revolving drum and the opposite coil to connect with the jacketed space surrounding the upper part of the drum, a pipe to connect the opposite hollow journal with the said jacketed chamber, a pump interposed in the supply-pipe for the drum to create a circulation for the heating medium through the drum and chamber, pipes to convey the liquid to be distilled to the bottom of the case and in contact with the revolving drum and discharge the distillate from the case, substantially as shown and described.

3. In a still the combination of the outer case, an interior case forming a jacketed space between the outer and inner cases, partitions for dividing the jacket into two chambers, the upper one to receive the heating medium and the lower one to exclude the heating medium from that portion of the case which contains the liquid to be distilled, a drum mounted to revolve in the case said drum having hollow journals to receive and pass the heating medium into and from said drum, a heating-coil, pipes from the terminal of said coil, one of said pipes to connect with one of the hollow journals of the revolving drum and the opposite coil to connect with the jacketed space surrounding the upper part of the drum, a pipe to connect the opposite hollow journal with the said jacketed chamber, a pump interposed in the supply-pipe for the drum to create a circulation for the heating medium through the drum and chamber, pipes to convey the liquid to be distilled to the bottom of the case and in contact with the revolving drum and discharge the distillate from the case, a coil for superheated steam, and a pipe from said coil passing into the case and across the case parallel with the revolving drum, said pipe being perforated its entire length within the case to discharge jets of superheated steam above the liquid to be distilled and against the drum, substantially as shown and described.

ing medium and the lower one to exclude the heating medium from that portion of the case which contains the liquid to be distilled, a drum mounted to revolve in the case said drum having hollow journals to receive and pass the heating medium into and from said drum, a heating-coil, pipes from the terminal of said coil, one of said pipes to connect with one of the hollow journals of the revolving drum and the opposite coil to connect with the jacketed space surrounding the upper part of the drum, a pipe to connect the opposite hollow journal with the said jacketed chamber, a pump interposed in the supply-pipe for the drum to create a circulation for the heating medium through the drum and chamber, pipes to convey the liquid to be distilled to the bottom of the case and in contact with the revolving drum and discharge the distillate from the case, a coil for superheated steam, and a pipe from said coil passing into the case and across the case parallel with the revolving drum, said pipe being perforated its entire length within the case to discharge jets of superheated steam above the liquid to be distilled and against the drum, substantially as shown and described.



4. In a still the combination of the outer case, an interior case forming a jacketed space between the outer and inner cases, partitions for dividing the jacket into two chambers, the upper one to receive the heating medium and the lower one to exclude the heating medium from that portion of the case which contains the liquid to be distilled, a drum mounted to revolve in the case said drum having hollow journals to receive and pass the heating medium into and from said drum, a heating-coil, pipes from the terminal of said coil, one of said pipes to connect with one of the hollow journals of the revolving drum and the opposite coil to connect with the jacketed space surrounding the upper part of the drum, a pipe to connect the opposite hollow journal with the said jacketed chamber, a pump interposed in the supply-pipe for the drum to create a circulation for the heating medium through the drum and chamber, pipes to convey the liquid to be distilled to the bottom of the case and in contact with the revolving drum and discharge the distillate from the case, a coil for superheated steam, and a pipe from said coil passing into the case and across the case parallel with the revolving drum, said pipe being perforated its entire length within the case to discharge jets of superheated steam above the liquid to be distilled and against the drum, and a scraper to bear against the periphery of the drum for preventing the formation of coats or sediment on the surface of the drum, substantially as shown and described.

5. In a still the combination of the outer case, an interior case forming a jacketed space between the outer and inner cases, partitions for dividing the jacket into two chambers, the upper one to receive the heating medium and the lower one to exclude the heating medium from that portion of the case which contains the liquid to be distilled, a drum mounted to revolve in the case said drum having hollow journals to receive and pass the heating medium into and from said drum, a heating-coil, pipes from the terminal of said coil, one of said pipes to connect with one of the hollow journals of the revolving drum and the opposite coil to connect with the jacketed space surrounding the upper part of the drum, a pipe to connect the opposite hollow journal with the said jacketed chamber, a pump interposed in the supply-pipe for the drum to create a circulation for the heating medium through the drum and chamber, pipes to convey the liquid to be distilled to the bottom of the case and in contact with the revolving drum and discharge the distillate from the case, a coil for superheated steam, and a pipe from said coil passing into the case and across the case parallel with the revolving drum, said pipe being perforated its entire length within the case to discharge jets of superheated steam above the liquid to be distilled and against the drum, and baffle-plates extending toward from the case to interrupt the current of the steam and deflect it against the periphery of the revolving drum, substantially as shown and described.

6. The combination of the separating vessel composed of a series of flanged sections having inwardly-projecting flanged troughs, said sections being secured together one above the other, heads covering the top and bottom of the sections, caps extending over the flanged uppermost inner edges of the gutters and supported above the bottom or shelf of the gutter, pipes passing through the troughs, extending up into them and having their lower ends bent to prevent the vapors passing through said pipes and receiving vessel of the separator, an exhaust-pipe for the superheated steam at the top thereof, a cooling-chamber surrounding said pipe and having inlet and outlet pipes for the cooling-water to condense a portion of the steam and prevent the escape of glycerin, and an inlet-pipe for the heated vapors in the lower section of said separator, substantially as shown and described.

7. A plant for purifying glycerin consisting of a still in which the vapor of glycerin is mingled with superheated steam, coils for heating the medium and superheating the steam which passes into the still, a separator to separate the vapors of glycerin and steam, and the pipe connecting the vapor-chamber of the still with the lower part of the separator, substantially as shown and described.

705,718. EXHAUST APPARATUS. JOHN Y. SMITH, Doylestown, Pa., assignor, by direct and mesne assignments, to William B. Dewey trustee, Boston, Mass. Filed Mar. 7, 1902. Serial No. 97,049. (No model.)

Claim.—1. An apparatus of the character specified, comprising a stack or conduit, and an annular exhaust-nozzle within the conduit, said nozzle having in its upper side a series of outlets arranged to deliver a series of jets surrounding the central portion of the conduit, and an exhaust-pipe entering one side of said nozzle and arranged to deliver steam horizontally therein, the bottom of the nozzle being inclined relatively to the top, whereby the pressure of the steam at the several outlets is substantially equalized.

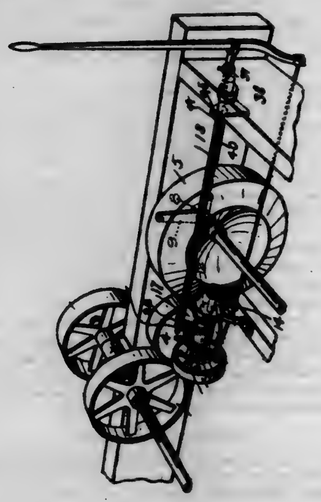
2. An apparatus of the character specified, comprising a stack or conduit, an annular exhaust-nozzle in said conduit having in its upper side a series of outlets arranged to deliver a series of jets surrounding the central portion of the stack, an exhaust-pipe communicating with the nozzle, a supplemental conduit surrounded by said nozzle, and a series of passages between the nozzle and supplemental conduit, whereby a series of induced jets of air from the smoke-chamber may be admitted to the stack.

3. An apparatus of the character specified, comprising a stack or conduit, an annular exhaust-nozzle in said conduit having in its upper side a series of outlets arranged to deliver a series of jets surrounding the central portion of the stack, and a series of projections on its inner side, an exhaust-pipe communicating with the nozzle, and a supplemental conduit surrounded by the nozzle, said pipe and the projections on the nozzle forming a series of passages for the delivery of induced jets of air to the stack.

4. An apparatus of the character specified, comprising a stack or conduit, an annular exhaust-nozzle in said conduit having in its upper side a series of outlets arranged to deliver a series of jets surrounding the central portion of the stack, an exhaust-pipe communicating with the nozzle, a supplemental conduit surrounded by said nozzle, a series of passages between the nozzle and supplemental conduit, whereby a series of induced jets of air from the smoke-chamber may be admitted to the stack, and a

nozzle connected with a constant source of steam-supply and adapted to direct steam under boiler-pressure upwardly through the supplemental pipe into the stack.

705,714. FRICTIONAL GEARING. SIMEON W. STEBBINS, Shreve, Ohio. Filed Nov. 14, 1901. Serial No. 82,216. (No model.)



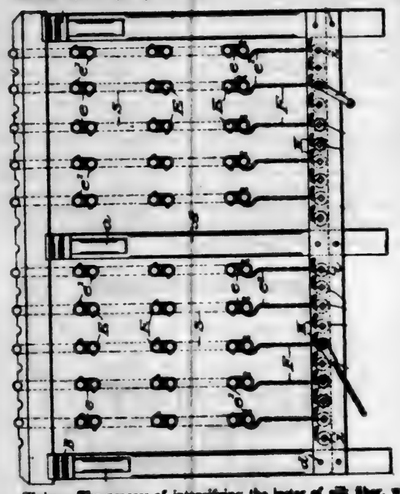
Claim.—1. The combination of a train of friction-wheels, an eccentrically-journaled shaft, a friction-wheel slidably mounted upon the shaft, a rotatable head, carrying the shaft provided with the sliding friction-wheel, and provided with a toothed segment, a toothed segment to mesh with the segment of the head, said segment fixed to a shaft, the shaft provided with an operating-lever, the operating-lever extended below its pivotal point, and a rod connected to the lower end of the operating-lever, a link connected to the rod and to an arm, said arm fixed to the head and said head located around the hub of the sliding friction-wheel, a beveled friction-wheel mounted upon the eccentrically-journaled shaft, and one of the train of friction-wheels provided with a beveled side face, substantially as and for the purpose specified.

2. The combination of a driving-shaft, a train of friction-wheels, one of the train mounted upon the driving-shaft, a shaft for the intermediate wheel of the train, and the other wheel of the train provided with a beveled side, a beveled friction-wheel located adjacent to the beveled side of one of the train of wheels, a rotatable head, and a shaft, eccentrically journaled in the head, a slidable friction-wheel mounted upon the eccentrically-journaled shaft and located opposite the intermediate wheel, means for sliding the slidable friction-wheel and means for rotating the head carrying the eccentrically-journaled shaft, substantially as and for the purpose set forth.

3. The combination of a driving-shaft, a friction-wheel mounted thereon, an intermediate friction-wheel located in contact with the friction-wheel upon the driving-shaft, a feed-wheel and shaft, the shaft of the feed-wheel journaled in a swinging bearing, and the feed-wheel provided with a beveled face located upon its side, a beveled friction-wheel located adjacent to the beveled side of the feed-wheel, an eccentrically-journaled shaft, a sliding friction-wheel located upon the eccentrically-journaled shaft, a rotatable head carrying the eccentrically-journaled shaft, means for rotating said head, and means for sliding the friction-wheel back and forth upon its shaft, substantially as and for the purpose specified.

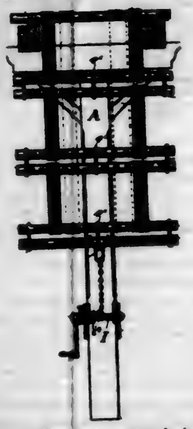
4. The combination of a driving-shaft, a train of friction-wheels, one of said wheels mounted upon the driving-shaft, a swinging shaft and an arm, a feed-wheel constituting one of the train, mounted upon the swinging shaft, a shaft provided with an operating-lever, a grooved pulley fixed to the shaft having the operating-lever, a chain secured to the grooved pulley and to an arm, the arm fixed to the shaft 66, and the said shaft connected at one end, to the bearing of the swinging shaft, a cam fixed to the shaft provided with the grooved pulley, and a fixed cam located adjacent to the cam upon the shaft 66, a sliding friction-wheel located adjacent to the face of the intermediate friction-wheel and an eccentrically-journaled shaft, substantially as and for the purpose set forth.

705,715. PROCESS OF INTENSIFYING THE LUSTER OF SILK FIBER. CHARLES STUART, Paterson, N. J. Filed Jan. 17, 1902. Serial No. 90,133. (No specimens.)



Claim.—The process of intensifying the luster of silk fiber, which consists in taking the skeins directly from the hydro-extractor after dyeing, and, while still damp stretching them and simultaneously maintaining them in a stretched condition and subjecting them in a closed chamber to dry air at a temperature of about 120° Fahrenheit, thereby preventing shrinking during the drying, as set forth.

705,716. MACHINE FOR LUSTERING SILK. CHARLES STUART, Paterson, N. J. Filed Jan. 20, 1902. Serial No. 90,397. (No model.)



Claim.—1. In a machine for increasing the luster of silk, the combination of a frame, means for suspending therefrom a series of interdependent skeins of wet silk, flexible means connecting each series with a mechanism located in the lower portion of the frame, and which is adapted to stretch the silk, and to maintain it in a stretched condition while being dried to prevent shrinkage, substantially as set forth.

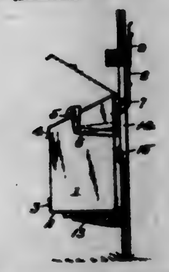
2. In a device for increasing the luster of silk, the combination of a frame, a series of horizontal rods suitably connected and depending from said frame, said rods being adapted to hold skeins of silk stretched between each pair, flexible means connected to the lower portion of the frame, and to the lowest rod of each series for stretching the wet skeins and for preventing the contraction of the same while drying, and rotating means for holding the said flexible means, as set forth.

3. In a device for increasing the luster of silk after it is dyed, the combination of a frame, horizontal rods suitably connected and depending from said frame, said rods being adapted to hold skeins of wet silk stretched around each pair, flexible means connecting the lowest rod with a mechanism in the lower portion of the frame, and such a mechanism for stretching the wet skeins and for preventing the contraction thereof while drying, substantially as set forth.

705,717. SIEVE. ALBERT TIEDEMANN, Pforzenwalde, Germany. Filed June 10, 1901. Serial No. 64,602. (No model.)

Claim.—A sieve for sifting and analogous machines, consisting of a hot-pressed perforated sheet of vulcanized fiber, substantially as and for the purposes set forth.

705,718. GARBAGE-RECEPTACLE AND MEANS FOR HANDLING SAME. JOSEPHINE THIELE, St. Louis, Mo. Filed Feb. 20, 1902. Serial No. 94,868. (No model.)



Claim.—1. The combination of a receptacle having a hinge-cover and an offset shield extending backward and upward for covering the opening in the partition through which the receptacle is drawn, and means connected to said shield for raising said receptacle and at the same time locking the cover of the receptacle; substantially as described.

2. The combination of a receptacle having a hinge-bottom and a hinge-cover, a vertically-sliding handle, hooks for locking the hinge-cover and connected to said handle, and a derrick mounted on a suitable wagon provided with means for lifting said receptacle by said sliding handle and moving said receptacle to a position to discharge the contents thereof into the wagon; substantially as described.

3. The combination of a receptacle 1 provided with a hinge-bottom 2 and the hinge-cover 4 having hooks 6 mounted on the sides, a vertically-sliding handle 9 secured to operate said hooks 6 and cause them to lock the hinge-cover 4 in its closed position when the handle 9 is raised; substantially as described.

705,719. TRACE-FASTENER. WILLIAM H. TRESCOTT, Marinette, Wis., assignor of one-half to Joseph B. Reynolds, Marinette, Wis. Filed Feb. 25, 1902. Serial No. 95,501. (No model.)

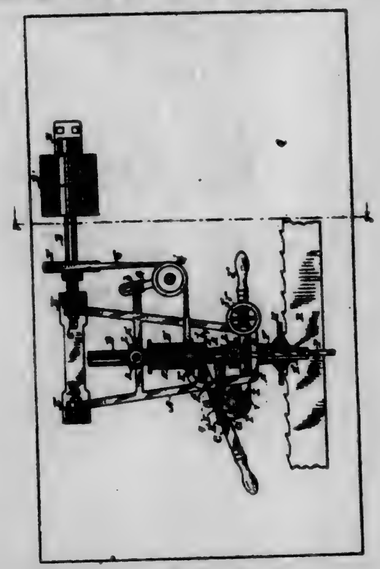
Claim.—1. A trace-fastener having a transverse aperture for the reception of a trace, and a pivoted lever mounted within the aperture with its pivotal point adjacent to one wall thereof and having a stud extending toward and terminating short of the opposite wall of the aperture to engage a perforation in a trace, and also having an arm extending rearwardly from the stud to bear laterally against a trace engaged by the stud and force it into frictional contact with the wall of the aperture.

2. A trace-fastener having a transverse aperture for the reception of a trace, and a lever pivoted for swinging movement within said aperture with its pivotal point adjacent to one wall of the aperture, said lever having a stud extending toward and terminating short of the opposite wall of the aperture to engage a perforation in a trace, and also having an arm extending rearwardly from the stud and projecting beyond the aperture to bear laterally against a trace in rear of the rear edge of the aperture-wall to hold the trace laterally in rear of the aperture.

3. A trace-fastener having an aperture for the reception of a trace, and a lever pivoted for swinging movement within the aperture with its pivotal point adjacent to the inner wall of the aperture and having an outwardly-extending stud swinging out of contact with the outer wall of the aperture to engage an opening in a trace and having an arm extending diagonally rearward and outward from the stud to bear terminally against a trace in rear of said outer wall of the aperture to deflect a trace laterally in rear of the rear edge of said wall.

4. In a trace-fastener, the combination with a whiffletree, of sockets upon its extremities with transverse apertures therethrough, levers pivotally supported in said apertures, and with studs upon their outer free ends, springs disposed to yieldably retain said lever projected or withdrawn, bearing-surfaces projecting from said levers and extending in the rear of said sockets and inclined outwardly and rearwardly, and traces having opened perforations and adapted to pass through said apertures with one of its perforations engaged by said stud, and with the rear end of said bearing-surface engaging the trace in the rear of the socket, substantially as described.

705,720. MACHINE FOR REPAIRING SAWS. WILLIAM TRAVIS, Ludington, Mich., assignee of two-thirds to Alvah J. Carson, Kalamazoo, Mich. Filed Nov. 6, 1901. Serial No. 81,589. (No model.)



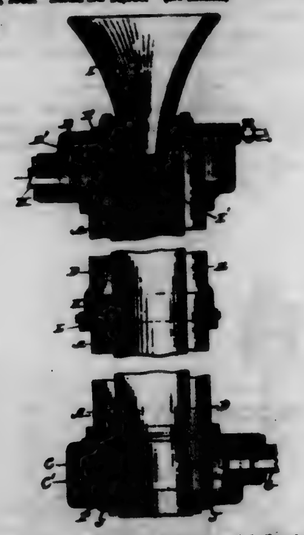
Claim.—1. In a machine of the class described, the combination of a table Q; a driving-shaft D supported in suitable bearings thereon; a frame A supported on trunnions in line with the said shaft D; a shaft B at right angles to the said trunnions and supported in suitable bearings on the frame A and adapted to reciprocate in said bearings; an elongated pulley B' on the said shaft; a driving-belt G'' from the driving-pulley F on the driving-shaft to said pulley B'; a shipper-lever connected to said shaft by a suitable collar B'' to reciprocate the same; an adjustable screw-stop J' in the frame A for regulating the height of the frame; a rock-shaft N' supported in suitable bearings above the shaft B; brackets on the shaft with adjustable slides thereon; a bar P carried by the said adjustable slides and extending forwardly and provided with a clamp to retain a strip of steel to form a patch for a saw, counting for the purpose specified.

2. In a machine of the class described, the combination of a table Q; a driving-shaft D supported in suitable bearings thereon; a frame A supported on trunnions in line with the said shaft D; a shaft B at right angles to the said trunnions and supported in suitable bearings on the frame A and adapted to reciprocate in said bearings; an elongated pulley B' on the said shaft; a driving-belt G'' from the driving-pulley F on the driving-shaft to said pulley B'; a shipper-lever connected to said shaft by a suitable collar B'' to reciprocate the same; an adjustable screw-stop J' in the frame A for regulating the height of the frame, counting for the purpose specified.

3. In a saw-repairing machine, the combination of a vibrator frame with transverse bar supporting it; a shaft at right angles to the said transverse adapted to reciprocate back and forth in its bearings; a grinding-wheel on the end of said shaft and means for controlling the elevation of the same whereby a curved cut can be cut in the side of the saw, as specified.

4. In a saw-repairing device, the combination with the grinding-wheel; a frame supported on a rock-shaft in line with the shaft of said grinding-wheel; a clamp for supporting a strip of steel on said frame whereby the same can be swung back and forth and be ground in the saw of the chain in said grinding-wheel, for the purpose specified.

705,721. APPARATUS FOR CASTING INGOTS IN CUTTING-OFF LEAD LININGS. JAMES S. THOMS, Worcester, Mass. Filed Apr. 23, 1902. Serial No. 104,703. (No model.)



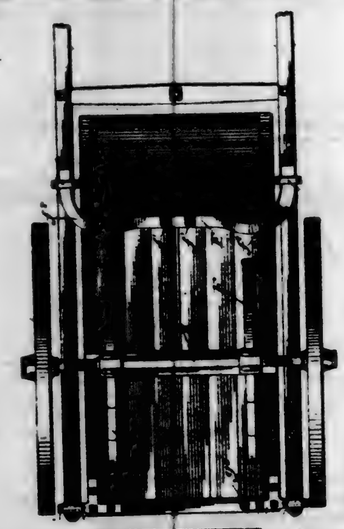
Claim.—1. The combination of jacket A, and hollow heads B, C, the latter fastened to the ends of said jacket and having supply and discharge pipes, also having opposite openings to receive and hold the ends of the ingot-mold D, with said ingot-mold, the latter held rigid at the upper end in head B, fitted loose at its lower end in head C, and whose inner surface is polished straight and smooth, and the funnel I, said funnel having the downward extension I' into the ingot-mold, and fastened to head B, substantially as and for the purpose set forth.

2. The jacket A and hollow heads B, C, the latter fastened to the ends of said jacket and having supply and discharge pipes, also having opposite openings to receive and hold the ends of the ingot-mold D, the latter being held rigid in the upper end in head B, fitted loose at its lower end in head C, and whose inner surface is polished straight and smooth, and the funnel I, said funnel having the downward extension I' into the ingot-mold, and fastened to head B, in combination with means for supporting the molten metal in the ingot-mold until properly cooled to draw, for conducting it to the rolls of the rolling-mill, and said rolls; said means for supporting and conducting the metal comprising the vertically-operating plates M, connecting-rod N and head O, substantially as and for the purpose set forth.

705,722. VEHICLE. LOUIS S. THOMAS, Tonawanda, N. Y. Filed Mar. 14, 1902. Serial No. 98,210. (No model.)

Claim.—1. In a vehicle of the class described, the combination of a vehicle-body, a single supporting-axle for said body, a pair of shafts, supporting devices for the vehicle-body disposed one in front and one in rear of the vehicle-body directly connecting the shafts and vehicle-body and constituting the sole connection of the shafts with the vehicle, the supporting devices in front of the vehicle-body comprising a transverse spring having an upward-bowed central portion, the ends of the spring being carried to the line of the shafts and turned at substantially right angles to the transverse spring and lengthwise of the shafts and connected directly thereto, the supporting devices at the rear of the vehicle-body comprising a bracket having an adjustable connection with ends of the shafts.

2. In a vehicle of the class described, the combination of a vehicle-body, a single supporting-axle for said body, a pair of shafts, supporting devices for the vehicle-body disposed one in front and one in rear of the vehicle-body directly connecting the shafts and vehicle-body and constituting the sole connection of the shafts with the vehicle, the supporting devices in front of the vehicle-body comprising a transverse spring having an upward-bowed central portion, the ends of the spring being carried to the line of the shafts and turned at substantially right angles to the transverse spring and lengthwise of the shafts and connected directly thereto, the supporting devices at the rear of the vehicle-body comprising corner-irons having a closed socket-piece to receive the ends of the shafts.



705,723. PROCESS OF VARNISHING. GUSTAV THIELE, Odessa, Russia. Filed Dec. 16, 1901. Serial No. 86,066. (No specimens.)

Claim.—The process of varnishing or coating surfaces which consists in applying to the same in a heated condition a varnish composed of one thousand grams of white lead, fifteen hundred grams of water, one to two grams of yellow oxalin, and one hundred and twenty-five grams of stick Russian glue, substantially as described.

705,724. PIPE HOLDER OR CLUTCH. DELEVAN P. UPDIKE, Jonesville, Fla. Filed May 9, 1902. Serial No. 106,662. (No model.)

Claim.—1. In an implement of the character described, an inclosing shell having longitudinal apertures, a cylinder revolubly mounted in said shell and having longitudinally-disposed cam-surfaces, and grip-bars extending through said apertures and in operative engagement with said cam-surfaces, and means for revolving said cam-cylinder within said shell, substantially as set forth.

2. In an implement of the character described, an inclosing shell having longitudinal apertures, a cylinder revolubly mounted within said shell and having tangentially-disposed exterior surfaces, grip-bars extending through said apertures and in operative engagement with said tangential surfaces, and means for revolving said cylinder within said shell, substantially as set forth.

3. In an implement of the class described, an inclosing shell having longitudinal apertures, a cylinder within said shell having longitudinally-

disposed cam-surfaces, caps engaging the ends of said cylinder within said shell, grip-bars extending through said apertures and in operative engagement with said cam-surfaces, and means for revolving said cylinder and caps within said shell, substantially as set forth.

4. In an implement of the character described, an inclosing shell having longitudinal apertures, a cylinder within said shell and having longitudinally-disposed exterior cam-surfaces, caps engaging the ends of said cylinder and the interior of said shell and adapted to support the cylinder within said shell, slots within said caps and paralleling said cam-surfaces, grip-bars extending through said apertures in said shell and in operative engagement with said cam-surfaces and with studs engaging said slots, and means for revolving said cylinder and caps, substantially as set forth.

5. In an implement of the character described, an inclosing shell having longitudinal apertures and with a sleeve extending centrally from one end, a cylinder inclosed by said shell and with longitudinally-disposed exterior cam-surfaces and with a stud engaging said sleeve, an operating-handle upon said stud outside of said sleeve, and grip-bars extending through said apertures and in operative engagement with said cam-surfaces, substantially as set forth.

705,725. CORSET-COVER. JOHN M. VAN ORDEN, Newark, N. J. Filed May 14, 1902. Serial No. 107,304. (No model.)

Claim.—1. A corset-cover composed of an upper section having forwardly-extending flaps that are adapted to be connected over the bust, and of a lower section having rearwardly-extending flaps that are adapted to be connected at the bust, substantially as specified.

2. A corset-cover composed of an upper section having forwardly-extending flaps adapted to be interconnected over the bust, a lower section having rearwardly-extending flaps, means for adjustably connecting said rearwardly-extending flaps at the bust, and means for connecting the upper section with the lower section, substantially as specified.

705,726. FILTER-BED. JAMES C. WALLACE, Colorado City, Colo. Filed May 5, 1902. Serial No. 105,977. (No model.)

Claim.—1. In a filter-bed a lead filter sheet, blanket or sieve formed in a series of corrugations with the crowns of each corrugated arch inverted or dipping downward and having a number of small drain-holes perforated through the lower area of said corrugations.

2. In a filter-bed a series of metal lead-covered strips or bars bent or formed into lateral corrugations adapted to receive and support a filter sheet or blanket superimposed thereon.

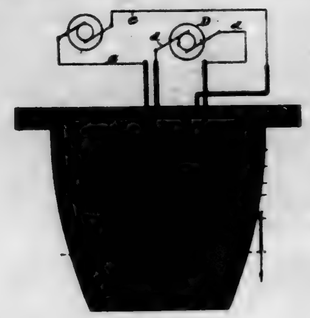
3. In a filter-bed a series of metal lead-covered binding strips or bars having lateral corrugations adapted to fit over and upon a filter sheet or blanket, and having a portion of the under surface of each end channeled or recessed laterally to receive a perpendicularly-placed bar.

4. In a filter-bed a side binding strip or bar, having bridges at intervals and recessed thereunder to receive the ends of transverse bars.

5. In a filter-bed the combination of a corrugated filter sheet or blanket having numerous perforations through the lower area of said corrugations; a series of transverse supporting-bars formed to fit under and receive the corrugated contour of said filter-sheet; a series of superimposed binding-strips or bars with transverse corrugations and slotted ends; two longitudinal side binding-strips or bars; and bolts adapted to holding the several members together and in place within a filter barrel or tank.

705,727. METHOD OF TREATING METALLIC OXIDS IN THE PRODUCTION OF METALS AND ALLOYS. FREDERIC C. WEBER, Chicago, Ill. Filed Apr. 14, 1901. Serial No. 55,503. (No specimens.)

Claim.—1. The method of treating metallic oxids with aluminium in the production of metals, metalloids and alloys and their compounds, which consists in subjecting the entire charge, comprising aluminium in admixture with a metallic oxid reducible by aluminium, to a drying and preparatory treatment by heat, whereby the charge is brought into a condition for reaction by eliminating all the moisture, rendering the charge wholly anhydrous, and thereafter subjecting the mixture to a temperature sufficient to effect reaction, substantially as described.



2. The method of treating metallic oxids with aluminium in the production of metals and alloys which consists in placing the to-be-treated charge, comprising aluminium in admixture with a metallic oxid reducible by aluminium, in a crucible, subjecting the same therein to a drying and preparatory treatment by electric heat at the time the reaction is to be undergone, for the preparatory treatment to eliminate moisture, break up the molecules containing water of crystallization and drive off the water of crystallization and bring the charge into a condition for reaction, then raising the temperature to a degree sufficient to effect reaction and adding to the intensity of the reaction temperature the temperature of the preparatory heating, thereby increasing the effective heat by the added calorie of the preparatory treatment, substantially as described.

3. The method of treating metallic oxids with aluminium in the production of metals and alloys which consists in placing a charge, comprising aluminium in admixture with coarsely-powdered metallic oxid reducible by aluminium, in a crucible, subjecting the charge in the crucible to a drying and preparatory treatment by electric heat for the preparatory treatment to eliminate the moisture, break up the molecules containing water of crystallization and drive off the water of crystallization and bring the charge into a condition for reaction and then igniting the charge by electric heat to cause reaction and have the intensity of the reaction heat increased by the added calorie of the preparatory treatment, substantially as described.

4. The method of treating metallic oxids with aluminium in the production of metals and alloys which consists in placing the to-be-treated charge, comprising aluminium in admixture with a metallic oxid reducible by aluminium, in a crucible, subjecting the charge therein to an electric heat and a preparatory treatment for drying the oxid, breaking up the molecules containing water of crystallization, driving off the water of crystallization, eliminating all moisture and bringing the charge into a condition for reaction and then igniting the charge by electric heat and increasing the intensity of the heat by the added calorie of the preparatory heat giving an increased heat for the production of chemical compounds, substantially as described.

5. The method of treating metallic oxids with aluminium in the production of metals and alloys and their compounds which consists in placing a quantity of finely-powdered oxid reducible by aluminium in the bottom of a crucible with a small coil of aluminium wire and passing an electric current through the wire of sufficient intensity to melt the aluminium wire and produce a reaction with the finely-powdered oxid, substantially as described.

6. The method of treating metallic oxids with aluminium in the production of metals and alloys which consists in placing a charge of finely-powdered oxid reducible by aluminium in the bottom of a crucible with a small coil of aluminium wire, placing the to-be-treated charge, comprising aluminium in admixture with a metallic oxid reducible by aluminium, around an upper coil or helix of aluminium wire, passing an electric current through the upper coil or helix of aluminium wire to dry and raise the temperature of the charge and add additional calorie to the heat of the reaction and then passing an electric current through the lower coil of sufficient intensity to melt the coil and produce a reaction with the finely-powdered oxid for such reaction to transmit reaction to the dried and prepared charge which is to be reduced, substantially as described.

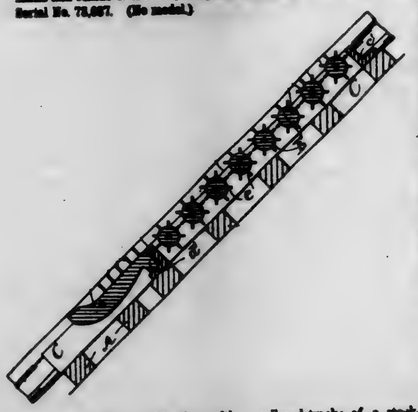
705,728. MANUFACTURE OF BITUMINOUS PAVING. WALTER S. WILKINSON, Baltimore, Md. Filed Dec. 31, 1901. Serial No. 87,260. (No specimens.)

Claim.—1. That improvement in the manufacture of bituminous paving or pavement mixtures or compositions which consists in first producing a fluxe-impregnated cement by mixing bituminous cement and fluxe; dry-mixing by agitating the remaining body material, and then, while the latter is in agitation, mixing therewith said fluxe-impregnated cement.

2. That improvement in the manufacture of bituminous paving or pavement mixtures or composition which consists in impregnating the bituminous cement with as much of the fluxe as may be added thereto while still preserving the necessary liquidity of the cement, agitating the remaining body material, and, while the latter is in agitation, mixing therewith said fluxe-impregnated cement.

3. That improvement in the manufacture of bituminous pavements which consists in producing a fluxe-impregnated cement consisting of bituminous cement fluxed with fluxe, agitating the remaining body material, and, while in agitation, mixing therewith the fluxe-impregnated cement, subjecting the resultant mixture to heavy compression in a mold and subjecting the compressed body to the action of a cooling agent, to set it to preserve its shape.

705,729. STOCK-GUARD FOR RAILROADS. GEORGE A. WILLIAMS and JAMES O. MCCALL, Dougherty, Ind. Ter. Filed Oct. 9, 1901. Serial No. 78,057. (No model.)



Claim.—1. The combination with a railroad-track; of a stock-guard, comprising frames, spiked plates pivoted in said frames, and spiked, revolvable rollers mounted in said frames, and all adapted to be laid in and by said railroad-track; all substantially as and for the purpose set forth.

2. In a stock-guard for railroads, the combination with frames, adapted to be laid in and by a railroad-track; of plates pivoted in said frames, and a plurality of revolvable rollers mounted in said frames; all substantially as and for the purpose set forth.

3. In a stock-guard for railroads, the combination with supporting-frames, adapted to be laid in and by a railroad-track; of plates having on their surfaces a plurality of spikes, and pivoted in said frames and a plurality of revolvable rollers, having each on its surface a plurality of spikes, and mounted in said frames; all substantially as and for the purpose set forth.

4. In a stock-guard for railroads, the combination, with supporting-frames, adapted to be laid in and by a railroad-track; of spiked plates in said frames; said plates connected to the frames by pivots in front of their centers of gravity so that the weight of said plates will hold them in normal position; and a plurality of spiked rollers also mounted in said frames, all substantially as and for the purpose set forth.

705,730. BALANCED SLIDE-VALVE. JOHN T. WILSON, Jersey Shore, Pa. Filed July 13, 1901. Serial No. 66,195. (No model.)

Claim.—1. The combination with a steam-chest having a ported seat, sides, and a cover; of a valve; and a balancing-plate; said valve adapted to reciprocate between the valve-seat and the lower surface of the balancing-plate; and said balancing-plate having an area or areas closed to the admission of motive fluid and adapted to move vertically and also to have a slight rocking motion so as to automatically take up the wear of the frictional surfaces.

2. The combination within a steam-chest, of a ported valve-seat; a reciprocating valve; and a balancing-plate; said balancing-plate being located between the valve and the steam-chest cover and provided with a permanent inclosed balancing area and with an inclosed area to which motive fluid is alternately admitted and exhausted by the valve at different portions of its travel.

3. The combination within a steam-chest, of a ported valve-seat; a reciprocating valve; and a balancing-plate located between the valve and the steam-chest cover, said balancing-plate being provided at its back with a permanent inclosed balancing space and also with two inclosed areas at opposite sides of the plate and to which motive fluid is admitted and exhausted.

4. The combination within a steam-chest, of a ported valve-seat; a reciprocating valve; and a balancing-plate; said balancing-plate being adapted to permanently hold the valve to its seat, and having two inclosed areas in line with the ports and to which areas motive fluid is alternately admitted and exhausted.

5. The combination within a steam-chest, of a ported valve-seat; a movable valve; a balancing-plate; and means for permanently balancing the valve; said balancing-plate having two inclosed areas, and the parts being so arranged that when motive fluid is admitted to a port it is simultaneously admitted to an inclosed area and when motive fluid is exhausted from the port it is simultaneously exhausted from the inclosed area.

6. The combination within a steam-chest, of a ported valve-seat; a movable valve; a balancing-plate; and means for permanently balancing the valve; said balancing-plate having inclosed areas at its back communicating with the live steam and exhaust, and said valve being slotted; whereby the valve is balanced at all points of its travel and a double admission and double exhaust is secured.

7. The combination within a steam-chest, of a ported seat; a movable valve; a balancing-plate; adapted to hold the valve between the balancing-plate and seat to form steam-tight joints; and inclosed areas or an inclosed area in communication with the ports or a port at all portions of the valve's travel.

8. The combination in a steam-chest, of a ported seat; a movable valve; a balancing-plate; adapted to hold the valve between the balancing-plate and seat to form a steam-tight joint; and a plurality of inclosed areas at the back of the plate; the said valve-seat being raised and the under surface of the balancing-plate being formed with a downwardly-extending portion corresponding to the valve-seat.

9. The combination within a steam-chest, of a ported valve-seat; a movable valve; a balancing-plate having inclosed areas; and means for effecting a permanent balance of the valve; the said plate being retained by lugs which prevent the lateral or longitudinal movement of the same.

10. The combination within a steam-chest of a seat; a valve; and a balancing-plate, constructed and operated substantially as set forth; the said balancing-plate having inclosed areas and pockets corresponding to the ports, and openings from the pockets to the inclosed areas.

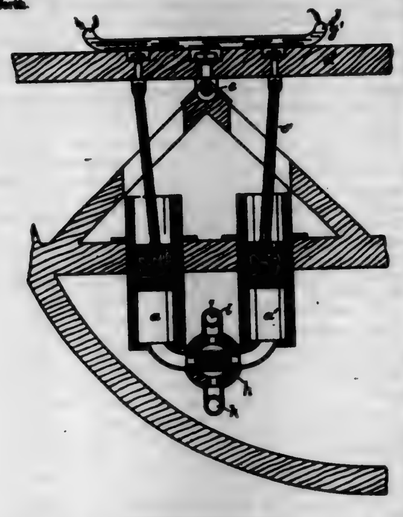
11. The combination within a steam-chest, of a ported seat; a movable valve; and a balancing-plate located beneath the steam-chest cover; means for effecting a permanent balance of the valve; and means for counterbalancing the valve when subjected to upward pressure by the motive fluid within the ports.

12. The combination within a steam-chest, of a ported seat; a movable valve; a balancing-plate; adapted to effect a permanent pressure upon the valve; and means for balancing opposite edges of the plate when said edges become unbalanced.

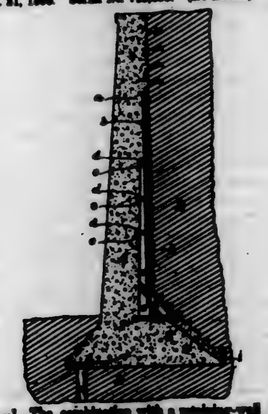
705,731. MEANS FOR KEEPING MOVING OBJECTS IN HORIZONTAL POSITIONS. HARDEN ACH, Göttingen, Germany. Filed Feb. 13, 1902. Serial No. 94,701. (No model.)

Claim.—1. In an apparatus for maintaining movable objects in a horizontal plane, the combination with such object, of a support to which the object is pivotally connected, cylinders rigidly connected to said support, pistons in said cylinders connected to said object on opposite sides of its pivot, valves for controlling admission of fluid-pressure to the cylinders, and means actuated by the movement of said object for controlling the said valves, substantially as set forth.

2. In an apparatus for maintaining movable objects in a horizontal plane, the combination with such object, of a support to which the object is pivotally connected, cylinders rigidly connected to said support, pistons in said cylinders connected to said object on opposite sides of its pivot, valves for controlling the admission of fluid-pressure to said cylinders, devices adapted to be electrically controlled for actuating the valves, and circuit-closing devices operated by the movement of said object for controlling the currents of electricity for said actuating devices, substantially as set forth.



705,732. RETAINING-WALL. FRANK A. BOSE, Lebanon, Ohio. Filed Apr. 21, 1902. Serial No. 103,893. (No model.)



Claim.—1. The combination with a retaining-wall having a heel, of a metal structure embedded vertically in said wall and obliquely in said heel, so that the weight of the retained material upon the heel of the metal structure will operate to retain the wall in vertical position.

2. In retaining-walls the combination with a wall of masonry, a series of tapering upright bents or members of metal braces embedded within the interior of said masonry at the back part, only, of the vertical portion and continuing down along the upper part of the heel of said wall to the back part thereof, substantially as and for the purposes set forth.

3. The combination with a retaining-wall having an inclined heel, of a metal structure embedded within said wall and heel, consisting of upright bents at the back part of the vertical wall and continuing down along the upper part of the heel of said wall to the back part thereof, in such a manner that the weight of the retained material upon the heel of the metal structure will operate to maintain the wall in vertical position.

4. A retaining-wall having a heel (strengthened by metal within and connected with braces in the wall by suitable brace-rods extending in the rear of the heel, upon which the retained material rests and acts by gravity to keep said wall in its normal position, substantially as described.

5. The combination with a retaining-wall having a heel, of a metal structure embedded within said wall and heel, consisting of upright bents at the back part of the vertical wall and continuing down along the upper part of the heel of said wall to the back part thereof in an inclined direction, whereby the weight of the retained material upon the heel of the metal structure will operate to maintain the wall in a vertical position, as set forth.

6. In a retaining-wall, a series of tapering bents embedded in said wall composed of the upright member *a*, base *g* and tie-brace *f* in combination with the masonry substantially as described.

7. In a retaining-wall, a series of bents of metal in the back part of said wall extending down along the upper part of the heel, and a series of strengthening-rods *k* provided with enlarged ends and embedded in the lower part of the toe of said wall, in combination with the masonry of said wall, substantially as described.

8. In retaining-walls a series of bents composed of the tapering upright member *a* having flanges *b*, the tie-brace *f* and base-brackets *g* in combination with the masonry, substantially as and for the purpose set forth.

9. In retaining-walls, a series of upright bents tapering in size and strength from the base to the top, angle-rods *i* and braces *f* between said rods and said bents, in combination with the masonry, substantially as described and for the purpose set forth.

10. In a retaining-wall, the combination with the masonry thereof, of upright bents having their lower ends suitably anchored and braced, and provided with suitable angle-plates and brackets, said angle-plates and brackets being adapted to be so held in said masonry that any vertical or lateral slipping or movement of said plates or brackets independent of the movement of the upright bents and the wall will be prevented.

11. In retaining-walls the anchor-bars *d* attached to the bracket *c* in combination with the upright member *a* and wall A substantially as and for the purposes set forth.

12. In a retaining-wall, the beam *i* attached to the brace *f* in combination with the masonry A, substantially as and for the purpose set forth.

13. In a retaining-wall the combination of the metal framework consisting of the longitudinal bars *a* and *i* and a series of tapering upright bents and braces between said bents and the bars *i*, with a wall of masonry inclosing said framework substantially as and for the purposes set forth.

14. In retaining-walls, the brackets A attached to the brace *f* in combination with the masonry A for the purpose set forth.

15. In a retaining-wall, the base *g* in combination with the upright member *a*, tie *f* and masonry A, substantially as described.

16. The combination with a retaining-wall having a heel and a toe at opposite sides thereof, said toe having an independent metal structure embedded therein, of a metal structure embedded within said wall and heel, said structure consisting of upright bents at the back part of the vertical wall and continuing down along the upper part of the heel of said wall to the back part thereof, so that the weight of the retained material upon the heel of the metal structure will operate to maintain the wall in a vertical position.

17. The combination with a retaining-wall having an inclined heel and a toe at opposite sides thereof, of a metal structure embedded within said wall and heel, said structure consisting of upright bents at the back part of the vertical wall and continuing down along the upper part of the heel of said wall to the back part thereof, whereby by reason of the toe and the heel the weight of the retained material upon the heel of the metal structure will operate to maintain the wall in a vertical position.

705,733. YARN-SPINNING APPARATUS. JOHN BOOTH, Central Falls, R. I. Filed Jan. 28, 1902. Serial No. 91,847. (No model.)

Claim.—1. A spinning-ring, a fixed support upon which the ring is directly mounted, and connecting means for said parts having provisions for permitting free limited edgewise or horizontal movements of the ring and for preventing its rotation.

2. A spinning-ring, a fixed support upon which the ring is directly mounted, and connecting means for said parts having provisions for permitting free limited horizontal and limited vertical movements of the ring, and for preventing its rotation.

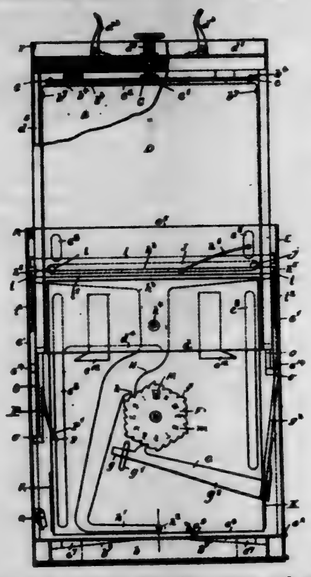
3. A spinning-ring support having a substantially horizontal ring-

cent, a ring resting directly and loosely thereon, and connecting means for said parts having provisions for permitting a free limited movement of the ring in any direction parallel with said seat, and for preventing rotation of the ring.

4. A spinning-ring support having a substantially horizontal ring-seat, a ring resting directly and loosely thereon, and connecting means for said parts having provisions for permitting a free limited movement of the ring in any direction parallel with said seat, and a free limited movement toward and from the seat, and for preventing rotation of the ring.

5. A spinning-ring support having a substantially horizontal ring-seat, a ring resting directly and loosely thereon, and couplings loosely engaged with the support and ring whereby the ring is permitted to have free limited horizontal and free limited vertical movements and is prevented from rotating.

705,784. MAGAZINE PLATE-HOLDER. ARTHUR A. BROWN and GEORGE A. WATSON, Liverpool, England. Filed Apr. 24, 1901. Serial No. 57,377. (No model.)



Claim.—1. In a magazine plate-holder, an exposure-frame consisting of a casing, a hollow slide therein adapted to contain sensitized films or plates, said casing having an exposure-aperture in the front side thereof, means for exposing a film at said aperture, and means for restoring said film to the interior of the hollow slide when the slide is withdrawn and pushed back.

2. In a magazine plate-holder, an exposure-frame consisting of a casing having an exposure-aperture, a hollow slide therein adapted to contain sensitized films or plates, means for extracting a film from the slide on its withdrawal, and means for pressing said film against the exposure-aperture upon its return movement.

3. In a magazine plate-holder, an exposure-frame consisting of a casing having an exposure-aperture, a hollow slide therein adapted to contain sensitized films or plates, means for extracting a film from the slide upon its withdrawal, means for pressing said film against the exposure-aperture upon its return movement, and means for reinserting the film in the slide upon its second withdrawal and return movement.

4. In a magazine plate-holder, an exposure-frame consisting of a casing having an exposure-aperture, a hollow slide therein adapted to contain sensitized films, means for withdrawing a film at the back of the slide upon the withdrawal thereof, means for pressing the film against the exposure-aperture upon the reinsertion of the slide in the casing, and means for pressing the upper edge of the film inwardly upon the second withdrawal of the slide, so that upon its second return movement the exposed film reënters the hollow slide at the front.

5. In a magazine plate-holder, a combined exposure-frame and change-box, consisting of a casing, a hollow slide therein, a film-case having an open end, a cover adapted to close said open end, means upon the hollow slide for drawing the film-case into the casing, and means for detaining the cover in the external casing and thereby stripping it from the film-case when the latter is drawn into the hollow slide

6. In a magazine plate-holder, a combined exposure-frame and change-box consisting of a casing, a hollow slide therein, a film-case closed at the top and sides and adapted to hold a number of sensitized films or plates, a cover adapted to close the open end of the film-case, a screw detachably connected to the top end of the film-case, a nut revolubly fixed to the top of the hollow slide and adapted to engage the said screw, and stops upon said casing adapted to detain the said cover when the film-case is drawn into the hollow slide.

7. In a magazine plate-holder, the combination with an outer casing and a hollow slide therein open at the bottom, of a film-case closed at the top and sides and adapted to hold sensitized films, perforated lugs attached to the top of the film-case, a bar adapted to engage in the perforations of said lugs, a screw fixed to the said bar and a spring adapted to hold said screw in the plane of the film-case, and a nut revolubly fixed to the top of the hollow slide and adapted to engage with the said screw.

8. A combined exposure frame and change-box for photographic cameras consisting of a casing, a hollow slide therein open at the bottom, a film-case fitting into the said hollow slide, a cover for the film-case, means upon said casing for detaining the cover in the casing, means for drawing the film-case into the hollow slide so as to strip off the cover, means operated by the withdrawal and reinsertion of the hollow slide for withdrawing a film from the case, pressing it against the exposure-aperture, returning it again to the film-case, and means for pushing the film-case back into its cover and releasing it from the hollow slide.

9. A combination exposure-frame and change-box for a camera, consisting of a casing having an exposure-aperture, a hollow slide therein open at the bottom, a film-case fitting into the said hollow slide, a cover for the film-case, means upon the casing for detaining the cover in said casing, means for drawing the film-case into the hollow slide so as to strip off the cover therefrom, means for withdrawing a film from the film-case upon the withdrawal of the hollow slide, means for pressing a film against the exposure aperture upon the reinsertion of the slide, means for causing a film to reënter the film-case upon the second withdrawal and reinsertion of the slide, and means for pushing the film-case again into its cover and releasing it from the slide.

10. A combined exposure-frame and change-box for a camera, consisting of a casing having an exposure-aperture, a hollow slide therein open at the bottom, a film-case adapted to contain sensitized films or plates and fitting into said hollow slide, a lever attached to the casing having a springing stud adapted to enter non-central holes in the films, and means operated by the withdrawal and reinsertion of the slide whereby said lever is moved so that said stud alternately engages with one of the non-central holes and is disengaged therefrom at each insertion of the slide.

11. A combined exposure-frame and change-box for a camera consisting of a casing, a hollow slide therein open at the bottom, a film-case having an unattached cover and adapted to contain sensitized films and fitting into said hollow slide, a cover for the film-case, means for drawing the film-case into the slide and stripping off its cover, a lever fulcrumed on said casing and having a springing stud adapted to enter a non-central hole in the sensitized films contained in the film-case, mechanism operated by the drawing out and pushing in of the said hollow slide and adapted to actuate said lever so as to move it at each alternate inpush of the slide into a position in which the stud can engage the hole of one of the films and hold it while the slide is drawn out, while by the intermediate inpush the lever is moved so that the stud will not engage a film, a spring-pressed cross-bar mounted on a pivot and having a projecting flange adapted to push inwardly the top of the film, a two-armed extension on said lever above the fulcrum, with notched ends adapted by the movement of the lever to arrest said cross-bar when the slide is drawn out for the extraction of a film from the case and to liberate said cross-bar when the slide is drawn out to return the film to the case after exposure.

12. A combined exposure-frame and change-box for a camera, consisting of a casing having an exposure-aperture, a hollow slide therein open at the bottom, a film-case adapted to contain sensitized films or plates and fitting into said hollow slide, a projecting cover for the film-case, stops to hold the cover in the casing so as to strip it from the film-case when the latter is drawn into the hollow slide, means for drawing the film-case into the hollow slide, a lever attached to the casing having a springing stud adapted to enter non-central holes in the films, means operated by the withdrawal and reinsertion of the slide, whereby said lever is moved so that the stud engages one of the non-central holes at each alternate inpush of the slide, and means consisting of resilient projections upon the inside of the film-case adapted to engage corresponding notches in the films, so as to prevent more than one film from being detached and withdrawn from the case at one time.

13. An exposure-frame for photographic cameras having a hollow slide therein adapted to hold sensitized films, mechanism actuated by the said slide in sliding in and out for withdrawing the films from the slide and guiding them in again one by one before and after exposure, guide-bars adapted to slide in pockets formed in the said slide and having projections at their ends adapted to slide in grooves of the exposure-frame, substantially as described.

14. In a magazine plate-holder, a combined exposure-frame and change-box consisting of a casing having an exposure-aperture adapted to receive a sensitized film, and a hollow slide in the casing open at its bottom side and having a revolubly-fixed nut upon its top side, a film-case having an open bottom adapted to contain a number of sensitized films and to fit inside said slide and having a detachably-connected screwed stud upon its top side adapted to engage with said revolubly-fixed nut, and a light-proof cap with prominent edges to fit over its open bottom before it is pushed home in the slide, stops in the bottom of the casing adapted to bear against the prominent edges of the cap, a sliding plate in the casing above said stops, a light-proof door in the bottom of the casing adapted to cover the film-case and cap, a transverse bar hinged to the casing near the upper end and having a flange adapted to press inwardly the top edge of the film, mechanism operated by the sliding in and out of the said slide consisting of a lever pivoted to the casing and having a springing stud adapted to enter non-central holes in the bottom edges of the films, an extension upon the lever above the fulcrum with notched ends adapted to support and free said hinged transverse bar, a revolubly-fixed polygonal toothed cam, a pawl carried by a depending springing bar arranged in the path of the slide to engage the teeth of the cam and turn it, and a nose upon the lever acting as a pawl to engage the cam-teeth, whereby the lever is moved step by step backward and forward by the polygonal face of the cam, so that upon alternate depressions of the slide the stud enters a film, and upon the intermediate withdrawal strokes of the slide the lever releases the transverse bar, which then presses in the top end of the film, and the following depression takes it into the film-case again, substantially as set forth.

15. In a magazine plate-holder, a combined exposure-frame and change-box, consisting of a casing having a hollow slide therein adapted to contain a number of sensitized films, a toothed cam-wheel rotatably mounted in the back of the casing, a pawl adapted to engage the toothed cam-wheel, a depending swinging strip fixed to one side of the casing in a groove therein and carrying a pawl and outwardly pressed into the path of the said slide so as to be operated thereby on its descent to turn the cam-wheel, a lever fulcrumed to the back of the casing above the cam-wheel and having an outwardly-projecting end carrying a springing stud upon its face adapted to engage the films, and lever having also a nose bearing against the toothed cam-wheel against which it is resiliently held, and a two-armed extension above its fulcrum, each arm of which terminates in a notched upturned end, a transverse rocking bar pivoted at its ends to the slide, and provided with an inwardly-projecting flange, and end fingers adapted to bear against and to be supported by the notched upturned ends of the lever extension, and a longitudinal spring fixed to the side of the casing above said transverse rocking bar and carrying studs at its ends which project through holes in the rocking bar and bear against the slide

16. An exposure-frame and change-box for a camera consisting of an internal casing having a rabbeted opening c^4 upon its front side adapted to receive a sensitized film for exposure, a closed hollow slide D sliding therein and having an open bottom d' and bearing a revolubly-fixed nut d^3 in its top side, a film-case B open at the bottom and adapted to contain sensitized films and to fit inside the hollow slide D and bearing a detachably-connected screwed stud f adapted to engage with the nut d^3, a cap b adapted to cover the open end of the said film-case and having overlapping edges b^2, a light-proof door c^2 covering the lower end of the exposure-frame, a cross-slide c^{11} in the lower part of the casing at a distance above said door c^2 to admit said cap b, stops c^7 upon the side of the casing adapted to engage the edges b^2 of the cap b and detain the cap in the outer compartment, plate-springs c^{10} adapted to press the film toward the exposure-aperture c^4, a toothed hexagonal cam-wheel F rotatably mounted in the back of the casing, a pendulous springing bar g^6 fixed by its upper end in a groove of the casing and in the path of the slide D and bearing at its lower end a pawl G engaging the teeth of the said cam-wheel, a lever H fulcrumed upon the back of the casing above the said cam-wheel and bearing a nose h which is pressed against the cam-wheel by the spring h^6, said lever H having also an outwardly-extending arm with a springing tip h' and an upstanding stud h^3 thereon, said lever H having further a two-armed extension h^2 above said fulcrum with notched upturned ends h^5, and a transverse bar I pivoted at its ends to the sides of the casing, and having fingers i adapted to rest upon the ends h^5 of the lever H and engage in the depressions therein, substantially as set forth.

17. In a combined exposure-frame and change-box adapted to contain a number of sensitized films or plates and expose them successively to the action of light, the combination of a casing, a hollow sliding member D therein adapted to contain the films or plates, means for withdrawing the films from the sliding member, and mechanism for preventing the withdrawal of the sliding member after all the films have been exposed, consisting of a bar O sliding in a longitudinal cavity in the slide D, a spring P fixed at one end upon the bar O and carrying at its other end a projection p which is normally held by the spring P at a distance from the bar O but is adapted to fold against the said bar O when the latter slides into the cavity within the slide D, and a stop p' adapted to engage said projection p so as to prevent the withdrawal of the slide D, whereby when a film is withdrawn from the slide D it will keep the projection p pressed inwardly and out of the way of the stop p', but when there is no film withdrawn from the slide D said projection p will engage the stop p' and prevent the withdrawal of the slide D.

18. In a combined exposure-frame and change-box adapted to hold a number of sensitized films or plates and expose them successively to the action of light, the combination of a casing, a hollow sliding member D therein adapted to contain the films or plates, means for withdrawing the films successively from the slide D, and mechanism for preventing the withdrawal of the sliding member after all the films have been exposed, consisting of a bar O sliding in a longitudinal cavity in the slide D, a spring P fixed at one end upon the bar O and carrying at its other end a projection p which is normally held by the spring P away from the bar O but is adapted to be folded against the bar O when the latter slides into the cavity within the slide D, a stop p' adapted to engage said projection p so as to prevent the withdrawal of the slide D, and a second stop Q carried by the casing below the stop p' to engage the projection p when the latter is drawn within the cavity of the slide D and pressed against the bar O, so as to insure the withdrawal of the said bar O from the cavity at the first outward movement of the slide D.

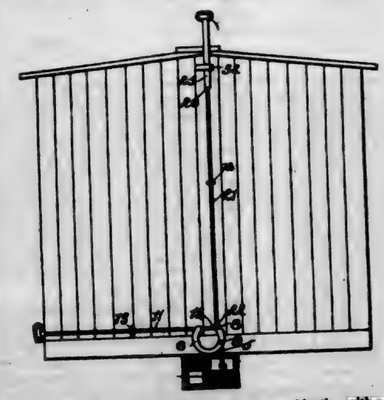
19. A film-case adapted for use in a combined exposure-frame and change-box consisting of a case open at the bottom and having resilient internal projections b^5 adapted to engage the edges of the films and prevent their withdrawal except individually.

20. A film-case adapted for use in a combined exposure-frame and change-box consisting of a case open at the bottom and having internal swellings b^6 adapted to press upon the first side of the films so as to leave a space between the uppermost film and the side of the case.

21. A film-case adapted for use in a combined exposure-frame and change-box consisting of a case open at the bottom and having a resilient internal projection b^5 adapted to engage the edges of the films and prevent them from being withdrawn except individually, and one or more internal swellings b^6 near the lower open end of the said case adapted to press upon the uppermost film so as to leave a space between it and the said case.

22. A film-case adapted for use in a combined exposure-frame and change-box consisting of a box having a lower open end covered by a light-proof cap and ears formed upon its upper end whereby it may be drawn into the exposure-frame.

705,785. UNCOUPLING DEVICE. HENRY BROWN, St. Louis, Mo. Filed Apr. 9, 1901. Serial No. 54,017. (No model.)



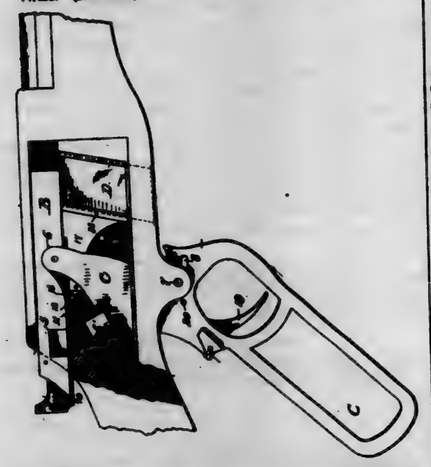
Claim.—1. In an uncoupling device, the combination with a rocker resting upon the draw-head and connected with the lock of an automatic coupler; of a substantially horizontal rod pivoted to and leading from the rocker loosely through an eye in the end of the car and laterally outward to a handle, an upright rod pivoted to and leading also from the rocker to a handle, an upright rod pivoted to and leading also from the rocker loosely through an eye in the end of the car and upward to a handle, and means for permitting vertical and lateral movements of the upper end of

this rod and for detachably holding it in elevated position, all substantially as described.

2. In an uncoupling device, the combination with a rocker connected with the lock of an automatic coupler; of a rod extending from the rocker loosely through an eye in the end of the car-body and having a handle at its upper end, the body of the rod just beneath said handle being enlarged so as to form a shoulder, and a plate carried by the car and having a keyhole-opening whose larger and smaller portions respectively loosely receive the larger and smaller portions of said rod, and a notch leading from the larger portion out through the edge of the plate, said notch standing oblique to a vertical line, substantially as described.

3. In an uncoupling device, the combination with a rocker resting upon the draw-head and connected with the lock of an automatic coupler; of a rod pivoted to and extending from the rocker loosely through an eye in the end of the car-body and having a handle at its upper end, the body of the rod just beneath said handle being enlarged so as to form a shoulder, and a plate carried by the car and having a keyhole-opening whose larger and smaller portions respectively loosely receive the larger and smaller portions of said rod, and a second rod pivoted to and leading from said rocker through an eye in the car-body located to that side of the upright rod and plate which is adjacent the smaller end of the opening in the latter, this second rod having a handle at its outer end, all substantially as described.

705,786. RIFLE. JOHN H. GAIL, Olivy, Cal., assignor of one-half to Thomas Harris, Olivy, Cal. Filed Oct. 3, 1901. Serial No. 77,635. (No model.)



Claim.—1. The combination in a gun of a frame, a breech-bolt reciprocable therein, a piece rigid with the frame, a sear fulcrumed to the piece and having the form of a bell-crank lever the upper arm of which is substantially horizontal and has a point adapted to engage a cocking-piece, a horizontally-disposed spring above the upper arm of the sear and fixed to the frame, and adapted to bear upon the sear in front of its fulcrum-point, a spring-actuated firing-pin slidable in the breech-bolt, a cocking-piece fixed to the firing-pin and having an under surface provided with notches, to be engaged by the point of the sear, a fulcrumed guard-lever having its front end forked and connected to the outer sides of the breech-bolt, a trigger carried by the guard-lever, and a means carried by the lever adapted to lock the trigger when the guard-lever is open and to lock said lever to the frame when the lever is closed.

2. In a gun the combination with complementary firing mechanism including a firing-pin, sear and trigger, of a fulcrumed guard-lever carrying said trigger, and a pivoted lever also carried by the guard-lever and directly engaging the trigger and capable of locking the trigger against movement when the guard-lever is open, said second lever engaging the breech-frame and locking the guard-lever in place when said lever is closed.

3. In a gun, the combination of a frame, a breech-bolt slidable therein, a pivoted sear, a combined firing and locking piece, said cocking-piece connected in a slot in the breech-bolt and having notches in its under side to be engaged by said sear, a fulcrumed guard-lever formed of a single piece having its front forked to straddle the lower part of the breech-bolt so as to be connected to the outer sides of the breech-bolt, a trigger mounted in and carried by said guard-lever, and a trigger-safety consisting of a lever fulcrumed in and carried by the trigger-guard, having one arm to engage a notch in the trigger, when the guard-lever is open, to lock the trigger, and said safety provided with a second arm having a hook, said frame having a projection to be engaged by said hook when the guard-lever is closed.

4. In a gun, the combination of a frame, a reciprocable breech-bolt, a firing-pin, a sear fulcrumed below the firing-pin and adapted to engage the same, a guard-lever fulcrumed between its ends and having its front end connected to the breech-bolt, a trigger fulcrumed in and carried by the guard-lever and provided with a notch, and a safety-lever, spring-actuated and also carried by the guard-lever in rear of the trigger said safety-lever fulcrumed between its ends, having one end to engage the notch in the trigger and the other end provided with a hook, said frame having a projection engaged by the hook of the safety-lever when the guard-lever is closed.

5. In a gun, the combination with a frame, and a firing mechanism including a breech-bolt, firing-pin and trigger, of a guard-lever having its front end forked to embrace the breech-bolt and having locking-lugs located in rear of said front ends, said bolt having mortises for the front ends of the lever and also for the locking-lugs and said frame also having its walls provided with channels or grooves for the lugs.

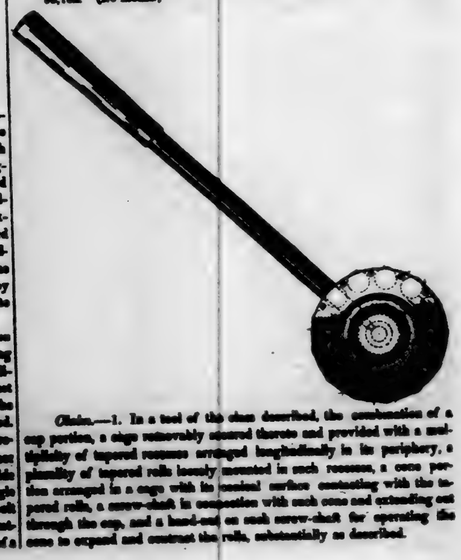
705,787. WOODEN PANEL, LINING, CEILING, AND FLOOR FOR BUILDINGS, &c., AND PAVING FOR STREETS. WALTER T. CREESE, county of Middlesex, England. Filed Aug. 3, 1901. Serial No. 70,793. (No model.)

Claim.—1. Two sets of laths, the laths in one set having longitudinal dovetail grooves and the laths in the other set having transverse dovetail grooves, the dovetails on two adjacent laths of one set fitting into a dovetail groove of a lath of the other set.

2. Two sets of laths, the laths in each set arranged side by side and abutting against one another, the laths in one set having longitudinal dovetail grooves and the laths in the other set having transverse dovetail grooves, the dovetails on two adjacent laths of one set fitting into a dovetail groove of a lath of the other set.

3. Two sets of laths, the laths in each set arranged side by side, a tongue on one lath fitting into a groove on the adjacent lath, the laths in one set having longitudinal dovetail grooves and the laths in the other set having transverse dovetail grooves, the dovetails on two adjacent laths of one set fitting into a dovetail groove of a lath of the other set.

705,788. MACHINE FOR TRUING PISTON-RING BUSHINGS. ABRAHAM R. DAVIS, Topeka, Kans. Filed Mar. 24, 1902. Serial No. 99,782. (No model.)



Claim.—1. In a tool of the class described, the combination of a cup portion, a cage removably secured thereto and provided with a multiplicity of tapered recesses arranged longitudinally in its periphery, a plurality of tapered rolls loosely mounted in such recesses, a cone portion arranged in a cage with its conical surface contacting with the tapered rolls, a screw-shaft in connection with such cone and extending out through the cup, and a hand-nut on such screw-shaft for operating the cone to expand and contract the rolls, substantially as described.

2. In a tool of the class described, the combination of a cup portion, a cage removably secured thereto and provided with a multiplicity of tapered recesses arranged longitudinally in its periphery, a plurality of tapered rolls loosely mounted in such recesses, a cone portion arranged in a cage with its conical surface contacting with the tapered rolls, a screw-shaft in connection with such cone and extending out through the cup, a hand-nut on such screw-shaft for operating the cone to expand and contract the rolls, and spring mechanism located between the hand-nut and the cone to assist in the retraction of the cone, substantially as described.

3. In a tool of the class described, the combination of a cup portion, a cage removably secured thereto provided with a multiplicity of tapered openings arranged longitudinally in its peripheral surface, a plurality of tapered rolls loosely mounted in such recesses, a movable cone arranged in the cage with its conical surface contacting with the tapered rolls, a shaft engaging such cone and provided with a threaded end extending out through the cup and a central longitudinal bore, a hand-nut on the threaded end of the shaft, and spring mechanism in the axial bore of the screw-shaft and bearing against the inner surface of the hand-nut to assist in the retraction of the cone, substantially as described.

4. In a tool of the class described, the combination of a cup portion, a cage portion removably secured thereto and provided with a multiplicity of tapered recesses arranged longitudinally in its periphery, a plurality of tapered rolls loosely arranged in such recesses, a movable cone arranged in the cage with its cone surface contacting with the tapered rolls, a headed shaft engaging such cone provided with a threaded end extending out through the cup, a central longitudinal bore and a transverse opening, a hand-nut engaging the threaded end of the shaft, a pin extending through the transverse opening of the shaft, a ring in engagement with the cone bearing against the transverse pin, and a spring bearing against such pin and the hand-nut, substantially as described.

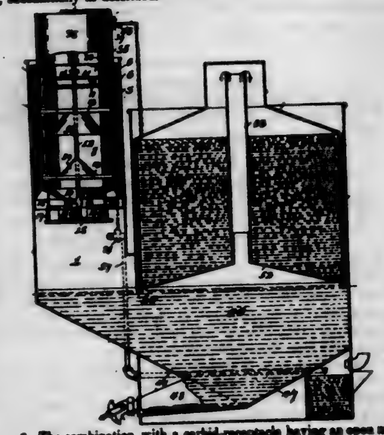
5. In a tool of the class described, the combination of a cup portion, a cage removably secured thereto and provided with a multiplicity of tapered recesses arranged longitudinally thereof, the larger diameters of such recesses being arranged adjacent to the cup portion, a plurality of tapered rolls arranged in such recesses, a movable cone arranged in the cage with its conical surface contacting with the tapered rolls, a headed shaft engaging the cone and provided with a threaded end extending out through the cup with a central longitudinal bore a transverse perforation and a radial slot, a hand-nut engaging the threaded end of such shaft, a pin passed through the transverse perforation of such shaft, a ring intermediate such pin and the cone, a spring intermediate the hand-nut and the transverse pin, a second spring intermediate the cup and the cone, and a set-screw or similar element passed through the cup and engaging the radial slot of such shaft, substantially as described.

6. In a tool of the class described, the combination of a cup portion, a cage removably secured thereto and provided with a multiplicity of tapered recesses arranged longitudinally thereof, the larger diameters of such recesses being arranged adjacent to the cup portion, a plurality of tapered rolls arranged in such recesses, a movable cone arranged in the cage with its conical surface contacting with the tapered rolls, a headed shaft engaging the cone and provided with a threaded end extending out through the cup with a central longitudinal bore a transverse perforation and a radial slot, a hand-nut engaging the threaded end of such shaft, a pin passed through the transverse perforation of such shaft, a ring intermediate such pin and the cone, a spring intermediate the hand-nut and the transverse pin, a second spring intermediate the cup and the cone, a set-screw or similar element passed through the cup and engaging the radial slot of such shaft, and a hand-lever engaging the cup for operating the tool, substantially as described.

705,789. ACETYLENE-GAS GENERATOR. ARTHUR DAVIS, Chicago, Ill., and FRED L. DAVIS, Marquette, Mich. Filed Apr. 16, 1900. Serial No. 13,101. (No model.)

Claim.—1. The combination with a stationary casing having an open upper end and a peripheral annular water-chamber, of a carbid-receptacle removably seated in said stationary casing, said receptacle having an open discharge-mouth at its lower end, a cap or bell the top whereof constitutes a cover for the carbid-receptacle and the depending walls whereof enter the annular water-chamber of the casing to constitute therewith a water seal, a horizontal feed-plate located below the mouth of the carbid-receptacle, a vertical driving-shaft extending therefrom upwardly through said receptacle and the top of said cap, and means for imparting a rotary motion to said feed-plate through said shaft, substantially as described.

2. The combination with a stationary casing having an open upper end and a peripheral annular water-chamber, of a carbid-receptacle removably seated in said stationary casing, said receptacle having an open discharge-mouth at its lower end, a cap or bell the top whereof constitutes a cover for the carbid-receptacle and the depending walls whereof enter the annular water-chamber of the casing to constitute therewith a water seal, a horizontal feed-plate located below the mouth of the carbid-receptacle, a vertical driving-shaft extending therefrom upwardly through said receptacle and the top of said cap, a coupling connecting separated ends of said shaft within said carbid-receptacle, and means for imparting a rotary motion to said feed-plate through said shaft and its coupling member, substantially as described.



3. The combination, with a carbid-receptacle having an open mouth at its lower end, of a horizontal feed-plate located below said mouth, a universally-yieldable sweep or scraper flexibly suspended over said feed-plate, and means for rotating said feed-plate, substantially as described.

4. The combination, with a carbid-receptacle having an open discharge-mouth at its lower end, of a horizontal feed-plate located below said mouth, a plurality of universally-yieldable sweeps or scrapers flexibly suspended over said feed-plate, and means for rotating said feed-plate, substantially as described.

5. The combination, with a carbid-receptacle having an open discharge-mouth in its lower portion, of a horizontal feed-plate located below said mouth, means for rotating said feed-plate, and an annular flexibly suspended over said feed-plate and provided with one or more sweeps or scrapers, extending diagonally over said plate, substantially as described.

6. The combination, with a vertical carbid-receptacle having an open discharge-mouth in its lower portion, of conical baffle-plates located within said receptacle, said plates being oval in peripheral contour and having their longest diameter disposed at an angle to each other.

7. The combination, with a carbid-receptacle having a contracted open discharge-mouth at its lower end, and a horizontal rotary feed-plate located below said mouth, of conical baffle-plates within the carbid-receptacle, said plates being oval in peripheral contour and asymmetrical relatively to each other and having their longer diameters arranged at an angle to each other, substantially as described.

8. The combination, with a carbid-receptacle having a contracted open mouth in its lower end, of a horizontal feed-plate located below said mouth, and a vertical shaft carrying said plate, extending upward through the receptacle and having that portion which lies within the discharge-mouth fluttered, substantially as described.

9. The combination, with a carbid-receptacle having an open discharge-mouth in its lower end, and a horizontal feed-plate located below said mouth and provided with a vertical shaft extending upwardly through the receptacle, of an independent motor connected with the upper end of said shaft, and means controlled by the variations in volume of the generated gas for stopping and starting said motor, substantially as described.

10. The combination, with a carbid-receptacle having an open discharge-mouth in its lower portion, of a horizontal feed-plate located below said mouth, an independent motor connected with said feed-plate to rotate the same, a brake normally holding said motor stationary, and means controlled by the variations in volume of the generated gas for releasing said brake, substantially as described.

11. The combination with an open-topped generating-chamber provided about its periphery with an annular sealing-chamber, of a carbid-receptacle provided with feed devices and removably located within the receptacle provided with feed devices and removably located within the generating-chamber, a removable cap entering said sealing-chamber and constituting therewith a water seal, the top of said cap resting on and forming a cover for the carbid-receptacle, and an independent motor for the feed devices carried on the top of said cap and removable therewith, substantially as described.

12. The combination with an open-topped generating-chamber provided about its periphery with an annular sealing-chamber, of a carbid-receptacle provided with feed devices and removably located within the generating-chamber, a removable cap entering said sealing-chamber and constituting therewith a water seal, the top of said cap resting on and forming a cover for the carbid-receptacle, an independent motor for the feed devices carried on the top of said cap and removable therewith, and means for locking said cap against vertical movement, substantially as described.

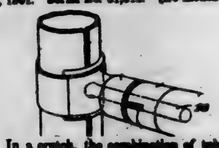
705,740. PROCESS OF PROTECTING EXPOSED FILTERS OR OTHER CONFINED LIQUID BODIES FROM FREEZING. LEWIS K. DAVIS, Indianapolis, Ind. Filed Mar. 5, 1900. Renewed Jan. 14, 1902. Serial No. 89,730. (No specimens.)

Claim.—1. The improvement in the art of preventing exposed filters and other confined liquid bodies from freezing, which consists in supplying heat beneath the surface at or near the vertical confining-walls and causing a circulation of the relatively heated water from such points, whereby the marginal portions of the liquid are prevented from freezing, and the more central open surface protected thereby.

2. The improvement in the art of preventing exposed filters and other confined liquid bodies from freezing, which consists in heating marginal portions of the liquid and causing a circulation to take place from such marginal portions and toward the center, substantially as and for the purposes set forth.

3. The improvement in the art of preventing exposed filters and other confined liquid bodies from freezing, which consists in supplying heat in an annular line beneath the surface of the liquid and substantially at its margin, for the purposes set forth.

705,741. ADJUSTABLE CRUTCH. WARREN F. DREW, Sacramento, Cal., assignor of one-half to Frank G. Snook, Sacramento, Cal. Filed Nov. 4, 1901. Serial No. 81,012. (No model.)



Claim.—1. In a crutch, the combination of tubular telescopic leg portions, the outer of said portions being longitudinally slotted, a handhold extending transversely between the legs and having terminal bands inclosing said slotted portions, and clamping mechanism carried by said handhold by which the said slotted portions are contracted and locked upon its respective slidable part.

2. In a crutch of the character described, upper and lower members slidably movable to lengthen or shorten the structure, hand grips and clamps controlled thereby to lock the parts together, and locking devices to prevent the clamps being turned backward.

705,742. PIPE-WRENCH. CHARLES L. DURHAM, Centerview, Ohio. Filed Nov. 23, 1901. Serial No. 84,082. (No model.)

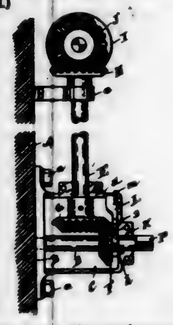
Claim.—In a pipe-wrench, the same comprising a fixed and a movable jaw, the two parts pivoted to one another at the upper end of the sections and above the horizontal line of the gripping-jaws and in rear thereof substantially as described.

705,743. NUT-LOCK. CHARLES L. DURHAM, Centerview, Ohio. Filed Nov. 20, 1901. Serial No. 84,021. (No model.)

Claim.—1. The within-described nut-lock, comprising two sections, one section having an inward-projecting lug and the other section being provided with a recess, having shoulders at each end thereof, said sections having adjacent inclined faces, said inclinations extending in a straight plane from one side of the nut to the opposite side, substantially as described.

2. A nut applicable to screw-threaded bolts, the same being divided about its center in a diagonal plane, forming two sections, the adjacent faces thereof presenting straight flat surfaces, one section provided with a lug and the opposite section provided with a recess, having shoulders or stops, whereby the movement of the locking-section is controlled in manipulating the nut, substantially as described.

705,744. DEVICE FOR RAISING OR LOWERING AWNINGS. GEORGE H. ESSERS, Cincinnati, Ohio. Filed Mar. 31, 1902. Serial No. 100,673. (No model.)

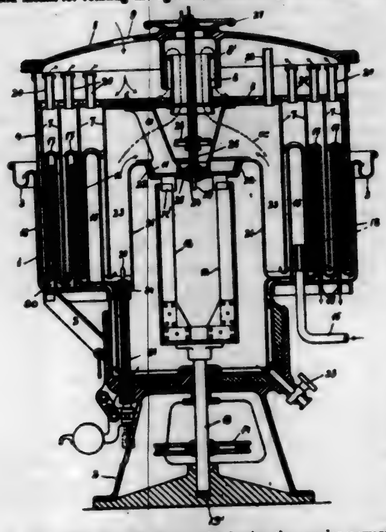


Claim.—1. A device for operating awnings consisting of a casing made in two sections, a base B formed integral with one of said sections, a driving-shaft D journaled to said base and casing provided with bevel-gear F, a driven shaft journaled in said casing, a bevel-gear on said shaft meshing with the bevel-gear on the driving-shaft, fastening-flanges on said casing which form the bearings of the said shafts, and fastening-bolts fastening through said flanges upon each side of respective shafts, substantially as specified.

2. In a device for operating awnings the combination with a casing adapted to be anchored to the walls of a building, a slotted cap for the casing, a driving-shaft and driven shaft journaled in said casing, a ratchet-gear inclosed within said casing, a pawl-lever hinged within the casing and having an arm projecting through said slot in the casing-cap, a projection on the casing coincident with the said projecting arm when the parts are in their position, substantially as specified.

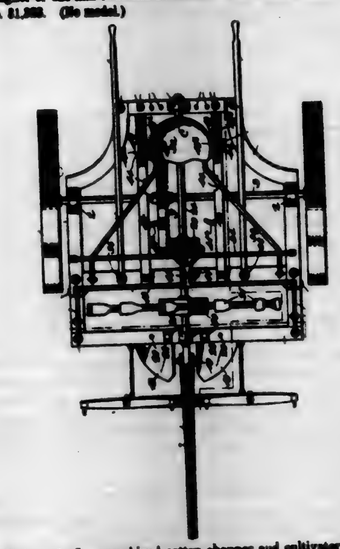
705,745. APPARATUS FOR HEATING LIQUIDS. JOSEF FLIEGEL, Mallmitz, Germany. Filed Aug. 22, 1901. Serial No. 72,902. (No model.)

Claim.—1. In combination, an outer vessel 1 having the annular piece 18 extending up therefrom, a cylinder 4 extending down into the vessel 1 and having chambers 17, the walls of which fit over the annular piece 18, an agitator having downwardly-extending annular pieces 7 extending between the walls of the chambers 17, a heating-body 16, a centrally-arranged receiving-chamber 21 connected with the passage formed between the walls of the chambers 17 and the depending pieces 7 of the agitator, said receiving-chamber having an outlet connecting with the passage formed between the walls of the chambers 17 and the annular pieces 18 of the vessel 1, said agitator having a horizontal diaphragm or top whereby the milk is directed to the passage between the chambers 17 and the agitator, the said vessel 1 having an outlet for the milk and means for rotating the agitator, substantially as described.



2. In combination with the vessel 1 having the annular upwardly-extending piece 18, a cylinder 4 having the annular chambers 17, the walls of which fit over the annular piece 18 to form a circuitous milk-passage, agitator means and air-exhaust pipe 19 open at a point above the upper edge of the piece 18 within the said circuitous passage, substantially as described.

705,746. CUTTER-CHOPPER. JOHN H. FORSTER, Evelyn, Tex., assignor of one-half to James H. Hobbs. Filed Nov. 6, 1901. Serial No. 81,808. (No model.)



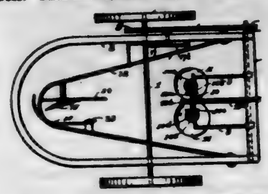
Claim.—1. In a combined cotton chopper and cultivator, the combination of a main frame, a supporting-axle therefor, a front section flexibly connected to the said main frame, a tongue attached to the said front section, plows carried by the latter, a longitudinally-disposed shaft having its bearings on said front section and at the rear side of said main section, a revolvable chopping element carried by said shaft, connections between said axle and said shaft, to rotate the latter, a handle attached to the said front section, and a support on said main frame, to which said handle is adjustably connected, whereby said plows and said chopping element may be raised and lowered, substantially as described.

2. In a combined cotton chopper and cultivator, the combination of a main frame, a supporting-axle therefor, a front section flexibly connected to the said main frame, a tongue attached to the said front section, plows carried by the latter, a longitudinally-disposed shaft having its bearings on said front section and at the rear side of said main section, a revolvable chopping element carried by said shaft, connections between said axle and said shaft, to rotate the latter, a handle attached to the said front section, spring connections between said handle and said front section, and a support on said main frame, to which said handle is adjustably connected, whereby said plows and said chopping element may be raised and lowered, substantially as described.

3. In a combined cotton chopper and cultivator, the combination of a frame, a pair of scraping-plows at the front end thereof, a revolvable chopping element in rear of said scraping-plows, a pair of longitudinally-disposed bars, flexibly connected at their front ends, to said frame and having cultivating-plows at their rear ends, in rear of said chopping element, levers connected to said bars, to raise and lower said cultivating-plows, and fulcrum-supports on which said levers are shiftable, longitudinally of the said frame, the latter having a seat, and rearwardly-extending handles, whereby said levers may be shifted for operation either from said seat, or from the rear of the machine, substantially as described.

4. In a combined cotton chopper and cultivator, the combination of a frame, a pair of scraping-plows at the front end thereof, a revolvable chopping element in rear of said scraping-plows, a pair of longitudinally-disposed bars, flexibly connected at their front ends to said frame and having cultivating-plows at their rear ends, in rear of said chopping element, levers connected to said bars, to raise and lower said cultivating-plows, and spring connections between said levers and said bars, substantially as described.

705,747. SUGAR-BEET HARVESTER. RUSSELL H. FRASER, Norfolk, Nebr. Filed Mar. 6, 1899. Serial No. 708,080. (No model.)



Claim.—1. In a machine of the character described, topping mechanism composed of rotating disks, shafts supporting and rotating said disks, means for rotating said shafts operable from the ground-wheels of the machine, shoe-gage hung in front of said disks, in combination with a digging mechanism consisting of colters angularly disposed to each other, a landside and means for separating the dirt from the roots unearthed, substantially as set forth.

2. In a machine of the character described, topping mechanism composed of horizontally-disposed disks, shafts supporting and rotating said disks, means for rotating said shafts operable from the ground-wheels, shoe-gage hung in front of said disks, in combination with digging mechanism consisting of a standing colter, a rolling colter set at an angle to the standing colter, means for supporting said rolling colter, a landside, means for separating the dirt and the roots dug, a pivoted frame supporting said digging mechanism and means for raising and lowering said frame, substantially as described.

705,748. MANUFACTURE OF CELLULOSE PRODUCTS. MAX FREIBERG and JOHANNES URBAN, Oberbruch, near Aachen, Germany. Filed May 5, 1900. Serial No. 15,043. (No specimens.)

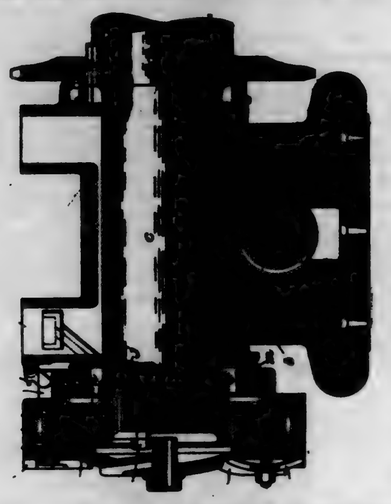
Claim.—1. In the washing of cellulose products resulting from the precipitation or coagulation of cellulose solutions, the method of facilitating and securing the elimination of metallic compound remaining within the said cellulose products, which method consists in causing water containing a substance capable of converting the said metallic compounds into soluble salts to slowly flow from above onto the said products while coiled up, substantially as set forth.

2. In the washing of cellulose products resulting from the precipitation or coagulation of cellulose solutions, the method of facilitating and securing the elimination of metallic compound remaining within the said cellulose products, which method consists in causing water containing a substance capable of converting the said metallic compounds into soluble salts to slowly flow from above onto the said products while coiled up

and then causing pure water to likewise flow from above on the said products, substantially as set forth.

3. In the washing of cellulose products resulting from the precipitation or coagulation of cellulose solutions, the method of facilitating and securing the elimination of metallic compounds remaining within the said cellulose products, which method consists in causing water containing an acid to slowly flow from above onto the said products while called up, substantially as set forth.

705,749. CURTAIN ROLL. ALBERT J. GUNN, Chicago, Ill., assignor to Allis-Chalmers Company, Jersey City, N. J., a Corporation of New Jersey. Filed July 30, 1901. Serial No. 70,059. (No model.)



Claim.—1. In a Cornish roll, the combination of a shaft, a thrust-collar secured thereto at or near one end thereof, a ring-nut in engagement with the journal-box of the shaft and means for holding the thrust-collar rotatably in engagement with the ring-nut to take up the thrust thereof, whereby as such ring-nut is rotated and moved inwardly and outwardly the thrust-collar is likewise moved, carrying with it the shaft and roll, substantially as described.

2. In a Cornish roll, the combination of a roll-shaft, a thrust-collar engaged therewith, a ring-nut surrounding the thrust-collar and having screw-threaded engagement with the frame of the machine, means for locking and holding the thrust-collar in rotatable engagement with the ring-nut used to sustain the thrust thereof, and means for locking and holding the ring-nut in desired engagement with the frame, substantially as described.

3. In a Cornish roll, the combination of a roll-shaft, a thrust-collar in engagement with one end thereof and provided with an annular flange, a ring-nut in threaded engagement with the frame of the machine and surrounding the thrust-collar, and a plate-nut in engagement with the other end of the ring-nut and forming in connection therewith a closure that holds the thrust-collar rotatably in position, substantially as described.

4. In a Cornish roll, the combination of a roll-shaft, a thrust-collar provided with an annular flange in engagement with one end of each roll-shaft, a ring-nut having one end in threaded engagement with the frame of the machine and upon which it is rotated and adjusted, a plate-nut adjustably mounted in engagement with the other end of the ring-nut for confining and forming a closure for the thrust-collar, means for holding the plate-nut in adjusted position, and wearing-rings interposed between the plate and ring-nuts and the flange of the thrust-collar, substantially as described.

5. In a Cornish roll the combination of a roll-shaft, a thrust-collar provided with an annular flange in engagement with one end of each roll-shaft, a ring-nut surrounding the thrust-collar having one end in threaded engagement with the frame of the machine and upon which it is rotated and adjusted, a plate-nut adjustably mounted in engagement with the other end of the ring-nut for confining and forming a closure for the thrust-collar to confine it therein and sustain the thrust thereof, means for holding the plate-nut in adjusted position, wearing-rings interposed between the plate and flange of ring-nut and the flange of the thrust-collar, and means for locking the ring-nut in adjusted engagement with the frame, substantially as described.

6. In a Cornish roll, the combination of a roll-shaft, a thrust-collar provided with an annular flange in threaded engagement with one end thereof, a gib-key engaging a slot formed by end in the threaded portions of the roll-shaft and thrust-collar for holding such parts in the desired position, a ring-nut surrounding the thrust-collar having one end in threaded engagement with the frame of the machine for the adjustment thereof, a plate-nut in threaded engagement with the other end of the ring-nut to complete the closure for and confine the thrust-ring, means for holding the plate-nut in adjustable engagement with the ring-nut, means for holding the ring-nut in adjustable engagement with the frame, a wearing-ring interposed between the ring-nut and the annular flange of the thrust-collar, and a wearing-ring interposed between the plate-nut and the annular flange of the thrust-collar, substantially as described.

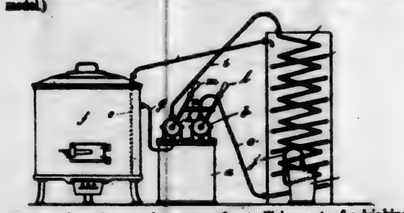
705,750. FISH TRAP-HOOK. HOMER GRIER, Atlanta, Ga., assignor to the Grier Lever Fish Hook Company, Atlanta, Ga. Filed Feb. 14, 1902. Serial No. 94,047. (No model.)

Claim.—1. In a fish trap-hook, the combination with a forked stem, a plurality of striking-hooks loosely hung from said stem, a spring-clamp on the stem adapted to engage and hold said hooks in perpendicular position, of a bait-hook having double diverging shanks slidably connected to said striking-hooks.

2. In a fish trap-hook, the combination with a forked stem, a plurality of striking-hooks pivoted thereto, a spring-clamp on said stem adapted to engage and hold said hooks in perpendicular position, said hooks being provided with elongated slots in their upper ends, of a bait-hook having double diverging shanks, bearings secured on the ends of said shanks and adapted to be secured and operated in the slots of the striking-hooks.

3. In a fish trap-hook, the combination with a forked stem, a plurality of striking-hooks, a spring-clamp on said stem adapted to engage and hold said hooks in perpendicular position, each of said hooks being provided with an eye on its inner end, by which it is pivoted to said stem, an elongated slot extending from said eye to an intermediate portion of the hook, of a bait-hook having double diverging shanks, eyes in the upper ends of said shanks, and studs secured in said eyes, said studs operating in said slots.

705,751. APPARATUS FOR STERILIZING WATER, &c. DAVID GROVE, Berlin, Germany. Filed Sept. 3, 1900. Serial No. 29,022. (No model.)



Claim.—In an improved apparatus for sterilizing water for drinking purposes, the combination with a tank for the water and an open heater containing primary and secondary coils, of an initial supply-pump connected to said primary coil, pipe connections from said primary coil to the heater, a second pump connected to the heater and a connection from said second pump to the secondary coil, said secondary coil having an outlet for the sterilized water.

705,752. SOLDERING-IRON. GEORGE GUTH, Brooklyn, N. Y. Filed Dec. 5, 1901. Serial No. 84,783. (No model.)

Claim.—1. In a soldering-iron, the combination, with a removable head provided with a socket which has tapering sides and is broadest at its end next to the head, said socket being open on top and at its narrow end, of a shank provided with a plate which fits the said socket, and a fastening device which secures the said plate in the said socket, substantially as set forth.

2. In a soldering-iron, the combination, with a shank provided with a head at one end and a series of projections struck up from its sides, of a handle which abuts against the said projections, and means for securing the said handle on the shank, substantially as set forth.

3. In a soldering-iron, the combination, with a shank, of a handle provided with an air-chamber around the shank, a collar of non-heat-conducting material encircling the shank and inserted in one end of the said chamber, and means for securing the shank in the handle, substantially as set forth.

4. In a soldering-iron, the combination, with a shank having a step for the handle, of a handle provided with an air-chamber around the shank, a collar of non-heat-conducting material inserted in one end of the said chamber and provided with a flange, a ferrule which bears against the said step and incloses the said flange, and means for securing the shank to the handle, substantially as set forth.

705,753. FLUE-CLEANER. THOMAS J. HART, Buffalo, N. Y., assignor to Sherwood Manufacturing Company, Buffalo, N. Y. Filed Oct. 26, 1900. Serial No. 34,426. (No model.)

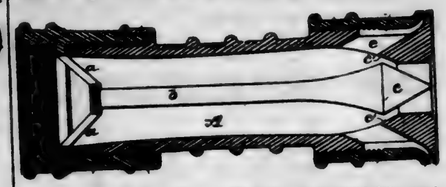
Claim.—1. The combination with the hollow case of a tube-cleaner adapted to receive a pressure fluid, and the cutter medium mounted on the case, of centering-arms arranged on the outer side of said case, and plungers which are guided in said case and engage with said arms and are pressed outwardly by the pressure fluid, substantially as set forth.

2. The combination with the hollow case of a tube-cleaner adapted to receive a pressure fluid, and the cutter medium mounted on the case, of centering-arms pivoted on the outer side of the case, plungers which engage with said arms and are pressed outward by the pressure fluid, and stops whereby the inward and outward movement of the arms and plungers is limited, substantially as set forth.

3. The combination with the hollow case of a tube-cleaner adapted to receive a pressure medium, and a rotary cutter mounted on the case, of centering-arms arranged longitudinally on the outer side of the case and pivoted at one end to the same while the opposite end is provided with a roller which is adapted to bear against the inner side of the tube to be cleaned, centering-plungers guided in the hollow case and projecting with their inner ends into the interior of the case while their outer ends bear against the centering-arms, stops arranged on the centering-arms and adapted to engage the case for limiting the outward movement of the arms and plungers, and stops arranged on the plungers and adapted to engage the case for limiting the inward movement of the arms and plungers, substantially as set forth.

705,754. FUSELE. CHARLES B. HAZEN, Williamsport, Pa., assignor to the Harris Safety Company, New York, N. Y. Filed Oct. 13, 1900. Renewed Nov. 25, 1901. Serial No. 83,089. (No model.)

Claim.—1. The combination with a coupling and an integral chuck-tang frame within said coupling, of a nozzle threaded and entering said coupling and having a valve-seat near its outlet, a valve-stem secured to the integral frame in the coupling and a valve at the forward end of said stem and adapted to coöperate with said valve-seat.



2. The combination with a coupling, of a nozzle threaded for attachment thereto, a flange on the nozzle and overhanging the end of the coupling, packing disposed between said flange and the outer face of the coupling, and a valve secured to the coupling for controlling the outlet of water when the nozzle is adjusted relatively to the coupling.

3. The combination with a coupling, of a nozzle adjustably attached thereto, said nozzle made in a single piece and having a valve-seat therein near its central outlet and having an exterior annular groove and a series of ducts or outlets communicating at one end with said groove and at the other end with the interior of the nozzle in rear of said valve-seat, an adjustable sleeve on the nozzle for controlling the passage of water through said ducts or outlets and annular groove, and a valve secured to and carried by the coupling and adapted to coöperate with said valve-seat.

705,755. WAGON-RACK. HENRY HAZEN and SAMUEL H. REESE, Galion, Ohio. Filed May 27, 1902. Serial No. 109,237. (No model.)

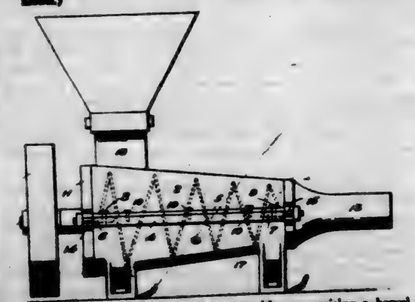
Claim.—1. The combination with a wagon-box, of a rack comprising a bracket, longitudinal bars secured thereto, a housing inclosing said bracket, and means for varying the inclination of the bracket and locking it to the housing, substantially as shown and described.

2. The combination with a wagon-box, of a rack comprising a bracket, longitudinal bars secured thereto, a housing for said bracket, openings in the bracket and housing, and a spring-pin engaging said openings for locking the bracket to the housing, substantially as shown and described.

3. A bracket comprising an adjustable arm, a housing inclosing the same to which said arm is pivoted, and means for varying the inclination of said arm and locking the same to the housing, substantially as shown and described.

4. A bracket comprising an adjustable arm, a housing therefor to which said arm is pivoted, openings in said arm and housing, and a spring-pin secured to the housing adapted to engage said openings to hold the arm in adjusted position, substantially as shown and described.

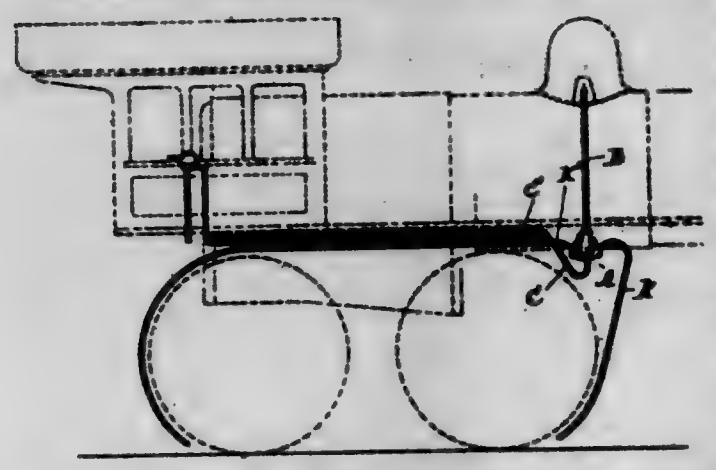
705,756. FORMING AND PLEATING MACHINE. WILLIAM H. HAYES, Flushing, N. Y. Filed Apr. 19, 1902. Serial No. 103,703. (No model.)



Claim.—A forming and pressing machine comprising a barrel or casing made in removable sections, flanges at the meeting edges of said

sections, ribs resting upon the flanges and bolted thereto, eyebolts secured between the ribs and flanges, said eyebolts projecting outward longitudinally of the barrel, to detachably secure the head of the barrel and the spout in place, substantially as described.

705,757. PNEUMATIC TRACK-SANDER. EDWARD H. EISLEY, Depew, N. Y. Filed Mar. 19, 1902. Serial No. 98,594. (No model.)



Claim.—1. A pneumatic track-sander comprising a casing having an opening for connection with the sand-reservoir, an opening for connection with the sand-discharge pipe and an opening for connection with the air-delivery pipe, of a valve movable transversely of said opening that leads to the sand-reservoir and a casing at one side of said last-mentioned opening to receive said valve when moved to open position, and a stem leading outside said valve-casing whereby said valve may be shifted.

2. A pneumatic track-sander comprising a casing having an opening for connection with the sand-reservoir, an opening for connection with the sand-discharge pipe and an opening for connection to the air-delivery pipe, of a valve for closing the opening that connects with the sand-reservoir, a chamber wherein said valve is inclosed, said chamber being formed with a slot to admit the valve, and a strip for closing said slot or opening of the chamber.

3. A pneumatic track-sander comprising a casing having an opening for connection with the sand-reservoir, an opening for connection with the sand-discharge pipe and an opening for connection with the air-delivery pipe, of a valve located in said casing and adapted to close the opening for the admission of sand, a handle connected with said valve and arranged upon the outside of said casing and a spring for holding said valve in open position.

4. A pneumatic track-sander comprising a casing having an opening for connection with the sand-reservoir, an opening for connection with the sand-discharge pipe and an opening for connection with the air-delivery pipe, of an air-jet nozzle or port for agitating the sand within the casing and an air-jet nozzle or port for causing the passage of sand through the sand-discharge pipe.

5. A pneumatic track-sander comprising a casing having an opening for connection with the sand-reservoir, an opening for connection with the sand-discharge pipe and an opening for connection with the air-delivery pipe, of an air-delivery channel extending partially around the sand-receiving chamber of said casing, an air-jet nozzle or port adjacent one end of said air-delivery channel and adapted to deliver a jet of air to agitate the sand, and a second air-jet nozzle or port at the opposite end of said channel and adjacent the opening of the casing that leads into the sand-discharge pipe, whereby the sand will be forced through said pipe.

6. A pneumatic track-sander comprising a casing having a sand-receiving chamber, an opening above said chamber, for connection with the sand-reservoir, an opening leading from said chamber at one side of said casing for connection with the sand-discharge pipe, an air-delivery channel beneath and extending partially around said chamber, an air-jet nozzle or port at the upper end of said channel and arranged to deliver air obliquely downward into said chamber, a second air-jet nozzle or port arranged at the end of said air-delivery channel opposite said sand-discharge opening and an air-delivery pipe connected to said channel.

7. A pneumatic track-sander comprising a casing having a sand-receiving chamber therein, an opening above said chamber for connection with the sand-reservoir, an opening at one side of said chamber for connection with the sand-discharge pipe, a deflector-arch arranged between said sand-admission opening and said sand-discharge opening, an air-jet nozzle or port arranged on the opposite side of the chamber from said deflector-arch and a pipe for delivering air to said air-jet nozzle or port, whereby a whirling movement of the sand within the chamber will be effected.

8. A pneumatic track-sander comprising a casing having an opening for connection with the sand-reservoir, an opening for connection with the sand-discharge pipe and an opening for connection with the air-delivery pipe, of a deflector-arch arranged within said casing, an air-jet nozzle or port for agitating the sand within the casing, said port being arranged at a point opposite said deflector-arch and a second air-jet nozzle or port arranged opposite the sand-discharge opening of said casing.

9. A pneumatic track-sander comprising a casing having an opening at its top for connection with the sand-reservoir, a vertically-disposed diaphragm arranged beneath said opening and dividing the casing into two chambers for receiving sand, a sand-discharge port leading from each of said chambers and individual air-delivery pipes and air-jet nozzles or ports for said chambers.

10. A pneumatic track-sander comprising a casing having at its top an opening for connection with the sand-reservoir, a diaphragm beneath said opening and dividing the casing into two sand-receiving chambers, each of which chambers is provided with a sand-discharge port, a deflector-arch within each of said chambers, an air-jet nozzle arranged adjacent the discharge-port of each of said chambers and serving to eject the sand therefrom, and an air-jet nozzle or port arranged within each of said chambers opposite said discharge-port for agitating the sand before it is discharged from the casing.

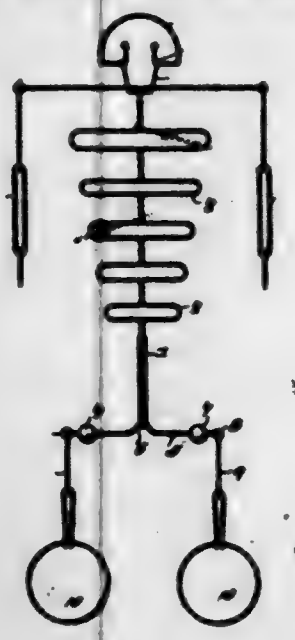
11. A pneumatic track-sander comprising a casing having an opening at its top for connection with the sand-reservoir, a vertically-disposed diaphragm beneath said opening and dividing said casing into two sand-receiving chambers, each of which chambers is provided with a sand-discharge port, a deflector-arch arranged within each of said chambers above said discharge-port, air-delivery channels extending beneath and partially around said chambers, each of said channels being provided at its upper end with an air-jet nozzle or port for delivering air to agitate the sand within the chamber and at its opposite end with an air-jet nozzle or port for delivering a jet of air to eject the sand from the casing, and air-delivery pipes connected with said channels.

12. A pneumatic track-sander comprising a casing having an opening for connection with the sand-reservoir, an opening for connection with the sand-discharge pipe and an opening for connection with the air-delivery pipe, of an air-jet nozzle for agitating the sand within the casing and an air-jet nozzle for causing the passage of sand through the sand-discharge pipe, said air-jet nozzles being removably held in position within said casing.

705,758. FISHING-REEL. ANDREW B. KIENZLE, New Haven, Conn. Filed May 24, 1902. Serial No. 108,968. (No model.)

Claim.—In a reel, the combination with the case-plate thereof, having a sleeve extending outward therefrom, a pinion-shaft extending outward through said sleeve, of a cap bearing upon said shaft and having a flange setting over the outer end of said sleeve, and a handle secured to said shaft and bearing upon said cap which rotates with it, substantially as described.

705,759. WIRE PUZZLE. FREDERICK HIRZ, Brooklyn, N. Y. Filed Nov. 16, 1901. Serial No. 82,604. (No model.)



Claim.—1. A wire puzzle comprising a main member having a fixed elongated loop, a bar and a link having a limited movement therethrough, and a removable member constructed to pass over the bar, link and elongated loop, and to pass through said elongated loop, substantially as specified.

2. A wire puzzle comprising a main member bent into the semblance of a human skeleton and having a fixed elongated loop, a bar and a link having a limited movement through said elongated loop, balls carried by the bar on each side of said elongated loop and forming stops for limiting the movement of the bar, and a removable member forming the head of the figure, said movable member being adapted to be passed through said elongated loop, substantially as specified.

3. A wire puzzle comprising a main body having an elongated loop, a bar passing through said elongated loop, balls arranged on said bar on each side of said elongated loop and of greater diameter than the width thereof, linked members carried by said bar and adapted to be passed through said elongated loop, and a removable member adapted to be passed through said elongated loop and over one of said balls and the end of the supporting-bar.

4. A wire puzzle comprising in combination, a strip of wire centrally bent to form an elongated loop and thence bent to form representations of the back, ribs and shoulders of the human frame, a transversely-disposed bar passing through said loop, balls carried by said bar on each side of the elongated loop and of a diameter greater than the width of said elongated loop, links hung to the outer ends of said bar, rings of a diameter less than the length of said elongated loop, said rings being hung to the lower ends of said links, and a removable member made in two pivotally-connected sections and adapted to represent the head and neck, said removable member being of a length less than the length of the said elongated loop, substantially as specified.

705,760. JOURNAL-BEARING. HERBERT H. LEWITT, Buffalo, N. Y. Filed Dec. 24, 1901. Serial No. 87,120. (No model.)

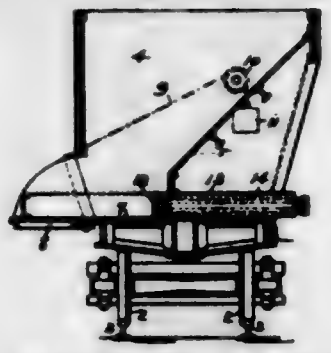
Claim.—1. A journal-bearing provided with a curved bearing-face of brass or like antifriction metal having solid ends, said face and ends being adapted in emergency to afford a bearing for the journal, its flange and shoulder, said face being longitudinally grooved intermediate its ends, and a thick, freely-detachable lining of relatively soft metal extending from end to end of said bearing and guarding the face thereof against normal contact with the journal, said lining being homogeneous throughout and being provided upon its back with a longitudinal lug terminating intermediate its ends, said lug being adapted to freely enter and pass from the grooved bearing and serving as the means for detachably connecting said lining to the bearing whereby the easy removal of said lining may be effected.

2. A journal-bearing provided with a curved bearing-face of brass or like antifriction metal having solid ends adapted in emergency to engage the wearing-surface, the flange and shoulder of the journal, and having seats running lengthwise of but terminating within the ends of said face, said seats lying upon opposite sides of the longitudinal center of the bearing, and a freely-removable, thick lining of relatively soft metal extending from end to end of said bearing and completely protecting its face from normal contact with the journal, said lining having a lug upon each side of its longitudinal center to enter the corresponding seat of the bearing and serving as the means for locking the lining to the bearing, the walls of the seats and lugs being shaped to permit the lining to be readily inserted and removed in a direction transverse to the axis of the bearing.

3. A journal-bearing comprising a back of malleable iron or like inferior metal, an emergency wearing-body of brass or like antifriction metal having solid ends and rigidly secured to said back and covering the inner face thereof from end to end, said emergency wearing-body being grooved longitudinally intermediate its ends and having its wearing-face and ends adapted in emergency to engage the wearing-surface, the flange and shoulder of the journal, and a thick lining of relatively soft metal extending from end to end of said wearing-body and being provided upon its back with a lug adapted to enter the groove of the wearing-body and serving as the means for detachably locking said lining to the wearing-body, whereby said lining may be freely removed in a direction transverse to the axis of the bearing.

4. A journal-bearing comprising a back of malleable iron or like inferior metal, an emergency wearing-body of brass or like antifriction metal rigidly secured to said back and covering the inner face thereof from end to end, the wearing-surface of said emergency-body being adapted in emergency to afford a bearing for the journal, its collar and flange and the concave surface of said wearing-body being provided at each side of its longitudinal center with a seat terminating within the ends of said wearing-face and a thick lining of relatively soft metal having lugs upon its back to enter the seat of said wearing-body, said lugs and said seats having their walls so relatively shaped as to permit the lining to be readily inserted and removed in a direction transverse to the axis of the bearing.

705,761. ORE-BIN. GEORGE H. HULETT, Cleveland, Ohio. Filed May 8, 1902. Serial No. 105,796. (No model.)



Claim.—1. In a bin for handling ore and similar material, the combination with a body having one inclined side and an opening in its opposite side, and a shelf or projection extending out beyond the opening, of a plunger adapted to move toward the opening and force the material in said bin through said opening.

2. In a bin for handling ore and other material, the combination with a body having one inclined side and an opening in its other side, and a shelf or projection extending out beyond the vertical plane of said opening, of a plunger adapted to move toward the opening and force the material through the latter, and a top plate carried by the plunger and forming a false bottom for the bin as the plunger is moved outwardly.

3. In a bin for handling ore and similar material, the combination with a body having an inclined side and an opening in its opposite side, of a door or shelf pivoted to the body and adapted to form a closure for said opening when in its upright position and a shelf or projection beyond said opening when in a horizontal position and a plunger for ejecting the material in the bin through said opening.

4. In a bin for handling ore, the combination with a body having one inclined side and a discharge-opening in its other side, and a counterweighted door for closing said opening, the said door adapted to turn downwardly to a horizontal position and form a shelf or projection, of a plunger for forcing the material in the body through said opening.

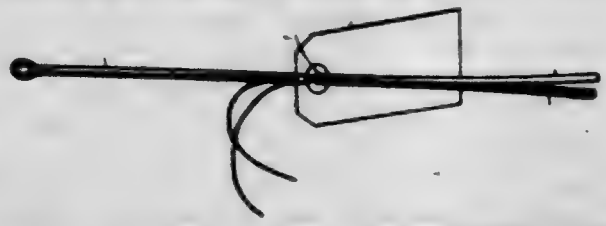
5. In a bin for handling ores, the combination with a body having one inclined side, an opening in its opposite side, and a counterweighted door pivoted at its lower end below the opening, of a plunger and a top plate secured to said plunger and moving under the inclined side of the bin.

6. In a bin for handling ore, the combination with a body divided into a series of compartments, each compartment having one inclined side and a discharge-opening in its other side, a pivoted door for each opening and a plunger for each compartment, each plunger having a top plate which moves under the lower edge of the inclined side of the compartment.

7. In a bin for handling ore, the combination with a body mounted on wheels and divided into a series of compartments, each compartment having an inclined side and a discharge-opening in its other side, a counterweighted door pivoted to the body below each discharge-opening, and a plunger in each compartment.

8. In a bin for handling ores, the combination with a body divided transversely into a series of compartments, each compartment having one inclined side and a discharge-opening in its other side, of a counterweighted pivoted door below each opening, a plunger in each compartment, a cylinder for each plunger, a supply-pipe common to all of the cylinders and a regulating-valve for each cylinder.

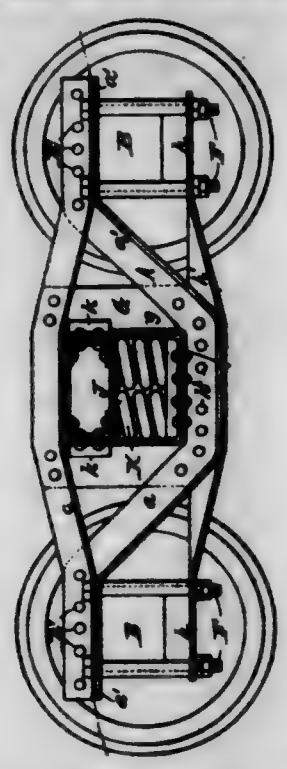
705,762. TAG-HOLDER. WILLIAM S. JACOBS, Malden, Mass. Filed Jan. 20, 1902. Serial No. 90,260. (No model.)



Claim.—A tag-holder comprising an elongated bodkin formed to enter the orifice in a tag, and having resilient diverging members at one end

adapted to yieldingly support the tag and to be forced inwardly by the margin of said orifice to permit the removal of the tag.

705,768. RAILWAY-CAR TRUCK. HERBERT R. KETTELEY, Buffalo, N. Y. Filed May 21, 1902. Serial No. 108,377. (No model.)



Claim.—1. In a diamond truck, the combination of axle-boxes, of a side frame composed of an upper and a lower chord, said lower chord having a horizontal flange and a vertical portion, the ends of said upper chord being riveted to the vertical portion of said lower chord, and vertical anchoring-bolts connecting said horizontal flange of the lower chord to said axle-boxes, substantially as set forth.

2. In a diamond truck, the combination with axle-boxes, of a side frame composed of an upper and a lower chord, said upper chord having a horizontal flange and a vertical portion, the ends of said lower chord being riveted to the vertical portion of said upper chord, and vertical anchoring-bolts connecting said horizontal flange of the lower chord to said axle-boxes, substantially as set forth.

3. In a diamond truck, the combination with axle-boxes, of a side frame composed of an upper chord and a lower chord, each having a horizontal flange and a vertical portion, the ends of said horizontal flanges being superposed and the ends of said vertical portions being riveted together, and vertical anchoring-bolts connecting said horizontal flanges to said axle-boxes, substantially as set forth.

4. In a diamond truck the combination with axle-boxes, of a side frame composed of an upper chord and a lower chord each comprising an angle-bar having a horizontal flange and a vertical flange, the ends of said horizontal flanges being superposed and the ends of said vertical flanges being riveted together, and vertical bolts connecting said horizontal flanges to said axle-boxes, substantially as set forth.

5. In a diamond truck, the combination with axle-boxes, of a side frame composed of an upper and a lower chord, one of said chords having a horizontal flange and a vertical flange, said other chord comprising two angle-bars each arranged with one flange vertical and one flange extending laterally from the vertical flange, the ends of the vertical flanges of the angle-bars of one chord being riveted to the ends of the vertical flanges of said other chord, and vertical bolts connecting the horizontal flange of one of said chords to said axle-boxes, substantially as set forth.

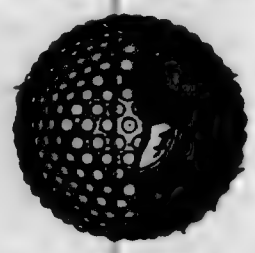
6. In a diamond truck, the combination with axle-boxes, of a side frame composed of an upper and a lower chord, said lower chord having a horizontal flange and a vertical flange, said upper chord comprising two angle-bars each arranged with one flange vertical and one flange extending laterally from the vertical flange, the ends of the vertical flanges of the angle-bars of the upper chord being riveted to the ends of the vertical flange of said lower chord, and vertical bolts connecting the horizontal flanges of said lower chord to said axle-boxes, substantially as set forth.

7. In a diamond truck, the combination with axle-boxes, of a side frame composed of an upper and a lower chord, said lower chord having a horizontal flange and a vertical portion, the ends of said upper chord being riveted to the vertical portion of said lower chord, vertical bolts connecting said horizontal flange of said lower chord to said axle-boxes, and a substantially U-shaped bar connecting said upper and lower chords between the axle-boxes, substantially as set forth.

8. In a diamond truck, the combination with axle-boxes, of a side frame composed of an upper and a lower chord, said lower chord having a horizontal flange and a vertical portion, the ends of said upper chord being riveted to the vertical portion of said lower chord, vertical bolts connecting said horizontal flange of said lower chord to said axle-boxes, a substantially U-shaped member connecting said chords between the axle-boxes and a tie-bar connected at its ends to said axle-boxes and at its central portion to said lower chord, substantially as set forth.

9. In a diamond truck, the combination with axle-boxes, of two side frames each composed of an upper and a lower chord, said lower chord having a horizontal flange and a vertical portion, the ends of said upper chord being riveted to the ends of the vertical portion of said lower chord, vertical bolts connecting said horizontal flanges of the lower chords to said axle-boxes, and a spring-board connecting said side frames, substantially as set forth.

705,764. PLAYING-BALL. ELEAZER KIMPBALL, Boston, Mass. Filed June 14, 1902. Serial No. 111,761. (No model.)



Claim.—1. The combination with a springy filling, of a shell comprising layers of gutta-percha, hard rubber, celluloid and fabric, said hard-rubber layer being inclosed within one of the other layers.

2. A playing-ball comprising a gutta-percha sphere between the inner and outer surfaces of which is embedded a shell of harder resilient material; said shell being close to the periphery of said gutta-percha sphere.

3. A playing-ball comprising a gutta-percha sphere between the inner and outer surfaces of which is embedded a shell of harder resilient material; said harder sphere being close to the periphery of said gutta-percha sphere, and the latter being provided with a filling of yielding material.

4. A playing-ball comprising a gutta-percha shell in which is embedded a perforated shell of harder resilient material; said harder shell being between the outer and inner surfaces of said gutta-percha sphere, and the latter being provided with a filling, and holding said filling under compression.

5. A playing-ball comprising a gutta-percha sphere in which is embedded a shell of thin hard rubber; said shell being close to the periphery of said gutta-percha sphere.

6. A playing-ball comprising a gutta-percha shell in which is embedded a shell of harder resilient material; said harder shell being close to the periphery of said gutta-percha shell, and the latter being filled with a sphere of soft rubber.

7. A playing-ball comprising a gutta-percha sphere in which is embedded a perforated shell of harder resilient material, said shell being close to the periphery of said gutta-percha sphere, and portions of said sphere lying within and without said shell.

8. A playing-ball comprising a gutta-percha sphere in contact with which is embedded a perforated shell of harder resilient material; said harder shell being close to the periphery of said gutta-percha sphere, and the latter being provided with a filling.

9. A playing-ball comprising a gutta-percha sphere in which is embedded a shell of harder resilient material; said shell being close to the periphery of said gutta-percha sphere; and a fabric-lined casing of celluloid upon said gutta-percha sphere.

10. A playing-ball comprising a gutta-percha shell in which is embedded a shell of hard rubber; said harder shell being close to the periphery of said gutta-percha shell, and the latter being filled with a sphere of soft rubber which is held under compression by said gutta-percha shell.

11. A playing-ball comprising a soft-rubber sphere and layers thereon of gutta-percha, hard rubber and celluloid, one of said gutta-percha and celluloid layers inclosing said hard-rubber layer.

12. A playing-ball comprising a gutta-percha sphere in which is embedded a perforated shell of harder resilient material; said shell being close to the periphery of said gutta-percha sphere; and a layer of celluloid upon said sphere.

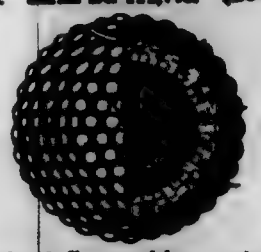
13. A playing-ball comprising a shell of gutta-percha in which is embedded a perforated shell of harder resilient material; said harder shell being between the inner and outer sides of said gutta-percha shell, and the latter being provided with a filling, and being also reinforced by a layer of fabric.

14. A playing-ball comprising a gutta-percha shell in which is embedded a perforated shell of hard rubber; said gutta-percha shell being

provided with a filling, and holding said filling under compression, and a casing of fabric-lined celluloid upon said gutta-percha shell.

15. A playing-ball comprising a sphere of soft rubber, a shell thereon consisting of gutta-percha and holding said soft-rubber sphere under compression, a perforated shell of hard rubber embedded in said gutta-percha shell and a casing consisting of celluloid and fabric upon said gutta-percha shell.

705,765. PLAYING-BALL. ELIAKIM KEMPSHALL, Boston, Mass. Filed June 14, 1902. Serial No. 111,772. (No model.)



Claim.—1. A playing-ball comprising a spherical soft-rubber shell inflated or distended by mineral cement injected thereinto and forming a core of stone-like consistency.

2. In a playing-ball, the combination of a spherical shell formed of springy material and inflated or distended by cement injected thereinto, said cement consisting at least partially of plaster-of-paris; and a hard casing formed of plastic material upon said springy shell.

3. A playing-ball comprising a rubber shell and a core filling the same, said core consisting chiefly or wholly of plaster-of-paris and magnesia, and a gutta-percha shell upon said rubber shell.

4. A playing-ball comprising a rubber shell and a core filling the same; said core consisting of plaster-of-paris and magnesia, and said rubber sphere being in a state of expansion upon said core, and a gutta-percha shell upon said rubber shell.

5. A playing-ball comprising a rubber shell, a rigid core filling the same, and consisting of cement and having a stone-like consistency, and a hard casing upon said shell.

6. In a playing-ball, the combination of a rubber shell, a core filling the same and consisting at least partially of plaster-of-paris, said rubber sphere being in a state of expansion upon said core, and a hard casing of plastic material upon said shell.

7. In a playing-ball, the combination of a rubber sphere, and a core within said sphere and filling the same; said core consisting of a mineral composition whose weight is less than that of water.

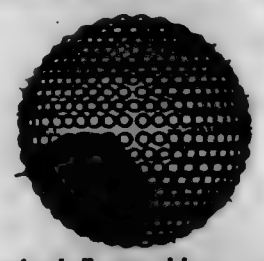
8. In a playing-ball, the combination of a rubber sphere, a core upon which said sphere is expanded, said core consisting of a mineral composition whose weight is less than that of water, and a shell of plastic material upon said rubber sphere.

9. In a playing-ball, the combination of a rubber sphere, expanded by a mineral composition injected thereinto and having less weight than water, and a shell of gutta-percha holding said rubber sphere under compression.

10. A golf-ball consisting of a whole rubber shell expanded by injected cement, said cement forming a core of stone-like consistency, and a shell of plastic material holding said rubber under compression; the specific gravity of the complete ball being less than that of water.

11. A playing-ball comprising a sphere of soft rubber distended by a core of plaster-of-paris injected thereinto, and a shell of gutta-percha holding said sphere under compression.

705,766. GOLF-BALL. ELIAKIM KEMPSHALL, Boston, Mass., assignor to The Kempshall Manufacturing Company, a Corporation of New Jersey. Filed Apr. 16, 1902. Serial No. 103,231. (No model.)



Claim.—1. A playing-ball comprising a center or core of gutta-percha, and applied cups or segments and an intermediate band, said segments and band consisting of plastic material and fabric, and being united at their edges.

2. A playing-ball comprising a spherical center or core, and applied shallow cups or segments and an intermediate band, said segments and band consisting of plastic material and fabric, and being welded together at their edges.

3. A playing-ball comprising a spherical center or core of gutta-percha, and applied shallow cups or segments and an intermediate band, said segments and band consisting of plastic material and fabric and being welded together at their edges, and said band consisting of a strip whose ends are welded together.

4. A playing-ball comprising a center or core, applied cups or segments, and an applied intermediate band composed of celluloid and fabric.

5. A playing ball comprising a center or core of gutta-percha, applied cups or segments, and an applied intermediate band composed of celluloid and fabric.

6. A playing-ball comprising a spherical center or core of gutta-percha, applied shallow cups or segments, and an applied intermediate band composed of celluloid and fabric.

7. A playing-ball comprising a center or core, applied cups or segments of celluloid and fabric, and an applied intermediate band composed of celluloid and fabric.

8. A playing-ball comprising a center or core of gutta-percha, applied cups or segments of celluloid and fabric, and an applied intermediate band composed of celluloid and fabric.

9. A playing-ball comprising a spherical center or core of gutta-percha, applied shallow cups or segments of celluloid and fabric, and an applied intermediate band composed of celluloid and fabric.

10. A playing-ball comprising a center or core, applied cups or segments, and an intermediate band joined or welded together at the edges, said segments and band consisting of plastic material and fabric.

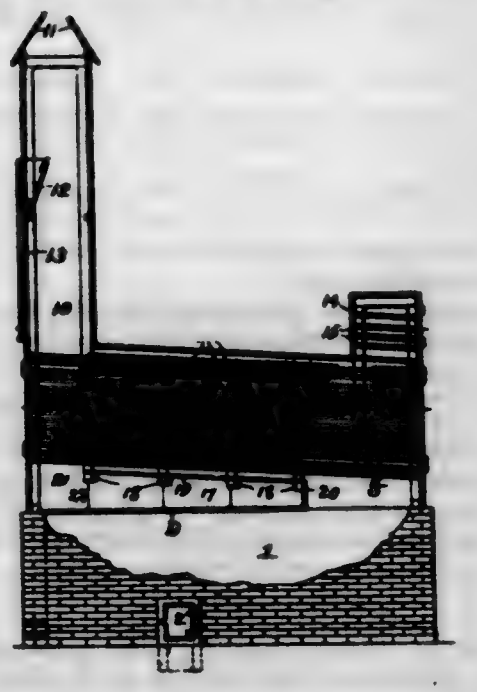
11. A playing-ball comprising a center or core, a plurality of sets of cups or segments applied thereto at opposite points, and an applied band intermediate the cups or segments of each set.

12. A playing-ball comprising a center or core, a plurality of sets of cups or segments applied thereto at opposite points, and an applied band intermediate the cups or segments of each set, the band of one set overlying the cups or segments of the next innermost set.

13. A playing-ball comprising a center or core, a plurality of sets of cups or segments applied thereto at opposite points, and an applied band joined or welded at the edges to the edges of each set of said cups or segments.

14. A playing-ball comprising a center or core, a plurality of sets of cups or segments applied thereto at opposite points, and an applied band joined or welded at the edges to the edges of each set of said cups or segments, the band of one set overlying the cups or segments of the next innermost set.

705,767. FRUIT-DRIER. CLIFFORD J. KURTS, Salem, Oreg. Filed Feb. 3, 1902. Serial No. 92,370. (No model.)



Claim.—1. In a drying apparatus, the combination of a heating-chamber, a drying-chamber above the same and communicating at one end therewith, an outlet-flue at the opposite end of the drying-chamber, and a dead-air chamber between said heating and drying chambers.

2. In a drying apparatus, the combination of a heating-chamber, a drying-chamber communicating at one end therewith, a flue communicating with the outer end of the drying-chamber, and a dead-air chamber between said heating and drying chambers, said dead-air chamber communicating with the drying-chamber at the same end with which the outlet-flue communicates.

3. In a drying apparatus, the combination with a heating-chamber,

a drying-chamber above the heating-chamber and communicating at one end therewith, and a flue communicating with the other end of the drying-chamber, of a hollow structure between said chambers and shorter than said chambers to permit communication between said chambers at one end of the apparatus and prevent such communication at the other end, said hollow structure forming a dead-air chamber in open communication with the outlet end of the drying-chamber and closed at its other end.

4. In a drying apparatus, the combination with a drying-chamber having doors at both ends and tray-supports extending throughout the length of said chamber to permit the continuous passage of trays therethrough, of an air-heating chamber below the drying-chamber, a partition between said chambers and terminating a distance from the tray-outlet end of the drying-chamber to permit the passage of heated air to this end of said drying-chamber, a flue at the tray-inlet end of said drying-chamber for the escape of air after passing through said chamber, dampers in said flue to regulate the draft of air and a dead-air space in said partition below the tray-supports, said dead-air chamber open at the end below the flue.

705,768. WHEEL-TIRE. HYMAN LIEBENTHAL, Chicago, Ill. Filed May 5, 1902. Serial No. 105,994. (No model.)

Claim.—1. In a wheel-tire, the combination with a flexible tube, of two series of yielding braces in said tube, each series being located at one side of the longitudinal center of the tube, and a spring for each brace intermediate of its ends, substantially as specified.

2. In a wheel-tire, the combination with a flexible tube, of two series of yielding wire braces in said tube, each of said series being located at one side of the longitudinal center of the tube and each brace having an intermediate coiled-spring portion, the several coils of which lie opposite the side of the tube, means for securing one end of said brace of each series opposite the tread portion of the tire, and means for securing the other end of each brace opposite the portion of the tire adapted to lie against a wheel-rim, substantially as specified.

3. In a wheel-tire, the combination with a flexible tube having oppositely-located internal ribs, of two series of yielding wire braces, each of said series being located in said tube at one side of the longitudinal center thereof, each of said braces having between its ends a coiled-spring portion whose coils lie opposite and against the side of the tube, and each brace extending substantially from one of said ribs to the other, substantially as specified.

4. In a wheel-tire, the combination with a flexible tube, of a series of yielding braces in the tube, each comprising a loop portion at each end and an intermediate spring acting to hold said ends in position, substantially as specified.

5. In a wheel-tire, the combination with a flexible tube, of a series of yielding braces in the tube, each composed of a single wire bent on itself to form a loop portion at each end and an intermediate coiled-spring portion, substantially as specified.

6. In a wheel-tire, the combination with a flexible tube, of a series of yielding braces in the tube, each composed of a single wire bent on itself to form a loop portion at each end and an intermediate coiled-spring portion, and means for uniting the sides of each loop portion, substantially as specified.

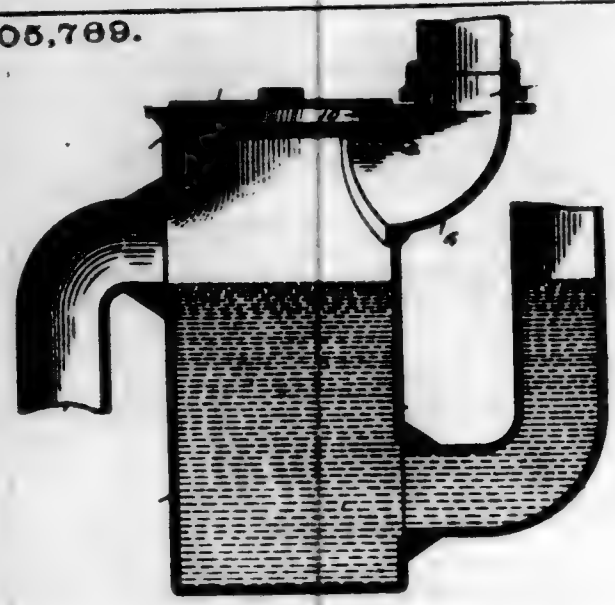
7. In a wheel-tire, the combination with a flexible tube, of a series of yielding braces in the tube, each composed of a single wire bent on itself to form a loop portion at each end and an intermediate coil-spring portion, the ends of the wire being bent and inserted within the intermediate spring portion, substantially as specified.

705,769. WASTE-PIPE TRAP. VICTOR E. LOMBARD and CLIFFORD E. COLE, Jackson, Miss. Filed Sept. 21, 1901. Serial No. 76,098. (No model.)

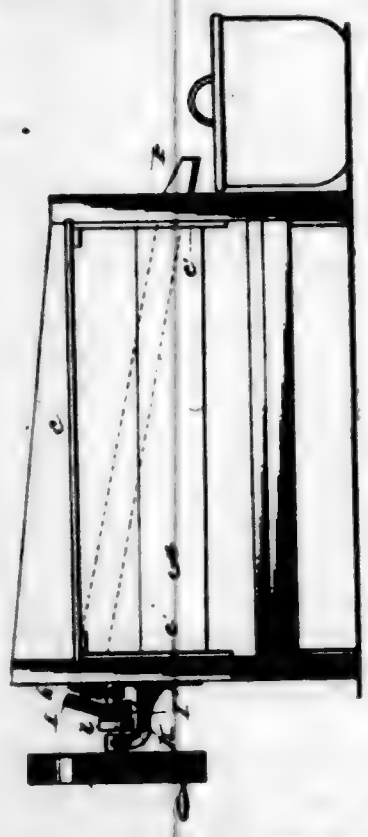
Claim.—1. A trap-cover and vent-pipe coupling comprising a ring having internal screw-threads and a laterally-extending vent-pipe section having an upwardly-tapering lower portion and a vertical cylindrical upper portion, and a cover formed with a depending annular flange provided with exterior screw-threads to engage the threads of the ring portion, substantially as described.

2. The combination with a trap of the kind described, having an inlet and an outlet pipe, of a trap-cover and vent-pipe coupling comprising a ring having internal screw-threads, and formed with a laterally-projecting vent-pipe coupling having an inclined upwardly-flaring portion and vertical pipe portion, substantially as described.

705,789.



705,770. CORN-HUSKER. LEAVITT R. LOOMIS, Humphreysville, N. Y. Filed Dec. 14, 1901. Serial No. 86,960. (No model.)



Claim.—1. In a corn-husker, the combination with the frame and drive-gear, of husking-rollers journaled in said frame and arranged in pairs, each of said rolls having a series of husking-pins mounted therein and having its diameter reduced immediately in advance of said pins, said reduced portion extending in a straight line longitudinally of the rollers and each roller having recesses for the reception of the ends of the pins on the cooperating roller, the rollers being so arranged as to bring a flat surface of one roller opposite the rounded surface of the coöperating roller; substantially as described.

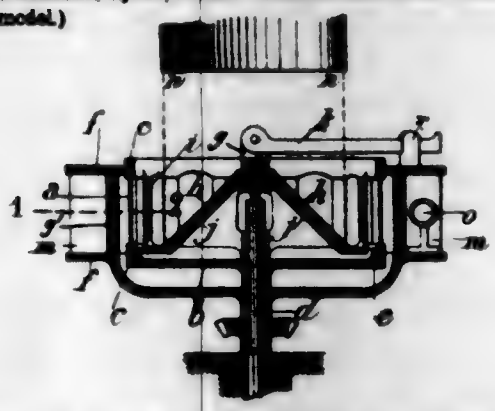
2. In a corn-husker, the combination with the frame and drive-gear, of husking-rollers journaled in said frame and arranged in pairs, one of said rollers having a series of husking-pins mounted therein and having its surface flattened immediately in advance of said pins, said flattened surface extending in a straight line longitudinally of the roller and the other having recesses for the reception of the ends of said pins, the rollers being so arranged as to bring a flattened surface and a rounded surface into coöperation; substantially as described.

3. In a corn-husker, the combination with the frame and drive-gear, of husking-rollers journaled in said frame and arranged in pairs, one of said rollers having a series of husking-pins mounted therein and having its surface flattened immediately in advance of said pins, said flattened surface extending in a straight line from end to end of the roller, the other of said rollers having recesses for the reception of the pins and a cutting-blade and coöperating recess in said rollers in rear of said pins whereby the husk is first removed and then the ear severed from the stem; substantially as described.

4. In a corn-husker, a husking-roll formed in solid halves clamped on a central shaft having flattened surfaces on its periphery extending from end to end of the roll with husking-pins projecting from said flattened surfaces at the rear thereof, a knife extending from end to end of the roll and recesses and longitudinal grooves; substantially as described.

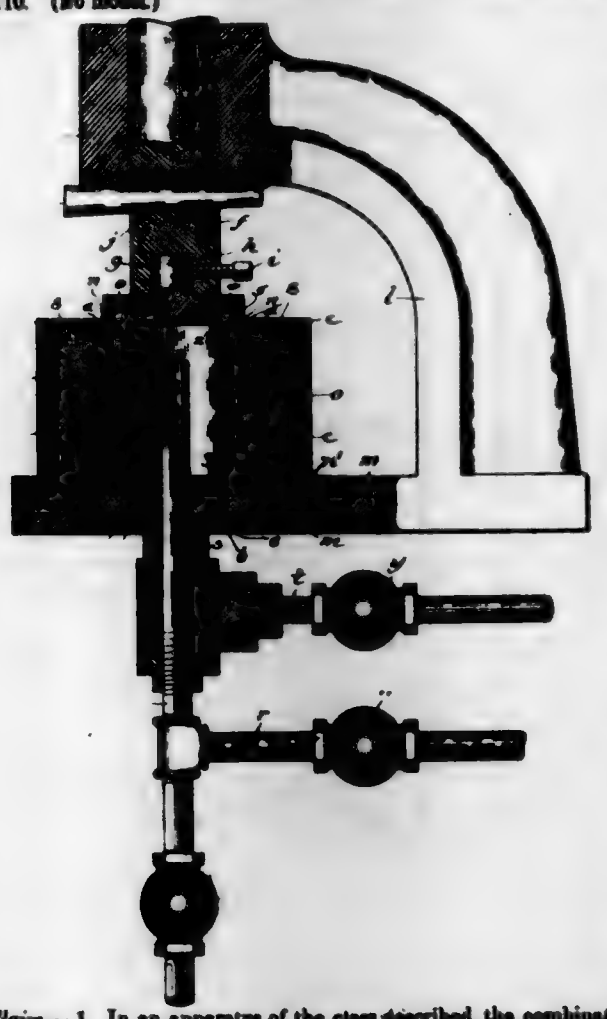
5. In a corn-husker, a husking-roll having flattened peripheral portions, pins projecting from said flattened portions at the rear thereof, and recesses in rear of said flattened portions, in combination with a coöperating roll having recesses for the pins and a knife extending from end to end of the roller in rear of said recesses adapted to enter the recess in the other roll in rear of the pins; substantially as described.

705,771. **PROJECTING APPARATUS.** AUGUSTE LUMIÈRE and LOUIS LUMIÈRE, Lyons, France. Filed Oct. 20, 1901. Serial No. 79,962. (No model.)



Claim.—In an apparatus for the projection of panoramic photographic images, the combination of a plate *b* keyed on a fixed vertical axle and carrying the image to be projected, a wheel *f* capable of revolving around the said axle on the exterior of the image and carrying a plurality of objectives accompanied by their correcting-mirrors *m*, and an illuminating apparatus capable of revolving in the interior of the film at the same speed as the objectives and comprising, in front of each objective, a mirror *h* inclined at an angle of forty-five degrees and a condenser *i*, substantially as herein set forth.

705,772. **APPARATUS FOR REPRODUCING PHONOGRAMS.** WILLIAM F. MEEKER, Chicago, Ill., assignor to the Lambert Company, Chicago, Ill., a Corporation of Illinois. Filed Feb. 1, 1902. Serial No. 92,110. (No model.)



Claim.—1. In an apparatus of the class described, the combination of a cylindrical matrix, a base portion at one end thereof arranged to contact with the end of a blank record-cylinder, and a head portion arranged in contact with the other end of the record-cylinder and provided with outlet means communicating with the inner surface of such head and extending to the outer surface of such record-cylinder, substantially as described.

2. In an apparatus of the class described, the combination of a cylindrical matrix, a base portion at one end thereof arranged to contact with the end of a blank record-cylinder and provided with outlet means communicating with the inner surface of such base and extending to the outer surface of such record-cylinder, and a head portion arranged in contact with the other end of the blank record-cylinder, substantially as described.

3. In an apparatus of the class described, the combination of a cylindrical matrix, a base portion at one end thereof arranged to contact with the end of a blank record-cylinder and provided with perforations extending through such base and communicating with the inner surface thereof, and a head portion arranged in contact with the other end of the blank record-cylinder and provided with perforations in such head communicating with the inner surface thereof, substantially as described.

4. In an apparatus of the class described, the combination of a cylindrical matrix, a base portion at one end thereof arranged to contact with the end of a blank record-cylinder arranged within the matrix and provided with a groove in its inner surface and perforated outlet means through such base communicating with the groove, and a head portion arranged at the other end of the record-cylinder forming in connection with the record-cylinder and base a pressure-chamber, substantially as described.

5. In an apparatus of the class described, the combination of a cylindrical matrix, a base portion at one end thereof arranged to contact with the end of a record-cylinder and provided with a groove in its inner surface and with outlet means through such base communicating with such groove, and a head portion arranged in contact with the other end of the record-cylinder and provided with a groove in its inner surface and with outlet means through such head communicating with the groove, substantially as described.

6. In an apparatus of the class described, the combination of a cylindrical matrix, a base portion at one end thereof arranged to contact with the end of a blank record-cylinder, and a head portion arranged in contact with the other end of the blank record-cylinder and providing an opening communicating with the inner surface of the matrix outside of the record-cylinder and provided with perforations communicating with the inner surface of such head, substantially as described.

7. In an apparatus of the class described, the combination of a cylindrical matrix, a base portion at one end thereof arranged to contact with the end of a blank record-cylinder and provide a vent communicating with the inner surfaces of the matrix and provided with outlet means communicating with the inner surface of such base and extending to the outer surface of such record-cylinder, and a head portion arranged in contact with the other end of the record-cylinder to form in connection with the record-cylinder and base a chamber within such record-cylinder, substantially as described.

8. In an apparatus of the class described, the combination of a cylindrical matrix, a base portion at one end thereof arranged to contact with the end of a blank record-cylinder having inwardly-extending end flanges, a head portion arranged in contact with the inner flange on the other end of the record-cylinder provided with perforations communicating with the inner surface of such head at points adjacent to the inner edge of such end flange and extending to the outer surface of such record-cylinder, substantially as described.

9. In an apparatus of the class described, the combination of a cylindrical matrix, a base portion arranged at the end thereof in contact with the end portion of a blank record-cylinder having inwardly-extending flanges, such base portion being provided with perforations communicating with the inner surface thereof at points adjacent to the inner edge of the end flange of the record-cylinder, and a head portion arranged in contact with the opposite end of the record-cylinder and the end flange thereon and provided with perforations through such head communicating with the inner surface of the head at points adjacent to the inner edge of such end flange, substantially as described.

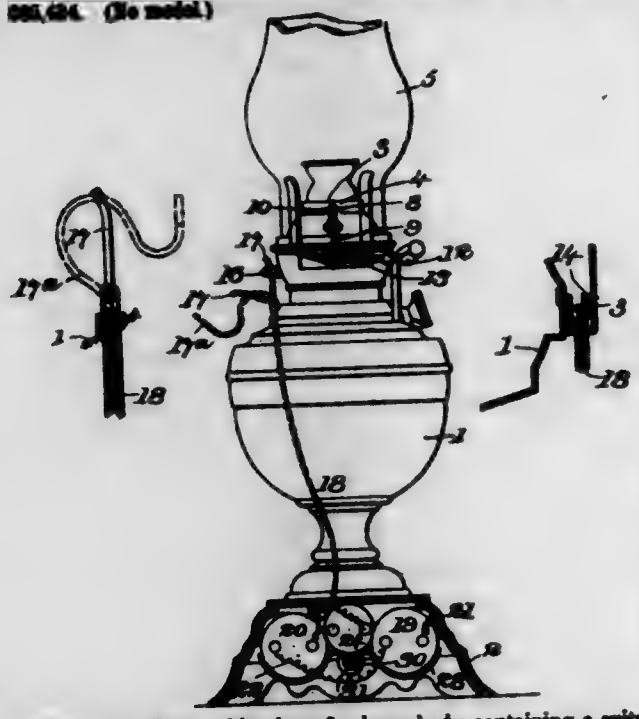
10. In an apparatus of the class described, the combination of a cylindrical matrix, a base portion arranged at one end thereof in contact with the end of a blank record-cylinder and provided with perforations extending through such base and communicating with the inner surface thereof, a head portion arranged in contact with the other end of the blank record-cylinder and provided with perforations in such head communicating with the space between it and the record-cylinder, a frame for holding the base in position, and means for admitting fluid under pressure to the chamber formed within the record-cylinder between the base and head, substantially as described.

11. In an apparatus of the class described, a movable head portion

adapted to close the end of a blank record-cylinder and provided with perforations through such head portion communicating with the inner surface thereof and extending to the outer surface of such record-cylinder, substantially as described.

12. In an apparatus of the class described, a base portion adapted to close one end of a blank record-cylinder to be operated upon and provided with perforations through such base portion communicating with the inner surface thereof and extending to the outer surface of such record-cylinder, substantially as described.

705,778. DEVICE FOR LIGHTING LAMPS BY ELECTRICITY. SVEND H. MEYER, Brooklyn, N. Y. Filed Jan. 3, 1898. Serial No. 665,624. (No model.)



Claim.—1. The combination of a lamp-body containing a suitable source of electricity, a burner removably mounted thereon, a conductor separably connecting the source of electricity in the body with a fixed conductor in the removable burner, connected with lighting device adjacent to the lamp-wick, a vibrating contact-making device on the burner closing the circuit at mid-stroke only and automatically thrown to either extremity of its movement when moved by hand from the opposite extremity, to close the circuit as described.

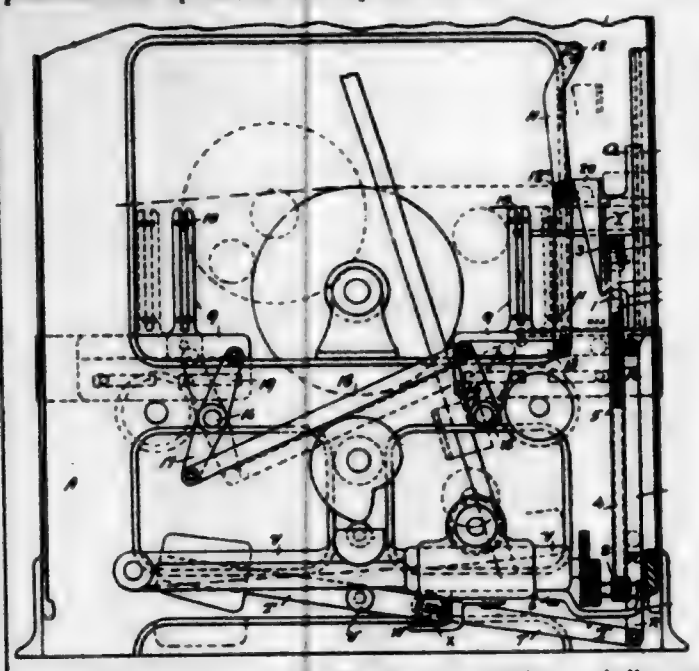
2. In a device for lighting oil-lamps by electricity, the combination of a lamp-body 1, a burner 3 removably mounted thereon, a suitable source of electricity in the body of the lamp, a fixed sparking point 8 adjacent to the lamp-wick, a vertical rock-shaft 9, a contact-spring 11 carried by said rock-shaft and engaging with the sparking point 8, a horizontal arm 12 for rocking the rock-shaft 9, a spring device throwing the rock-shaft to the extremity of its movement when moved to mid-stroke from either direction, and separable conductors from the respective poles of the source of electricity to the connections of the sparking points 8 and 10, permitting the removal of the burner from the body of the lamp in which the source of electricity is mounted, substantially as described.

3. In a device for lighting oil-lamps by electricity, the combination of a lamp-body containing a suitable source of electricity; a lamp-burner removably mounted thereon, the contact-piece 8, inclined insulating bearing-surfaces 13ª adjacent thereto, a vibrating contact-spring 10 sliding upon the bearing-surfaces 13ª and engaging with the fixed point 8, and separable conductors connecting the respective poles of the source of electricity with the contact-points 8 and 10, substantially as described.

4. In a device for lighting oil-lamps by electricity, the combination of a lamp-body 1, containing a suitable source of electricity, a burner 3 removably mounted thereon, a fixed contact-point 8 adjacent to the wick, a vibrating contact-spring 10 engaging with the contact-point 8 at mid-stroke, inclined insulated bearing-surfaces 13ª on either side of the contact-point 8 arranged to deflect the vibrating contact-spring 10 as it is moved toward the contact-point 8 from either direction and throw it to the opposite extremity of its stroke, means for imparting vibratory movement to the spring 10 and separable conductors connecting the respective poles of the source of electricity with the contact devices 8 and 10, and permitting removal of the burner from the body of the lamp, substantially as described.

705,774. MACHINERY FOR SPINNING AND DOUBLING FIBROUS SUBSTANCES. GEORGE H. MILWARD, Nottingham, England. Filed Oct. 11, 1901. Serial No. 78,287. (No model.)

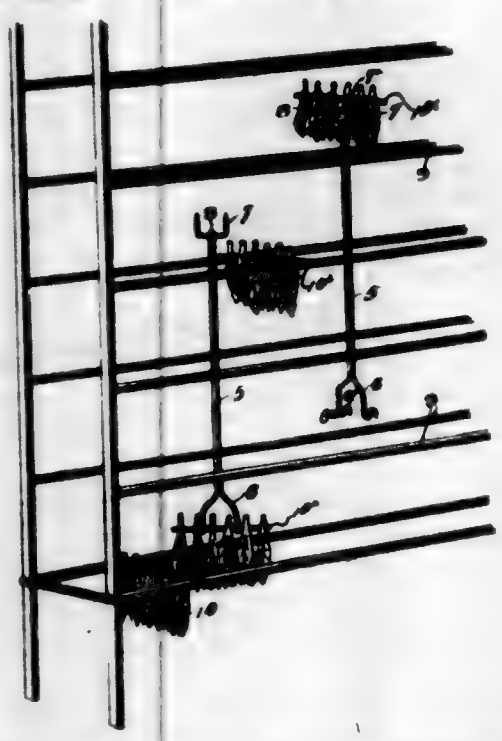
Claim.—1. In a ring spinning or doubling frame, a spindle, a spindle-rail, a tubular bolster having a recess in its top, conical bearing-surfaces in the recess and surrounding the spindle, a vertically-movable part in the recess, a weighted lever and means connecting it to said vertically-movable part whereby on the movement of the lever the desired drag is produced on the spindle, substantially as described.



2. A ring spinning or doubling frame, comprising a spindle, a spindle-rail, a pivoted lever, a hollow tubular bolster having a recess in its upper portion, conical bearings in said recess surrounding the spindle, a cone in the lower part of said recess, vertical L-shaped supports in the interior of the bolster with their upper ends acting on said cone, and their outer ends resting on and actuated by said pivoted lever, as and for the purpose described

3. A ring spinning or doubling frame having drag-weights and levers, in combination with a "builder," a vertical slide connected to and worked by the "builder," a horizontal cross-slide having a rack working across the face of the vertical slide, a hanging shaft, a pinion keyed at the top of the hanging shaft and rotated by the "builder," an adjustable "former-block" with an inclined face carried by the said vertical slide, and a hanging lever pivoted at the top to the frame and provided with a bowl adapted to act against the said inclined face, a series of levers at the lower end of the hanging shaft, slides connected to said levers and adapted to move the "drag-weights" along the horizontal levers on which they are suspended whereby they are caused to impart a differential pressure to the spindles as and for the purpose described.

705,775. TOBACCO-FORK. WILLIAM L. MOORE, Lecie, Ky. Filed Mar. 10, 1902. Serial No. 97,571. (No model.)



Claim.—1. As a new article of manufacture, a tobacco-fork consisting of a handle having a fork at each end adapted to engage the sticks

of tobacco, one of said forks being narrower than the other, substantially as shown and described.

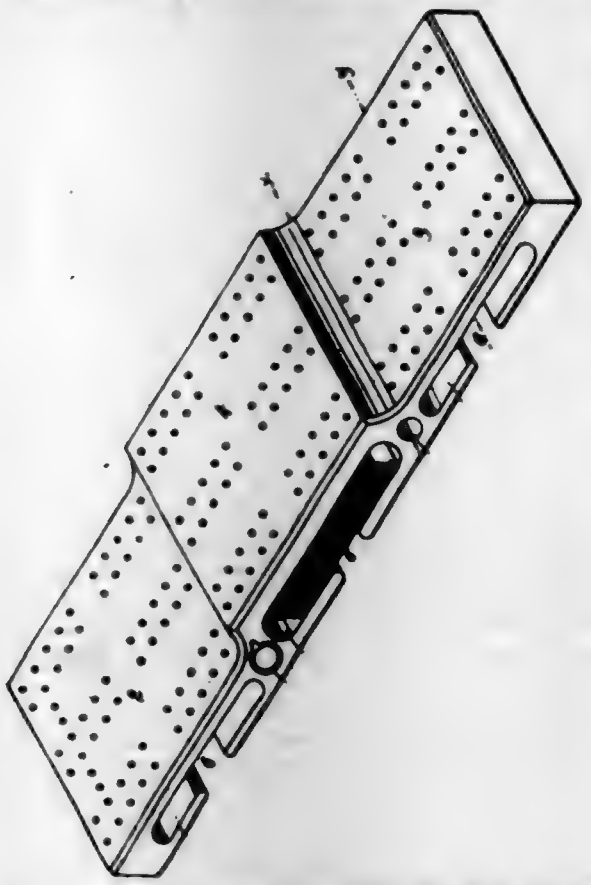
2. As a new article of manufacture, a tobacco-fork consisting of a handle having a fork at each end and adapted to engage the sticks of tobacco, one of said forks being permanently attached to one end of the handle and the other removably secured to the opposite end of the same, the said permanent fork being provided with divergent arms each terminating in reversed oppositely-opening hooks, substantially as shown and described.

3. As a new article of manufacture, a fork for handling tobacco consisting of a handle with a fork connected to one end formed of two diverging arms each terminating in reversed oppositely-opening hooks, substantially as shown and described.

4. As a new article of manufacture, a tobacco-fork consisting of a handle having a fork at each end adapted to engage the sticks of tobacco, one of said forks being narrower than the other and detachable from said handle, substantially as shown and described.

5. As a new article of manufacture, a tobacco-fork consisting of a handle having a fork at each end adapted to engage the sticks of tobacco, one of said forks being narrower than the other and detachable from the handle, and the other, permanent, fork being provided with or formed of two diverging arms each terminating in reversed oppositely-opening hooks, substantially as shown and described.

705,776. GAME-BOARD. FRANK E. MORRILL, San Francisco, Cal. Filed May 1, 1902. Serial No. 105,477. (No model.)



Claim.—1. A game-counting board having the upper surface divided transversely to form equal subdivisions, one of which is at a plane higher than the other two.

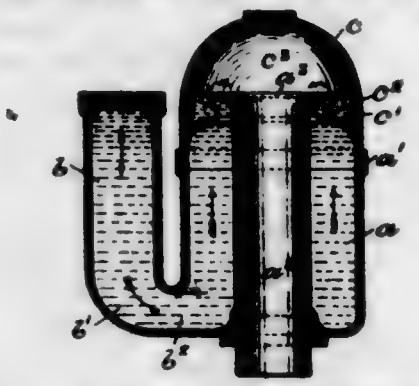
2. A game-counting board having parallel lines of holes extending from one end to the other, said board having its surface divided transversely and having the end surfaces upon essentially the same level and the central surface raised above said level, each of said surfaces containing an equal number of the marking-holes.

3. A game-counting board having its surface divided transversely and having a central section raised above the end sections, each section containing an equal number of marking-holes, transverse channels and holes made transversely in the board adapted to contain cards and marking-pins said channels opening through the bottom of the board.

4. A game-counting board consisting of a transversely-divided equally-spaced and unevenly-surfaced upper portion, channels made transversely from side to side to receive cards, said channels opening through the bottom of the board, and frictional pressure devices whereby the cards are held in place.

5. A game-counting board having holes in the upper surface, said surface being transversely divided into equal spaces, the central one of which is elevated above the end spaces, transverse channels with frictional devices whereby cards are retained therein, and pin-containing chambers between the channels, said chambers being inclined downwardly from the outer to the inner ends.

705,777. WASTE-TRAP. JOHN W. MCAULIFFE, Providence, R. I. Filed May 15, 1902. Serial No. 107,412. (No model.)



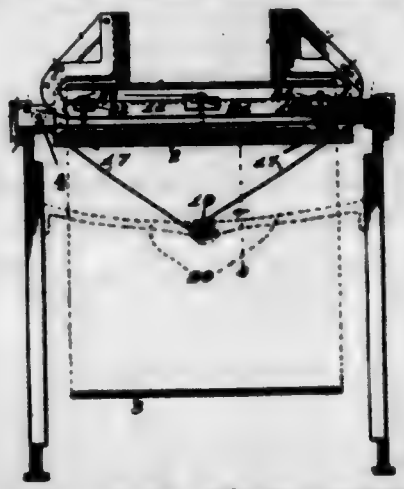
Claim.—1. In a waste-trap, the combination with the main body of the trap, a detachable dome-shaped upper body and an annular shelf in the detachable upper body, of a waste-duct extending from the bottom of the main body through the space inclosed by the annular shelf in the detachable upper body and having the expanded inlet-opening, as described.

2. In a waste-trap, the combination with the main body, a contracted opening in the upper part of the main body, an outflow-duct extending through the bottom of the main body and through the contracted opening in the upper part of the main body and the expanded inlet-opening of the discharge-duct, of an inlet-duct connected with the lower main body by a flaring branch, as described.

3. In a waste-trap, the combination with the inlet-duct b, a cylindrical main body, the flaring branch b^3 connecting the inlet-duct b with the main body and the contracted opening c^3 in the main body of the outflow-duct a^3 and the flaring inlet-opening a^2, as described.

4. In a waste-trap, the combination with the lower main body a, the dome-shaped cap c, means for connecting and disconnecting the cap from the main body, the annular shelf c^2 in the cap, the inlet-duct b and the flaring branch connecting the inlet-duct with the main body of the outlet-duct a^3 and the flaring inlet-opening a^2 of the same, located above the annular shelf within the dome-shaped cap, as described.

705,778. PORTABLE CONVEYER. WILLIAM I. MCCABE, Seattle, Wash. Filed Nov. 7, 1901. Serial No. 81,414. (No model.)



Claim.—1. In a mechanism of the class described, the combination with a suitable framework, of a transversely-arranged beam, brackets slidably mounted thereon, a roller supported at either end of said beam, a cable connected to one end of each of said brackets and passed over one of said rollers, and a shaft extending longitudinally of said framework and secured to said cables, whereby rotation of said shaft is designed to move said brackets, substantially as described.

2. In a mechanism of the class described, the combination with a suitable framework, of beams arranged transversely thereto, a bracket slidably supported at each side of each of said beams, means for moving each of said brackets longitudinally of its respective beam, and guiding-strips extending longitudinally of said framework at the sides thereof and connecting all of the brackets of their respective sides, substantially as described.

3. In a mechanism of the class described, the combination with a suitable framework, having T-rails extending longitudinally thereof, of a transversely-arranged beam, means for clamping the ends thereof to the opposite T-rails, slidably-mounted brackets carried by said transverse

beam, and means for moving said brackets toward each other, substantially as described.

4. In a mechanism of the class described, the combination with a suitable framework, having T-rails arranged longitudinally thereof on opposite sides, a transverse beam connecting said T-rails, a clamp at each end of said beams and formed of a vertical member, a horizontal member integral therewith, a lug extending downwardly therefrom designed to enter the material of the end of said transverse beam, a horizontally-extending lug projecting from the lower end of said vertical member, a screw threaded therethrough and designed to be screwed against the lower face of the outer flange of said T-rail, and means supported by said beam for guiding articles passed over the said framework, substantially as described.

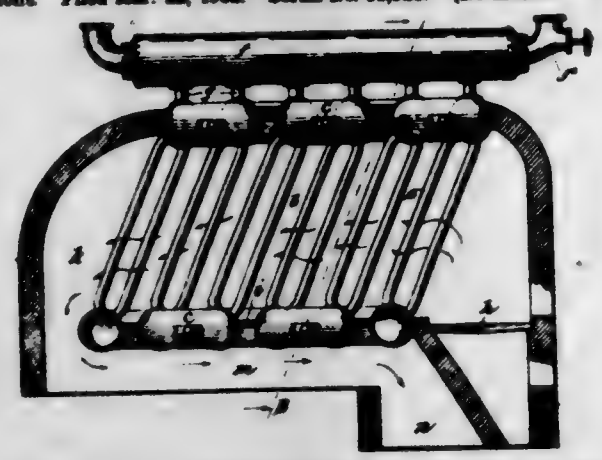
5. In a mechanism of the class described, the combination with a suitable framework, and laterally-moving brackets at the opposite edges of said belt supported by said transverse beam, each of the brackets comprising a lower straight member, an upwardly-curved portion, a horizontal portion in a parallel plane to the lower portion, and a vertical portion extending upwardly from said horizontal portion, the curved portion being designed to inclose one edge of said belt when the brackets are brought toward each other, substantially as described.

6. In a mechanism of the class described, the combination with a suitable framework, of a beam supported thereby, oppositely-arranged brackets slidably mounted upon said beam, each of said brackets being formed of angle-irons and having a straight portion designed to fit one of the longitudinal corners of said beam, and a guiding-bracket carried by said beam and inclosing the flanges of the straight portion of each of said slidable brackets, substantially as described.

7. In a mechanism of the class described, the combination with a suitable conveying means, and a transversely-arranged beam of laterally-slidable brackets supported thereby, each of the brackets being formed with an L-shaped straight portion designed to engage and slide longitudinally of one of the longitudinal corners of said beam, a plurality of guiding-brackets secured to said beam, and provided with flanges designed to partially inclose and retain in position the flanges of said L-shaped straight portion of each of said brackets, and means for moving said brackets longitudinally of said beam, substantially as described.

8. In a mechanism of the class described, the combination with a suitable framework, and a carrier-belt supported thereby of transversely-movable brackets mounted upon said framework, guiding-strips on both sides of said framework and connecting all the brackets upon their respective sides, a cable secured to each of said brackets and passed about the bearing on the opposite side of said framework, and a rotatably-mounted shaft extending longitudinally of said framework, the free ends of said cables being secured to said shaft, whereby rotation of said shaft is designed to move the said brackets of the opposite sides of the framework toward each other, substantially as described.

705,779. STEAM-BOILER. EDWARD W. MCCAHNA, Anaconda, Mont. Filed Mar. 22, 1902. Serial No. 99,523. (No model.)



Claim.—1. A steam-boiler header, of serpentine form, composed of pipes and cast-steel return-bends united by calking and riveting.

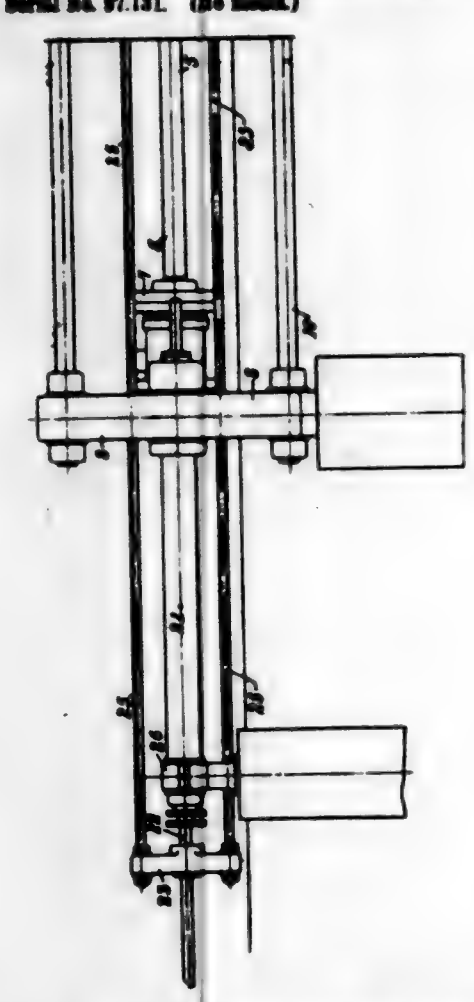
2. A steam-boiler, composed of top and bottom headers of serpentine form, constructed of commercial pipes and cast-steel return-bends calked and riveted to said pipes, and steel upright tubes expanded into said pipes, substantially as described.

3. A steam-boiler, composed of top and bottom headers of serpentine form, constructed of commercial pipes and cast-steel return-bends calked and riveted to said pipes, and steel upright tubes expanded into said pipes, combined with a steam-drum and steel nozzles connecting it with the pipes of the top header.

4. A steam-boiler, composed of top and bottom headers of serpentine form, constructed of commercial pipes and cast-steel return-bends calked and riveted to said pipes, and steel upright tubes expanded into said pipes, combined with a setting having a downdraft including a horizontal partition in which the bottom header is arranged.

5. In a steam-boiler, a serpentine header composed of pipes with cast-steel return-bends having hand-hole plates, and manhole-plates at the ends of the header, substantially as described.

705,780. METAL-PIERCING MACHINERY FOR MAKING HOLLOW BODIES. BALFOUR F. MCTEAR, Rainhill, England. Filed Mar. 7, 1902. Serial No. 97,131. (No model.)



Claim.—1. In piercing machinery for making seamless tubes or hollow bodies, a front die part and means connecting therewith to receive and hold the front portion of the metal to be pierced, a rear die part adapted to receive and hold the rear portion of said metal, and axially in line with said front holding-die part, and a piercing-tool, said die parts and tool being adapted to be moved relatively longitudinally; substantially as described.

2. In piercing machinery for making seamless tubes or hollow bodies, a die part to receive and hold the front portion of the metal to be pierced; a gripping device in said die part, adapted to grip the front portion of the metal; a rear die part adapted to receive and hold the rear portion of said metal, and axially in line with said front holding-die part; and a piercing-tool; said die parts and tool being adapted to be moved relatively longitudinally; substantially as described.

3. In piercing machinery for making seamless tubes or hollow bodies, a front die part for receiving and holding the front portion of the metal to be pierced; a rear die part adapted to receive and hold the rear portion of the said metal, and axially in line with said front holding-die part; a hydraulic cylinder and ram connected with said front holding-die part, adapted to move the said die part away from the rear holding-die part; and a piercing-tool; substantially as described.

4. In piercing machinery for making seamless tubes or hollow bodies, a front die part to receive and hold the front portion of the metal to be pierced; a rear die part to receive and hold the rear portion of the said metal, and axially in line with said front holding-die part; a hydraulic cylinder and ram connected with said front holding-die part, adapted to move the said die part away from the rear holding-die part; a hydraulic cylinder and ram connected with and adapted to move the rear holding-die part in the same direction as the front holding-die part; and a piercing-tool; substantially as described.

5. In piercing machinery for making seamless tubes or hollow bodies, a piercing-tube, a die adapted to receive and hold the metal to be pierced; a tubular support disposed within said die, for supporting longitudinally the outer portion of the metal to be pierced; and an inner ram within said tubular support, adapted to hold the center portion of the metal, and to have movement within said tubular support; substantially as described.

6. In piercing machinery for making seamless tubes or hollow bodies, a piercing-tube, a die part adapted to receive and hold the front portion of the metal to be pierced, a die part adapted to receive and hold the rear portion of the said metal, and axially in line with said front holding-die part; a tubular support in said rear holding-die part, having a hydraulic cylinder at its back end, for supporting the outer part of the back end of the metal longitudinally; a ram within said tubular support for supporting the center portion of the metal longitudinally, and adapted to be held up by hydraulic pressure within said tubular support-cylinder; and a piercing-tool, said die parts and tool being adapted to be moved relatively longitudinally; substantially as described.

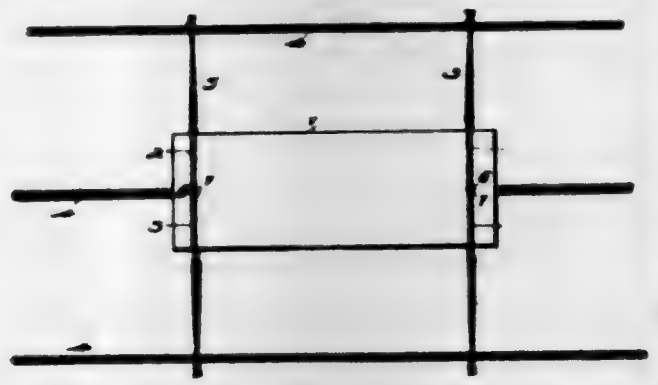
7. In piercing machinery for making seamless tubes or hollow bodies, a piercing-tube, the combination of the rear moving die parts 1, the front moving die parts 2, and a tubular support 31 within the die 1; substantially as set forth.

8. In piercing machinery for making seamless tubes or hollow bodies, a piercing-tube, the metal-die 1, the main piercing-ram 12 and cylinder 11, and the cylinder 31 disposed between the ram 12 and die 1, and its front end working within the die 1, substantially as set forth.

9. In piercing machinery for making seamless tubes or hollow bodies, a piercing-tube, the metal-die 1, the main piercing-ram 12 and cylinder 11, the cylinder 31 disposed between the ram 12 and die 1, and its front end working within the die 1, and the ram 33 disposed in the cylinder 31, said ram 12 and die 1 being connected together; substantially as set forth.

10. In piercing machinery for making seamless tubes or hollow bodies, the rear metal-containing die part 1, the main pressing-ram 12 and cylinder 11; a head 13 on said ram 12, separated from but connected with the die 1; the supporting-tube cylinder 31 between the head 13 and die 1; the front die part 2; the cylinders and ram 21, 22, connected with the die 2 for moving it in relation to the die 1; and a piercing-mandrel 5; substantially as set forth.

705,781. SIGN-BOARD. JOSEPH M. NIMMER, Elkhorn, Wis. Filed Dec. 27, 1901. Serial No. 87,508. (No model.)



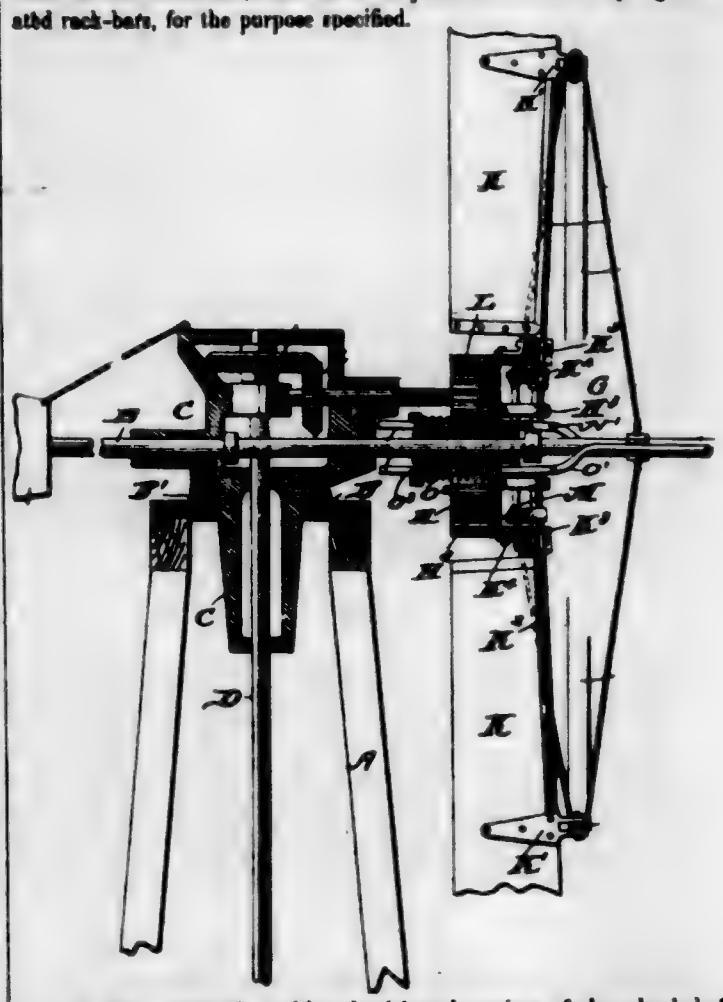
Claim.—The combination of a grooved board, wires extending across said board within said grooves and twisted together at the edges of said board to clamp the same, said wires having extended free ends for attachment to a suitable support, holes in said board communicating with said grooves, and wires passing over said first wires through the holes and having extended free ends twisted together at one face of the board to further secure said board and wires together.

705,782. GOVERNOR FOR WINDMILLS. CAMERON F. OBLER, Emmittsburg, Md. Filed May 3, 1902. Serial No. 105,834. (No model.)

Claim.—1. A windmill-governor comprising in combination a wheel having a series of independently-movable blades, means contained within the hub of the wheel for simultaneously shifting the said blades, governor-arms arranged substantially parallel with the wheel-shaft connected directly to two of the blades and adapted to operate the means for shifting all of the blades together with spring-actuated means for returning all of the parts to their normal positions, substantially as specified.

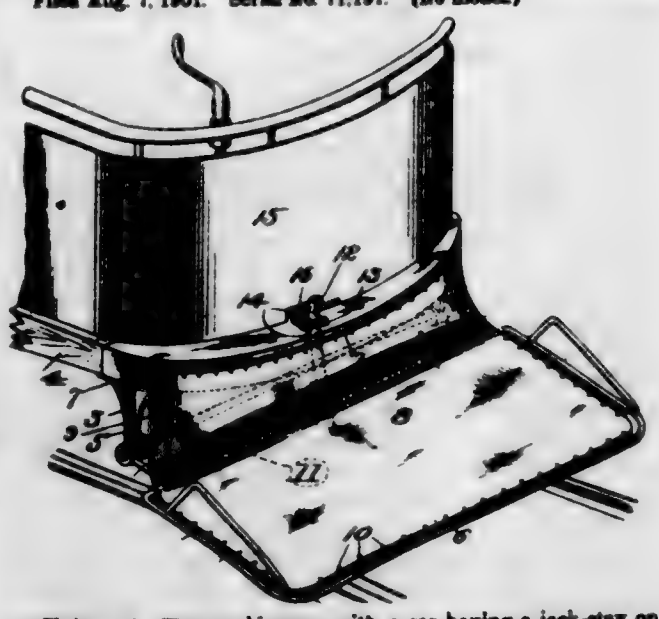
2. In a windmill-governor, a wheel comprising a hub and rim, a series of blades hinged to the rim and having shanks pivotally connected to the hub, the governor-arms connected to two of the shanks, the mutilated gears carried by all of the shanks, the gear-wheel adapted to mesh with said mutilated gears, and the spring-actuated device connected to the governor arms for returning them to their normal positions, substantially as described.

3. A wind-wheel governor comprising in combination a wheel-hub, the blades, rim and shanks, mutilated gears carried by the shanks, the gear-wheel arranged within the hub and adapted to mesh with said mutilated gears, the spring-actuated rock-bars extending longitudinally through the hub, the governor-arms connected to two of the shanks, and meshing with the said rack-bars, and a lever adapted to operate the spring-actuated rack-bars, for the purpose specified.



4. The combination with a derrick and casting, of the wheel-shaft journaled in the casting, the hub mounted upon said wheel-shaft, the said hub having the internally-toothed flange, the pinion meshing with said flange, the shaft carrying said pinion journaled in the casting and provided with a beveled gear, the vertical shaft having a beveled gear meshing with the aforesaid beveled gear, the wheel-rim, the blades hinged to the said rim, shanks attached to the blades and journaled upon the hub, the governor-arms attached to two of the said shanks, the mutilated gears arranged upon the inner ends of all the shanks, the gear-wheel mounted loosely upon the wheel-shaft within the hub and adapted to mesh with the said mutilated gears, the rack-bars extending through the hub, the toothed segments carried by the governor-arms, and adapted to mesh with the rack-bars, the springs surrounding said bars, the connecting-plate, the lever adapted to press against said plate, and means for operating the said lever for the purpose specified.

705,783. STREET-CAR FENDER. OLE OLSEN, St. Louis, Mo. Filed Aug. 7, 1901. Serial No. 71,197. (No model.)



Claim.—1. The combination with a car having a jack-stay on the end thereof, of a car-fender pivotally supported on the car-body, said fender comprising a frame, a jack-stay thereon, and an apron laced to said jack-stays, substantially as described.

2. A car-fender having a pivotally-supported frame, a jack-stay

thereon, and an apron connected to said jack-stay, substantially as described.

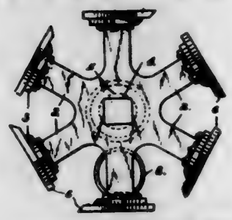
3. A car-fender having a pivotally-supported skeleton frame, a jack stay thereon, and a canvas apron connected to said jack-stay, substantially as described.

4. A car-fender comprising an apron having a rope secured to its edge on the under side, substantially as, and for the purpose set forth.

5. A car-fender comprising an apron having a rope secured to its edge on the under side and having eyelets near said edge, substantially as, and for the purpose set forth.

6. The combination with a car having a jack-stay on the end thereof, of a car-fender pivotally supported on the car-body, said fender comprising a frame, a jack-stay thereon and an apron having a rope secured to its edge on the under side, said apron being hung to said jack-stays, substantially as described.

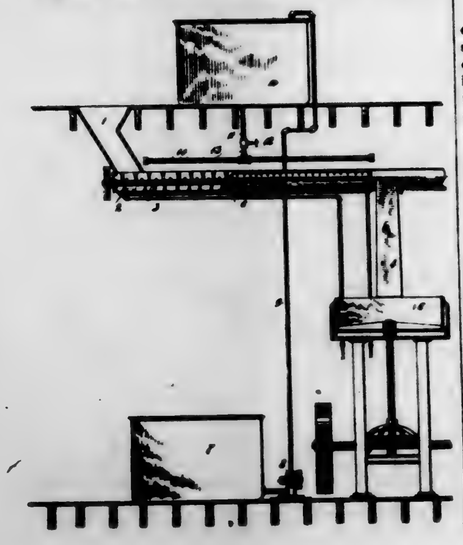
705,784. **HYDRAULIC-DREDGE CUTTER.** RAYMOND A. PERRY, Oakland, Cal., assignor of one-half to Atlantic Gulf & Pacific Co., New York, N. Y., and San Francisco, Cal., a Corporation of West Virginia. Filed Mar. 10, 1902. Serial No. 97,457. (No model.)



Claim.—1. The combination of a revolvable shaft, a hub and means for securing it to the shaft, arms extending radially outward from the hub and having their outer ends flattened to form a transversely-extended bearing-surface, cutters fitted flatwise against said surface, and a suction-pipe having its mouth located contiguous to the cutter.

2. The combination of a revolvable shaft, a hub and means for securing it to the shaft, arms extending radially outward from the hub, flat plates secured to the outer ends of the arms and extending transversely beyond the arms, cutters fitted flatwise against the flat plates, and a suction-pipe, having its mouth located within the circle of revolution and contiguous to the cutter.

705,785. **PROCESS OF PRODUCING COTTON-SEED OIL.** CECIL O. PHILLIPS, New York, N. Y., assignor to the American Cotton Oil Company, New York, N. Y., a Corporation of New Jersey. Filed Sept. 23, 1901. Serial No. 76,046. (No specimens.)



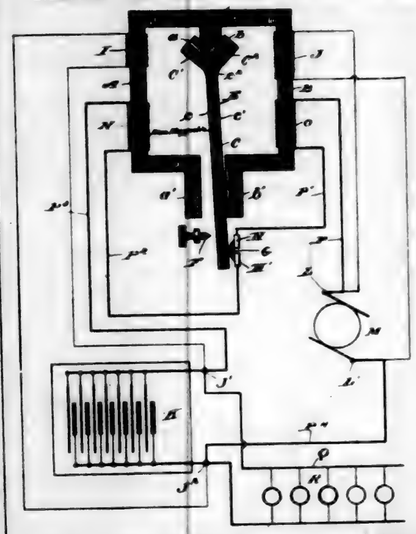
Claim.—1. The process of producing cotton-seed oil, which consists in crushing the cotton-seed meats, neutralizing the free fatty acids contained therein by an alkali, and then expressing the oil therefrom, substantially as described.

2. The process of producing cotton-seed oil, which consists in crushing the cotton-seed meats, treating them with a small proportion of alkali, heating them, and then expressing the oil therefrom, substantially as described.

3. The process of producing cotton-seed oil, which consists in crushing the cotton-seed meats, warming them, neutralizing the free fatty acids contained therein with a slight excess of alkali, heating them to a higher temperature and then expressing the oil therefrom, substantially as described.

4. The process of producing cotton-seed oil which consists in crushing the cotton-seed meats, agitating them, subjecting them to an alkaline spray and pressing out the oil therefrom, substantially as described.

705,786. **AUTOMATIC SWITCH.** HERMAN A. POPPENHUSEN, Evanston, Ill. Filed Oct. 31, 1901. Serial No. 80,594. (No model.)



Claim.—1. The combination of a dynamo, a storage battery, a circuit connecting the dynamo with the storage battery which includes a switch, and means for actuating the switch comprising two magnetic circuits, a movable armature which is included in said magnetic circuits and is connected with and operates the switch, and coils located severally on the two magnetic circuits; one of said coils forming part of a shunt-circuit from the dynamo and the other of said coils forming part of a shunt-circuit from the storage battery.

2. The combination of a dynamo, a storage battery, a circuit connecting the dynamo with the storage battery which includes a switch, and means for actuating the switch comprising two magnetic circuits, a movable armature which is connected with and operates the switch, said armature embracing two magnetically-separated parts which severally form parts of the two magnetic circuits and coils on the two magnet-cores which form parts of shunt-circuits from the dynamo and storage battery.

3. The combination of a dynamo, a storage battery, a circuit connecting the dynamo with the storage battery, which includes a switch, and means for actuating the switch comprising two magnetic circuits, a movable armature which is included in said magnetic circuits, and is connected with and operates the switch, coils on two magnetic circuits which form parts of shunt-circuits from the dynamo and storage battery, and another coil on one of said magnetic circuits which forms part of the circuit connecting the dynamo with the storage battery and which is so wound that it augments or decreases the effect of one or the other of the said shunt-circuit coils.

4. The combination of a dynamo, a storage battery, a circuit connecting the dynamo with the storage battery, which includes a switch, and means for actuating the switch comprising two magnetic circuits, a movable armature which is connected with and operates the switch and which is included in said magnetic circuits, coils on the two magnetic circuits which form parts of shunt-circuits from the dynamo and storage battery, and two other coils on said magnetic circuits which form parts of the circuit connecting the dynamo with the storage battery and which are so wound that one of them augments the effect of one of the shunt-circuit coils and the other decreases the effect of the other of the said shunt-circuit coils.

5. A switch-actuating device comprising two magnetic circuits, a vibratory armature which is included in said magnetic circuits, and two coils located severally on the said magnetic circuits one of which forms part of one electric circuit and the other part of another electric circuit; said coils being adapted to give a greater magnetic flux in one of said cores than in the other.

6. A switch-actuating device comprising two magnet-cores which are mechanically connected but magnetically separated, a vibratory armature consisting of two magnetically-separated parts which operate severally in connection with the two magnet-cores, and coils on the said magnet-cores adapted to give a greater magnetic flux in one of said cores than in the other.

7. A switch-actuating device comprising two magnetic circuits, a vibratory armature which is included in said magnetic circuits, two coils located severally on said magnetic circuits one of which forms part of one electric circuit and the other part of another electric circuit; said coils being adapted to give a greater magnetic flux in one of said circuits than in the other, and another coil on one of said magnetic circuits which is so wound as to augment or decrease the action of the one or the other of said first-named coils.

8. A switch-actuating device comprising two magnetic circuits, a vibratory armature which is included in said magnetic circuits, two coils located severally on said magnetic circuits one of said coils forming part of one electric circuit and the other of said coils forming part of another electric circuit and said coils being adapted to give a greater magnetic flux in one of said magnetic circuits than in the other, and two other coils on said circuits which form parts of a single electric circuit and are so wound that one of them augments the action of one of the first-named coils and the other decreases the action of the other of said first-named coils.

9. A switch-actuating device embracing two magnet-cores, the poles of which are adjacent to each other, a pivotally-supported, vibratory armature adapted to approach and recede from the poles of said magnet-cores, and two coils located severally on said cores, one of said coils forming part of one electric circuit and the other part of another electric circuit and the said coils being adapted to give a greater magnetic flux in one of said magnet-cores than the other.

10. A switch-actuating device embracing two magnet-cores, which are mechanically connected but magnetically separated, and the poles of which are adjacent to each other, a pivotally-supported, vibratory armature embracing two magnetically-separated parts adapted, in the vibratory movement of the armature, to approach and recede from the poles of said magnet-cores, and coils on said cores adapted to give a greater magnetic flux in one of said cores than in the other.

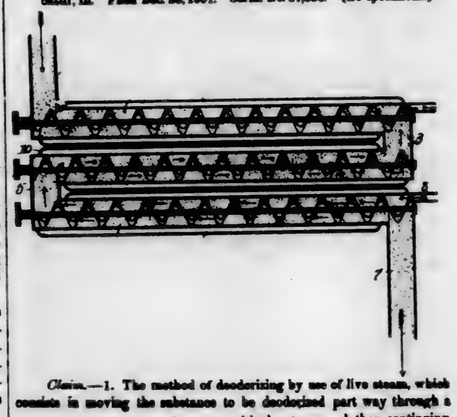
11. A switch-actuating device embracing two magnetic circuits, a pivotally-supported, vibratory armature which is included in said magnetic circuits, an adjustable stop controlling the movement of the armature in one direction, and two coils located severally on said circuits, one of said coils forming part of one electric circuit and the other coil forming part of another electric circuit and said coils being adapted to give a greater magnetic flux in one of said circuits than in the other.

12. A switch-actuating device embracing two magnet-cores which are mechanically connected but magnetically separated, and the poles of which are adjacent to each other, a pivotally-supported, vibratory armature embracing two magnetically-separated parts adapted, in the vibratory movement of the armature, to approach and recede from the poles of said magnet-cores, an adjustable stop controlling the movement of the armature in one direction and coils on said cores adapted to give a greater magnetic flux in one of said cores than in the other.

13. The combination of a dynamo, a storage battery, a working circuit connecting the dynamo with the storage battery, which includes a switch, a pivotally-supported, vibratory armature which is included in said magnetic circuits and is connected with and gives movement to the movable part of said switch, an adjustable stop controlling the movement of the armature, coils on the two magnetic circuits which form parts of shunt-circuits from the dynamo and storage battery, the coil in the dynamo shunt-circuit being adapted to give a greater magnetic flux than the coil in the storage-battery shunt-circuit, and other coils on said magnetic circuits forming parts of the said working circuit, one of said working-circuit coils being so arranged as to augment the action of one of the shunt-circuit coils, and the other of said working-circuit coils being arranged to decrease the action of the other of said shunt-circuit coils.

14. The combination of a dynamo, a storage battery, a working circuit connecting the dynamo with the storage battery which includes a switch, two mechanically-connected but magnetically-separated magnet-cores, the poles of which are adjacent to each other, a pivotally-supported, vibratory armature which is connected with and gives movement to the movable part of said switch, said armature embracing two magnetically-separated parts adapted, in the vibratory movement of the armature, to approach and recede from the poles of said magnet-cores, an adjustable stop controlling the movement of the armature in a direction to open the switch, coils on the two magnet-cores which form parts of shunt-circuits from the dynamo and storage battery, the coil in the dynamo shunt-circuit being adapted to give a greater magnetic flux in its magnet-core than the coil in the storage-battery shunt-circuit, and other coils on said magnet-cores, forming parts of the said working circuit, one of said working-circuit coils being so arranged as to augment the action of one of the shunt-circuit coils, and the other of said working-circuit coils being arranged to decrease the action of the other of said shunt-circuit coils.

705,787. **PROCESS OF DEODORIZING.** FRANK M. PRATT, Decatur, Ill. Filed Dec. 20, 1901. Serial No. 87,233. (No specimens.)



Claim.—1. The method of deodorizing by use of live steam, which consists in moving the substance to be deodorized part way through a heated passage-way out of contact with the steam and then continuing the movement of the substance through the heated passage-way in contact with live steam.

2. The method of deodorizing by use of live steam, which consists in moving the substance to be deodorized part way through a heated passage-way, in an agitated condition, out of contact with the steam and then continuing the movement and agitation of the substance through the heated passage-way in contact with live steam.

3. The method of deodorizing by use of live steam, which consists in moving a stream of the substance to be treated through a heated passage-way in one direction, and passing a current of live steam part way through the heated passage-way in the contrary direction; the steam being permitted to escape before reaching the supply-inlet for the substance to be deodorized.

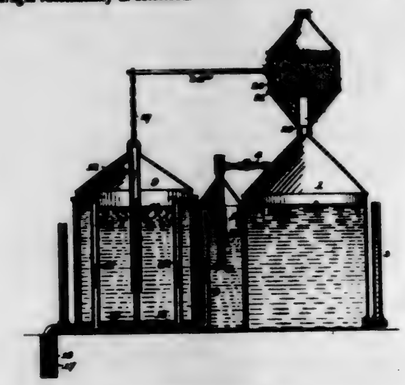
705,788. **ACETYLENE-GAS GENERATOR.** SAMUEL W. RAY, Dallas, Tex., assignor to New Process Manufacturing Company, Dallas, Tex. Filed Oct. 2, 1901. Serial No. 77,234. (No model.)

Claim.—1. In an acetylene-gas generator, the combination with a generator-tank and a gasometer provided with a bell, of a carbid-receptacle mounted on said generator and communicating therewith, a diaphragm mounted in the side of said receptacle, inner and outer couplings secured to said diaphragm, a short arm secured to said inner coupling, a longer arm secured to said outer coupling, a valve mounted in said carbid-receptacle, and connected to said short arm, and means for connecting said long arm and said bell, said means being constructed to exert a component of force at right angles to said lever-arm thereby causing compound flexure in said diaphragm, substantially as described.

2. The combination with a generator of a carbid-receptacle connected to the top of said generator, a diaphragm mounted in the side of said receptacle, a lever connected to said diaphragm, a valve mounted in said receptacle and connected to said lever, and means operated by the gas-pressure for actuating said lever, said means being constructed to exert a component of force at right angles to the said diaphragm thereby causing compound flexure in said diaphragm, substantially as described.

3. The combination with a generator and a gasometer provided with a bell, of a carbid-receptacle connected to said generator, a diaphragm mounted in the side of said receptacle, a lever connected to said dia-

phragm, a valve mounted in said receptacle and connected to the short arm of said lever, and a flexible member connecting said lever and said gas-bell, said member being arranged to exert a component of force at right angles to said lever thereby causing compound flexure in said diaphragm substantially as described.



705,789. MOLD FOR HOLLOW CONCRETE ARTICLES. WILLIAM W. REEVES, Braddock, Pa. Filed Oct. 2, 1901. Serial No. 77,304. (No model.)

Claim.—1. A mold for concrete tombs, &c., having a core with end boards, each consisting of a plurality of adjustable parts; substantially as described.

2. A mold for hollow concrete articles having a core with side boards made in two or more parts and provided with adjustable separators; substantially as described.

3. A mold for concrete tombs, &c., having a core with side boards made in two or more parts and provided with adjustable separators, and end boards each consisting of a plurality of adjustable parts; substantially as described.

4. A mold for hollow concrete tombs, &c., having side boards and outwardly-flanged end boards adjustable along the side boards; said parts having means for clamping them in place; substantially as described.

5. A mold for hollow concrete tombs, &c., having a core with side boards made in two or more parts with a downwardly-tapering separator between said parts, and holders for preventing the separator from collapsing inwardly; substantially as described.

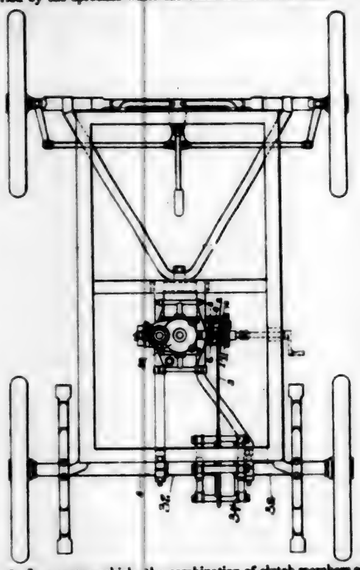
6. A cover-mold having a core adjustable in transverse and longitudinal dimensions; substantially as described.

7. A cover-mold having a longitudinally-movable shaper fitting and guided upon the side board; substantially as described.

705,790. TWO-SPEED AND DIFFERENTIAL GEAR FOR MOTOR-VEHICLES. JOHN C. ROSSIUS, Waltham, Mass. Filed Oct. 31, 1900. Serial No. 35,091. (No model.)

Claim.—1. In a motor-vehicle, means for varying the speed of the vehicle from fast with relatively low power, to slow with increased power, without varying the speed of the motor or power developed by the same, comprising a motor-driven shaft, a gear fast thereto, a gear loose on the same shaft and driven at a different speed by the first said gear through a speed-changing train of gears, a sprocket placed between said gears also loose on said drive-shaft, a clutch member formed on each side of said sprocket, corresponding clutch members on the driving-gears adapted to engage positively with the clutch members on the sprocket, and means for moving said sprocket laterally on the shaft to cause one of its clutch members to engage with the corresponding clutch member of either driving-gear, substantially as described.

2. In a motor-vehicle provided with a driving-sprocket positively connected with the motor and a following sprocket connected by chain-gearing with the driving-sprocket and loose on the driving-axle of the vehicle, means for varying the speed of the vehicle without altering the speed of the motor, comprising a high-speed gear fast to the driving-shaft of the motor, a gear loose on said shaft and driven at a low speed through a reducing train of gears by said high-speed gear, the said driving-sprocket placed between said gears loose on said shaft, a clutch member formed on each side of said sprocket, corresponding clutch members on the driving-gears adapted to engage positively with the clutch members on the sprocket, and means for moving said driving-sprocket laterally on the shaft to cause one of its clutch members to engage with the corresponding clutch member of either driving-gear, in combination with means for yieldingly connecting the following sprocket with the driving-axle of the vehicle, on which it turns freely, comprising a friction-clutch one member of which is carried by the sprocket while the other is fast to the axle.



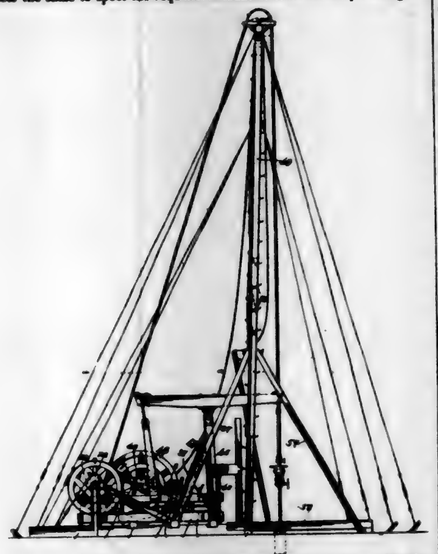
3. In a motor-vehicle, the combination of clutch members operating constantly at different speeds, a driving sprocket or gear having clutch members complemental thereto, provisions for bringing said sprocket or gear clutch members into connection with either of said constantly-operating clutch members, a driven axle having a friction clutch member, a complemental friction clutch member positively connected with the driving sprocket or gear, and means under control of the operator for bringing said friction clutch members into and out of clutching relation with each other.

4. In a motor-vehicle having a positively-driven sprocket or gear turning loosely about the driving-axle of the vehicle, means for yieldingly connecting said sprocket or gear with said axle, so that they will turn in unison, comprising a drum or pulley fast to the axle, a portion of an annular cylinder attached to the sprocket or gear and surrounding said drum or pulley, a suitable friction member or members surrounding said annular cylinder and suitably attached to said drum or pulley, adjustable bell-crank levers attached to the drum or pulley for pressing the friction member or members against the annular cylinder, and means controlled by the operator of the vehicle for so operating said levers as to press the friction member or members against the annular cylinder and cause the axle of the vehicle to turn with the sprocket or gear, substantially as specified.

705,791. PORTABLE DRILLING-MACHINE. JAMES ROURKE, Parkersburg, W. Va. Filed Dec. 10, 1901. Serial No. 85,360. (No model.)

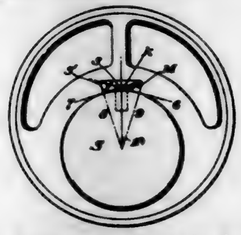
Claim.—1. In a drilling-machine of the character described, the combination of a frame, a crank-shaft mounted upon said frame, a band-wheel mounted upon said crank-shaft, a sprocket-wheel also mounted upon said shaft, of a bull-wheel shaft, a sprocket-wheel carried by said bull-wheel shaft, one of the gudgeons of said bull-wheel shaft being mounted in one side of said frame, the other gudgeon being mounted in a post, one side of said frame being of lesser length than the other, to permit the mounting of the bull-wheel in close proximity to the ground and enable the same to spool the requisite amount of cable for deep drilling.

2. In a drilling-machine of the character described, the combination with a frame having two sides, of a bull-wheel shaft having one of its gudgeons mounted in the end of one of said sides, and a post forming a bearing for the other gudgeon of said bull-wheel shaft, the other side of said frame being of lesser length than the first-mentioned side to permit the mounting of the bull-wheel in close proximity to the ground and enable the same to spool the requisite amount of cable for deep drilling.



3. In a drilling-machine of the character described, the combination of a bull-wheel shaft, of a brake-wheel carried on the end of said shaft, a sprocket-wheel formed integral with one of the gudgeons of said shaft and having key-pins engaging perforations in the end of said shaft, of braces squared against said shaft and bracing the brake-wheel, of bolts passing through said sprocket-wheel, the brake-wheel and said braces, of transverse cots in said shaft, and bolts passing through said sprocket-wheel and longitudinally through said shaft to the transverse cots.

705,792. KEY CONNECTION. JOSEPH T. SCHLAGER, Helper, Utah. Filed May 21, 1901. Serial No. 61,263. (No model.)



Claim.—1. The combination with a pair of contiguous members to be connected, of a removable intermediate inserted between said members and positioned to maintain a predetermined fixed relation to both of them in any single setting of the parts, and connecting means between said intermediate and one of said members and having a changeable relation to said intermediate.

2. The combination with a pair of contiguous members to be connected, of a removable intermediate inserted between and positioned to maintain a predetermined fixed relation to both of said members, and a key-and-slot connection between said intermediate and one of said members.

3. The combination with a pair of members to be connected, of an intermediate inserted between said members, a key-and-slot connection between said intermediate and one of said members and having a changeable relation to said intermediate, and a fixed connection between said intermediate and the other of said members.

4. The combination with rotary driving and driven members, of a removable intermediate inserted between said members and positioned to maintain a predetermined fixed relation thereto, and a key-and-slot connection between said intermediate and one of said members.

5. The combination with a rotary driver and with an eccentric, of a removable intermediate inserted between said members and positioned to maintain a predetermined fixed relation thereto, and a key-and-slot connection between said intermediate and one of said members.

6. The combination with a pair of contiguous members to be connected, of a removable intermediate inserted between said members and positioned to maintain a predetermined fixed relation thereto and having its inner wall in the meeting line of said members, and changeable connecting means between said intermediate and the other of said members.

7. The combination with rotary driving and driven members, of a removable intermediate inserted between said members and positioned to maintain a predetermined fixed relation thereto and having an inner wall conforming to the journal-surfaces of said members, and changeable connecting means between said intermediate and the other of said members.

8. The combination with a pair of members to be connected, of a key-and-slot connection therefor embodying a removable intermediate inserted between said members and having a master portion positioned to maintain a predetermined fixed relation to both of said members in any single setting of the parts and also having a changeable relation thereto governed by a plurality of adjustment-controlling individual portions located in different characteristic positions with respect to the master portion and each constituted to form when in use one element of the key-and-slot connection.

9. The combination with a pair of members to be connected, of a key-and-slot connection therefor embodying a master-key inserted between and positioned to maintain a predetermined fixed relation to both of said members and having an adjustment-controlling individual key-slot located in any characteristic position.

10. The combination with rotary driving and driven members, of a key-and-slot connection therefor embodying a master-key inserted between and positioned to maintain a predetermined fixed relation to both of said members in any single setting of the parts and also having a changeable relation thereto governed by a plurality of adjustment-controlling individual portions located in different characteristic positions and each constituted to form when in use one element of the key-and-slot connection.

11. The combination with rotary driving and driven members, of a key-and-slot connection therefor comprising an individual key in fixed relation with one of said members and a master-key in fixed relation with the other of said members and having an adjustment-controlling individual key-slot located in any characteristic position for receiving said individual key.

12. The combination with rotary driving and driven members, of a key-and-slot connection therefor comprising an individual key in fixed relation with one of said members and a master-key in fixed relation with the other of said members and having a journal-surface and also having in said journal-surface an adjustment-controlling individual key-slot located in any characteristic position for receiving said individual key.

13. The combination with rotary driving and driven members, of a key-and-slot connection fixed relatively to both of said members to prevent turning thereof relatively to each other said key and slot having contacting forward walls defined by the radius of the driver.

14. The combination with rotary driving and driven members, of a key-and-slot connection fixed relatively to both of said members to prevent turning thereof relatively to each other said key and slot having contacting forward walls and contacting rear walls disposed in planes passing through the axis of the driver.

15. The combination with a pair of movable members to be connected, of an intermediate having a slot connection with one of said members the forward wall of which connection is perpendicular to such path of movement, and a key-and-slot connection between said intermediate and the other of said movable members.

16. The combination with a pair of movable members to be connected, of an intermediate having a slot connection with one of said members the forward and rear walls of which connection are perpendicular to such path of movement, and a key-and-slot connection between said intermediate and the other of said movable members.

17. The combination with rotary driving and driven members, of an intermediate having a slot connection with one of said members the forward wall of which connection is defined by the radius of the driver, and a key-and-slot connection between said intermediate and the other of said rotary members.

18. The combination with rotary driving and driven members, of an intermediate having a slot connection with one of said members the forward and rear walls of which connection are defined by radii of the driver, and a key-and-slot connection between said intermediate and the other of said rotary members.

19. In a key-and-slot connection, a connecting master-key made in one piece and of such construction that its end walls are in engagement with the end walls of its coacting slot, said master-key also having an adjustment-controlling individual connector.

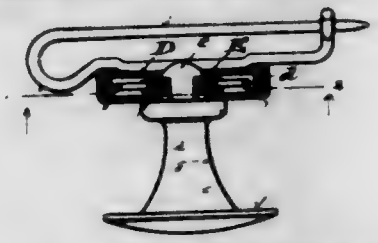
20. In a key-and-slot connection, a connecting master-key of such construction that its end walls are in engagement with the end walls of its coacting slot and said master-key also having an adjustment-controlling individual key-slot.

21. In a key-and-slot connection, a tapered connecting master-key of such construction that its end walls are in engagement with the end walls of its coacting slot and said master-key also having an adjustment-controlling individual key-slot.

22. In a key-and-slot connection, a connecting master-key wedge-shaped in cross-section and of such construction that its end walls are in engagement with the end walls of its coacting slot and said master-key also having an adjustment-controlling individual key-slot.

23. In a key-and-slot connection, a connecting master-key wedge-shaped in cross-section and of such construction that its end walls are in engagement with the end walls of its coacting slot and said master-key also having a concave journal-surface, tapered sides converging toward said journal-surface, and an adjustment-controlling individual key-slot in said concave surface.

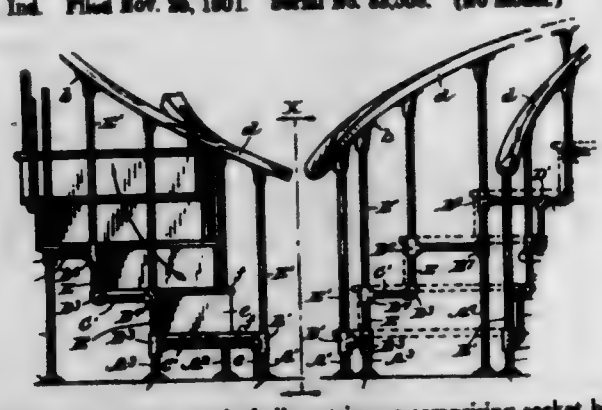
705,793. **SEPARABLE BUTTON.** HENRY R. SIEVERKROPP, Racine, Wis. Filed Sept. 30, 1901. Serial No. 77,115. (No model.)



Claim.—1. A separable button comprising a back and shank section the shank being provided with a forward annular bead and a flat tongue having opposite edge notches; a tongue-engaging cap-section consisting of an annular shell provided with an inner annular seat and a disk held between the seat and an inturned shell-flange, a pair of levers fulcrumed intermediate of their extremities in notches of the shell-wall and said seat to have engagement with the tongue-notches, and a spring-wire arranged in said cap-section of the button to have its ends press the levers adjacent to their fulcrums.

2. A separable button comprising a back and shank section, the shank being provided with a forward annular bead and a flat tongue having opposite edge notches; a tongue-engaging cap-section consisting of an annular shell provided with an inner annular seat and a disk held between the seat and an inturned shell-flange, a pair of spring-controlled levers fulcrumed intermediate of their extremities in notches of the shell-wall and said seat to have engagement with the tongue-notches, and means in connection with said cap-section for attachment of same to a necktie.

705,794. **WINDING STAIRCASE.** HARRISON SNIDER, Indianapolis, Ind. Filed Nov. 26, 1901. Serial No. 83,563. (No model.)



Claim.—1. A staircase including stringers comprising socket base-flanges, sections of piping vertical upon the flanges, L's upon the sections of piping, sections of piping attached horizontally to the L's, L's attached to the horizontal sections of piping, and sections of piping extending vertically from the L's and attached thereto, the horizontal sections of piping being supported by the L's, and the L's supported by the vertical sections of piping, substantially as set forth.

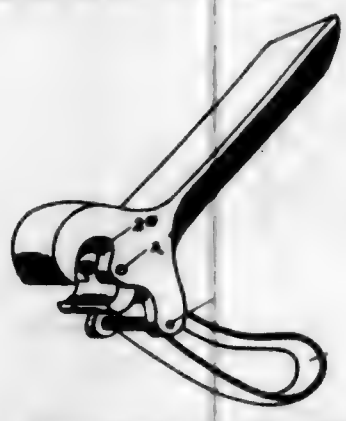
2. A staircase including stringers comprising socket base-flanges, sections of piping vertical upon the flanges, T's upon the sections of piping, sections of piping having oblique-angled flanges and vertical upon the T's, sections of piping attached horizontally to the T's, L's attached to the horizontal sections of piping, sections of piping extending vertically from the L's and attached thereto, the horizontal sections of piping being supported by the L's and the T's, and the L's supported by the vertical sections of piping, and hand-rails attached to the oblique-angled flanges, substantially as set forth.

3. A staircase comprising base-flanges, vertical pipe-sections attached to the flanges, T's attached to the vertical pipe-sections, pipe balusters attached to the T's, a hand-rail mounted upon the pipe balusters, horizontal pipe-sections attached to and supported by the T's, L's attached to and supported by the horizontal pipe-sections, vertical pipe-sections attached to and supported by the L's, and tread members supported upon the horizontal pipe-sections, substantially as set forth.

4. A staircase comprising vertical pipe-sections, L's, and horizontal pipe-sections, alternately, connected together, the vertical sections forming the risers and the horizontal sections forming the treads of the stringers, riser-boards attached to the vertical pipe-sections, and tread-boards mounted upon the horizontal pipe-sections, substantially as set forth.

5. A staircase comprising stringers composed of vertical pipe-sections, T's, L's, horizontal pipe-sections in pairs of unequal length, and base-flanges, the vertical sections being supported by the base-flanges and the L's and the T's, and the horizontal sections by the T's and the L's; riser-boards attached to the vertical pipe-sections, and tread-boards mounted on the horizontal sections, each tread-board on a long and a short section, substantially as set forth.

705,795. **THILL-COUPLING.** GEORGE H. SPITELL and GEORGE E. LORD, Utica, N. Y.; said Lord assignor to Arthur B. Maynard, Utica, N. Y. Filed Nov. 22, 1901. Serial No. 83,431. (No model.)



Claim.—1. The combination in a thill-coupling of the axle-clip and pin and the thill part having a downwardly-opening recess therein adapted to receive the clip-pin, a lock pivoted to the thill part and arranged to close said recess and engage the clip-pin, a bowed spring pivoted at one end to the said thill part and at the other to the said lock, said last-mentioned pivotal point being arranged to pass to both sides of the direct line between the pivot of the lock and the pivot of the spring, substantially as set forth.

2. The combination in a thill-coupling of the thill part having a downwardly-opening hook adapted to receive and engage the coupling-bolt and the hook portion of a size and arranged at an angle to engage both the coupling-bolt and the wall of the clip back of the coupling-bolt when in position for use and prevent vertical displacement, a lock or latch operating in the hook-opening and adapted to engage the bolt, and a spring for holding said lock or latch in open or closed position, substantially as set forth.

3. The combination with the thill portion of a thill-coupling having a downwardly-opening recess therein adapted to receive the coupling-bolt, a lock or latch arranged in said recess and having a part adapted to engage the coupling-bolt from the under side in securing said coupling and a part adapted to engage the coupling-bolt from the top in attaching or detaching said coupling and a spring for holding said lock or latch in closed or open position, substantially as set forth.

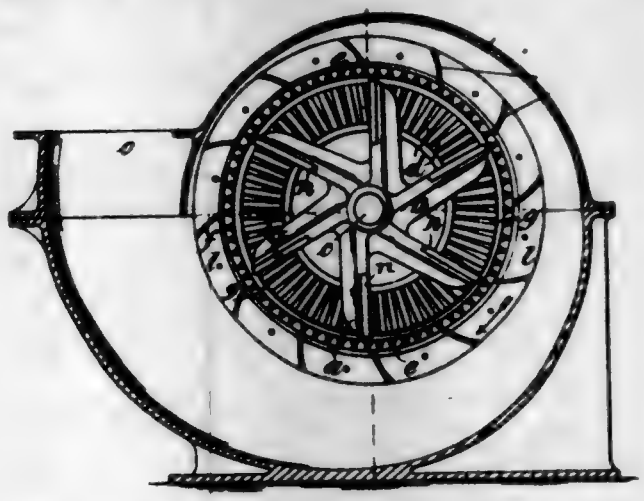
4. The combination with the thill portion of a thill-coupling having a downwardly-opening hook-recess to receive the coupling-bolt of a lock for closing said opening, a spring for holding said lock in open or closed position and means for automatically closing the lock, substantially as set forth.

5. The combination in a thill-coupling of the head having a hook-recess to receive the coupling-bolt, a lock to close said recess and grip the bolt, a spring for holding said lock in closed position and a catch for securing said lock against accidental opening, substantially as set forth.

6. The combination in a thill-coupling of the axle-clip and pin and the thill part having a downwardly-opening recess therein adapted to receive the clip-pin, a lock pivoted to the thill part in front of said recess and adapted to close said recess and arranged to engage said clip-pin both on the upper and lower sides, a bowed spring pivoted at one end to said thill part and at the other to said lock, said last-mentioned pivotal point

being arranged to pass to both sides of the direct line between the pivot of the lock and the pivot of the spring, substantially as set forth.

705,796. DISINTEGRATOR. EDGAR R. SUTCLIFFE, Leeds, England, assignor of one-half to Fred Spenkman, Leigh, England. Filed Apr. 17, 1902. Serial No. 103,587. (No model.)



Claim.—1. In a disintegrator and in combination, a fixed casing having a feed-inlet and a discharge, a revoluble grinding-chamber having circumferential openings and fan-blades fixed around and outside of the circumferential openings and revolving with the grinding-chamber, whereby the ground material is drawn from the chamber into the casing and ejected from the latter.

2. In a disintegrator and in combination, a fixed casing having a feed-inlet and a discharge, a revoluble grinding-chamber having circumferential openings, fan-blades fixed around and outside of the circumferential openings and revolving with the grinding-chamber, and a revoluble fan-beater within the revoluble grinding-chamber, whereby the ground material is both drawn and forced from the chamber into the casing.

3. In a disintegrator and in combination, a fixed casing having a feed-inlet and a discharge, a revoluble grinding-chamber, fan-blades fixed to said chamber outside of and around its circumferential openings, a revoluble fan-beater within said chamber, and a circumferential grid between the external and the internal fan parts.

4. In a disintegrator and in combination, a fixed casing having a feed-inlet and a discharge, a revoluble grinding-chamber having a circumferential grid of bars, a fan carried by the chamber external to its grid, and surrounding it, and means whereby the grid-bars and their surrounding fan-blades are separately fastened together and to the side walls of the grinding-chamber.

5. In a disintegrator and in combination, a fixed casing having a feed-inlet and a discharge, a revoluble grinding-chamber having a circumferential grid of bars and means for spacing and securing the grid-bars consisting of a pair of ring-plates each formed with serrations or teeth on their concave edges by which the ends of the bars are spaced, and bolts binding the toothed rings upon the ends of the bars.

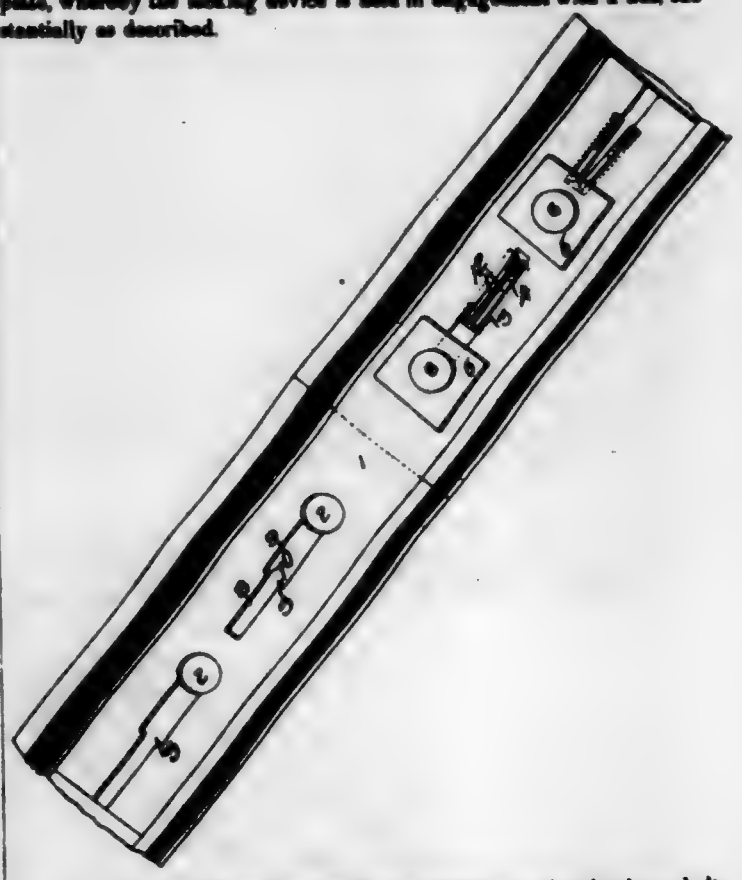
6. In a disintegrator and in combination, a fixed casing having a feed-inlet and a discharge, a revoluble grinding-chamber having circumferential grid of bars, fan-blades fixed around and outside of the circumferential grid, and means whereby the grid-bars are spaced and together with the fan-blades are fastened between the side walls of the chamber, consisting of a pair of ring-plates, each formed with serrations or teeth on their concave edges between which the ends of the grid-bars are spaced and bolts passing through the chamber-walls and through the toothed ring-plates binding the latter and the fan-blades together upon the ends of the grid-bars.

7. In a disintegrator and in combination with a fixed casing having a feed-inlet and a discharge, a revoluble grinding-chamber having circumferential grid of bars, a pair of rings having serrations adapted to intermatch with the grid-bars, fan-blades around and outside of the circumferential grid, and means whereby, the fan-blades, the toothed rings, and the grid-bars are detachably secured to the sides of the grinding-chamber.

705,797. NUT-LOCK. GEORGE W. VANDEVENDER, Mingo, W. Va. Filed May 10, 1902. Serial No. 106,813. (No model.)

Claim.—1. A device of the class described comprising a plate having a bolt-opening and provided with a dovetailed groove extending from the bolt-opening and having an inner narrow portion and an outer wide portion forming shoulders, and a nut-engaging locking device arranged in the groove and having dovetailed portions of different sizes forming shoulders for engaging the shoulders of the plate, whereby the locking device is held in engagement with a nut, substantially as described.

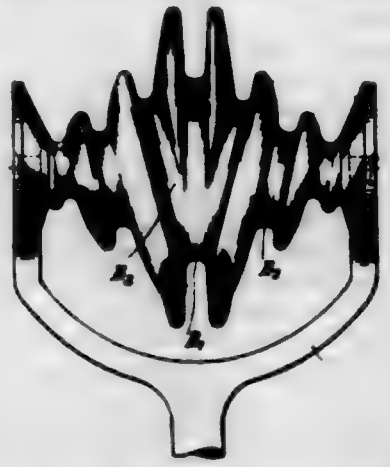
2. A device of the class described comprising a plate having a bolt-opening and provided with a dovetailed groove extending from the bolt-opening, and a resilient locking device composed of two sides provided with longitudinal dovetailed portions arranged in the said groove, the sides of the locking device being provided with means for engaging the plate, whereby the locking device is held in engagement with a nut, substantially as described.



3. A device of the class described comprising a plate having a bolt-opening and provided with a dovetailed groove extending from the bolt-opening, and a locking device having dovetailed side portions interlocked with the walls of the groove and provided with projecting portions adapted to be compressed to permit the locking device to slide in the groove, said locking device being provided with a connecting end portion enlarged between the sides and the latter being reduced at the end portion to increase their resiliency, substantially as described.

4. A device of the class described comprising a nut having recesses and adapted to engage a bolt, a plate having a bolt-opening and provided with a dovetailed groove extending from the bolt-opening and provided between its ends with shoulders, and a locking device having resilient sides provided with dovetailed portions interlocked with the walls of the groove, and provided with means for detachably engaging the said shoulders, whereby the locking device is held in engagement with the nut, substantially as described.

705,798. TROLLEY. WILLIAM L. VON HARDENBERG, Brooklyn, N. Y. Filed June 22, 1901. Serial No. 65,577. (No model.)



Claim.—1. A trolley-wheel formed with a deep central annular groove, a right and left handed helical groove substantially tangent to said annular groove, said helical grooves being of varying diameter, the increase in diameter of each grooves being substantially proportional to the distance between any two points, a trolley-arm formed with a yoke at the end of the same, beveled circular bearing portions formed on said yoke, said beveled portions serving to guide said trolley with relation to the trolley-wire.

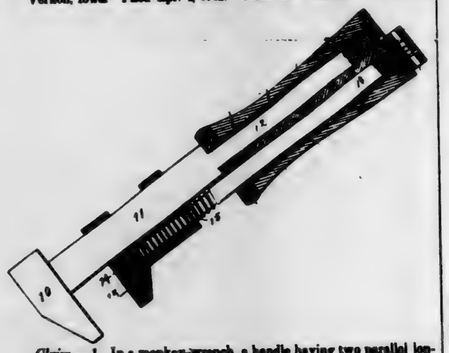
2. A trolley-wheel formed with a deep annular groove in the center of the same, a right and a left handed helical groove substantially tangent to said annular groove, said helical grooves being gradually increased in diameter from the ends to the center of said trolley-wheel, a cylindrical bearing extension formed on either end of said trolley-wheel, a trolley-arm having a yoke formed at the end of the same, bearing portions formed on said yoke having circular beveled extensions and annular grooves into which said bearing extensions on said trolley-wheel fit and a pivot-pin secured to said trolley-arm and passing through said wheel.

3. A trolley-wheel formed with a central groove inclosed by annular flanges, and right and left handed helical shoulders forming helical grooves leading into said annular groove, said annular flanges having a greater diameter than the greatest diameter of said helical shoulders.

4. A trolley-wheel formed with an annular groove inclosed by annular flanges, and a helical shoulder forming a helical groove leading into said annular groove, said annular flanges having a greater diameter than the greatest diameter of said helical shoulder.

5. A trolley-wheel formed with a central annular groove inclosed by annular flanges, and helical shoulders forming helical grooves leading into said annular groove, said annular flanges having a greater diameter than the greatest diameter of said helical shoulders; a trolley-arm formed with a yoke to support said trolley-wheel and with beveled extensions on said yoke on either side of said wheel.

705,799. MONKEY-WRENCH. CHARLES P. WHITTEMORE, Mount Vernon, Iowa. Filed Apr. 4, 1902. Serial No. 101,235. (No model.)



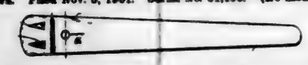
Claim.—1. In a monkey-wrench, a handle having two parallel longitudinal bores, a jaw having an integral shank and a tang extended from the end of the shank and fixed in one of said bores in the handle, a slidable jaw fitted on the shank of the fixed jaw and provided with a screw-seat, a screw fitted in the screw-seat and provided with an integral stem extended through the other bore in the handle and means for securing the screw in the handle, arranged and combined to operate in the manner set forth for the purposes stated.

2. In a monkey-wrench, a jaw having a fixed shank, a tang extending from the end of the shank, a sliding jaw fitted on the shank and provided with a screw-seat, a screw fitted in the screw-seat, an enlargement on the outer end of the screw and bores in the enlargement and a handle fitted and fixed on the tang to abut against the end of the shank, arranged and combined to operate in the manner set forth for the purposes stated.

3. A monkey-wrench comprising a jaw having a shank that terminates in shoulders adapted to abut against the end of a handle and a tang adapted to project through a bore in a handle, a slidable jaw on the shank, a screw-seat in the slidable jaw, a screw fitted in the screw-seat and terminating in a stem, a metal handle having a longitudinal bore to admit the stem and a parallel bore to admit the tang, a head on the end of the stem provided with transverse bores and means for fastening the handle to the tang on the end of the shank of the fixed jaw, arranged and combined to operate in the manner set forth for the purposes stated.

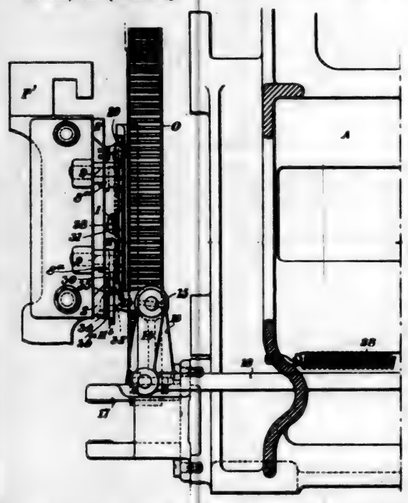
4. A monkey-wrench comprising a jaw having a shank that terminates in shoulders to engage the inner end of a handle, a tang adapted to project through a bore in a handle, a slidable jaw on the shank, a screw-seat in the slidable jaw, a screw fitted in the screw-seat and terminating in a stem, a metal handle having a longitudinal bore to admit the stem and a parallel bore to admit the tang, a head on the end of the stem provided with transverse bores, means for fastening the handle to the tang on the end of the shank of the fixed jaw and a wooden cover on the metal handle, arranged and combined to operate in the manner set forth for the purposes stated.

705,800. TAPE-NEEDLE. MARY B. WHITTEMORE, Mount Vernon, Iowa. Filed Nov. 5, 1901. Serial No. 81,199. (No model.)



Claim.—A needle made of a single piece of sheet metal, wide at one end and tapering to a point at its other end and provided with a transverse eye at its large end, teeth near the eye and projecting toward the wide end and outward relative to the surface of the needle and a perforation near the center portion of the eye, to operate in the manner set forth for the purposes stated.

705,801. TRIMMING MECHANISM FOR LINOTYPE-MACHINES. FERDINAND J. WICH, Altringham, England. Filed Apr. 11, 1902. Serial No. 102,418. (No model.)



Claim.—1. In a linotype-machine the combination with the knife-block, a trimming-knife laterally movable thereon, an arm adapted to move the knife laterally, and a plurality of cams adapted to operate the arm at each cycle of the machine, of a fork pivotally mounted on the knife-block, the two prongs of the fork being situated in different planes, one on either side of the arm, a member in operative connection with the fork situated in the path of, and adapted to be operated by, overhang letters on the linotype to insert one fork-prong into operative connection with the arm and movable knife and render the second prong ineffective, and a spring for inserting the second prong into operative connection with the movable knife and rendering the first one ineffective substantially as set forth.

2. In a linotype-machine the combination with the knife-block and a trimming-knife laterally movable thereon, and toggles pivoted to the knife-block and movable knife, of a link pivotally connected to the toggles, abutments on the link, a vibrating arm between the abutments, a fork pivotally mounted on the knife-block, its two prongs being situated in different planes one on either side of the arm, a member in operative connection with the fork situated in the path of, and adapted to be operated by, overhang letters on the linotype to insert one prong between the arm and the proximate abutment and render the second arm ineffective substantially as set forth.

3. In a linotype-machine the combination with the knife-block and a trimming-knife laterally movable thereon, and toggles pivoted to the knife-block and movable knife, of a link pivotally connected to the toggles, abutments on the link, a vibrating arm between the abutments, a fork pivotally mounted on the knife-block, its two prongs being situated in different planes and one on either side of the arm, a member in operative connection with the fork, situated in the path of, and adapted to be operated by, overhung letters on the linotype to insert one of the prongs between one side of the arm and the proximate abutment and a spring connected to the knife-block and fork for inserting the other of the prongs between the other side of the arm and the second abutment substantially as set forth.

4. In a linotype-machine the combination with the laterally-movable knife, a link in operative connection with the knife and a vibrating arm operating the link, of bearings on the knife, a rod axially and angularly movable in the bearings, a fork rigid on the rod, the prongs of which are situated in different planes and one on either side of the vibrating arm, a plate rigid with the fork and at the opposite side of the axis of oscillation, and in the path of overhangs on the linotypes, and projections on the fork-prongs for insertion between the arm and link substantially as set forth.

5. In a linotype-machine, a knife movable toward and from its companion, power-driven mechanism for effecting the adjustment of the knife, and a controlling device for said mechanism, arranged to be acted upon by a projection on an outgoing linotype.

6. In a linotype-machine, a knife, adjustable transversely to its length, an independently-movable device for imparting motion to the knife, an intermediate movable member for connecting and disconnecting said parts, and a device for adjusting said member adapted to be acted upon by projections on the linotypes.

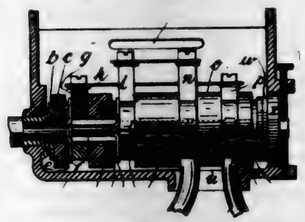
7. In a linotype, a knife, power-driven mechanism for adjusting the knife, and intermediate controlling devices arranged to be operated by the linotypes.

8. In a linotype-machine, a knife adjustable in a direction transverse to its length, a controlling device to be acted upon by the passing linotypes, and intermediate mechanism through which the controlling device determines the adjustment of the knife.

9. In a linotype-machine, a trimming-knife movable transversely, spring connections tending to advance the knife toward the path of the linotypes, positively-acting mechanism to retract the knife, and a device acted upon by the passing linotype to cause the action or non-action of the retracting mechanism.

10. In a linotype-machine, a transversely-adjustable knife, power-driven mechanism for effecting the adjustment, and a controlling device for said mechanism extending the entire length of the path traversed by the linotype, whereby a projection or overhang at any point in the length of the linotype will effect the adjustment of the knife.

705,802. CABLE-TERMINAL BOX FOR ELECTRICITY-SUPPLY PURPOSES. GEORGE WILKINSON, Harrogate, England. Filed Apr. 21, 1902. Serial No. 104,584. (No model.)



Claim.—1. The combination, with a box, and a supply-cable which enters the box and has its inner and outer conductors spread out inside the box in different planes; of service-cables which also enter the box, separate contact-washers which bear against the said conductors and service-cables respectively, fuses which connect the contact-washers of the inner and outer conductors with the service-cables to which they pertain, and a spring which operates longitudinally of the supply-cable and which holds its inner and outer conductors in contact with their respective contact-washers, substantially as set forth.

2. The combination, with a box, and a supply-cable which enters the box and has its lead covering and its inner and outer conductors spread out inside the box in different planes and insulated from each other; of service-cables which also enter the box, separate contact-washers which bear against the said conductors and service-cables respectively, fuses which connect the contact-washers of the inner and outer conductors with the service-cables to which they pertain, and a spring which operates longitudinally of the supply-cable and which holds its inner and outer conductors in contact with their respective contact-washers and its lead covering in contact with the said box, substantially as set forth.

3. The combination, with a box, of a supply-cable which enters the box and has its conductors spread out inside it, a single service-cable which also enters the box, separate contact-washers which bear against the said conductors and the service-cable respectively, a fuse connecting the said washers, a spring which operates longitudinally of the said supply-cable and which holds its said conductors in contact with their contact-washer, and a second supply-cable and a second single service-cable operatively connected together so as to form a complete circuit with the first said supply and service cables, said supply-cables being arranged concentric of each other where they enter the said box, substantially as set forth.

705,808. ASPHALTIC PAVING MIXTURE OR COMPOSITION. WALTER S. WILKINSON, Baltimore, Md., and CHARLES H. BURCHENAL, Pittsburg, Pa. Filed Aug. 16, 1901. Serial No. 72,220. (No specimens.)

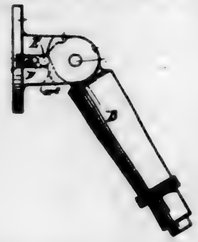
Claim.—1. A bituminous paving or pavement mixture or composition wherein the body material is crushed rock or sand, said mixture or composition containing a small percentage of comminuted copper in amount not exceeding three per cent. of the body material, and a bituminous cement.

2. An asphaltic paving or pavement mixture or composition wherein the body material is crushed conglomerate rock bearing a small percentage of copper; and an asphaltic cement.

3. An asphaltic paving or pavement mixture or composition consisting of crushed conglomerate rock bearing one-half of one per centum to one and one-half per centum of native copper; fines; and an asphaltic cement.

4. As a new article of manufacture, a paving block or tile made from crushed conglomerate rock bearing from one-half of one per centum to one and one-half per centum of native copper, calcareous fines of substantially the condition of an impalpable powder, and an asphaltic cement.

705,804. DOOR-STOP. JASPER C. WISE, Chicago, Ill., assignor, by mesne assignments, to Jacob Rothschild, Chicago, Ill. Filed May 16, 1900. Renewed May 2, 1902. Serial No. 105,602. (No model.)



Claim.—1. In a door-stop the combination of a base, a movable member provided with a recess in one end thereof and fulcrumed to the base, an adjustable member provided with screw-threads fitting into corresponding screw-threads in the recess in the movable member, a head on one end of the adjustable member provided with screw-threads turned in a direction opposite to the first-named screw-threads, a spring wound to correspond with the screw-threads on the head of the adjustable member and engaged therewith, and a lug in the recess wherein such spring is contained engaging with the spring, substantially as described.

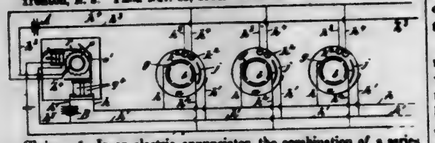
2. In a door-stop, the combination of a base, a movable member fulcrumed to the base, an adjustable member, a spring connected to the members and attaching them together, and means for longitudinally adjusting the adjustable member relative to the fulcrumed member; substantially as described.

3. In a door-stop the combination of a base, provided with a recess, a spring in the recess, a ball on one end of the spring, a second ball on the first-named ball, and a member fulcrumed to the base and provided with recesses in the end adjacent to the base, with which recesses the second-named ball comes in contact as such member is turned on its fulcrum; substantially as described.

4. In a door-stop the combination of a base, provided with a recess, a spring in the recess, a ball on one end of the spring, a second ball on the first-named ball, a member fulcrumed to the base and provided with recesses in the end adjacent to the base, with which recesses the second-named ball comes in contact as such member is turned on its fulcrum, and provided with a recess at the other end thereof in which a spring and an adjustable member are placed, an adjustable member provided with screw-threads fitting corresponding screw-threads in the recess in which it is placed, a head on one end of the adjustable member provided with screw-threads turned in a direction opposite to the first-named screw-threads, a spring wound to correspond with the screw-threads on the head of the adjustable member and engaged therewith, and a lug in the recess wherein such spring is contained engaging with the spring; substantially as described.

5. In a door-stop, the combination of a base, provided with a recess, a movable member fulcrumed to the base, an adjustable member, a spring connected to the members and attaching them together, means for longitudinally adjusting the members, a spring in the recess in the base, a ball mounted on the spring and a second ball on the first-named ball, between such first-named ball and the end adjacent thereto of the fulcrumed lever; substantially as described.

705,805. ELECTRIC ANNUNCIATOR. WILLIAM R. WISTER, Trenton, N. J. Filed Nov. 15, 1901. Serial No. 82,340. (No model.)



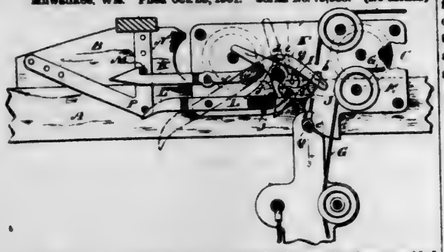
Claim.—1. In an electric annunciator, the combination of a series of delivery-stations each having a series of commutator-segments, a contact engaging the segments, a circuit controlled by the contact, an oscillating lever for operating the segments, a pin depending from the lever, an armature for locking the lever, and a yielding contact engaged by the pin, with a receiving-station having a signal-wheel, a ratchet-wheel attached to the signal-wheel, a pawl engaging the ratchet-wheel, an electric armature for operating the pawl and controlled by the circuit coming from the delivery-station, a second pawl engaging the ratchet-wheel, an armature for operating the second pawl, a circuit controlled by the yielding contact and adapted to operate the armature, a commutator attached to the signal-wheel, two contacts engaging the commutator, and a circuit controlled by the contacts and adapted to operate the armature for locking the levers of the delivery-station, substantially as specified.

2. In an electric annunciator, a delivery-station having a commutator, a stop attached to the commutator, a ratchet-wheel, a spiral spring connecting the ratchet-wheel to the commutator, a hand-lever for operating the ratchet-wheel, a detent fastened to the ratchet-wheel, said detent engaging the stop and adapted to be withdrawn by the hand-lever, and an armature for locking the hand-lever in its initial position, substantially as specified.

3. In an electric annunciator, a delivery-station having a frame, a ratchet-wheel rotatable upon the frame, a hand-lever engaging the ratchet-wheel, a pin attached to the hand-lever, a commutator having openings and yieldingly connected to the ratchet-wheel, a spring-influenced oscillating lever having a detent, an inclined plane and a hook, the detent being adapted to engage the openings of the commutator, the inclined plane being operated by the pin, and the hook being adapted to lock the hand-lever, substantially as specified.

4. In an electric annunciator, a series of delivery-stations each having a frame, a yielding curved contact-guide attached to the frame, a contact-piece adapted to slide upon the guide and composed of a metallic and an insulated portion, a circuit controlled by the metallic portion of the contact-piece, a hand-lever rotatable upon the frame, and a pin depending from the hand-lever and adapted to operate the contact-piece, combined with a receiving-station having a ratchet-wheel, a pawl engaging the ratchet-wheel, and an electric armature for operating the pawl and controlled by the circuit, substantially as specified.

705,806. HOISTING-BUCKET CARRIER. ANDREW WIRSING, Milwaukee, Wis. Filed Oct. 25, 1901. Serial No. 79,933. (No model.)

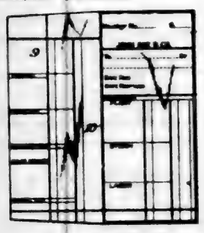


Claim.—1. A hoisting-bucket carrier having its side plates provided with recesses arranged to be engaged by a bucket-pin, bell-cranks intermediate of the plates, dogs having limited pivotal play on arms of the bell-cranks to be normally crosswise of the plate-recesses, a latch in pivotal connection with the carrier having branches that are also crosswise of said recesses above said dogs, and a pivotal yoke with said carrier in opposition to said bell-cranks, the latch being engageable with a stationary catch adjacent to a stationary striker in the path of a curved shank of the yoke.

2. A hoisting-bucket carrier having its side plates provided with recesses arranged to be engaged by a bucket-pin, guides to the recesses in the form of curved lower projections of the plates, bell-cranks intermediate of said plates, dogs having limited pivotal play on arms of the bell-cranks to be normally crosswise of the plate-recesses, a latch in pivotal connection with the carrier having branches that are also crosswise of the plate-recesses above said dogs, and a pivotal yoke with said carrier in opposition to said bell-cranks, the latch being engageable with a stationary catch adjacent to a stationary striker in the path of a curved shank of the tilt-yoke.

3. A hoisting-bucket-carrier track having buffer-blocks, stationary rods transversely of the track, the carrier having its side plates provided with recesses arranged to be engaged by a bucket-pin, bell-cranks intermediate of the plates, dogs having limited pivotal play on arms of the bell-cranks to be normally crosswise of the plate-recesses, a latch in pivotal connection with said carrier having branches that are also crosswise of said recesses above said dogs, and a pivotal yoke with the aforesaid carrier in opposition to said bell-cranks, the latch being engageable with one of the aforesaid rods and the other rod arranged in the path of a curved shank of the yoke.

705,807. VOUCHER. HOMER WEBB, Flushing, N. Y., assignor to Union Voucher Company, a Corporation of New York. Filed June 4, 1901. Serial No. 63,147. (No model.)



Claim.—1. An envelop-voucher adapted to contain a plurality of bills or statements of account, and comprising two parts one of which is a voucher proper having a column of account-classifying headings indicating expense items of different natures to which headings the items of said bills or statements are chargeable, and the other of which is a connected portion forming with said voucher an envelop or pocket.

2. The combination with a combined voucher and receipt the voucher portion of which has a column of account-classifying headings indicating expense items of different natures, of a connected portion forming therewith an envelop or pocket, said connected elements constituting an envelop-voucher.

3. The combination with a combined voucher and receipt having a fold-line at one edge of the receipt and the voucher portion of which has a column of account-classifying headings indicating expense items of different natures, of a connected portion at the other side of said fold-line and forming with the combined voucher and receipt an envelop or pocket, said connected elements constituting an envelop-voucher.

4. The combination with a combined voucher and receipt having the voucher and the receipt at opposite sides thereof and also having a fold-line at one edge of the receipt, said voucher portion having a column of account-classifying headings indicating expense items of different natures, of a connected portion located at the other side of said fold-line and forming with the combined voucher and receipt an envelop or pocket, said connected elements constituting an envelop-voucher.

705,808. SIGNAL-LAMP. FREDERICK K. WRIGHT, Syracuse, N. Y. Filed May 8, 1901. Serial No. 59,218. (No model.)

Claim.—1. The combination of a lamp provided with a lens, an upright guideway arranged adjacent to said lens, a circular signal-plate arranged in said guideway, and an actuating-lever having a suitable fulcrum, said lever being pivoted at its free end to the signal-plate near the periphery thereof, whereby the lens is caused to move up or down in the guideway with a rolling movement, substantially as set forth.

2. The combination of a lamp provided in its side with a light-opening, an upright guideway which intersects said opening, a circular signal-plate arranged in said guideway, and an actuating-lever having a suitable fulcrum, said lever being pivoted at its free end to the signal-plate near the periphery thereof, substantially as set forth.

3. The combination of a lamp provided in its side with a light-opening, an upright guideway intersecting said opening, a transverse partition dividing said guideway into a front and rear compartment, circular signal-plates arranged in said compartments, and actuating-levers pivoted in the front and rear walls of said guideway and having their free ends connected by pivots with said plates near the periphery thereof, substantially as set forth.

4. The combination of a lamp provided in its side with a light-opening, an upright guideway intersecting said opening and having its upper portion detachably connected with said lamp, a circular signal-plate arranged in said guideway, and an actuating-lever pivoted in the upper detachable portion of the guideway and connected at its free end directly with said plate by a pivotal connection, substantially as set forth.

5. The combination of a lamp provided in its side with a light-opening, an upright guideway intersecting said opening, circular signal-plates arranged one behind the other in said guideway, and actuating-levers pivoted in the front and rear walls of said guideway, each lever being composed of an inner arm which is connected with a signal-plate and an outer arm by which the lever is manipulated, substantially as set forth.

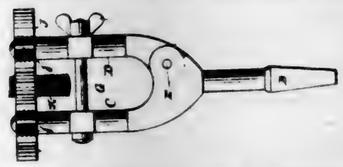
6. The combination of a lamp provided in its side with a light-opening, an upright guideway intersecting said opening, circular signal-plates arranged one behind the other in said guideway, actuating-levers pivoted, respectively, in the front and rear walls of said guideway and having inner arms connected with said signal-plates and outer manipulating-arms, and stops on the guideway for limiting the movement of said outer arms, substantially as set forth.

7. The combination of a lamp provided in its side with a light-opening, an upright guideway which intersects said opening, a circular signal-plate arranged in said guideway, an actuating-lever having a suitable fulcrum, said lever being composed of an outer manipulating-arm and an inner disk-shaped member, and a pivot which is arranged on said disk-shaped inner member, near the periphery thereof, and connects the same with said signal-plate near the periphery thereof, substantially as set forth.

8. The combination of a lamp provided in its side with a light-opening, an upright guideway intersecting said opening and provided with a circular opening, an actuating-lever arranged with its hub in said opening and provided with an inner and an outer arm on opposite sides of the wall of the guideway, and a circular signal-plate arranged in said guideway and connected directly with the inner arm of said lever, substantially as set forth.

9. The combination with the guideway and a signal-plate movable in the same, of an actuating-lever composed of two arms, one of which has a projecting hollow hub which is provided on diametrically opposite sides with openings in which the other arm is secured, substantially as set forth.

705,809. ADJUSTABLE THREAD-CUTTING TOOL. HARRY B. YATES, Slater, Mo. Filed Mar. 14, 1901. Serial No. 51,054. (No model.)

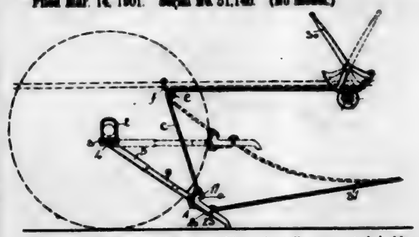


Claim.—1. A thread-cutting tool comprising two rotary members provided each with a plurality of cutting devices each of which, when the said rotary members have been rotated to the proper position, coöperates with a corresponding cutting device on the other rotary member, means for adjusting the said rotary members toward and from each other, and each rotary member being provided with a locking device adapted to engage the opposite rotary member for preventing transverse movement of the said rotary members when they have been adjusted to the desired position, substantially as described.

2. A thread-cutting tool comprising two rotary members provided each with a plurality of faces having each a cutting device which, when the rotary members have been rotated to the proper position, coöperates with a corresponding cutting device on a corresponding face of the other rotary member, and corresponding faces of the two rotary members being provided with interlocking projections and recesses for preventing transverse movement of the rotary members, and means for adjusting the two members toward and from each other, substantially as described.

3. A thread-cutting tool comprising two rotary members provided each with a plurality of faces having each a cutting device which, when the rotary members have been rotated to the proper position, coöperates with a corresponding device on a corresponding face of the other rotary member, and corresponding faces being provided with interlocking projections and recesses for preventing transverse movement of the rotary members, the disposition of the said projections and recesses being such that only those on corresponding faces will properly register, and means for adjusting the said two rotary members toward and from each other, substantially as described.

705,810. HORSE-HITCHER. PHILIP K. YOUNG, Omaha, Nebr. Filed Mar. 14, 1901. Serial No. 51,140. (No model.)

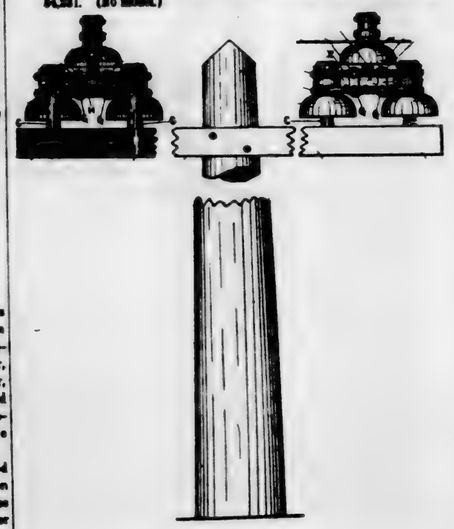


Claim.—1. The combination with a pivotally-supported holder, of a bar yieldingly held within said holder, a latch secured to said bar, and a trip held by said latch.

2. The combination in a device of the character described of a pivotally-supported holder, a bar yieldingly held within said holder a lever pivotally secured to the end of said bar and a keeper to lock said lever, as and for the purpose set forth.

3. In combination with a pivotally-supported tube provided with slots upon opposite sides, of a bar working within said tube provided with trunnions extending through said slots, a spring working against said bar to normally force the same outward, a stub-bar secured to said first-mentioned bar, said bar being provided with two steps and a supporting-pin, a keeper secured to said first-mentioned bar, a tilting lever secured to the end of said stub-bar and adapted to be engaged by said keeper, and means to actuate said keeper, as and for the purpose set forth.

705,811. INSULATING-SUPPORT FOR METALLIC CIRCUITS. JOHN S. ALLEN, Los Angeles, Cal. Filed Nov. 20, 1901. Serial No. 84,231. (No model.)

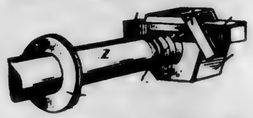


Claim.—1. A support for electric wires comprising two insulators mounted upon the cross-arm; a core interposed between said insulators and supported thereby; a yoke surrounding and uniting said insulators and core; and a third insulator mounted in said core.

2. An insulating-support for electric wires comprising a cross-arm affixed to a pole; two pins mounted in said cross-arm; an insulator on each pin; a core between said insulators, resting thereon and supported thereby; a yoke uniting said core and insulators and affixed thereto; a pin mounted in said core and carrying an insulator adapted for the attachment thereto of an electric wire.

3. A support for an electric wire comprising two insulators mounted upon the cross-arm, a yoke surrounding and supported by said insulators and adapted to receive a support for a third insulator, a third insulator mounted upon a support in said yoke.

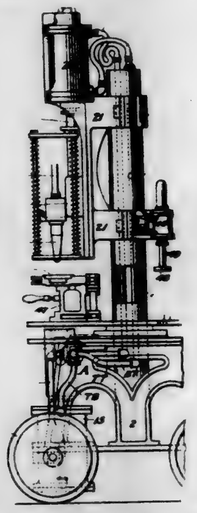
705,812. NUT-LOCK. HUGH ANDERSON, Wellsville, Ohio, assignor of one-half to Charles C. Lawson, Wellsville, Ohio. Filed Dec. 3, 1901. Serial No. 84,502. (No model.)



Claim.—1. In a nut-lock, the combination with a bolt and a nut having a recess formed therein, a key carrying engaging teeth secured in said recess of said nut, a staple producing a wedging action between said nut and key and engaging one of said teeth in the screw-threads of said bolt, substantially as described.

2. In a nut-lock, the combination of a bolt, a washer, a nut having a recess formed therein, a key having a central cut-away portion, inwardly-extending teeth formed on said key, said key arranged in the opening of said nut, and a staple secured between said nut and key to engage one of said teeth in the screw-threads of said bolt, all parts being arranged and operating substantially as described.

705,818. APPARATUS FOR FORMING GLASS ARTICLES. JAMES A. ARNOLD, Allegheny, Pa. Filed May 23, 1901. Serial No. 61,434. (No model.)



Claim.—1. In apparatus for forming glass articles, the combination of a rotating mold-carrier, a press-mold, a press-mold cylinder, a plunger-cylinder in alinement with the press-mold cylinder, a plunger, and a single valve for controlling the supply and exhaust of fluid to and from each end of said cylinders.

2. In apparatus for forming glass articles, the combination of a rotating mold-carrier, a press-mold, a press-mold cylinder, a plunger-cylinder in alinement with the press-mold cylinder, a plunger, means for controlling the supply and exhaust of fluid to and from said cylinders consisting of a single element, and intervening connections therefrom to each end of each cylinder.

3. In apparatus for forming glass articles, the combination of a rotating mold-carrier, a press-mold, a press-mold cylinder, a plunger-cylinder in alinement with the press-mold cylinder, a plunger, a blowing-cylinder situate above the carrier, a valve for controlling the supply and exhaust of fluid to and from each end of the press-mold cylinder and plunger-cylinder respectively, and a valve for controlling the supply and exhaust to and from the blowing-cylinder.

4. In apparatus for forming glass articles, the combination of a main frame provided with a horizontal rotating mold-supporting table, a press-mold, a cylinder provided with a piston attached to and supporting the press-mold, a plunger-cylinder situate above the press-mold cylinder provided with a piston connected with a plunger, a controlling-valve, and connections therefrom to each end of each cylinder for supplying intermittent fluid-pressure to said cylinders.

5. In apparatus for forming glass articles, the combination of a main frame provided with a horizontal mold-supporting table, a press-mold cylinder adapted to actuate a press-mold, a plunger-cylinder situate above the press-mold cylinder adapted to actuate a plunger, means for establishing a cushioning pressure in the cylinders, and means for supplying intermittent fluid-pressure to the cylinders.

6. In apparatus for forming glass articles, the combination of a main frame provided with a horizontal mold-supporting table, a press-mold cylinder provided with a piston supporting the press-mold, a plunger-cylinder situate above the press-mold cylinder provided with a piston connected with a plunger, means for establishing a cushioning pressure in the cylinders, and means for supplying intermittent fluid-pressure to each end of each cylinder, substantially as set forth.

7. In apparatus for forming glass articles, the combination of a main frame, a press-mold cylinder mounted thereon adapted to operate a press-mold vertically, a central mast supporting a plunger-cylinder above the press-mold cylinder, and a valve with connections therefrom to the top and bottom of the press-mold cylinder and the plunger-cylinder respectively, so as to establish therein intermittent fluid-pressure, substantially as set forth.

8. In apparatus for forming glass articles, the combination of a main frame, a press-mold cylinder mounted thereon adapted to operate a press-mold vertically, a central hollow mast supporting a plunger-cylinder above the press-mold cylinder, and a valve with connections therefrom to the top and bottom of the press-mold cylinder and the plunger-cylinder respectively, so as to establish therein intermittent fluid-pressure, such connections from the valve to the plunger-cylinder passing upwardly through the hollow mast, substantially as set forth.

9. In apparatus for forming glass articles, the combination of a main frame provided with a central mast, a press-mold cylinder mounted upon the main frame adapted to operate a press-mold vertically, a plunger-cylinder adjustably mounted upon the mast, and supporting a plunger in alinement with the press-mold, a controlling-valve, and means for supplying intermittent pressure therefrom to each end of each cylinder, substantially as set forth.

10. In apparatus for forming glass articles, the combination of a main frame provided with a central mast, a press-mold cylinder mounted upon the main frame, adapted to operate a press-mold vertically, a vertically-adjustable frame mounted upon the mast supporting a plunger-cylinder, the plunger, and its connected mechanism; and a controlling-valve with connections therefrom to each end of the press-mold cylinder and plunger-cylinder respectively, so as to establish therein intermittent fluid-pressure, substantially as set forth.

11. In apparatus for forming glass articles, the combination of a main frame provided with a central mast, a press-mold cylinder mounted in the main frame, adapted to operate a press-mold vertically, a supporting-framework adjustably mounted upon the hollow mast, carrying the plunger-cylinder, a plunger, and its connected mechanism, a blowing-cylinder rigidly connected with the framework, a controlling-valve with connections therefrom to each end of the press-mold cylinder and plunger-cylinder respectively, so as to establish therein intermittent fluid-pressure, and a valve with connections to the blowing-cylinder, substantially as set forth.

12. In apparatus for forming glass articles, the combination of a main frame provided with a central hollow mast, a press-mold cylinder mounted in the main frame adapted to operate a press-mold vertically, a supporting-framework adjustably mounted upon the hollow mast, carrying the plunger-cylinder, a plunger, and its connected mechanism; a blowing-cylinder rigidly connected with the framework, a controlling-valve with connections to the blowing-cylinder, the connections to and from the valve to the blowing-cylinder being located within the hollow mast, substantially as set forth.

13. In apparatus for forming glass articles, the combination of a main frame provided with a central hollow mast, a press-mold cylinder mounted in the main frame, adapted to operate a press-mold vertically; a supporting-framework adjustably mounted upon the hollow mast, carrying a plunger-cylinder, a plunger, and its connected mechanism; a blowing-cylinder rigidly connected with the framework; a controlling-valve with connections to the blowing-cylinder within the hollow mast, such connections being provided with flexible connecting portions whereby the cylinder may be adjusted with relation to the valve, substantially as set forth.

14. In apparatus for forming glass articles, the combination of a main frame, provided with a central mast, a rotatable mold-supporting table mounted upon the main frame, a press-mold cylinder supported in the frame adapted to operate a press-mold vertically, a supporting-framework adjustably mounted upon the mast carrying a plunger-cylinder, a plunger, and its connected mechanism; means for establishing intermittent fluid-pressure in the plunger-cylinder, and press-mold cylinder, and a blowing-cylinder rigidly connected with the framework; a controlling-valve; connections therefrom to the blowing-cylinder, and a treadle device for operating such valve, substantially as set forth.

15. In apparatus for forming glass articles, the combination of a main frame provided with a central mast, a rotatable mold-supporting table mounted upon the main frame, a press-mold cylinder supported in the frame adapted to operate a press-mold vertically, a supporting-framework adjustably mounted upon the mast carrying a plunger-cylinder; a plunger, and its connected mechanism; means for establishing intermittent fluid-pressure in the plunger-cylinder and press-mold cylinder; a blowing-cylinder rigidly connected with the framework; a controlling-valve, connections therefrom to the blowing-cylinder, a treadle device for operating such valve, a controlling-valve for both mold-cylinder and plunger-cylinder, and connections from such valve to such cylinders, substantially as set forth.

16. In apparatus for forming glass articles, the combination of a main frame provided with a central hollow mast, a rotatable mold-supporting table mounted upon the main frame, a press-mold cylinder supported on the frame adapted to operate a press-mold vertically, a supporting-framework adjustably mounted upon the hollow mast carrying a plunger-cylinder, a plunger, and its connected mechanism; means for cooling the plunger, a blowing-cylinder rigidly connected with the framework, a controlling-valve, connections therefrom to the blowing-cylinder, a treadle device for operating such valve, a controlling-valve for both the mold and plunger cylinders, so as to establish therein intermittent fluid-pressure, and connections from such valve to such cylinders, substantially as set forth.

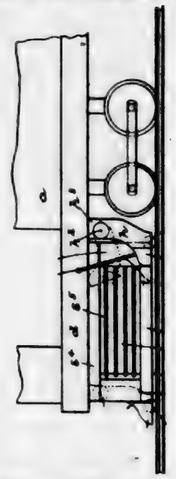
17. In apparatus for forming glass articles, the combination of a main frame, a press-mold cylinder mounted thereon adapted to operate a press-mold vertically, a plunger-cylinder situate above the press-mold cylinder provided with a piston connected with the plunger, such plunger being in alinement with the press-mold, means for supplying fluid-pressure to the cylinders, and means located at each end of each cylinder for equalizing the pressure therein at the termination of the stroke, substantially as set forth.

18. In apparatus for forming glass articles, the combination of a main frame, a press-mold cylinder mounted thereon adapted to operate a press-mold vertically, a central mast, a framework adjustably mounted thereon, a plunger-cylinder supported upon the framework above the mold-cylinder, a controlling-valve with connections to the mold-cylinder and plunger-cylinder respectively, and a blowing-cylinder mounted upon the framework provided with a seating device, adapted to be adjusted upon a blow-mold and to deliver air-pressure thereto, a valve controlling the operation of such device, and connections from such valve to the blowing-cylinder, whereby air-pressure is supplied to it for the purposes set forth.

19. In apparatus for forming glass articles, the combination of a main frame provided with a central hollow mast, a rotatable mold-supporting table mounted upon the main frame, a blowing-cylinder adjustably mounted upon the mast and adapted to aline with the molds of the table, such blowing-cylinder being provided with a piston having a hollow stem and a perforated disk adapted to be set upon a blow-mold, air-pressure connections to the blowing-cylinder whereby its piston is raised or lowered and whereby pressure is established through the hollow stem in the blow-mold; a controlling-valve in communication with the connections to the blowing-cylinder, and treadle mechanism for actuating the controlling-valve, substantially as set forth.

20. In apparatus for forming glass articles, the combination of a main frame provided with a central hollow mast, a rotatable mold-supporting table mounted upon the main frame, a blowing-cylinder adjustably mounted upon the mast and adapted to aline with the molds of the table, such blowing-cylinder being provided with a piston having a hollow stem, means for holding such stem in a raised position independent of the air-pressure, a disk at the lower end of the hollow stem adapted to be set upon the blow-mold, air-pressure connections with the blowing-cylinder whereby its piston is raised or lowered, and whereby pressure is established through the hollow stem in the blow-mold, and a controlling-valve in communication with the connections to the blowing-cylinder, substantially as set forth.

705,814. FENDER OR GUARD FOR TRAMWAY-CARS. JOHN BAUER, New York, N. Y. Filed Mar. 19, 1902. Serial No. 98,886. (No model.)



Claim.—1. A fender or guard for tramway-cars comprising main side members supported beneath the platform of a car in a V shape or triangular position, the apex thereof being directed forwardly, a supplemental member hinged beneath the platform of the car in the apex of the main side members and provided at its lower end with a wheel or roller, and other supplemental members hinged beneath the platform of the car at the rear end thereof and at the rear ends of the side members and provided with wheels or rollers adapted to travel on the rails of the track, substantially as shown and described.

2. A fender or guard for tramway-cars comprising side members supported beneath the platform of a car in a V shape or triangular position, the apex thereof being directed forwardly, a supplemental member hinged to the platform of the car, at the rear end thereof and at the rear ends of the side members and provided with wheels or rollers adapted to travel on the rails of the track, said last-named supplemental members being provided with means for raising them and holding them in a lifted position, substantially as shown and described.

705,815. BARREL HOOK OR HANDLE. GEORGE H. BERCHIPS, Summit, N. J. Filed May 7, 1901. Serial No. 59,083. (No model.)

Claim.—1. An improved barrel-hook, comprising a rod bent into two parallel loops *c*, *c*, the ends of one pair of arms having inward-projecting spurs *d*, and the ends of the other arms being connected by an outwardly-bent handle.

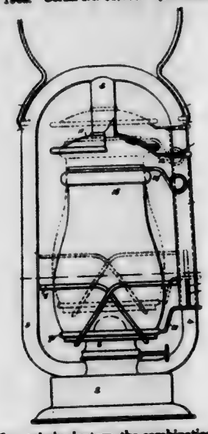
2. The herein-described barrel-hook, consisting of a piece of iron rod bent into parallel loops adapted to set down over the edge of a barrel, and each having arms of substantially equal length, one arm of each loop forming at its extremity an inwardly-turned spur, and the other two arms being connected by an integral handle bent out of the middle portion of the rod.

3. In a barrel-hook, the combination with a handle portion, of a U-shaped loop *c*, adapted to set down over the edge of a barrel, one arm of said loop having at its extremity an inwardly-projecting spur, and the other arm being of a length not less than the first said arm and connected at its extremity to said handle.

4. A barrel-hook comprising two parallel rigid loops of an inverted-U shape and adapted to set down over the edge of a barrel, one arm of each loop having at its end an inwardly-pointing spur and the other arms being connected to an outwardly-extending handle, said spurs and handle all lying substantially in a plane disposed at right angles to the loop.

5. A barrel-hook having parallel loops *c*, *c*, adapted to set down over the edge of a barrel at a little distance apart, said loops each having an inwardly-directed spur on one arm, and the other arms being connected by a handle bent outward to clear the curved side of the barrel.

705,816. LANTERN. ALBERT T. BISHOP, Southington, Conn. Filed Mar. 24, 1902. Serial No. 99,775. (No model.)



Claim.—1. In a tubular lantern, the combination with the side tubes thereof, of a vertically-movable sleeve arranged upon one of said tubes, rigid connection between the sleeve and globe-rest and swivel connection between the sleeve and a portion of the lantern above the globe whereby the upward movement of the sleeve will raise the globe and a portion of the lantern above the same, so as to permit the globe to be swung to one side, substantially as described.

2. In a tubular lantern, the combination with one of the said tubes, hood and globe-rest thereof, of a vertically-movable sleeve arranged on said tube, a swivel connection between the hood and the upper end of the sleeve, and a rigid connection between the globe-rest and lower end of the sleeve, substantially as described.

705,817. SHOE-FASTENER. MILTON S. BROWN, Washington, D. C. Filed Dec. 14, 1901. Serial No. 85,910. (No model.)

Claim.—1. In a shoe-fastener, the combination with lacing-eyelets extending part way up the meeting edges of the upper, of short lacing-loops attached to the upper above said eyelets and lying just below the line of the ankle-joint, long lacing-loops attached to the upper just above the line of the ankle-joint and extended substantially to the upper-top, and a lace crossed and recrossed through the eyelets and loops and retained against removal therefrom, substantially as set forth.

2. In a shoe-fastener, short lacing-loops attached adjacent the edges of the upper and below the line of the ankle-joint, and long lacing-loops also attached adjacent the edges of the upper and above the line of the ankle-joint, said long loops extending to substantially the top of the upper, substantially as set forth.

3. In a shoe-fastener, a single long lace-receiving loop on each side of the upper-opening and extending from just above the line of the ankle-joint to substantially the top of the upper, said loops being curved slightly toward each other for a purpose substantially as set forth.

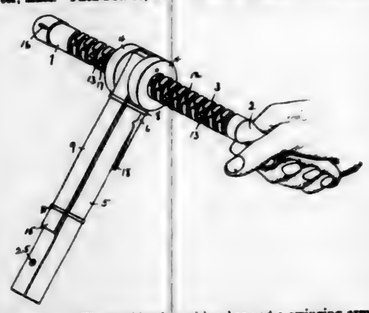
705,818. INCANDESCENT GAS-LAMP. FRANK M. BROOKS, Brooklyn, N. Y. Filed Oct. 4, 1901. Serial No. 77,512. (No model.)

Claim.—1. In an incandescent gas-lamp the combination of a globe-holder provided with a horizontal flange having recesses and ledges between the recesses, a gallery connected with the burner having projections adapted to pass through the recesses in the flange of the holder to engage with the ledges thereof, locking devices engaging with inside ledges and projections which prevent accidental disengagement of the said parts and a gas-cock and operating devices therefor located below the burners.

2. In an incandescent gas-lamp the combination of a globe-holder provided with an inwardly-extending horizontal flange having a centrally-located opening large enough to permit the easy passage therethrough of the operating devices for the gas-cock, the inner edge of said flange having recesses and ledges between the recesses, a gallery connected with the burner having a perforated bottom for the free passage of the air and having also projections adapted to pass through the recesses in the flange of the globe-holder and to engage with the ledges thereof and a gas-cock and operating devices therefor located below the globe-support.

3. In an incandescent gas-lamp the combination of a globe-holder provided with an inwardly-extending horizontal flange, said flange having a central opening large enough to permit the devices which operate the gas-cock to pass freely through it, recesses and ledges between the recesses on the inner edge of said flange, a gallery connected with the burner and having projections adapted to pass through the recesses in the flange of the holder to engage with the ledges thereof, locking devices engaging with inside ledges and projections which prevent accidental disengagement of the said parts and a gas-cock and operating devices therefor located below the burners.

705,819. RHYTHMICAL RATTLE. LOUIS S. BURBANK, Worcester, Mass. Filed Dec. 10, 1900. Serial No. 39,304. (No model.)



Claim.—1. The combination with a bar and a swinging arm capable of rotating about said bar, of a series of notches on said bar, a yielding tooth arranged to engage said notches, and means for advancing said arm along said bar, substantially as described.

2. The combination of a bar provided with a series of notches of varying distances apart, a swinging arm capable of rotating about said bar, and a yielding member carried by said arm and arranged to engage said notches, whereby with a uniform movement of the swinging arm sounds are produced with varying intervals, substantially as described.

3. The combination of a bar provided with a screw-thread, a swinging arm capable of rotating about said bar, and means for engaging said screw-thread, whereby said arm is traversed along said bar, a yielding member carried by said arm, and means on said bar for engaging said yielding member and producing a snapping sound as the arm travels along said bar, substantially as described.

4. The combination in a rhythmical rattle, of a stationary, notched member provided with notches varying in distance apart and in depth, an arm arranged to swing around said notched member and a yielding member carried by said arm and arranged to snap against the arm as actuated by said notched member and produce a series of rhythmical sounds varying in accent and at varying intervals, substantially as described.

5. The combination of a bar and an arm capable of rotating around said bar, of a series of notches of varying depth on said bar, and a yielding member carried by said arm and arranged to engage said notches, whereby a series of snapping sounds are produced with an accent, substantially as described.

6. The combination of a bar and a swinging arm, of a screw-thread on said bar, a lever pivoted on said arm, yielding means for normally holding said lever in engagement with said screw-thread, whereby said arm is traversed along said bar, a yielding member carried by said arm, and means on said bar for intermittently engaging said yielding member and producing a succession of snapping sounds, substantially as described.

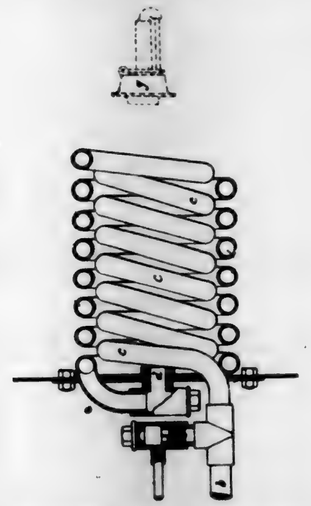
7. The combination of a bar provided with a screw-thread, a swinging arm capable of rotating about said bar, means carried by said arm for engaging said screw-thread, whereby said arm is traversed along said bar, means for disengaging said arm from said screw-thread, a series of notches in said screw-thread, a yielding member carried by said arm and arranged to engage said notches, substantially as described.

8. The combination of a bar provided with a screw-thread having a series of notches 12 in abutment, an arm capable of rotating around said bar, a lever pivoted on said arm and engaging said screw-thread, a yielding member carried by said arm and provided with a tooth arranged to snap into said notches, means for disengaging said arm from said screw-thread, substantially as described.

9. The combination of a bar provided with a screw-thread, an arm capable of swinging around said bar, means carried by said arm for engaging said screw-thread, a row of notches 12, a yielding member carried by said arm and provided with a tooth engaging said notches, and a stop for checking the rotation of said arm, with its tooth in said row of notches, substantially as described.

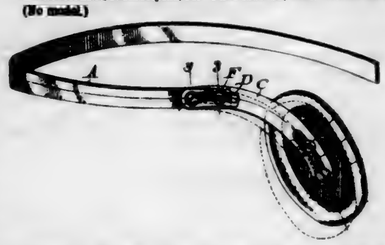
10. The combination of a bar provided with a screw-thread having a series of notches, collars 4, 4, inclosing said bar, a swinging arm having one end attached to said collars, means carried by said arm for engaging said screw-thread, a vibrating tongue pivoted at one end to said collars, yielding means for holding its free end in contact with said arm, a tooth on said tongue arranged to slide on the periphery of said screw-thread, and a series of notches in said screw-thread, substantially as described.

705,820. OIL-BURNER. JOHN S. CHENHALLS, Plymouth, England. Filed Feb. 28, 1902. Serial No. 96,168. (No model.)



Claim.—In combination, an oil-pipe, an exhaust-pipe, a connection between the said pipes, a check-valve in said connection closing toward the oil-pipe, a pipe *c* connecting with the exhaust-steam pipe *b* and comprising inner and outer coils, the outer coil having a vapor-discharge nozzle arranged to discharge vapor centrally through the coil, substantially as described.

705,821. HERNIAL TRUSS. JOHN H. CHESTERMAN and DANA L. CHESTERMAN, Philadelphia, Pa., assignors to Chesterman & Streeter, a firm composed of Edwin Chesterman, John H. Chesterman, and Dana L. Chesterman, Philadelphia, Pa. Filed Mar. 22, 1902. Serial No. 99,395. (No model.)

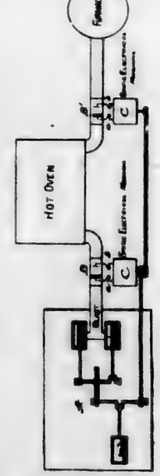


Claim.—1. In a truss, a pad, a spring, and a downwardly-deflected plate adapted to connect said pad with said spring, the opposite end portions of said plate having matched slots therein for the connecting members of said plate and pad in either the right or the left disposed position of said plate, substantially as described.

2. In a truss, a curved plate adapted to connect the pad and spring of the truss, opposite end portions of said plate having curved matched slots therein for the connecting-screws of said pad, substantially as described.

3. In a truss, a pad, a spring and a curved plate adapted to connect said pad with said spring, the opposite end portions of said plate having matched curved slots therein for the connecting-screws of said plate and pad in either the right or left disposed position of said plate, said slots and the shanks of said screws admitting of the adjustment of said plate in both longitudinal and lateral directions, substantially as described.

705,822. BLAST OR OTHER FURNACE. ELLERY F. COFFIN, Muirkirk, Md., assignor of one-fourth to Charles H. Coffin, Muirkirk, Md. Filed Mar. 27, 1901. Renewed May 31, 1902. Serial No. 109,809. (No model.)



Claim.—1. The improvement in the art of operating furnaces requiring a blast of air, consisting in drying the air by passing an electric current through it and then forcing the dried air into the furnace, substantially as described.

2. The improvement in the art of operating furnaces requiring a blast of air consisting in drying the air by passing a diffused electric current through it and then forcing the dried air into the furnace, substantially as described.

3. The improvement in the art of operating furnaces requiring a blast

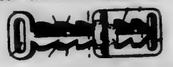
of air, consisting in passing a current of electricity through the air to eliminate a part of the moisture, heating the air and then passing the dried air to the furnace, substantially as described.

4. The herein-described process of drying a blast or current of air, by passing an electric current through it, and then passing the dry air to the point of use.

5. The process of facilitating the reduction of iron in a blast-furnace, which consists in subjecting to an electric discharge a column of rapidly-moving air under pressure and forcing said air into the furnace.

6. The process hereinbefore described consisting in subjecting a blast or current of air to an electric discharge and then passing the air thus treated to the point of use, substantially as described.

705,823. CLASP OR FASTENER. NEWTON CRANE, Boston, Mass. Filed Dec. 12, 1898. Serial No. 699,016. (No model.)



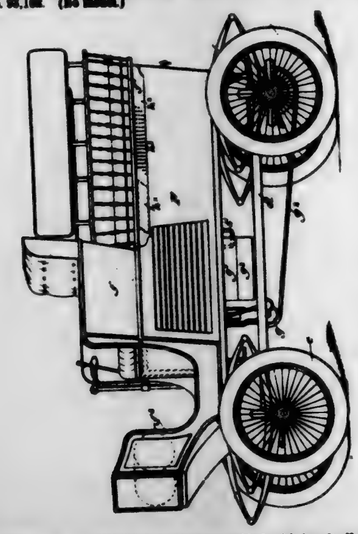
Claim.—1. A clasp member V shape in cross-section and having provisions at its outer end for attachment to a shoe or arctic, said member being elongated, and having two separated parallel series of upwardly or outwardly projecting engaging shoulders.

2. A clasp member having provisions at its outer or rear end for attachment to a shoe or arctic, said member being elongated and having its edges bent outward and notched to provide a plurality of engaging shoulders or parts.

3. A clasp member having provisions at its outer end for attachment to a shoe or arctic, said member being longitudinally curved and V-shaped in cross-section, and being provided with two parallel rows of upwardly or outwardly projecting engaging shoulders, which extend substantially from end to end of said member.

4. A clasp or fastener consisting of two members having provisions at their outer ends for attachment to a shoe or arctic, one member having two separated parallel rows of engaging upwardly or outwardly projecting shoulders, and the other member being substantially flat and being adapted to receive the first-mentioned member and having an engaging portion for the shoulders of each row of said first-mentioned member.

705,824. AUTOMOBILE. SAMUEL T. DAVIS, Jr., Ardsley-on-Hudson, N. Y., assignor to the "Locomobile" Company of America, New York, N. Y., a Corporation of West Virginia. Filed Feb. 8, 1902. Serial No. 93,102. (No model.)



Claim.—1. A steam-motor vehicle provided with longitudinal side seats having a steam-engine and a steam-generator, the latter being provided with a plurality of draft-flues extending outwardly and then rearwardly to such a distance as to leave between said rearwardly-extended flues and between said longitudinal side seats an available and useful space.

2. A steam-motor vehicle, the steam-generator of which is provided with a plurality of rearwardly-extended longitudinally-arranged draft-flues having perforated side walls.

3. The combination with a motor-vehicle body having laterally-overhanging portions of a steam-generator carried beneath said body and provided with a longitudinal draft-flue arranged under one of said overhanging portions.

4. The combination with a motor-vehicle body having laterally-overhanging portions of a steam-generator carried beneath said body and provided with a longitudinal draft-flue arranged under one of said overhanging portions and having a closely-perforated side wall.

5. The combination with a motor-vehicle body having laterally-overhanging portions of a steam-generator carried beneath said body and provided with longitudinal draft-flues arranged respectively under the said overhanging portions.

6. The combination with a motor-vehicle body provided with longitudinal side seats of a steam-generator and a steam-engine carried beneath said body, the former being provided with a hood having flues extending divergently and rearwardly and longitudinal draft-flues communicating therewith and extending to the rear of said generator and contiguous to the sides of said vehicle-body and leaving an available and useful space between said flues and between said longitudinal side seats.

7. In a motor-vehicle the combination of a steam-generator a plurality of draft-flues extending outwardly and then rearwardly, having each a plurality of outlets at the side of the vehicle and a downdraft-flue in communication therewith.

8. In a motor-vehicle the combination of a steam-generator, a plurality of draft-flues extending outwardly and then rearwardly having each a plurality of outlets at the side of the vehicle, a downdraft-flue in communication therewith, and an exhaust-steam-supply device arranged in said downdraft.

9. In a motor-vehicle the combination of a steam-generator, a draft-flue extending rearwardly at the side of the body, having a plurality of side outlets, a downdraft-flue in communication therewith and an exhaust-steam-supply device arranged in said downdraft.

10. In a motor-vehicle, a body provided with longitudinal side seats, a steam-generator on said body, and one or more longitudinally-arranged draft-flues therefor, arranged under said seats.

11. In a motor-vehicle a body, a steam-generator, and a plurality of connected water-supply tanks therefor, arranged in the rear of said generator and separated to provide available and useful space between.

12. In a motor-vehicle a body provided with longitudinal side seats, a steam-generator, and connected water-supply tanks therefor arranged respectively beneath said seats, leaving available and useful foot-space between.

13. In a motor-vehicle, a body provided with a transverse seat, longitudinal seats in the rear thereof, and a dasher-box in front thereof, a steam-generator, a hydrocarbon-burner therefor and its fuel-supply tank arranged in said dasher-box; and a plurality of feed-water-supply tanks arranged beneath said longitudinal seats with useful space between.

14. A steam-motor vehicle provided with a body having a rearwardly-extending useful available space for carrying and transportation purposes, a steam-engine, a steam-generator therefor, the latter being provided with a plurality of draft-flues extending outwardly and then rearwardly contiguous to the sides of the vehicle to such a distance as to embrace between said rearwardly-extended flues said useful and available carrying-space.

15. A steam-motor vehicle the steam-generator of which is provided with a rearwardly-extended draft-flue arranged in a substantially longitudinal direction contiguous to the side of the vehicle and having outlet-passages at the side thereof.

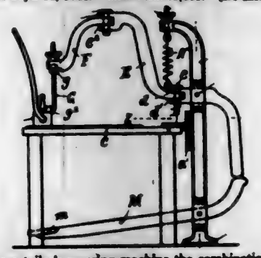
16. A steam-motor vehicle, the steam-generator of which is provided with a draft-flue extending outwardly and then rearwardly in a substantially longitudinal direction having a plurality of outlet-passages at the side of the vehicle.

705,825. TROLLEY HEAD AND WHEEL. WALTER A. E. DAVIS, Toledo, Ohio, assignor to W. H. Lidell, Brooklyn, N. Y. Filed Dec. 18, 1901. Serial No. 86,377. (No model.)

Claim.—1. In a trolley-head, the combination of a socket-piece formed with upper and lower bearing-lugs; a trolley-head formed with a vertical bearing-piece fitted between said lugs and pivoted thereto to swing laterally, said trolley-head having inwardly and downwardly turned flanges; a trolley-wheel journaled in the head, a vertically-sliding bracket disposed between the side plates of the head, having vertical standards terminating in curved upper ends, and a lever to actuate the bracket.

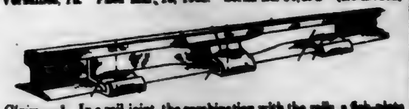
2. In a trolley-head, the combination of a socket-piece formed with upper and lower bearing-lugs, a trolley-head formed with a vertically-bearing piece fitted between said lugs and pivoted thereto to swing laterally, said trolley-head having inwardly and downwardly turned guide-flanges, a trolley-wheel journaled in the head, a vertically-sliding bracket disposed between the side plates of the head and formed with curved upper ends, a lever to actuate the bracket, guide-arms pivotally fixed to the sides of the trolley-head, a trolley-rope to move the lever, and connections between the rope and the guide-arms to move the arms.

705,826. TAILOR'S PRESSING-MACHINE. JOHN DEERE, Cincinnati, Ohio, assignor of one-half to Chris Frankenstein, Cincinnati, Ohio. Filed Sept. 11, 1901. Serial No. 75,005. (No model.)



Claim.—In a tailor's pressing-machine the combination of a standard, an upper and a lower lever pivoted to the standard each to swing in a vertical plane the lower lever bearing upward against the upper, a spring attached to the upper end of the upper lever and to the standard at a point above the lever, an arm coupled to the upper end of the upper lever to swing in a horizontal plane, and a second arm coupled to the free end of the first arm to swing in a horizontal plane, substantially as shown and described.

705,827. RAIL-JOINT. JOSEPH W. DEERE and JOHN D. DEVORE, Versailles, Pa. Filed Mar. 10, 1902. Serial No. 97,494. (No model.)



Claim.—1. In a rail-joint, the combination with the rails, a fish-plate carrying pins or studs, chair portions on each end having upturned ends formed integral with said fish-plate, a central rib carrying an upward extension, a fish-plate carrying extensions adapted to interlock in the upturned ends of the chair portions, substantially as described.

2. In a rail-joint, the combination with the rails, a fish-plate carrying pins or studs extending inwardly, chair portions carrying upturned ends formed integral with said fish-plate, a central rib carrying upward extensions, the fish-plate having a central recess or seat formed therein, downward extensions formed integral with said fish-plate adapted to interlock said chair portions and central rib, all parts being arranged and operating substantially as described.

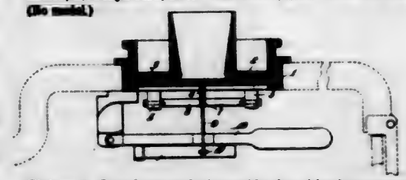
705,828. HEATING-STOVE. WILLIAM DEMUTH, Pittsburg, Pa. Filed Feb. 20, 1902. Serial No. 94,600. (No model.)

Claim.—1. In a gas-stove, the combination of a casing, partitions arranged therein adjacent to the side walls thereof forming chambers between said partitions and the side walls of the casing, said chambers in communication with the open air, a fireback having a curved upper end, a rearchamber between the fireback and the rear wall of the casing, said chamber in communication with the open air, a hood mounted in the casing above the curved upper end of the fireback forming a chamber in communication with the rear chamber and the side chambers, and a cover on the casing forming a chamber above the hood which is in communication with the exit-flue, substantially as described.

2. In a gas-stove, the combination of a casing partitions arranged therein and forming chambers between the same and the side walls of the casing, a fireback having a curved upper end, a chamber between the fireback and the rear wall of the casing and in communication with the open air, a curved hood mounted over the curved upper end of the fireback forming a hot-air chamber which is in communication with the side and rear chambers, and a cover for said casing forming a chamber above the hood which is in communication with the side and rear chambers, substantially as described.

3. In a gas-stove, the combination of a casing, partitions therein adjacent to the side walls of the casing forming side chambers in communication with the open air, a fireback having a forwardly-curved upper end, a rear chamber between the fireback and the rear wall of the casing in communication with the open air, a hood forming a hot-air chamber between the same and the upper end of the fireback and in communication with the rear chamber, and a chamber above said hot-air chamber in communication with the exit-flue and side chambers, substantially as described.

705,829. REPRODUCER FOR SOUND-RECORDS. THOMAS A. EDISON, Llewellyn Park, N. J. Filed Nov. 8, 1901. Serial No. 81,886. (No model.)



Claim.—1. In a phonograph, the combination with a sinuous grooved record, of a stylus presenting a curved extended bearing-surface engaging the record and vibrating in a plane parallel with the record-surface, an arm for carrying said stylus and vibrating with respect to a support extending substantially perpendicular to the record-surface, a diaphragm, and connections between said arm and the diaphragm, substantially as set forth.

2. In a reproducer for effecting reproductions from a sinuous grooved record, the combination of a diaphragm, a stylus presenting a curved extended bearing-surface engaging the record and vibrating in a plane parallel with the record-surface, and connections between said stylus and diaphragm, substantially as set forth.

3. In a reproducer for effecting reproductions from a sinuous grooved record, the combination of a diaphragm, a stylus presenting a curved extended bearing-surface engaging the record and vibrating in a plane parallel with the record-surface, connections between said stylus and diaphragm, and a compensating weight for engaging the stylus with the record and for compensating for mechanical variations or eccentricities in the latter, substantially as set forth.

4. In a reproducer for effecting reproductions from a sinuous grooved record, the combination of a diaphragm, a stylus presenting a curved extended bearing-surface engaging the record and vibrating in a plane parallel with the record-surface, connections between said stylus and diaphragm, and a compensating weight which carries the stylus for engaging the stylus with the record and for compensating for mechanical variations or eccentricities in the latter, substantially as set forth.

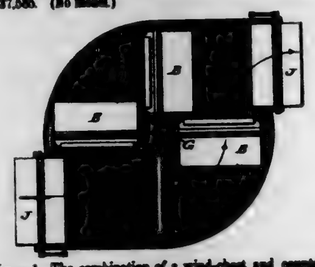
5. In a reproducer for effecting reproductions from a sinuous grooved record, the combination of a diaphragm, a spring maintained under a normal tension, connections between said spring and diaphragm, and a reproducer carried by the spring for engaging the record and vibrating in a plane parallel to the record-surface, substantially as set forth.

6. In a reproducer for effecting reproductions from a sinuous grooved record, the combination of a diaphragm, a pivoted compensating weight, a spring carried by said compensating weight and maintained under tension, connections between said spring and diaphragm, and a reproducer carried by the spring for engaging the record and vibrating in a plane parallel to the record-surface, substantially as set forth.

7. In a reproducer for effecting reproductions from a sinuous grooved record, the combination of a diaphragm, a spring maintained under a normal tension, a bell-crank lever between said spring and diaphragm, and a reproducing stylus carried by said spring and vibrating in a plane parallel with the record-surface, substantially as set forth.

8. In a reproducer for effecting reproductions from a sinuous grooved record, the combination of a diaphragm, a pivoted compensating weight, a spring carried by said weight, a bell-crank lever between said spring and diaphragm, and a stylus carried by said spring and vibrating in a plane parallel with the record surface, substantially as set forth.

705,880. PNEUMATIC MOTOR FOR CAR FANS AND VENTILATORS. CLARENCE A. EVANS, Upland, Pa. Filed Nov. 24, 1900. Serial No. 37,585. (No model.)



Claim.—1. The combination of a wind-chest and counterbalanced vane, a shaft freely carrying said vane, and a collar with separated shoulders on its hub, whereby the vane may be held in a vertical position while presenting its broad side or face to the impact of wind and in a feathering position while in its return motion, said shouldered collar being freely mounted on said arm and adjustably connected therewith whereby its abutments and those of the hub of the vane may be set relatively to each other.

2. The combination of a swinging vane, an arm carrying said vane, a counterpoise on said vane to facilitate the turning of the same by centrifugal force, a collar on said arm provided with separated shoulders, and means for adjustably securing said collar to said arm, the hub of said vane having separated shoulders thereon which are adapted to play between the shoulders of said collar and positively engage with the latter-named shoulders in the upright and horizontal positions of the vane.

705,881. DEVICE FOR MAKING IMPRESSIONS. DEREN L. FALARDEAU, Albany, N. Y. Filed June 6, 1901. Serial No. 63,447. (No model.)

Claim.—1. A device for taking impressions, consisting of the opposite jaws carrying the elastic cushions, said cushions having a thickness sufficient to receive the thickness of or encompass the object of which the impression is to be taken, and means for forcing said jaws together, substantially as specified.

2. A device for taking impressions of keys, consisting of the opposite jaws carrying the cushions of rubber or the like, said cushions being of a thickness sufficient to receive the thickness of the key, and means for forcing said jaws together, substantially as specified.

3. A device for making impressions of keys and other rigid objects, having three leaves or jaws, the intermediate jaw and one of the outer jaws being provided upon their meeting-faces with cushioned pad-like plateaus, and the opposite face of the intermediate jaw and the opposing face of the other outer jaw being provided with inking-pads, substantially as described.

705,882. LABELING-MACHINE. JOHN J. GAYNOR, Indianapolis, Ind., assignor of five-sixths to Frank Mans Fenyve and Anthony Harman, Indianapolis, Ind. Filed Dec. 2, 1901. Serial No. 84,627. (No model.)

Claim.—1. In a labeling-machine, oppositely-placed pairs of label-carrying plates that bring the labels into position against the neck and body of the bottle or the like for being affixed, and a label-holder that conforms to the neck and body of the bottle and which enters between said plates and holds the labels centrally lengthwise against the neck and body of the bottle while being affixed.

2. In a labeling-machine, a stationary label-support, means for elevating labels from the support to the under side of the bottle, a label-holder adapted to engage the labels centrally lengthwise of the bottle and hold them while being affixed, and means for moving the label-holder from the side into position between the label-support and label-carrier and then upward for engaging said labels.
